

Southwest Regional Partnership – Phase I Analysis and Results

Sixth Annual Conference on Carbon Capture & Sequestration • May 7–10, 2007 • Pittsburgh, Pennsylvania Presented by Brian McPherson

Who is the Southwest Partnership?

Partnership Objectives

- Develop a regional CO₂ capture and sequestration strategy
- Identify and evaluate CO₂ sources and sinks
- Develop a regional CO₂ capture and sequestration strategy
- Identify and evaluate CO₂ sources and sinks
- Develop a regional CO₂ capture and sequestration strategy
- Identify and evaluate CO₂ sources and sinks

Partnership Structure

Partnership Members

- Arizona: Arizona Department of Energy Services, Arizona State University, University of Arizona
- Colorado: Colorado Department of Natural Resources, Colorado State University, University of Colorado
- New Mexico: New Mexico Department of Energy, Minerals and Natural Resources, New Mexico State University, University of New Mexico
- Texas: Texas Department of Energy Conservation, Texas A&M University, University of Texas
- Utah: Utah Department of Natural Resources, Utah State University, University of Utah
- Oklahoma: Oklahoma Department of Energy, Oklahoma State University, University of Oklahoma

Primary Phase I Goals

- Top 10 Plants – 50%
- Characterize Region
- Main Factors
- Capacity of sinks
- Viability of sinks (link assessment/MVA)
- Feasibility of sinks (transportation)
- Cost/economics (including long-term MVA)
- Regulatory constraints

Link CO₂ Sources to CO₂ Sinks

Phase I Primary Tasks

- Characterize SW region's sources and sinks
- Identify the best options for linking sources to sinks
- Outcome – to be practical "first opportunities" for linking existing CO₂

Sources of CO₂ in the Southwest

Description of the Southwest Region

- Electrical power plants
- Cement and other processing plants
- Urban centers
- Non-point sources (agriculture, automobiles, etc.)

Sinks

- Geological (oil/gas reservoirs, deep saline aquifers, coal beds, natural CO₂ reservoirs, etc.)
- Terrestrial (agriculture, forests, etc.)
- Mineralization (engineering, landfill)
- Extensive CO₂ pipeline networks

Point Sources Group

Examine and rank all point sources of CO₂ in the region, including:

- Coal-fired plants
- Cement plants
- Other processing plants

For Each State in Region

CO₂ Emissions by Source

Electrical Generation Fuel Type

- Type of CO₂ generated per year
- Number of plants
- Data for 2000

Emissions Summary

Separating and Capturing CO₂ from the Sources

CO₂ Capture

- Renewed capture literature and capture technologies to use in each state (MEA/amine-based is "commercial technology")
- Knowledge-based limited data in large coal-fired power plants
- Costs of \$60-\$80 per ton CO₂ captured, including transport + sequestration
- AOC is more expensive currently, but results in lower avoided costs when CO₂ capture is required – physical systems, not MEA, are used

CO₂ Capture – New Technology

- New solvents to replace MEA (e.g. for example, are being commercialized)
- Optimized and integrated MEA design
- CO₂ Capture Project – substantial cost reductions
- Demonstration – very small-scale testing underway
- AOC – acceptance despite higher costs
- The avoided cost of CO₂ capture
- Numerous other developments underway – 10+ year development time frames

Separating and Capturing CO₂ from the Sources

Emissions and Capture Summary

- Renewed capture technologies in use in region
- Capture is expensive – CO₂ may increase 50% for conventional technology (PC, plants, MEA)
- Emerging technology can reduce the capture cost for CO₂ capture but CO₂ will grow up 50%
- Incentives for credits, emissions trading, technology breakthroughs, additional demonstrations of emerging technology required before CO₂ capture becomes widely employed

Geologic Sinks

Sequestration Themes

- Geologic Systems
- Terrestrial Systems
- Mineralization
- Engineering

Capacity Results

- Capacity Approach

Pipeline Infrastructure and Major Geologic Sinks

"String of Pearls" Concept

Terrestrial Sinks

What is Terrestrial Carbon Sequestration?

Potential to increase soil carbon storage depends on:

- Precipitation
- Soil fertility
- Soil disturbance
- Land use history

Defining the Potential for Carbon Sequestration

- Highly variable spatially (most recent – 25 cm)
- Irrigated vegetables not considered
- Forest land (35%) most considered
- Carbon sequestration is tracked by USFS, but land is not managed for carbon
- Results are presented (state level)

Arizona

Colorado

New Mexico

Texas

Education and Outreach

Objectives

1. Identify and respond to needs, fears, and desires
2. Inform about requirements, science, strategies, and technologies
3. Involve in discovery of opportunities
4. Enable recognition of mutual benefits

Goals Identify

- Capacity of sink
- Public to evaluate costs and benefits associated with carbon sequestration

Enable

- Public to evaluate costs and benefits associated with carbon sequestration

Tools

- Web page (dissemination, dialogue)
- Information packet (dissemination)
- Town hall meetings (dissemination, dialogue)
- Mediated modeling workshops (dialogue, dissemination)
- Participation by "Industry Advisory Panel"

Challenges

- Engaging specific stakeholder groups
- Environmental interests are site specific
- Disengaged stakeholders do not see immediate benefits
- Time restrictions: people lack the time to be involved
- In-person interaction
- Number of states involved and travel distance
- In-person interaction
- Information transmission
- Participation by "Industry Advisory Panel"

Integrated Assessment Model

Main Factors

- Sources
- Feasibility of sinks (transportation)
- Capacity of sinks
- Viability of sinks (regional link assessment/MVA)
- Cost/economics (including long-term MVA)
- Regulatory constraints
- Public education and approval

Other Screening Criteria

- Support candidate site and technology selection process

Best Demonstration Options and "String of Pearls"

Choosing the Best Pilot Study Sites

- Over 80 sites considered
- Evaluated and ranked using many criteria

Some criteria included:

- Storage capacity
- Diversity of geologic attributes
- CO₂ availability for testing purposes

3 of the 7 Geologic Options were selected as the Most Promising Opportunities for Evaluation in Phase II

- EOR and deep saline water aquifer, Permian Basin, Utah
- EOR and deep saline water aquifer, San Juan Basin, NM
- EOR and aquiferation, Permian Basin, TX

"String of Pearls" Concept

The development of a "string of pearls" concept for the southwest region, linking sources to sinks.

Southwest Regional Partnership – Phase II Demonstrations

Sixth Annual Conference on Carbon Capture & Sequestration • May 7–10, 2007 • Pittsburgh, Pennsylvania Presented by Brian McPherson

Introduction – Concept: “String of Pearls”

In the southwest USA, practical “first opportunities” for sequestration lie along existing CO₂ pipelines.

Pilot demonstrations will test short-term strategy: sequester along pipelines.

The demonstrations include 5 pilot tests of geologic sequestration and 2 terrestrial sequestration analyses –

- I. Aneth Unit, UT – Deep saline res.
- II. SACROC Unit, TX – EOR res.
- III. SACROC Unit, TX – EOR res.
- IV. Claytonville Field, TX – EOR res.
- V. San Juan Basin, NM – ECBM res.
- VI. San Juan Basin, NM – Regional terrestrial analysis.

Injection minimum at each site is 75,000 tons per year CO₂ for four years.

I & II – Utah Sequestration Demonstrations

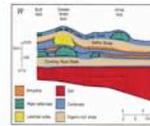

2 Demonstrations –

I. Deep Saline Reservoir Demo – 20,000 tons

- Injection of CO₂ into Mississippi carbonate Leachville Limestone formation
- Scalability: the Leachville Limestone represents a possible regionwide sequestration target

II. EOR and Sequestration Demo – 750,000 tons/year

- “Third” reservoir (Dowse Creek Fm.)
- Medium-scale injection (100,000 tons/year for 3 years)

Major Aneth Tasks and Timeline

- Construction of new pipeline, meter and CO₂ and facilities began in March 2006
- First phase of CO₂ injection into the main reservoir well began June 2007
- Deepwater Mississippi saline injection may begin Sept 2007
- CO₂ sequestration injection stages 2 and 3 (in different parts of field) to begin Sept 2007

III & IV – Texas Sequestration Demonstrations

2 Demonstrations –

III. EOR and Sequestration Demo – 350,000 tons/yr

- Detailed analysis of SACROC Unit, site of 30 yrs of CO₂ injection for EOR
- History match to determine what happened to CO₂ at SACROC

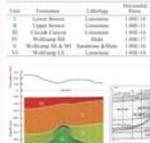

IV. EOR and Sequestration Demo – 300,000 tons/yr

- New CO₂ injection for EOR and sequestration analyses of the nearby Claytonville field
- Field never previously subjected to CO₂ injection

III. SACROC Unit, Texas, Demo

Year	Production	Injection	Residual	Net
1962	1,000,000	0	1,000,000	1,000,000
1963	1,000,000	0	1,000,000	1,000,000
1964	1,000,000	0	1,000,000	1,000,000
1965	1,000,000	0	1,000,000	1,000,000
1966	1,000,000	0	1,000,000	1,000,000
1967	1,000,000	0	1,000,000	1,000,000
1968	1,000,000	0	1,000,000	1,000,000
1969	1,000,000	0	1,000,000	1,000,000
1970	1,000,000	0	1,000,000	1,000,000
1971	1,000,000	0	1,000,000	1,000,000
1972	1,000,000	0	1,000,000	1,000,000
1973	1,000,000	0	1,000,000	1,000,000
1974	1,000,000	0	1,000,000	1,000,000
1975	1,000,000	0	1,000,000	1,000,000
1976	1,000,000	0	1,000,000	1,000,000
1977	1,000,000	0	1,000,000	1,000,000
1978	1,000,000	0	1,000,000	1,000,000
1979	1,000,000	0	1,000,000	1,000,000
1980	1,000,000	0	1,000,000	1,000,000
1981	1,000,000	0	1,000,000	1,000,000
1982	1,000,000	0	1,000,000	1,000,000
1983	1,000,000	0	1,000,000	1,000,000
1984	1,000,000	0	1,000,000	1,000,000
1985	1,000,000	0	1,000,000	1,000,000
1986	1,000,000	0	1,000,000	1,000,000
1987	1,000,000	0	1,000,000	1,000,000
1988	1,000,000	0	1,000,000	1,000,000
1989	1,000,000	0	1,000,000	1,000,000
1990	1,000,000	0	1,000,000	1,000,000
1991	1,000,000	0	1,000,000	1,000,000
1992	1,000,000	0	1,000,000	1,000,000
1993	1,000,000	0	1,000,000	1,000,000
1994	1,000,000	0	1,000,000	1,000,000
1995	1,000,000	0	1,000,000	1,000,000
1996	1,000,000	0	1,000,000	1,000,000
1997	1,000,000	0	1,000,000	1,000,000
1998	1,000,000	0	1,000,000	1,000,000
1999	1,000,000	0	1,000,000	1,000,000
2000	1,000,000	0	1,000,000	1,000,000
2001	1,000,000	0	1,000,000	1,000,000
2002	1,000,000	0	1,000,000	1,000,000
2003	1,000,000	0	1,000,000	1,000,000
2004	1,000,000	0	1,000,000	1,000,000
2005	1,000,000	0	1,000,000	1,000,000
2006	1,000,000	0	1,000,000	1,000,000
2007	1,000,000	0	1,000,000	1,000,000

- Current operations inject ~1.5 M CO₂/yr, with rise and rise ~7 M CO₂/yr net storage of ~5 M CO₂/yr
- The site has accumulated ~85 M CO₂
- In comparison, Sleipner injects ~1 M CO₂/yr since 1996
- History matching analysis extremely valuable in understanding fate of CO₂

IV. Claytonville Field Texas, Demo

Geology very similar to that of SACROC (Claytonville is not on Frio/San Jose, but is isolated reef build-up on Easter Shelf)

- Planned injection of ~100,000 tons per year of life of project
- Target Reservoir: Canyon Reef Fm. FERTT in depth below surface
- Reservoir has only been subjected to waterflooding
- CO₂ injection will begin March 2007
- This field represents a potentially huge CO₂ storage site

V & VI – New Mexico Sequestration Demonstrations

V. ECBM/CO₂ Test in San Juan CBM “Fairway” – 75,000 tons

Assessed by ARJ in DOE-sponsored Coal-Seg project as one of top US

- Potential storage capacity (12 of CO₂, 12% of US total)
- ECBM potential (16 TCF, 10% of U.S. total)
- Potential net profit of \$4.8/ton of CO₂
- Geologically, results of joints directly available to much of San Juan and other coalfield basins

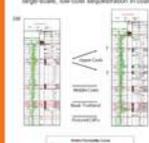

Infrastructure for large scale sequestration already in place

- Many shafts characterized by exceptionally high permeability (>100 mD)
- Mitigating factor: coal swelling and injectivity loss (meaninging high injectivity critical for large scale, low cost sequestration in coal)

San Juan Basin Demonstration

Research Properties of Pump Co.

San Juan Basin

Proposed Seismic

- 2-D seismic lines for pre- and post-injection
- Controlled source seismic with OIP being investigated
- Presence of source, in part, to gain information on depth structure above and below

Ongoing Baseline Monitoring

Full year study began Summer 2006

- Permeability (2006)
- Soil gas depth profiles up to one meter
- 2-D seismic (2006)
- City and CO₂ flow measurements
- Radar and flow concentrations in soil gas
- Water well monitoring

VI. San Juan Basin Local Terrestrial Demonstration

The ~10 km scale pilot will be conducted in tandem with the ECBM sequestration pilot

- Produced water from the ECBM test will be dewatered and used to restore riparian lands
- Two-pronged strategy: enhance existing woody plant species along riparian areas and re-establish native grasses and shrubs in upland areas
- Desalinate CBME/ECBM produced water using zeolite RO membrane (or other technology) for application to riparian riparian ecosystems
- Limiting factor: water, both quality and quantity
- SWP collaborating with Big Sky Partnership

VII. Regional Terrestrial Analysis

Focus for Phase II will be Continued Regional Analysis of Terrestrial Sequestration – Including Land-use Patterns and Evolution

- MMV – Soil Carbon Analyses LBS
- 10C in soil (2m scale)
- Monitor differences through time
- Use to calibrate remote sensing

Phase II

Phase II is focusing on reducing high levels of uncertainty associated with analysis in areas outside the High Plains, including improper land characterization

Phase II will continue evaluation of existing carbon policy and WTO farm subsidies, which will both impact land-use trends and incentive programs

Chihuahuan and Sonoran desert land degradation may be being C at ~1 T C/ha

- These lands are roughly ~2.8 Mha in US
- Losses through wind erosion one being evaluated in Phase II

Current work for all sites

- MMV
- Risk Assessment
- Regulatory
- Integrated Analysis
- Outreach and Education

Schedule of Major Activities

Activity	Start	End
Construction of new pipeline, meter and CO ₂ and facilities	March 2006	March 2006
First phase of CO ₂ injection into the main reservoir well	June 2007	June 2007
Deepwater Mississippi saline injection	Sept 2007	Sept 2007
CO ₂ sequestration injection stages 2 and 3	Sept 2007	Sept 2007
