Coal Crusher, 254,000 lbs, Construction

Reference Flow: 1 piece (pcs) of Coal Crusher, 254,000 lbs **Brief Description:** Based on manufacturer specifications for a Gundlach Braker model 12048, 254,000 lbs, used in crushing coal, this unit process quantifies the amount of steel needed to produce the coal crusher. Section I: Meta Data Geographical Coverage: US Region: Powder River Basin 2009 **Year Data Best Represents: Process Type:** Manufacturing Process (MP) **Process Scope:** Gate-to-Gate Process (GG) **Allocation Applied:** No **Completeness:** Individual Relevant Flows Recorded Flows Aggregated in Data Set: Process Energy P&D Material P&D Energy Use **Relevant Output Flows Included in Data Set:** Releases to Air: Greenhouse Gases Criteria Air Pollutants Other Other Releases to Water: Inorganic Emissions **Organic Emissions** Water Consumption Water Demand (throughput) Water Usage: Releases to Soil: **Inorganic Releases** Organic Releases Other **Adjustable Process Parameters: Tracked Input Flows:** Steel cold rolled (St) [Metals] Cold rolled steel used for construction of the crusher **Tracked Output Flows:** Coal Crusher, 254,000 lbs [Construction] Construction of a single Gundlach Braker model 12048 coal crusher

# **Section II: Process Description**

#### **Associated Documentation**

This unit process is composed of this document and the data sheet (DS) DS\_Stage1\_C\_Coal\_Crusher\_254000lb\_2010.01.xls, which provides additional details regarding calculations, data quality, and references as relevant.

# **Goal and Scope**

The scope of this unit process encompasses the materials and weights of those materials necessary to construct a single 254,000 lb coal crusher, to be used for the preparation of surface-mined Powder River Basin sub-bituminous coal. The unit process is based on the reference flow of 1 piece of coal crusher, 254,000 lbs, as described below, and as shown in **Figure 1**. The crusher is assumed to be constructed entirely of cold rolled steel; therefore cold rolled steel is assumed to be the only material required for crusher construction. Other materials are assumed to be negligible.

This unit process is used during LC Stage #1 to assist in the preparation of subbituminous coal. It is combined with other mine equipment construction unit processes in the assembly unit process for sub-bituminous coal,

DF\_Stage1\_C\_Assembly\_PRB\_Coal\_Surface\_Mine\_2010.01.doc. This assembly unit process quantifies the fraction of each piece of equipment needed under LC Stage #1 to produce 1 kg of coal ready for transport (LC Stage #2) to the energy conversion facility (LC Stage #3).

# **Boundary and Description**

Construction of the coal crusher is based on manufacturer specifications for a Gundlach Braker model 12048 coal crusher. The crusher is used to crush the extracted coal into smaller pieces which is then stored, and later transported.

**Figure 1** provides an overview of the boundary of this unit process. Emissions related to the physical assembly of the crusher (e.g., that are emitted while putting together the components of a crusher, including transport of those components) are not considered in this study. Upstream emissions from the production of raw materials used for the construction of the crusher (e.g., cold rolled steel) are calculated outside the boundary of this unit process, based on proprietary profiles available within the GaBi model. As shown in Figure 1 and discussed above, the crusher constructed in this unit process is incorporated into the surface mine assembly processes for LC Stage #1 for surface mined Powder River Basin sub-bituminous coal.

The total weight of a crusher was readily available but reliable data for the material breakdown of crusher subcomponents were not. Therefore, the crusher was assumed to be composed entirely of cold rolled steel (Steel cold rolled (St) [Metals]).

**Table 1** shows relevant properties and assumptions used to calculate the amount of cold rolled steel contained in a single crusher. Total weight for one crusher is estimated

to be approximately 115,213 kg (254,000 lbs) (Gundlach 2009). Based on the assumption that the crusher is constructed entirely out of cold rolled steel, the total weight is assigned to this material. **Table 2** provides a summary of modeled input and output flows. Additional detail regarding input and output flows, including calculation methods, is contained in the associated DS sheet.

Coal Crusher, 254,000 lb, Construction Unit Process: System Boundary Cold Rolled Steel Coal Crusher, 254,000 lb (Upstream Profile) <u>Kev</u> **Process** LC Stage #1 Construction Upstream Assembly Unit **Emissions Data Process** 

Figure 1: Unit Process Scope and Boundary

Table 1: Properties of the Coal Crusher, 254,000 lbs

Total Weight of Single Coal Crusher	Weight	Reference
One Crusher Weight, kg (lbs)	115,213 (254,000)	Gundlach 2009
Total Cold Rolled Steel in One Crusher, kg (lbs)	115,213 (254,000)	NETL Engineering Judgment

**Table 2: Unit Process Input and Output Flows** 

Flow Name*	Value	Units (Per Reference Flow)		
Inputs				
Steel cold rolled (St) [Metals]	115,213	kg		
Outputs				
Coal Crusher, 254,000 lbs [Construction]	1.00	piece		

<sup>\*</sup> **Bold face** clarifies that the value shown *does not* include upstream environmental flows. Upstream environmental flows were added during the modeling process using GaBi modeling software, as shown in Figure 1.

## **Embedded Unit Processes**

None.
