Driving innovation and delivering solutions for an environmentally sustainable and prosperous energy future:

- Ensuring affordable, abundant and reliable energy that drives a robust economy and national security, while
- Developing technologies to manage carbon across the full life cycle, and
- Enabling environmental sustainability for all Americans.

To be the nation’s premier energy technology laboratory, delivering integrated solutions to enable transformation to a sustainable energy future.
Introduction

• History of NETL CCUS products
• Techno-economics analysis and life cycle analysis
  • Cost and Performance Baselines
    Pulverized coal, NGCC
  • Bio-Energy with Carbon Capture and Storage (BECCS)
• Carbon capture retrofit databases
• Carbon storage
  • FE CM/NETL CO\textsubscript{2} Transport and Saline Storage Cost Models
  • Carbon Storage Atlas
Bio-energy with Carbon Capture and Storage

• BECCS is one pathway to negative CO₂ emissions

Technoeconomic and Life Cycle Analysis for Bio-Energy with Carbon Capture and Storage (BECCS) Baseline
Bio-energy with Carbon Capture and Storage

• BECCS is one pathway to negative CO₂ emissions
• Co-firing coal can ease logistics and cost
Bio-energy with Carbon Capture and Storage

• The analysis also highlights the environmental tradeoffs for the GHG reductions

Industrial capture

- Previous work provided LCAs for industrial facilities with CCS:
  - Petroleum refineries
  - Ammonia plants

- We’re continuing to add to that:
  - Cement
  - Steel
  - Natural gas processing plants

- Again, the implementation of capture has tradeoffs

Saline Aquifer Storage

- Onshore storage LCA model
- Connects to FE CM/NETL CO$_2$ Saline Storage Cost Model
- Formation-specific impacts
- Refined leakage rates

Managing well leakage risks at a geologic carbon storage site with many wells

CO2 Utilization LCA Guidance Toolkit Update

- NETL first developed for CO2 utilization projects using captured CO2 from power plants
- Newer funding opportunities allow different CO2 sources and for different end uses
- Version 2 of the Guidance Document addresses these changes
- Along with other updates to the database and other parts of the toolkit

NETL CO2U LCA GUIDANCE TOOLKIT
Version 2.0.0

Life Cycle Impact Assessment
Converts emissions to environmental impact equivalences (i.e., mid-point impacts).

- **Global Warming Potential (GWP):** is the heat absorbed by any greenhouse gas in the atmosphere, as a multiple of the heat that would be absorbed by the same mass of carbon dioxide (CO₂). GWP is dependent on the time horizon the greenhouse gas emission impacts are assessed; 20 and 100-year time frames are commonly reported, with 100-year being the default time horizon. GWP values are defined by the Intergovernmental Panel on Climate Change (IPCC). IPCC 5th Assessment Report values applied in this study on a 20 and 100-year basis are:
  - Carbon Dioxide (CO₂): 20-year: 1; 100-year: 1.

- **Acidification Potential:** is the increased concentration of hydrogen ions in a local environment. Substances, which cause acidification, can cause damage to building materials, paints, and other human-built structures, lakes, streams, rivers, and various plants and animals.

- **Eutrophication Potential:** is the enrichment of an aquatic ecosystem with nutrients (nitrogen, phosphorus) that accelerate biological productivity (growth of algae and weeds) and an undesirable accumulation of algal biomass. High levels of nitrogen and phosphorus can cause adverse effects on local water ways and other downstream destinations.

- **Ozone Depletion Potential:** is the deterioration of ozone within the stratosphere by chemicals such as chlorofluorocarbons (CFCs). Stratospheric ozone provides protection for people, crops, and other plant life from radiation.

- **Particulate Matter Formation Potential:** is the increased concentration of a mixture of solid particles and liquid droplets found in the air that are smaller than 10 microns in diameter that have the potential to cause human respiratory effects.

- **Photochemical Smog Formation Potential:** is created by various chemical reactions, which occur between nitrogen oxides (NOx) and volatile organic compounds (VOCs) in sunlight. Ground level ozone can have both ecological impacts on crops and ecosystems as well as cause respiratory effects in humans.

- **Water Consumption:** volume of water consumed across the life cycle of the product or service. Increased water consumption in water scarce areas may restrict water availability for human, agricultural, and other uses.

LCIA methods for non-GWP indicators is based on the U.S. EPA “Tool for Reduction and Assessment of Chemicals and Other Environmental Impacts (TRACI)” Bare, 2008; Bare 2011
