Abstract

The Southwest Partnership on Carbon Sequestration completed its Phase I program in December 2005. The main objective of the Southwest Partnership Phase I project was to evaluate and demonstrate the means for achieving an 18% reduction in carbon intensity by 2012. Many other goals were accomplished on the way to this objective, including (1) analysis of CO_2 storage options in the region, including characterization of storage capacities and transportation options, (2) analysis and summary of CO_2 sources, (3) analysis and summary of CO_2 separation and capture technologies employed in the region, (4) evaluation and ranking of the most appropriate sequestration technologies for capture and storage of CO_2 in the Southwest Region, (5) dissemination of existing regulatory/permitting requirements, and (6) assessing and initiating public knowledge and acceptance of possible sequestration approaches.

Results of the Southwest Partnership's Phase I evaluation suggested that the most convenient and practical "first opportunities" for sequestration would lie along existing CO_2 pipelines in the region. Action plans for six Phase II validation tests in the region were developed, with a portfolio that includes four geologic pilot tests distributed among Utah, New Mexico, and Texas. The Partnership will also conduct a regional terrestrial sequestration pilot program focusing on improved terrestrial MMV methods and reporting approaches specific for the Southwest region. The sixth and final validation test consists of a local-scale terrestrial pilot involving restoration of riparian lands for sequestration purposes. The validation test will use desalinated waters produced from one of the geologic pilot tests.

The Southwest Regional Partnership comprises a large, diverse group of expert organizations and individuals specializing in carbon sequestration science and engineering, as well as public policy and outreach. These partners include 21 state government agencies and universities, five major electric utility companies, seven oil, gas and coal companies, three federal agencies, the Navajo Nation, several NGOs, and the Western Governors Association. This group is continuing its work in the Phase II Validation Program, slated to conclude in 2009.

Executive Summary

The Southwest Regional Partnership on Carbon Sequestration (SWP) region includes Arizona, Colorado, New Mexico, Oklahoma, Utah, and contiguous areas from three adjacent states, including western Texas, southern Wyoming, and western Kansas. This region is a net exporter of electricity, coal, oil and gas, and has some of the largest growth rates in the nation.

The Partnership characterized the region's geologic and terrestrial sequestration attributes and options, including ranges of storage capacities of each option. The Partnership also evaluated and summarized CO2 sources in the region, and associated separation and capture technologies employed in the region. Measurement, mitigation and verification (MMV) options were evaluated, and a suite of most appropriate MMV options for Phase II validation testing was assembled. Outreach and education of the public was initiated, using a range of communication approaches, including websites, townhall meetings and conferences. The resulting data from all SWP analyses were compiled and published in comprehensive databases, with public online access; these data were also propagated to NATCARB.

The southwest region possesses an extensive CO_2 pipeline network that transports over 30 Mt of naturally-sourced CO_2 per year from the central Rockies to the Permian basin for EOR operations. In the Partnership's Phase I project, we concluded that the most convenient and practical opportunities for sequestration would be to supplant the natural CO_2 in these pipelines with power-plant-sourced CO_2. We maintain this idea and suggest that "first options" for the nation may lie along existing pipelines. Furthermore, the SWP's Phase I ranking of sequestration opportunities considered proximity to sources and/or pipeline infrastructure in addition to economic, safety, risk mitigation potential, and other factors. The result of the Phase I ranking process produced plans for a technology validation program that includes four geologic pilot tests located among Utah, New Mexico, and Texas, in addition to a region-wide terrestrial analysis and a local-scale terrestrial pilot test. The Phase I project recommended geologic sequestration test sites to inject a minimum of ~75,000 tons/year CO_2, with a minimum injection duration of one year. Such pilots represent medium-scale validation tests in sinks that may host capacity for possible larger-scale sequestration operations in the future. These validation tests will also demonstrate a broad variety of carbon sink targets and multiple value-added benefits, including testing of deep saline sequestration, enhanced oil recovery and sequestration, enhanced coalbed methane production and a geologic sequestration test combined with a local terrestrial sequestration pilot. The local terrestrial pilot involves restoration of riparian lands for sequestration purposes, using desalinated waters produced from our scheduled enhanced coalbed methane / CO_2 sequestration pilot project. The Partnership's regional terrestrial sequestration pilot program will focus on improved terrestrial MMV methods and reporting approaches specific for the Southwest region. In sum, the SWP's Phase I project produced a field validation testing program that will seek to maximize specific performance, economic, and environmental goals of the DOE Carbon Sequestration Roadmap. This validation-testing will demonstrate efficacy of sequestration technologies to reduce or offset greenhouse gas emissions in the region. Risk mitigation, optimization of MMV protocols, and effective outreach and communication are additional critical goals of these field validation tests.

The SWP comprises a diverse group of expert organizations specializing in carbon sequestration science and engineering, as well as economics, public policy and outreach. These partner organizations are drawn from: 1) industry, 2) State governmental agencies and universities, 3) U.S. Federal government entities, and 4) other specialized partners, including the Western Governors Association. The Southwest Partnership continues a close alliance with the other Regional Partnerships, and the Western Governors' Association has facilitated communication and collaboration. For Phase II, the Southwest Partnership is collaborating with Big Sky Partnership and WESTCARB on two different pilot tests in the region.

This report outlines the general results of the Phase 1 SWP program, which focused on characterization of the region and its sequestration options. Also included is a series of appendices, which are intended as stand-alone documents; these appendices include descriptions of the general regulatory frameworks in the Southwest region (by state), a summary of carbon sources in the region, a summary of the SWP risk factors assessment, a summary of monitoring technologies and gaps in coverage, a summary of activities conducted by the Western Governors Association on behalf of the SWP, and the action plans for the SWP Phase 2 sequestration validation program.

Experimental

No special experimental methods are being employed in this project. Materials and equipment used include only standard communication means and data management tools, including computerized databases, internet websites, etc.

Results and Discussion

Geologic Sinks

Arizona Geologic Sinks

The total carbon dioxide (CO_2) sequestration capacity of geologic sinks in Arizona, excluding mineralization, is estimated to be in excess of 27,520 million metric tons (Table 1). Saline reservoirs on the Colorado Plateau in northern Arizona and the intermountain basins in southern Arizona account for essentially all of this capacity even though they have the greatest uncertainty as to effective reservoir and trap development (Fig. 1). Oil and gas fields on the Navajo Nation in northeastern Arizona account for only 14.1 million metric tons of the total. No CO_2 sequestration capacity was estimated for coal because none of the coal deposits meet the minimum depth requirement for maintaining CO_2 in a critical state. The deepest coal deposits are less than 2,000 ft deep whereas the CO_2 critical state requirements are based on temperature and pressure levels below a minimum depth of 2,600 ft. There is no coalbed methane production in Arizona.

The six major utility point sources in Arizona discharged 41 million metric tons of CO_2 in 2002. The Navajo Generating Station near Page discharged 18 million metric tons of CO_2 in 2002. The Navajo Generating Station is the largest point source of CO_2 emissions in Arizona. All six major utility point sources are located over potential saline reservoirs. None of the major utility point sources are located near oil and gas fields.

Oil and Gas Fields

There are 14 relatively small oil and gas fields in northeastern Arizona (Fig. 1). The total CO_2 sequestration capacity for all of the fields together is estimated to be about 14.1 million metric tons. The oil and gas fields include the (1) Dineh-bi-Keyah, (2) East Boundary Butte, (3) Black Rock, (4) Dry Mesa, (5) Teec Nos Pos, (6) Tohache Wash, (7) Bita Peak, (8) Twin Falls Creek, (9) North Toh Atin, (10) Toh Atin, and (11) Walker Creek fields on the Navajo Nation and the (12) Pinta Dome, (13) Navajo Springs, and (14) East Navajo Springs helium fields in the Holbrook Basin. All have been abandoned except for the Dineh-Bi-Keyah, East Boundary Butte, Black Rock and Dry Mesa fields. All production has come from geologic units of Paleozoic age except for Dineh-bi-Keyah. Dineh-bi-Keyah is unique because the producing reservoir is igneous rock of Tertiary (Oligocene) age that was intruded into carbonate and organic-rich, black shale of Pennsylvanian age.

Field	Location	Productive horizon
Dineh-bi-Keyah	35-36n/29-30e	Tertiary Igneous in Penn. Hermosa Fm
East Boundary Butte	41n/28-29e	Penn. Paradox Fm
Black Rock	40n/29e	Miss. Leadville Ls / Penn. Paradox Fm
Dry Mesa	40n/28e	Miss. Leadville Ls / Penn. Paradox Fm
Teec Nos Pos	41n/30e	Penn. Paradox Fm
Tohache Wash	41n/30e	Devonian Aneth Fm/ Miss. Leadville Ls
Bita Peak	41n/31e	Penn. Paradox Fm
Twin Falls Creek	41n/30e	Penn. Paradox Fm
North Toh Atin	41n/28e	Penn. Paradox Fm
Toh Atin	40n/28e	Penn. Paradox Fm
Walker Creek	41n/25e	Devonian McCracken Ss
Pinta Dome	19-20n/26e	Permian Coconino Ss
Navajo Springs	19-20n/27-28e	Permian Coconino Ss
East Navajo Springs	19-20n/27-28e	Permian Coconino Ss

Only two oil and gas fields in Arizona exceed the cumulative production values of 1 million barrels of oil or 10 billion cubic feet of gas used by the Southwest Partnership to identify preferable geologic sink candidates. These include the Dineh-bi-Keyah field with a cumulative oil production of 18.5 million barrels and the East Boundary Butte field with a cumulative gas production of 10 billion cubic feet. The total estimated sequestration capacity of Dineh-bi-Keyah and East Boundary Butte is 11 million metric tons. None of the fields in Arizona are in close proximity to a major point source of CO_2. The closest point sources are about 45 miles to the east in northwest New Mexico.

Dineh-bi-Keyah Field (AZ-000F02)

Why the site looks good:

- Demonstrated reservoir with effective seal
- Cumulative production of 18.3 million barrels oil, 6.6 million barrels water, and 4.7 billion cubic feet gas
- Existing well bores plus added value from a potential CO_2 flood
- Injection targets range from 2,800 to 3,800 ft
- Potential CO_2 sequestration capacity of 9 million metric tons

Issues needing further evaluation:

- Approximately 45 miles to nearest point sources in northwestern New Mexico
- Located on Navajo Nation and may require special permits and fees

East Boundary Butte Field (AZ-000F01)

Why the site looks good:

- Demonstrated reservoir with effective seal
- Cumulative production of 10 billion cubic feet gas, 5.2 million barrels water, and 0.9 million barrels oil
- Existing well bores plus added value from a potential CO_2 flood
- Injection targets range from 4,700 to 5,000 ft
- Potential CO_2 sequestration capacity of 2 million metric tons

Issues needing further evaluation:

- Approximately 45 miles to nearest point sources in northwestern New Mexico
- Located on Navajo Nation and may require special permits and fees

Deep Saline Reservoirs

The total maximum CO_2 sequestration capacity for the ten deep saline reservoirs identified in Table 1 is estimated to be about 27,500 million metric tons. Three of the saline reservoirs are Paleozoic units located near Page, Holbrook, and St. Johns in northern Arizona. The remaining seven are basin-fill sediments located in the intermountain Tertiary basins in southern Arizona. Six of the saline reservoirs underlie major utility point sources of CO_2 including the Navajo, Cholla, Coronado, and Springerville power plants in northern Arizona and the Apache and Irvington power plants near Willcox and Tucson in southern Arizona (Fig. 1).

Greater uncertainty exists in terms of reservoir extent and trap efficiency in the deep saline reservoirs as opposed to the oil and gas fields. There is very little direct reservoir and trap information such as porosity, permeability, depth, and thickness available for the saline reservoirs, especially in the Tertiary basins, because there are so few deep drill holes and the information that is available from the few deep drill holes is in most cases very sparse and sketchy. As a result, porosity, depth and thickness are based mostly on driller's descriptions and old electrical logs. Reservoir pressures are estimates based mostly on a pressure gradient of 0.433 psi per ft of depth. The estimated area of the saline reservoirs in the Tertiary basins is based on the 3,000 ft depth-to-bedrock contours, which in turn are based on gravity.

Focus Site: Navajo Generating Station

The Navajo Generating Station (NGS) is the largest stationary point source of CO_2 emissions in Arizona. It discharged about 18 million metric tons of CO_2 in 2002. The 2,400 MW coal-fired NGS is approximately five miles southeast of Page on property leased from the Navajo Nation. The Salt River Project (SRP) operates the NGS.

The youngest to oldest potential CO_2 sequestration reservoirs underlying the NGS include the Kaibab Limestone, Coconino Sandstone, and Cedar Mesa Sandstone of Permian age; Redwall Limestone of Mississippian age; and Tapeats Sandstone of Cambrian age. Potential reservoir seals include the Muav Limestone, Bright Angel Shale, Organ Rock Shale, Chinle and Moenkopi Formations. The estimated reservoir and seal depths and thicknesses underlying the NGS are tabulated in Table 2.

There are no deep exploratory wells in the immediate vicinity of the NGS. Formation depths and thickness estimates underlying the NGS are based on projections of formation tops in the Shell Soda Unit #1 in Utah (2-40s-7e) and the Sinclair Oil Navajo Tribal #1 in Arizona (28-37n-14e). The Shell Soda Unit #1 and Sinclair Oil Navajo Tribal #1 are approximately 39 miles northeast and 38 miles southeast of the NGS, respectively. Figure 2 illustrates the relative location of the NGS, wells, orientation of A-A' profile, NGS projection point onto A-A', and a cross section along A-A'.

The NGS is within the Kaibito Plateau physiographic province, which is part of the Kaiparowits Basin. The Kaibab Uplift, White Mesa, and Navajo Mountain bound the basin on the west, south, and east, respectively. The basin extends north into Utah and covers approximately 3,000 square miles in Arizona.

Land surface elevation near the NGS is approximately 4,350 ft above mean sea level and located within a grassland-shrub vegetation zone. Average annual temperature is approximately 58°F. Mean annual precipitation is less than eight inches. Range in annual snowfall exceeds 40 inches. Municipal and industrial water demands in the area are provided from Lake Powell surface-water withdrawals.

Groundwater is present at approximately 1,050 ft below land surface and occurs primarily in the Glen Canyon Group, which is known as the N-aquifer system. The early Jurassic to upper Triassic (180 to 210 Ma) N-aquifer system consists of the Navajo Sandstone, Kayenta Formation, and Wingate Sandstone. The deeper C-aquifer includes the Kaibab Limestone and Coconino Sandstone. The C-aquifer is not a water supply formation in the northern Arizona Colorado Plateau region. Indications are that the Kaibab Limestone and the Coconino Sandstone are dry west of the north-south trending Wahweap syncline, located approximately three miles east of Page. Groundwater in the vicinity of the NGS flows north toward Lake Powell.

Cambrian Tapeats Sandstone

The Grand Canyon Tonto Group of Cambrian age has been differentiated into the Tapeats Sandstone, Bright Angle Shale, and Muav Limestone. The Tapeats Sandstone is the deepest saline reservoir under consideration for CO_2 sequestration with approximately 6,500 ft of overburden. Thickness estimates range between 200 to 350 ft near the confluence of the Little Colorado and Colorado Rivers. It is not considered an aquifer due to its depth and salinity. The Tapeats is very fine to very coarse, subrounded to subangular and is poorly sorted with clear, white, and pink quartz grains. The sandstone is thin- to thick-bedded with planar-tabular cross-bedding that is medium to low angle and medium to large scale. It may contain lenses of conglomerate near the basal contact and is generally well cemented by siliceous quartzite material. Thus, the Tapeats does not readily transmit water rapidly unless fractured. The Hopi have used the seeps near the mouth of the Little Colorado River as a source of salt. The Sinclair Oil Navajo Tribal #1 did not fully penetrate the Tapeats (only 30 ft) so the projected thickness is unknown. The Tapeats thickness in the Shell Soda Unit #1 is 215 ft. The thickness estimate underlying NGS is 330 ft.

Mississippian Redwall

The Mississippian Redwall Limestone in Grand Canyon is equivalent to the Leadville Limestone in the Four Corners region. The Redwall is approximately 500 ft thick in Grand Canyon where it has been differentiated into four members:

- Member-A, the basal Whitmore Wash Member, is a thick-bedded unit 70 to 130 ft thick. Limestone predominates in the western part of the area and dolomite in the eastern part.
- Member-B, Thunder Springs Member, is approximately 65 to 105 ft thick and consists of alternating beds of chert and carbonate rock approximately 1 to 5 inches thick and forms a conspicuous banded cliff.
- Member-C, Mooney Falls Member, is a thick bedded, massive, cliff-forming unit that ranges from 200 to 400 ft thick.
- Member-D, the uppermost Horseshoe Mesa Member, is a 40 to 100 ft thick thin bedded, mostly aphanitic limestone.

The Mississippian rocks thin progressively to the southeast and are no longer present east of Holbrook. The Redwall Limestone appears massive but close inspection indicates it contains numerous solution channels and cavities developed along bedding planes, faults, and joints. Previous thickness estimates near Page are between 600 and 700 ft.

Pennsylvanian and Permian Rocks

The Aubrey Group, named after the Aubrey Cliffs near Seligman, consists of the following units from top to bottom: Kaibab Limestone, Coconino Sandstone, Hermit Shale, and the Supai Formation. The Coconino and the Kaibab are the chief water-bearing units in the southern part of the Colorado Plateau. These units are connected hydraulically and form the C-multiple aquifer system. The Kaibab Limestone is not present in the Sinclair Oil Navajo Tribal #1 and, assuming the unit pinches out at the well, is of negligible thickness beneath the NGS (15 ft). The projected Coconino Sandstone thickness is approximately 550 ft beneath the NGS.

Discussion

The Kaibab Limestone and Coconino Sandstone are above a depth of 2,600 ft in the vicinity of the NGS (Table 2, Fig. 2). Geological sequestration of CO_2 below a depth of 2,600 ft is preferred because formation temperature and pressure conditions below 2,600 ft will maintain CO_2 in a critical state.

The 1,315 ft thick Cedar Mesa Sandstone, which lies deeper than the preferred depth of 2,600 ft, underlies approximately 455 ft of Organ Rock Shale, a potential seal formation. The deeper-lying Redwall Limestone and Tapeats Sandstone merit further evaluation. Exploratory drilling near the NGS is needed to obtain direct and critical information regarding the potential for CO_2 sequestration near the NGS.

Tapeats-Redwall-Cedar Mesa (AZ-000R01)

Why the site looks good:

- Location beneath major point source (Navajo Generating Station)
- Thick sandstone and carbonate rocks with good porosity provide potential reservoirs
- Thick shale units with few mapped faults provide effective seals
- Injection targets range from 5,000 to 10,000 ft

Issues needing further evaluation:

- Insufficient number of boreholes to demonstrate storage capacity of reservoirs
- Environmental concern of potential reservoir rocks beneath national recreation area
- Located on Navajo Nation and may require special permits and fees

Naco Limestone (AZ-000R02)

Why the site looks good:

- Location beneath major point source (Cholla Power Plant)
- Extensive salt deposits to provide effective seal
- Possible permeability and porosity development in carbonate or clastic reservoirs
- Injection targets range from 2,500 to 3,500 ft

Issues needing further evaluation:

- Insufficient number of boreholes to demonstrate storage capacity of reservoirs
- Insufficient number of boreholes to delineate structural and stratigraphic traps

Tertiary Basin Fill (AZ-000R04)

Why the site looks good:

- Location beneath major point source (Apache Power Plant)
- Thick clastic basin-fill deposits as potential injection reservoirs
- Injection targets range from 2,500 to 6,000 ft

Issues needing further evaluation:
- Insufficient number of boreholes to demonstrate the presence of effective seals
- Insufficient number of boreholes to demonstrate storage capacity of reservoirs
- Insufficient number of boreholes to delineate structural and stratigraphic traps

St. Johns – Springerville (AZ-000R03)

Why the site looks good:
- Location beneath major point source (Springerville Power Plant)
- Operator press releases report up to several trillion cubic feet of gas in place

Issues needing further evaluation:
- Relatively shallow injection targets range from 1,500 to 3,000 ft
- Insufficient number of boreholes to demonstrate storage capacity of reservoirs
- Insufficient capacity resulting from the recent start and low volume of production
- Low hydrostatic gradients and reservoir pressures
- Relationship between numerous springs, travertine domes, and effectiveness of seals

Coal

Unminable coal seams were evaluated as potential CO_2 sequestration sinks but none of the coal deposits met the minimum depth requirement for maintaining CO_2 in a critical state. Carbon dioxide critical state requirements are based on temperature and pressure levels below 2,600 ft minimum depth. There is no coal-bed methane production in Arizona.

Coal Deposits in the Black Mesa Basin

Why the site looks good:
- Large reserve containing an estimated 20 billion tons of unminable coal
- Added value from potential enhanced recovery of coal-bed methane from CO_2 flood

Issues needing further evaluation:
- Approximately 65 miles to nearest point source at Page, Arizona
- Very shallow injection targets between 300 and 1,700 ft
- Insufficient number of boreholes to demonstrate storage capacity of reservoirs
- Located on Navajo and Hopi lands and may require special permits and fees

Colorado Geologic Sinks

The Colorado Geological Survey (CGS) participated in Phase I of the Southwestern Regional Partnership for Carbon Sequestration Project where the primary objective was to characterize the CO_2 environment throughout the southwestern region of the United States. For the State of Colorado, this task consisted of the following three subtasks: (1) assemble CO_2 source data, (2) assemble CO_2 sink data, and (3) estimate carbon storage capacity. These results were incorporated into a geographical information system for public access and region-based analysis. The summary that follows briefly discusses the methodology, data sources, and findings for each of these subtasks**.**

CO2 Source Data

In 2000, CO_2 emissions were more than 68 million metric tonnes (MMt) in Colorado and are projected to increase by 1.5 % per year from 2002 to 2025 (U.S. Environmental Protection Agency, 2004; Energy Information Administration, 2004). Nearly 75 % of these emissions result from activities in the utility and transportation sectors (Fig. 3, Table 3). Power generation in the state relies primarily on coal and as a result, 42% of the total CO_2 emissions in Colorado are emitted from power plants in the utility sector (U.S. Environmental Protection Agency, 2004). These stationary point sources afford the possibility of capture and separation of CO_2 for transport and storage at nearby "sinks". The primary source of the CO_2 emission data for this project was the most comprehensive public database that includes CO_2 data, *Emissions & Generation Resource Integrated Database* (eGRID), which is maintained by the Office of Atmospheric Programs at the U.S. Environmental Protection Agency.

CO2 Sink Potential

Although CO_2 sink potential is widely distributed across the state, data collection focused on seven primary Pilot Study Regions (Fig.3). These study regions were defined based on the maximum diversity in potential sequestration options within close proximity to CO_2 sources; that is, within a 30 to 40 mile radial distance of one or more power plants. The sequestration options evaluated for Colorado included oil and gas reservoirs, underground gas storage facilities, natural CO_2 fields, coalbed reservoirs, deep saline aquifers, and advanced mineralization processes. Table 4 summarizes the potential CO_2 sequestration capacity for each of the sequestration options in each of the pilot study regions.

Utilizing both geologic and mineralization options, the preliminary forecast for CO_2 sequestration within the seven pilot study regions is nearly 157 billion metric tonnes (Gt). These areas have the potential for several hundred years of carbon dioxide storage based on 1999 emission levels. The highest CO_2 sequestration capacity potential for Colorado lies within the Denver Basin and Canyon City Embayment east of the Rocky Mountains, and within the Piceance and Sand Wash basins in northwestern Colorado.

The Denver and Rangely regions provide the greatest potential for carbon dioxide storage in oil and gas reservoirs; their combined carbon dioxide storage is estimated at 1.2 Gt or 70 % of the total oil and gas sink potential for Colorado. The Craig study region is estimated to provide more than 10 Gt of carbon dioxide storage due to the vast coal resources in the area. When combined with the coal resources of the Ignacio and Palisade study regions, the carbon storage potential for these three regions exceeds 14 Gt or nearly 85 % of the total coalbed methane storage potential for Colorado. The Cañon City, Denver, and Palisade study regions have very similar carbon dioxide storage capacities estimated for the deep saline aquifers that occur in these areas. With more than 20 Gt each, the carbon dioxide storage for these three regions represents more than half of the saline aquifer potential for Colorado. The Craig study region provides the greatest mineralization potential through carbonation of silicate minerals. Preliminary estimates are almost 27 Gt if mineralization engineering technology were commercially available.

Oil and Gas Reservoirs

There are approximately 1,400 oil and gas fields in Colorado; about 223 of these fields constitute large-volume producers; that is, cumulative production exceeds 1 million barrels (MMBbls) of oil and / or 10 billion cubic feet (Bcf) of gas. More than half of these large-volume producing fields (122) are located within 30 miles of a large CO_2 point source consisting of one or more coal-burning power plants. All of these 122 large-volume fields produce from oil and gas reservoirs that are deep enough to maintain CO_2 at supercritical conditions; that is, average reservoir depth exceeds 3,000 ft, which is sufficient to maintain CO_2 at a pressure and temperature of 1,000 psi and 90°F, respectively.

A minimum level of data has been compiled on all oil and gas fields in Colorado, consisting primarily of location, geologic age, production, discovery date, and depth. Where data are available in the public domain, additional reservoir properties such as porosity, permeability, gas and oil composition and fluid properties were compiled, particularly for those reservoirs within the seven pilot study regions. Data sources consisted of the Colorado Oil and Gas Conservation Commission, PI/Dwights, U.S. Department of Energy, and state geological survey publications.

The estimate of CO_2 sequestration capacity for oil and gas reservoirs in the seven source areas is 1,710 MMt with nearly 70 % of that capacity contained in the Denver and Rangely source areas (Table 4.). This estimate is based on cumulative production through December 2003. Estimating CO_2 storage capacity for oil and gas reservoirs was accomplished by calculating the equivalent mass of CO_2 that is required to replace the reservoir volume voided by production. This CO_2 capacity calculation for Colorado should be considered conservatively low due to the significant underestimation of water production for the state.

CO_2 sequestration capacity for oil and gas reservoirs in the seven pilot study regions is estimated at nearly 1,710 MMt with about 70 % of that capacity potential associated with the Denver and Rangely regions (Table 4). Recent work by Advanced Resources suggests that 510 to 580 MMBbls of oil may be economically recoverable from potential future enhanced oil recovery projects using CO_2 flooding (CO_2-EOR) in 12 of Colorado's major oil reservoirs (Advanced Resources, 2006). These EOR projects would not only provide suitable longer-term sequestration opportunities but would also result in increased production to offset costs.

Craig Region

The Craig Pilot Study Region is comprised primarily of the eastern two-thirds of the Sand Wash Basin, the extreme northern part of the Piceance Basin, and the Axial Basin Uplift separating the two (Fig. 4). There are 39 oil and gas reservoirs in 12 fields that screened as candidates for CO_2 sequestration. The total carbon dioxide capacity calculated for this region is 112 MMt with an average capacity of 2.9 MMt per field (Table 5). The largest capacity is estimated at 65 MMt for the Wilson Creek field in the northernmost Piceance Basin; nearly all of this capacity is associated with production from the Morrison and Entrada reservoirs. Screened reservoir depth varies 2,300 to 9,400 ft, averaging in excess of 5,000 ft.

The principal reservoirs in the Sand Wash Basin are those within the Upper Cretaceous stratigraphic interval, including the Niobrara Member of the Mancos Shale; Mesaverde Group, Lewis Shale, and Lance Formation (Fig. 5). For these reservoirs, porosity ranges from 10 to 30 % and permeability ranges from 0.1 to 500 millidarcies. Reservoir thickness is highly variable, ranging from 10 to 40 f.t. Cretaceous reservoirs in the deeper part of the basin are low-permeability reservoirs. The trapping mechanism for nearly all accumulations is structural. Existing fields are anticlinal folds that are commonly faulted. Impermeable shales and / or faults provide the seals (U.S. Geological Survey, 2005).

The principal reservoirs in the Axial Basin Uplift and northern Piceance Basin include the Pennsylvanian Minturn Formation; Pennsylvanian-Permian Weber Sandstone; Permian Phosphoria Formation; Triassic Moenkopi Formation and Shinarump Sandstone; Jurassic Entrada Sandstone, Curtis and Morrison Formations; Lower Cretaceous Dakota Group; and Upper Cretaceous Niobrara Formation, and Marapos Sandstone Member of the Mancos Shale (Fig. 5). Porosity ranges from 12 to 20 % and permeability ranges from 0.1 to 300 millidarcies. Reservoir thickness ranges 8 to 65 ft. Most hydrocarbon accumulations are in structural traps although reservoirs such as the Weber, Entrada, Shinarump, Dakota and Frontier have stratigraphic aspects (U.S. Geological Survey, 2005). Seals are provided by shales within the section.

Reservoir lithologies in the Craig Pilot Study Region are primarily sandstones interbedded with shales and reflect deposition in eolian, fluvial deltaic, strand plain, and shallow margin environments. Horizontal and vertical reservoir heterogeneity varies widely due to facies variations, diagenetic effects, and faulting.

Denver Region

The Denver Pilot Study Region coincides with the western third of the Denver Basin and includes the heavily-populated metropolitan areas concentrated along the eastern edge of the Front Range (Fig. 4). There are 82 oil and gas reservoirs in 31 fields that screened as candidates for CO_2 sequestration. The total carbon dioxide capacity calculated for this region is 505 MMt with an average capacity of 6.2 MMt per field (Table 6). The largest capacity is estimated at 352 MMt for the Wattenberg field in the west-central part of the Denver Basin; all of this capacity is associated with production from multiple reservoirs with the Cretaceous stratigraphic interval. Screened reservoir depth varies from 1,800 to 9,200 ft, averaging in excess of 6,400 ft.

The principal reservoirs in the Denver region include the Lower Cretaceous Lytle Formation (Lakota) and Dakota Group (Muddy J Sandstone); the Upper Cretaceous Benton Group (Greenhorn Limestone and Codell Sandstone Member of the Carlile Shale), Fort Hays (Timpas) Member of the Niobrara Formation, and the Pierre Shale (Shannon, Sussex, and Parkman Sandstone Members of the Pierre Shale) (Fig. 5). There is also some production from the Lower Permian Lyons Sandstone. For these reservoirs, porosity ranges from 2 to 26 % and permeability ranges from a very tight 0.05 to 100 millidarcies. Reservoir thickness is highly variable, ranging from 5 to 165 ft. The Cretaceous producing interval is characterized primarily by low-permeability reservoirs. The trapping mechanism for most of the accumulations is stratigraphic; although combination structural / stratigraphic traps are common.

The lithology of most the reservoirs in this region are sandstones and siltstones with some carbonaceous shales and limestones that reflect deposition in shallow shelf, fluvial deltaic, and strand plain environments. Horizontal and vertical reservoir heterogeneity is consistently very high due to depositional and diagenetic effects.

Fort Morgan Region

The Fort Morgan Pilot Study Region is immediately adjacent to the Denver Pilot Study Region and is approximately half its size (Fig. 4). There are 51 oil and gas reservoirs in 48 fields that screened as candidates for CO_2 sequestration. The total carbon capacity calculated for this region is 149 MMt with an average capacity of 2.9 MMt per field (Table 7). The largest capacity is estimated at 37 MMt for the Adena field near the center of the region, where all of this capacity is associated with the Dakota reservoir, which is currently undergoing waterflood operations. Screened reservoir depth varies from 4,400 to 6,500 ft, averaging about 5,300 ft.

The principal reservoirs in the Fort Morgan region include the Lower Cretaceous Dakota Group (Muddy J Sandstone), the Upper Cretaceous Benton Group (D Sandstone, Greenhorn Limestone and Codell Sandstone Member of the Carlile Shale), and the Niobrara Formation (Fig. 5). For these reservoirs, porosity ranges from 7 to 27 % and permeability ranges from 1 to 1,200 millidarcies. Reservoir thickness is highly variable, ranging from 3 to 72 ft. The trapping mechanism for most of the accumulations is stratigraphic; although combination structural / stratigraphic traps are also common.

Reservoir lithology is consistently sandstone with the exception of the Greenhorn Limestone. Depositional environments include fluvial deltaic, shallow shelf, and strand plain environments. Horizontal and vertical reservoir heterogeneity is consistently very high due to abrupt facies variations and post-depositional diagenetic effects.

Ignacio Region

The Ignacio Pilot Study Region is located in the southwestern part of Colorado and includes most of the northern portion of the San Juan Basin and the southeastern part of the Paradox Basin (Fig. 1.4). There are 10 oil and gas reservoirs in four fields that screened as candidates for CO_2 sequestration. The total carbon dioxide capacity calculated for this region is 169 MMt with an average capacity of 17 MMt per field (Table 8). The largest capacity is estimated at 155 MMt for the Ignacio Blanco field in the northern San Juan Basin, where most of this capacity is associated with Cretaceous-age reservoirs. Screened reservoir depth varies from 3,100 to 9,800 ft, averaging about 5,800 ft.

The principal reservoirs in the Paradox Basin are the Pennsylvanian Molas Formation and Hermosa Group; Jurassic Morrison Formation; and the Lower Cretaceous Dakota Sandstone (Fig. 5). For these reservoirs, reported porosity data is consistently very low at less than one % and permeability ranges from 10 to 20 millidarcies. Reservoir thickness is highly variable, ranging from 15 to 100 ft. The trapping mechanism is typically stratigraphic for most accumulations.

Reservoir lithology is dominated by limestones and dolomites in the Paleozoic part of the section where deposition was associated with large reef complexes. Alternatively, reservoir lithology is dominated by sandstones in the Mesozoic part of the section where deposition was associated with fluvial deltaic and non-marine environments. Horizontal and vertical reservoir heterogeneity is very high particularly for carbonate reservoirs that have experienced significant post-depositional diagenetic effects.

The principal reservoirs in the San Juan Basin include the Upper Jurassic Morrison Formation; Lower Cretaceous Dakota Sandstone; and Upper Cretaceous Mesaverde Group (Fig. 5). For these reservoirs, porosity ranges from 5 to 10 % and permeability is generally less than 10 millidarcies. Total reservoir thickness ranges from 100 to 150 ft. The trapping mechanism is usually structural anticlines for most accumulations.

Reservoir lithology is dominated by sandstones and siltstones where deposition was associated with fluvial deltaic and strand plane environments. Horizontal and vertical reservoir heterogeneity is related to depositional effects and is considered moderate for this basin.

Palisade Region

The Palisade Pilot Study Region is located in the southern half of the Piceance Basin, approximately south of Interstate Highway 70 (Fig. 4). There are 26 oil and gas reservoirs in 12 fields that screened as candidates for CO_2 sequestration. The total carbon dioxide capacity calculated for this region is 105 MMt with an average capacity of 4 MMt per field (Table 1.7). The largest capacity is estimated at 29 MMt for the Rulison field in the east-central part of the Piceance Basin; all of this capacity is associated with Mesaverde Group production interval. Screened reservoir depth varies from 400 to 8,000 feet, averaging in excess of 3,700 ft.

The principal reservoirs in the Palisade region include the Middle Jurassic Entrada (Sundance) Sandstone; Upper Jurassic Morrison Formation; Lower Cretaceous Cedar Mountain Formation of the Dakota Group; Upper Cretaceous Frontier Sandstone Member of the Mancos Shale and the Mesaverde Group (Iles and Williams Fork Formations, and Ohio Creek Member); and the Paleocene Wasatch Formation (Fig. 5. For these reservoirs, porosity ranges from 2 to 23 % and permeability ranges from a very tight 0.05 to 0.15 millidarcies. Total reservoir thickness is highly variable, ranging from 10 to 1,500 ft. The Cretaceous producing interval is characterized primarily by low-permeability reservoirs. The trapping mechanisms for most of the accumulations are a combination of structural and stratigraphic; specific types include lateral variations in facies and post-depositional porosity development, anticlinal features and structural noses; fracturing and faulting are common.

The lithologies of most the reservoirs in this region are sandstones and siltstones with interbedded shales. Environments of deposition include shallow shelf, fluvial deltaic, and strand plain environments. Horizontal and vertical reservoir heterogeneity is extremely high due to depositional and diagenetic effects as well as the presence of extensive fracturing and faulting.

Rangely Region

The Rangely Pilot Study Region is located in the northern half of the Piceance Basin, approximately north of Interstate Highway 70 (Fig. 4). There are 39 oil and gas reservoirs in 10 fields that screened as candidates for CO_2 sequestration. The total carbon dioxide capacity calculated for this region is 671 MMt with an average capacity of 1.6 MMt per field when the Rangely field is excluded from the computation (Table 1.8). The largest capacity is estimated at 617 MMt for the Rangely field in the northwestern part of the Piceance Basin; all of this capacity is associated with Weber Sandstone, which is currently undergoing a CO_2 miscible flood. Screened reservoir depth varies from 2,400 to 14,400 ft, averaging nearly 5,600 ft.

The principal reservoirs in the Rangely region include the Pennsylvanian-Lower Permian Weber (Maroon) Sandstone; Upper Triassic Shinarump Sandstone Member of the Chinle Formation; Middle Jurassic Entrada (Sundance) Sandstone; Upper Jurassic Morrison Formation; Lower Cretaceous Cedar Mountain Formation of the Dakota Group; Upper Cretaceous Emery (Mancos B) Sandstone of the Mancos Shale and the Mesaverde Group (Williams Fork Formation and Ohio Creek Member); Paleocene Wasatch Formation; and Eocene Douglas Creek Member of the Green River Formation (Fig. 5). For these reservoirs, porosity ranges from 8 to 17 % and permeability ranges from a low of 0.1 to 25 millidarcies. Total reservoir thickness ranges from 200 to 300 ft. The trapping mechanisms for most of the accumulations are a combination of structural and stratigraphic; specific types include lateral variations in facies and post-depositional porosity development, anticlinal features and structural noses; fracturing and faulting are common.

The lithology of most the reservoirs in this region are sandstones and siltstones with interbedded shales; limestones and conglomerate are less common. Environments of deposition include eolian, lacustrine, and fluvial deltaic environments. Horizontal and vertical reservoir heterogeneity is extremely high due to depositional and diagenetic effects as well as the presence of extensive fracturing and faulting.

Underground Gas Storage

In 2004, Colorado had nine underground gas storage (UGS) facilities in operation, providing a total working gas storage capacity of 45.3 billion cubic feet (Bcf) (American Gas Association, 2004). Most of these are located in the Denver and Piceance basins (Fig. 6). In addition to working gas volumes, UGS facilities require base gas that in Colorado ranges from 17 to 163 % of working gas. Thus, the actual total gas injected into Colorado UGS facilities is nearly 60 Bcf.

Together, gas storage and EOR projects represent the largest industrial experience in gas injection into geologic formations. With the exception of the Leyden Mine, all of Colorado's underground storage facilities are converted from depleted oil and natural gas fields, which is typical for UGS facilities throughout the world. Reservoir types are all sandstone lithology except for the Leyden Mine, which is coal. The Leyden Mine was decommissioned for gas storage in 2005 and is undergoing conversion to water storage for municipal use.

In natural gas storage, the working gas (CH_4) is injected and produced seasonally while a base (or cushion) gas that is not extracted is used to provide pressure support. In the case of depleted gas reservoirs being used for gas storage, the base gas is commonly leftover native gas (CH_4). Another approach is to produce most of the methane from the reservoir since it can be sold for profit, replacing it with a cheaper inert gas for use as the base gas. CO_2 injection associated with carbon sequestration via enhanced gas recovery (CSEGR) can be conducted while simultaneously producing the reservoir's methane. Particularly advantageous is the significant density change CO_2 undergoes near its critical pressure, increasing methane storage about 30 % relative to a native gas base (Oldenburg, 2003). Furthermore, CO_2 injection may in the future be economically favorable through carbon credits or tax advantages offered to encourage carbon sequestration. Limiting the rate of mixing between methane and carbon dioxide through careful reservoir selection and operations will be critical to the use of CO_2 as a base gas (Oldenburg, 2003).

Current underground gas storage facilities in Colorado have nearly 48 Bcf committed in base gas, representing a significant portion of total project investment. Some of these facilities may be suitable to base gas reductions via CO_2 replacement. Up to 4 MMt of CO_2 would be required to offset the current base gas levels in Colorado, assuming complete replacement of existing base gas volumes. If this replacement is linked with a 30 % increase working gas, the current 45.3 Bcf could potentially be increased to 58.9 Bcf.

Natural CO_2 Fields

Large naturally occurring geologic deposits of carbon dioxide are found in three of Colorado's sedimentary basins – the Paradox, Raton, and North Park (Fig. 7). The resources of the Paradox and Raton basins provide low-cost sources of high-pressure CO_2, primarily for EOR projects in the Permian Basin of New Mexico and Texas. In this basin alone, approximately 50 projects produce an incremental 145 MMBbls of oil per day, more than 80 % of the North American enhanced oil produced from CO_2 floods in 2004 (Cappa and others, 2005).

An extensive CO_2 pipeline and re-injection infrastructure system exists throughout the Permian Basin, making it attractive for expanding or starting new projects. High-pressure pipelines supply CO_2 from natural source fields at Bravo Dome in northern New Mexico, and

McElmo Dome and Sheep Mountain in southern Colorado. Shell's completion of the pipeline out of McElmo Dome in 1983 significantly increased the value of the naturally occurring CO_2 reserves in Colorado. In addition to EOR applications, CO_2 is used in welding, the manufacture of dry ice, and the food and beverage industry.

Colorado has some of the largest natural CO_2 reserves in the Rocky Mountain region (Table 11). McElmo Dome field is the largest deposit in Colorado, contains over 17 Tcf of 98 %-pure CO_2 that does not require processing or compression prior to injection (New Mexico Bureau of Geology and Mineral Resources, 2006). Natural CO_2 fields are useful analogs for evaluating the safety and costs of geologic sequestration, both in terms of the long-term physical and chemical interactions of CO_2 with reservoir rocks and fluids, but also in terms of industry's field operational experience in handling and transporting large volumes of CO_2 (Stevens and others, 2001).

Use of CO_2-EOR has resulted in CO_2 becoming a valuable commodity. The total value of carbon dioxide production in Colorado was nearly $130 million in 2004, an increase of nearly 32 % over the value $98 million in 2003 (Cappa and others, 2005). Carbon capture and storage technology is key to extending the availability this valuable natural resource.

Colorado's production of natural CO_2 has averaged 300 Bcf per year since the mid-1980s primarily for use in Permian Basin CO_2-EOR projects. Representing an annual equivalent of 16 MMt, economic sources of anthropogenic CO_2 would have considerable commodity value and would have the potential to offset depletion of existing natural deposits.

Coalbed Reservoirs

Deep unmineable coal for Colorado is defined as coal-bearing formations occurring between 2,000 and 7,500 ft deep. Coal parameters such as rank, gas content, ash and moisture content were compiled from U.S. Bureau of Mines data, Gas Research Institute reports, and state geological survey publications. The vast majority of coals in the state are bituminous in rank, which makes them suitable for enhanced coalbed methane recovery and carbon sequestration. The estimate of CO_2 sequestration capacity for coalbed methane reservoirs in the seven pilot study regions is nearly 17 Gt with nearly 80 % of that capacity associated with the Iles-Williams Fork-Fort Union coals of the Sand Wash Basin and the Fruitland coals of the San Juan Basin (Table 4.). This estimate of capacity was made by applying a carbon dioxide/methane (CO_2/CH_4) replacement ratio based on coal rank and a replacement efficiency of 65 %. In reality, the physics are far more complicated than this and require a reservoir simulator to calculate more accurately.

Cañon City and Denver Regions

The Laramie coalbeds straddle the boundary between the Cañon City and Denver Pilot Study Regions, covering an area in the subsurface in excess of 500,000 acres (Fig. 8). These coals are Upper Cretaceous in age and subbituminous in rank. With an average thickness of 10 ft and gas content approaching 300 standard cubic feet of gas per ton of coal (scf/ton), the coalbed methane in-place is estimated to be 2.7 trillion cubic feet (Tcf). Assuming a CO_2/CH_4 replacement ratio of 10, the CO_2 capacity is estimated at 1.4 Gt. Although there is considerable variability in recovery estimates, recent work by Advanced Resources suggests that the replacement of CH_4 by CO_2 may average 65 % overall (Reeves, 2003). A replacement efficiency of 65 % would reduce the carbon dioxide storage estimate to just under 1 Gt with the potential of about 1.5 Tcf in enhanced coalbed methane recovery (Table 12.). This recovery factor assumes 1.7 Tcf of produced CH_4 per Gt of sequestered CO_2 (Reeves, 2003)

.

Craig Region

The Craig Pilot Study region has three stratigraphic intervals characterized by coalbed reservoirs: the Upper Cretaceous Iles and Williams Fork Formations of the Mesaverde Group, and the Upper Cretaceous – Lower Tertiary Fort Union Formation (Figure 1.3). These coal "packages" differ in their subsurface areal extent from approximately 500,000 acres for the Iles to 750,000 acres for the Williams Fork; the Fort Union covers about 700,000 acres (Fig. 8.). Coal rank varies from high-volatile A bituminous (HVA) to high-volatile bituminous (HV). With a total average thickness in excess of 160 ft and gas content approaching 350 scf/ton, the coalbed methane in-place is estimated to be 62 Tcf. Assuming a CO_2/CH_4 replacement ratio of 3 for HV-ranked coals and 6 for HVA-ranked coals, the CO_2 capacity is estimated at 15.4 Gt. A replacement efficiency of 65 % would reduce the carbon storage estimate to 10 Gt with the potential of about 17 Tcf in enhanced coalbed methane recovery (Table 12.).

Ignacio Region

The Ignacio Pilot Study region has active coalbed methane development ongoing in both the Upper Cretaceous Menefee and Fruitland Formations (Fig. 5). These two coal intervals both extend over approximately 550,000 acres each in the subsurface of the northern San Juan Basin (Fig. 1.8). The Menefee coal rank is HVA and the Fruitland coals vary from HVA to medium-volatile bituminous (MV). More than 50 % of the Fruitland coal volume is estimated to be the higher MV coal rank. With a total average thickness of 70 ft and gas content approaching 300 scf/ton, the coalbed methane in-place is estimated to be 23 Tcf. Assuming a CO_2/CH_4 replacement ratio of 1.5 for MV-ranked coals, 3 for HV-ranked coals, and 6 for HVA-ranked coals, the CO_2 capacity is estimated at 4 Gt. A replacement efficiency of 65 % would reduce the carbon storage estimate to 2.5 Gt with the potential of about 4.3 Tcf in enhanced coalbed methane recovery (Table 12).

Palisade and Rangely Regions

The Cameo-Fairfield Coal Group in the Piceance Basin straddles the boundary between the Palisade and Rangely Pilot Study Regions and covers a subsurface area of nearly 1.5 million acres (Fig. 8). This coal group lies within the Upper Cretaceous Iles and Williams Fork Formations of the Mesaverde Group. The Piceance Basin is the only area in Colorado where coal depths actually exceed 7,500 ft. Coal rank ranges from HV to MV with more than 75 % of the coals being MV in rank. With a total average thickness of almost 55 ft and gas content exceeding 200 scf/ton, the coalbed methane in-place is estimated to be 34 Tcf. Assuming a CO_2/CH_4 replacement ratio of 1.5 for MV-ranked coals, 3 for HV-ranked coals, and 6 for HVA-ranked coals, the CO_2 capacity is estimated at 4 Gt. A replacement efficiency of 65 % would reduce the carbon storage estimate to 2.6 Gt with the potential of about 4.4 Tcf in enhanced coalbed methane recovery (Table 12.).

Trinidad Region

Although there is minimal anthropogenic CO_2 available in the Raton Basin, the Trinidad Pilot Study Region was defined only for the purpose of including a carbon storage estimate for the Upper Cretaceous Raton and Vermejo coals (Fig. 5). These HV- to MV-ranked coals cover a subsurface area of nearly 600,000 acres (Fig. 8). The Raton and Vermejo coals are under active coalbed methane development, where gas is produced from very shallow depths particularly adjacent to the Purgatoire River. As such, for this basin only, the depth cutoff was limited to a depth of 500 ft (instead of the 2,000 ft used elsewhere). With a total average thickness of about

60 ft and gas content exceeding 300 scf/ton, the coalbed methane in-place is estimated to be nearly 13 Tcf. Assuming a CO_2/CH_4 replacement ratio of 1.5 for MV-ranked coals and 3 for HV-ranked coals, the CO_2 capacity is estimated at 1 Gt. A replacement efficiency of 65 % would reduce the carbon storage estimate to less than 700 MMt with the potential of about 1 Tcf in enhanced coalbed methane recovery (Table 1.10).

Deep Saline Aquifers

The criteria used to select deep saline aquifers suitable for CO_2 sequestration included lithology consisting primarily of sandstone or other rock types with sufficient porosity and permeability, depth exceeding 3,000 ft (to maintain supercritical conditions for CO_2 and to minimize the possibility that the formation would be developed for future water resources), salinity exceeding 1,000 ppm (again, to minimize the possibility that the formation would be developed for potable water sometime in the future), and the presence of an overlying formation that would function as a top seal to prevent vertical migration of injected CO_2. Most of the formations evaluated have had some associated oil or gas production. This implies the existence of a long-term structural or stratigraphic trapping mechanism that may decrease the possibility of migration of injected CO_2 to the surface. Data sources consisted of Colorado Oil and Gas Conservation Commission, Colorado Division of Water Resources, and publications from the Rocky Mountain Association of Geologists, Texas Bureau of Economic Geology, U.S. Geological Survey, and state geological surveys.

The amount of carbon that a given formation may sequester was calculated using the sequestration calculator available on the Midcontinent Interactive Digital Carbon Atlas and Relational dataBase (MIDCARB) website (Carr and White, 2003). The calculation is based on empirical data for the solution of CO_2 in water under various temperature, pressure, and salinity conditions. The part of the calculator used for this study is that related to CO_2 dissolution only; no consideration was given to the volume of water that may be displaced by injected CO_2. The estimate of CO_2 sequestration capacity for deep saline aquifers in the seven pilot study regions is 109,520 MMt with about 56 % of the capacity contained in the Cañon City, Denver, and Palisade regions (Table 1.11). This capacity estimate is limited to only that portion of these areally extensive aquifers that lie within a 30 mile radius of the primary CO_2 sources. The carbon storage capacity of these vast deep saline aquifers may be greater when not screened for distance. However, further study is required to develop a better understanding of the distribution of trap mechanisms needed to contain injected CO_2. Aquifer characterization data are provided in Table 14 and distribution is shown in Fig. 9.

Cañon City Region

The Jurassic Morrison Formation is one of the most widespread geologic units in the U.S., underlying portions of 13 states, and all of the Denver Basin except for a small area in northwestern Nebraska (Curtis, 1963). The unit is composed mainly of variegated mudstone, claystone, siltstone, and marlstone, but includes dominantly lenticular beds of sandstone, limestone, and conglomerate. The Morrison Formation ranges in thickness from 200 to 400 ft along the east flanks of the Front Range and Sangre de Cristo Mountains and thins irregularly to the east. The Morrison only underlies part of the eastern half of the region, so formation volume is limited, and geologic well logs (Denver Earth Resources Library, 2004) indicate that the unit becomes too shallow for sequestration in its southern parts.

The Lyons Formation is fairly homogeneous, massive, medium-grained sandstone cemented with silica and minor amounts of lime (Shaw, 1956; Mitchell and others, 1956). Locally thin beds of red shale and arkosic sandstone are present within the normally homogeneous sandstone. In the northern part of the Raton Basin, the Lyons thins from the east to the west and pinches out directly east of the Sangre de Cristo Mountains (Shaw, 1956). Shaw (1956) reports that the formation averages 150 ft in thickness, but Mitchell and others (1956) report a thickness of 300–500 ft. The Lyons Formation in the Dome gas field was one of the few producing formations in the area (Clair and Bradish, 1956), and at this site well logs report the thickness of the unit at 270 ft. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Lyons Formation becomes too shallow for sequestration toward the south side of the region.

The Fountain Formation is correlative with the Maroon Formation of western Colorado and the Sangre de Cristo Formation of southern Colorado (Pearl, 1977), and the names are used interchangeably in some reports. The formation is divided into two members, and research suggests that it may be the thickest sedimentary formation in the area. The strata of the lower member of the formation vary from 2,000 to 4,500 ft of medium- to coarse-grained, micaceous, arkosic sandstones and conglomerates, to up to 6,000 ft of fine-grained, arkosic sandstones, siltstones, shales, and few lenticular limestone and gypsum beds and minor coal (De Voto, 1980). The lower member generally is comprised of large-scale (up to 700 ft thick) cycles of sediment, each cycle grading upward from conglomerates and conglomeratic sandstone to fine-grained sandstones, siltstones, and shales (De Voto, 1980). Thin, occasionally stromatolitic, lime mudstones occur in some localities near the top of some of the cycle units. The lower member strata are overlain unconformably by up to 9,000 ft of coarse-grained, arkosic sandstones and boulder conglomerates of the Permian age upper member (Crestone Conglomerate Member) of the Sangre de Cristo Formation. No oil or gas production records were found for the Fountain Formation in this region. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Fountain Formation becomes too shallow for sequestration toward the south side of the region.

<u>Craig Region</u>

The Entrada Sandstone in the Sand Wash Basin grades from cross-bedded eolian sandstone in the east to marginal marine, muddy sandstone and siltstone westward (Freethey and Cordy, 1991). The Slick Rock Member, which comprises 50 to 80 % of the total unit thickness, consists of very fine- to fine-grained, cross-bedded and massive, flat-bedded, eolian sandstone. The sandstone is moderately well sorted and generally weakly cemented. The grains are 95 % frosted quartz with siliceous cement with glauconite present in the matrix (Grace and Nelson, 1963). The Entrada is the second largest oil producing formation in northwest Colorado after the Weber Formation (Haun, 1962; Piro, 1962), accounting for 40 % of total production. The unit also produced gas (Brainerd and Carpen, 1962). The Entrada differs from the other units in the area in that it is the only true blanket sandstone, and therefore there is little variation in lithological parameters, which allows uniform completion practices (Polumbus, 1963). On this basis the Entrada would appear to be a highly favorable formation for sequestration. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Entrada thickens from east to west, locally attaining thicknesses greater than 400 feet on the western edge of the basin. However, the logs indicate that the formation becomes too shallow for sequestration at some locations on the western edge of the basin.

The Weber Formation in the Sand Wash Basin is composed of over a thousand feet of massive white cross-bedded, sandstones that outcrop along the Uinta Mountains and along the Utah-Colorado border (Daniels, 1982). At the type section in Weber Canyon, Utah, the age of this sandstone is Pennsylvanian, but in the Danforth Hills area of Colorado the upper portion is Permian, as determined by fossils in the overlying Park City Formation (Daniels, 1982).

Additional details regarding the characteristics of the Weber Formation can be found in the section devoted to the Palisade and Rangely Pilot Study Regions.

The Weber produces both oil and gas in the Sand Wash Basin, and was one of the largest producers in the basin (Cummings and Pott, 1962), though not nearly to the magnitude as in the Piceance Basin. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Weber pinches out toward the eastern edge of the area, and becomes too shallow for sequestration at some locations on the west and south sides of the area.

Denver and Fort Morgan Regions

The Denver Basin is a structural basin that contains a large aquifer system in Tertiary and Cretaceous age formations. Underlying the aquifers is up to 7,000 ft of nearly impermeable Pierre Shale, which should function well as a top seal if the deeper formations are developed as sinks for carbon sequestration.

The lithology of the Morrison Formation in eastern Colorado is highly variable (Curtis, 1963), but is very similar to the Brushy Basin Member of the Morrison Formation of southwestern Colorado, consisting of variegated claystones, siltstones, sandstones, and dense limestones characterized by Chara algae and stromatolitic fresh-water algal limestones with some conglomerates (Curtis, 1963; Berman and others, 1980). These sequences have been interpreted as representing lacustrine, lacustrine-deltaic, distributary-channel and floodplain depositional environments (Jackson, 1979). Thickness ranges from 100 to 300 ft beneath the Denver Basin (Curtis, 1963). No record of hydrocarbon production from the Morrison Formation in the Denver Basin was found, although noncommercial shows are reported (Clark and Rold, 1961).

The Morrison in Colorado becomes too shallow for sequestration on the west side of the basin where it outcrops.

The Dockum Group consists mainly of fine- to medium-grained, usually massive sandstone, although locally it can be interbedded with siltstone and shale with rare interbeds of carbonate and anhydrite (Robson and Banta, 1987). Intergranular cement is commonly silica but locally consists of anhydrite, calcite, or clay (Robson and Banta, 1987). The Entrada Sandstone overlies the Dockum Group and consists of cross-bedded, eolian sandstone and planar-bedded, water-lain sandstone (Berman and others, 1980; Robson and Banta, 1987). Toward the central and northeastern parts of the study area, the unit grades into siltstone and shale (Berman and others, 1980; Robson and Banta, 1987). The aggregate sandstone thickness of the group is about 50 ft in the area surrounding the largest carbon dioxide producers in the Denver area, but exceeds 500 ft in the southeastern part of the state (Robson and Banta, 1987). The steepening dip of the formation on the west side of the basin renders it too shallow for sequestration locally. No record of hydrocarbon production from the Entrada-Dockum Group in the Denver Basin was found, although non-commercial shows are reported (Hofstra, 1961; Lavington, 1961).

The Lyons Formation in the Denver Basin consists of fine- to medium-grained, well-sorted, cross-bedded quartzose sandstone with minor siltstone and conglomeratic sandstone (Fenneman, 1905; Maughan and Wilson, 1960; Walker and Harms, 1972). It has been interpreted by at least two workers as an eolian and littoral deposit (Thompson, 1949; Maughan, 1980). The top of the Lyons is generally capped by 2- to 3-ft thick, parallel-bedded to massive, brown sandstone deposited subaqueously above the cross-bedded sequence. Locally, arkosic sandstone intertongues with the Lyons, but this is not common except in the vicinity of the town of Lyons and to the south. The Lyons in the vicinity of Morrison has been shown to include stream-channel and shallow-water deposits as well as eolian sandstones (Weimer and Erickson, 1976).

The Lyons Formation underlies most of the area of Colorado east of the Front Range, although it pinches out in eastern Colorado. Silica, carbonates, and anhydrite are the primary cementing materials in the Lyons Sandstone (Levandowski and others, 1973). The thickness of the Lyons ranges from zero in the northeastern and southwestern parts of the eastern plains to 370 ft at its type locality near the town of Lyons (Thompson, 1949). Limited well log data for the Lyons Formation (Denver Earth Resources Library, 2004) suggest that the unit might be too shallow for sequestration locally on the western edge of the Denver Basin.

The Fountain Formation in the Denver region is dominantly a continental deposit of arkoses, conglomerates, sandstone, siltstones and shales (Hoyt, 1963), consisting primarily of unsorted to poorly sorted arkose and arkosic conglomerate, with an average porosity of about 7 % (Robson and Banta, 1987). Distal from the Front Range uplift, in the eastern parts of the Denver Basin, the lithology grades from sandstone to predominantly shale and carbonates. The Front Range uplift to the west was the source of the arkosic clastic rocks comprising the Fountain Formation (Rascoe, 1978). Eastward from the Front Range, the Fountain Formation interfingers with Permo-Pennsylvanian marine sediments (Hoyt, 1963). The Fountain produced oil from several fields in eastern Colorado, including the Bent's Fort (Brown, 1961), the Colt (Adams, 1961), and the McClave (Carpen, 1961). One of the highly favorable aspects of the Fountain is its great thickness, up to 4,500 ft in the Colorado Springs area (Lovering and Goddard, 1950). In the Denver area, the formation is closer to 2,000 ft thick (Robson and Banta, 1987). The Fountain is exposed along the east flank of the Front Range in northern Colorado (Maughanz and Wilson, 1963), so it is likely too shallow for sequestration in some locations in this area.

<u>Ignacio Region</u>

The Mesaverde Group consists of the Cliff House Sandstone, the Menefee Formation, and the Point Lookout Sandstone. The Cliff House consists of calcareous marine sandstone, very fine- to fine-grained, locally cross-bedded and massive shaly sandstone with local silt and shale beds (Topper and others, 2003; Brogden and Giles, 1976). The maximum thickness of the Cliff House is about 350 ft. The Menefee Formation contains varying proportions of sandstone, siltstones, and shale with interbedded coal seams (Brogden and Giles, 1976), and attains a maximum thickness of 350 ft. The Point Lookout Sandstone is a fine- to very fine-grained well-cemented marine sandstone with laminations of carbonaceous shale (Pritchard, 1973; Fassett, 1983). The unit is generally massive and cliff-forming and has a maximum thickness of 400 ft (Brogden and Giles, 1976). The Mesaverde was the largest gas-producing Cretaceous unit in the San Juan Basin (Irwin, 1983; Thomaidis, 1978). Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Mesaverde becomes too shallow for sequestration along the northern edge of its extent.

The Dakota Sandstone is the basal Cretaceous unit in the basin, and can be divided into continental and marine lithologic sequences (Dane and Bachman, 1957; Grant and Owen, 1974; Ridgley, 1977). The basal sequence generally consists of fluvial sandstone and conglomeratic sandstone, carbonaceous shale and siltstone, and thin coal beds. The upper sequence is primarily medium- to fine-grained sandstone, locally cross-bedded, and represents deposition in coastal and near-shore marine distributary channel environments (Ridgely and others, 1978). Within the central basin, the basal Dakota Sandstone is often conglomeratic and rests unconformably on the Jurassic Morrison Formation (Deischl, 1973). The thickness of the Dakota generally ranges from 200 to 300 ft with a maximum observed thickness of 350 ft (Stone and others, 1983). Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Dakota is too shallow for sequestration on the north and west edges of the area.

The Morrison Formation is a heavily studied unit in the San Juan Basin, where it is the uppermost Jurassic stratum. The Morrison is present throughout the San Juan structural basin (Green and Pierson, 1977), and is unconformably overlain in most of the basin by the Cretaceous Dakota Sandstone (Dam and others, 1990). In the San Juan Basin, the Morrison is generally composed of coarse-grained, arkosic to subarkosic sandstone, with locally conglomeratic sandstone and claystone, representing deposition in a variety of alluvial, fluvial and lacustrine environments (Ridgely and others, 1978; Dam and others, 1990; Condon, 1992; Craig and others, 1955; Turner-Peterson, 1985; Peterson and Turner-Peterson, 1987; Green and Pierson, 1977). Minor limestone beds also appear in the unit (Stone and others, 1983; Green and Pierson, 1977; Woodward and Schumacher, 1973). Thickness of the Morrison ranges from zero at its erosional edge to about 1,100 ft in the northwest part of the basin (Dam and others, 1990; Condon and Peterson, 1986). The low-permeability Brushy Basin Member, a mudstone (Treviño, 2003), could function effectively as a top seal. The lower part of the formation has been mined for uranium in the Four Corners area (Condon, 1992), and is a significant source of both uranium and water in the Grants uranium region of New Mexico (Stone and others, 1983). Oil and gas production data were commingled with the overlying Dakota Sandstone (Irwin, 1983) and reservoir data are sparse. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Morrison is too shallow for sequestration along the north and west edges of the basin.

The Middle Jurassic Entrada Sandstone is a sugary, friable, cross-bedded sandstone that underlies the entire basin except for the southern margin (Ridgely and others, 1978) across the border in New Mexico. The formation attains a maximum thickness of nearly 400 ft in the center of the basin (Ridgely and others, 1978). It consists of the basal Dewey Bridge Member, which is a very fine-grained, argillaceous sandstone and siltstone, and the overlying Slick Rock Member, which is a very fine-grained to fine-grained, locally medium-grained, sandstone (Wright and others, 1962). The Entrada is a minor oil and gas producer in the San Juan Basin (Halpenny and Harshbarger, 1950; Matheny and Ulrich, 1983). The evaporite minerals in the overlying Todilto Limestone may contribute to the salinity of the Entrada (Lyford, 1979). Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Entrada becomes too shallow for sequestration along the north edge of its extent in the region.

The Hermosa Group consists of, from oldest to youngest, the Pinkerton Trail, Paradox, and Honaker Trail Formations (Huffman and Condon, 1993). The group includes four distinct interbedded facies consisting of poorly sorted conglomeratic arkose, siltstone, fine-grained sandstone, cyclic deposits of dolomite, limestone, and carbonaceous shale, and an evaporite sequence consisting of cyclic deposits of halite and minor shale, dolomite, limestone, and anhydrite (Peterson and Hite, 1969). The evaporite sequence contains as many as 33 separate beds of halite divided by interbeds of limestone, dolomite, anhydrite, and black shale (Hite, 1960; Hite and Buckner, 1981). The Hermosa Group has produced both oil and gas (Thomaidis, 1978), and is an attractive sequestration target due to its great thickness, over 3,000 ft at maximum (Ridgely and others, 1978; Huffman and Condon, 1993).

The Pinkerton Trail and Honaker Trail Formations have lesser amounts of chemical precipitates and greater amounts of clastic rocks (Huffman and Condon, 1993) than the Paradox. The Pinkerton Trail Formation consists of finely to coarsely crystalline, argillaceous to silicified limestone and minor carbonaceous shale (Huffman and Condon, 1993). Amounts of coarse clastic detritus increase north of Durango (Fetzner, 1960). The Pinkerton Trail is thin relative to the other Hermosa units, attaining a maximum thickness of only 225 ft across the border in Utah (Huffman and Condon, 1993). Fassett (1983) reports no fields producing oil or gas from the Pinkerton Trail Formation.

The Paradox Formation consists primarily of thick chemical precipitates (carbonate, anhydrite, halite, or potash) with relatively minor interbedded clastic rocks, but coarser grained clastic rocks are more common on the edges of the basin (Huffman and Condon, 1993). The Desert Creek and Ismay Zones are the primary oil and gas producers of the Paradox Formation.

The Honaker Trail Formation consists of a variable sequence of finely crystalline limestone and dolomite, micaceous siltstone, and arkosic sandstone (Huffman and Condon, 1993). The percentage of carbonate is higher at the base of the unit and at the center of the basin. Clastic rocks increase along the northern margin of the basin and in the upper part of the unit (Wengerd, 1957). The Honaker Trail is at least 1,390 feet thick in the San Juan Trough, and the thickness combined with the favorable lithology suggests it may be the most attractive sequestration target in the group.

Because of the variety of lithologies in the Hermosa Group, reported porosities range from 4 to 22 %, and permeabilities from 0.01 to 114 millidarcies (Bevacqua, 1983; Brown, 1978; Ghazal, 1978; Halverson and Roe, 1978; Hart and Mickel, 1983; Krivanek, 1978; Latch, 1978; Lehman, 1983; Lister, 1983; Mecham, 1978, Mickel, 1978a, 1978b; Miesner, 1978; Roth, 1983a, 1983b, 1983c; Riggs, 1978; Spencer, 1978; Squires, 1978; Wold, 1978; Young, 1978). The average porosities reported for 11 fields producing from the Paradox Formation and an equal number of fields producing from the Honaker Trail are nearly the same at around 11 %, but the average permeability of the Paradox is roughly twice that of the Honaker Tail (27 versus 14 millidarcies).

The Hermosa Group is sufficiently deep for sequestration throughout its extent in the San Juan Basin.

The Leadville Limestone is composed of a thin basal dolomite and a thick, massive upper limestone (Ridgely and others, 1978; Condon, 1992). The lower unit is commonly a sucrosic dolomite to micritic limestone and correlates with the Redwall Limestone of the Grand Canyon (Parker and Roberts, 1963; Stevenson, 1983). The upper unit is predominantly limestone that is commonly oolitic and crinoidal (Stevenson, 1983; Baars, 1966). The unit thickens toward the northern part of the basin (Ridgely and others, 1978: Stevenson, 1983), where it attains a thickness locally of at least 300 ft (Denver Earth Resources Library, 2004). The Leadville Limestone produced both oil and gas (Condon, 1992; Thomaidis, 1978) and has been an important producer of carbon dioxide and helium in the region (Gerling, 1983; Casey, 1983). Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Leadville Limestone is sufficiently deep for sequestration throughout its extent in the San Juan Basin.

Palisade and Rangely Regions

The Dakota Aquifer includes the Dakota Sandstone, the Burro Canyon, Cedar Mountain, and Cloverly Formations, the Gannett Group, and the Bear River, Smith, Thomas Fork, and Cokeville Formations (Freethey and Cordy, 1991). Sandstone and mudstone are the dominant rock types in the Burro Canyon and Cedar Mountain Formations. The Dakota Sandstone consists of a lower conglomeratic sandstone, a middle unit consisting of carbonaceous shale and coal, and an upper massive, fine- to medium-grained sandstone. The Gannett Group consists of a variety of well-cemented fluvial and lacustrine sediments. The Cloverly Formation consists of a lower conglomeratic sandstone and an upper bentonitic shale with siliceous and calcareous zones (Freethey and Cordy, 1991). The thickness of the Dakota ranges from 100 to 300 ft within the Piceance Basin with an average of 130 ft. Geologic well logs (Denver Earth Resources Library, 2004) indicate that the Dakota Formation becomes too shallow for sequestration around the edges of the Piceance basin, but depths exceed 13,000 ft in the center of the basin.

The Morrison Formation in the Piceance Basin includes the Tidwell, Bluff Sandstone, Salt Wash, Recapture, and Westwater Canyon Members. The Cow Springs Sandstone and Junction Creek Sandstone are also considered part of the Morrison Aquifer (Freethey and Cordy, 1991). The lithology of the Morrison in this region consists predominantly of siltstone (Tidwell Member), interbedded fine- to medium-grained sandstone and claystone (Salt Wash, Recapture, and Westwater Canyon Members), and conglomeratic sandstone and sandstone (Bluff Sandstone Member and Junction Creek and Cow Springs Sandstones) (Freethey and Cordy, 1991). The Morrison Formation is thicker on the west sides of both the Palisade and Rangely areas. In the Palisade area, the unit ranges from 100 to 1,055 ft thick, and in Rangely from 100 to over 1,400 ft thick, with an average thickness over both areas of 680 ft (Denver Earth Resources Library, 2004). The Morrison directly underlies the Dakota Sandstone, and in similar fashion becomes too shallow for sequestration around the edges of the Piceance basin (Denver Earth Resources Library, 2004).

The Weber Formation in the Piceance Basin is a clean, fine- to very-fine-grained, well sorted, cross bedded, quartzose sandstone up to 1,300 ft thick, with local, thin carbonate interbeds and varying but generally low permeability (Grace and Nelson, 1963; McMinn and Patton, 1963; Curtis, 1962). Variations in permeability are due to partially compressed and interlocking grains, secondary silica, micro-cross-laminations, and cement (McMinn and Patton, 1963). The unit interfingers to the east and south with conglomeratic and arkosic upper Maroon Formation beds (Haun, 1962; Curtis, 1962). The Weber correlates with the Tensleep Formation of Wyoming and the Wells Formation of Idaho (Grace and Nelson, 1963). There is a large variation of porosity and permeability throughout the entire section of the Weber, and fractures are thought to be of major importance in the reservoir capabilities of these sands (Grace and Nelson, 1963).

Geologic well logs indicate that the Weber becomes too shallow for sequestration on the north edge of the Rangely area and on the east edge of the Palisade area (Denver Earth Resources Library, 2004).

Mineralization

The primary goal of the mineral carbonation process is to sequester large amounts of CO_2 through carbonation of silicate minerals. Although there are numerous naturally occurring silicate minerals in the earth's crust, research for mineral CO_2 sequestration has focused primarily on olivine, serpentine, and wollastonite; silicate minerals that are rich in magnesium or calcium. In Colorado, these minerals are prevalent in mafic and ultramafic rocks such as serpentinite, peridotite, dunite, gabbro, and to a lesser extent, basalt and alkalic igneous rocks. In the industrial sector, waste materials such as coal fly ash or municipal solid waste incinerator bottom ash, asbestos waste, and metal slag are potential alternative feedstocks. Mineral silicates are a promising option for CO_2 sequestration in Colorado. Given current technology, silicate ore contained within the Cañon City, Craig, and Palisade source areas could sequester a total of 28,808 MMt of CO_2 assuming 15 to 20 % efficiency and subtracting CO_2 emitted during the sequestration process (Table 4.). Continued research and technological advances are needed before this process becomes a cost-effective and leading contender in the pool of technologies available for CO_2 sequestration.

Waters produced in association with oil and gas extraction are also a potential source of cations, particularly calcium, for mineral carbonation. However, preliminary calculations indicate that the water needed to sequester CO_2 emissions in a given region far exceeds current produced water volumes, and sequestration via this method is not likely to be practical. Even assuming 100 % efficiency, the volume of water produced in Colorado could only sequester about 23,000 metric tonnes of CO_2 (Table 4).

Three of Colorado's pilot study regions offer mineral carbonation via silicate rocks: Cañon City, Craig, and Palisade. Waters produced coincident with oil and gas extraction are potential candidates for the mineral carbonation process in all but the Cañon City region.

Silicate Rocks

In Colorado, feedstock options for the mineralization process include basalt, gabbro, syenite, and minor pyroxenite, diabase, dunite, and diorite. Although these resources are quite small relative to those in other parts of the country, they may prove adequate to handle local CO_2 emissions. Basalt is the most abundant of the potential feedstocks in Colorado. Outcrops are found primarily throughout the central part of the state along a northwest trend (Fig. 10). There are also basalt flows east of the Front Range in the southern part of the state. The vast majority of these flows are Miocene in age, although some were extruded during Pleistocene time. The combined MgO, CaO, and FeO content for these rocks averages 15 to 20 wt %. This is significantly lower than in the high purity experimental feedstocks (such as olivine), which can have as much as 49 wt % MgO (O'Connor and others, 2004). This does not automatically eliminate basalt as a potential mineralization candidate. Rather, it merely indicates that a greater tonnage of ore must be utilized to sequester the same amount of CO_2 as would be assimilated by a more pure feedstock. Depending on which mineralization process is deemed optimal by future research, this may or may not be economical.

Mafic and ultramafic rocks are of higher quality for CO_2 sequestration than basalt, but in Colorado, are much less widespread (Fig. 10). They crop out as small stocks, plugs, and dikes that are Precambrian or Cambrian in age. Of the larger mafic bodies, gabbro is the dominant rock type, and has a combined MgO, CaO, and FeO content that averages 25 to 30 wt %. While still of lower quality than the experimental feedstocks, gabbro has a greater capacity for CO_2 storage than does basalt. Similarly, syenite has lower Na_2O and K_2O concentrations than do source materials used for the mineralization process in which soda ash (Na_2CO_3) is formed, but still may be practical for local sequestration projects. Syenite crops out at only a handful of locations in south-central Colorado. It should be noted that carbonation with the sodium and potassium ions results in a highly soluble material, such as soda ash, that will require immediate industrial use or ensured long-term dry storage. The mineralization reaction is reversed with the addition of water, and thus, CO_2 will be released back into the atmosphere if the product is not kept dry.

Three Colorado pilot study regions have potential for mineral carbonation using silicate rocks as feedstock (Table 15). Total sequestration potential was calculated for each region on the basis of the following factors and assumptions:

- Ore resources within about 40 miles of the CO_2 point source(s) as shown on 1:250,000-scale geologic maps (Fig. 10)
- Mining depth of 200 ft for basalt; 500 ft for all other rocks
- Average specific gravity of 2.8 for syenite; 3.0 for all other rocks
- Geochemistry extracted from the U.S. Geological Survey PLUTO database (U.S. Geological Survey, 2004a) and averaged for similar rock types

Cañon City Region: Silicate rocks crop out primarily in the western half of the pilot study region and are predominantly gabbro and syenite in composition, although minor basalt and pyroxenite are also present. Mafic and ultramafic rocks represent more than 32 Gt of potential feedstock for the mineralization process. Similarly, syenite bodies in the area could provide about 28 Gt of feedstock. Basaltic rocks would provide a mere 1.6 Gt of material. Ore tonnage requirements per metric tonne of CO_2 sequestered would be 3.7 metric tonnes for mafic and ultramafic rocks, 4.3 metric tonnes for syenite, and 5.9 metric tonnes for basalt. Total theoretical CO_2 sequestration potential for the area is over 13.1 Gt, assuming 100 % efficiency (Table 15).

Experiments conducted by O'Connor and others (2004) suggest that the reaction efficiencies for basalt and gabbro are far below 100 % using current technology. In fact, they are probably as low as 15 to 20 %, respectively, significantly lower than pure olivine feedstock, which yields 60 to 80 % efficiency. Actual CO_2 sequestration potential is therefore greatly reduced. In addition, an energy penalty must be added to account for the CO_2 produced during the mineralization process. Carbon dioxide avoided is the difference between total CO_2 sequestered and CO_2 that is produced during mineralization, which averages about 75 % of total CO_2 sequestered for several mineral feedstocks investigated. This translates to actual sequestration potential of about 2.0 Gt of CO_2 for the Cañon City region (Table 15). The large gap between theoretical potential and potential based on current technology clearly indicates there is a great deal of room for technological advancement.

Craig Region: Bimodal basalt is prevalent in the southern part of the region and represents 1,323 Gt of potential feedstock. To the northeast, mafic and ultramafic rocks (primarily gabbro) could provide 55.2 Gt of material. Assuming 100 % efficiency, these rocks could sequester more than 232 Gt of CO_2. At 15 to 20 % reaction efficiency, estimated sequestration potential would be closer to 26.7 Gt (Table 15). Basalt and (ultra)mafic rocks would be consumed at a rate of 5.4 and 3.7 metric tonnes per metric tonne of CO_2 sequestered, respectively.

Palisade Region: Basalt is the only feedstock option in the Palisade region. Total ore available is estimated at 8.9 Gt, which indicates a maximum sequestration potential of 1.5 Gt of CO_2. Actual sequestration potential is closer to 165 MMt when current reaction efficiencies and CO_2 emissions are taken into account (Table 1.13).

Produced Waters

The majority of produced waters in Colorado are associated with the principal oil and gas producing basins: Denver, Raton, San Juan, and Piceance (Fig. 11). Statewide production of water amounted to nearly 294 million barrels in 2003 (Colorado Oil and Gas Conservation Commission, 2004), more than half of which was from the Purgatoire River, Rangely, and Ignacio Blanco oil and gas fields. An evaluation of all produced water in the state reveals that calcium concentrations are highly variable, ranging from trace amounts to as much as 62,000 ppm. Magnesium is similarly variable and may reach over 7,000 ppm. Nearly all of the produced waters contain more than 1,000 ppm total dissolved solids (TDS). Maximum TDS is over 340,000 ppm; mean TDS for 2,001 samples is 25,319. Average geochemistry may be calculated for various fields or basins, but the high degree of variability, even within a single well, suggests that other factors will need to be considered. If all the water produced from all the various formations in a given region is combined for use at a single mineralization plant, then a simple average, weighted by volume per producing horizon, may suffice. If, however, it is deemed more practical to collect high-calcium water only from selected horizons then several permutations may be necessary and acceptable collection methods will need to be developed.

Six Colorado pilot study regions have potential for mineral carbonation using produced waters as a cation source (Table 16). Total sequestration potential was calculated for each region on the basis of the following factors and assumptions:

- Includes water resources from all fields within about 40 miles of the region's CO_2 point source(s) (Fig. 11)
- Assumes 100 % mineralization with the Ca and Mg cations, energy requirements are not considered
- Water geochemistry extracted from the U.S. Geological Survey produced waters database (U.S. Geological Survey, 2004b) and averaged by principal producing formations and by pilot study region

Craig Region: About 50 fields produce oil and gas from the Sand Wash Basin located in this region. Three fields also produce coalbed methane. Cumulative water production for the past five years is well over 111 million barrels. Two of Colorado's 2003 top 10 water-producing fields are located in the Craig region: Iles and Maudlin Gulch fields. Waters with the highest calcium content originate from the Cretaceous Mancos Shale, Triassic Chinle Formation, and Pennsylvanian-Permian Weber Formation (Fig. 5).

Denver Region: Wattenberg field is the largest in the region and is a source of oil, natural gas, and CO_2 gas. Nearly all other fields in the area produce only oil and natural gas. Production of water is predominantly from the Cretaceous Dakota and Pierre Formations and the Permian Lyons and Ingleside Formations (Fig. 5). Total water production in the region amounted to 44.2 million barrels from 1999 to 2003. Calcium content in waters from the Denver region is relatively low, averaging 264 ppm, regardless of producing formation.

Fort Morgan Region: There are several hundred small oil and gas fields in this region, which is situated in the central part of the Denver Basin in northeastern Colorado. Nearly all production is from the D Sand and the Muddy J Sand of the Cretaceous Dakota Group (Fig. 5). Cumulative water production since 1999 is over 70.2 million barrels, but average calcium concentration in these waters is very low, which renders this region lowest on the list of proposed pilot study areas for produced water mineralization.

Ignacio Region: The largest Colorado field in the area is Ignacio Blanco, which has produced significant volumes of oil, gas, and coalbed methane from several different stratigraphic horizons. Water has been produced from many of these same horizons, but has been most prolific from the Cretaceous Dakota, Mancos, and Mesaverde Formations and the Pennsylvanian Hermosa Group (Fig. 5). Colorado water production in this region has totaled 122.5 million barrels from 1999 through 2003. Water chemistry indicates that the Hermosa Formation tends to have the highest calcium content, whereas the Mancos Shale is relatively low in calcium.

Palisade Region: The majority of the 50-plus fields in this region produce oil and/or natural gas. Roughly a dozen of these fields also produce coalbed methane. Water production from 1999 through 2003 exceeded 7.4 million barrels. Geochemical analyses indicate that the Cretaceous Dakota and Mesaverde Formations and the Jurassic San Rafael Formation produce waters high in calcium (Fig. 5).

Rangely Region: There are over 50 oil and gas fields in this region; four of the fields also produce coalbed methane. The Rangely field is the top water producer and is also an important oil and gas reservoir. There are numerous producing horizons in the Piceance Basin and water chemistry is highly variable. The Jurassic San Rafael Group and the Pennsylvanian-Permian Weber Sandstone have the highest calcium concentrations (Fig. 5). The Mancos Shale, as in the Ignacio region, tends to produce waters that are very low in calcium. Produced waters have exceeded 400 million barrels over the course of the last five years.

New Mexico Geologic Sinks

The total carbon dioxide (CO_2) sequestration capacity of geologic sinks in New Mexico, excluding mineralization, is estimated to be in excess of 278,000 million metric tons (Table 17). This total sequestration capacity is so large that it requires knowledge of the output from the two largest power plants in New Mexico to be put in perspective. The San Juan and Four Corners power plants, located about 10 mi apart and about 15 mi west of Farmington, NM, released about 31 mmt of CO_2 into the atmosphere during 2001 (Allis et al., 2003). The 278,000 mmt of estimated sequestration capacity is equivalent to about 9,000 years of storage for 100% of the CO_2 released from those two power plants in 2001.

The total sequestration capacity is spread unequally across New Mexico in three basins and three sink types (Fig. 12). The San Juan Basin in northwest quarter of the state has about 65% of the estimated total; the Raton Basin in the northeast, has less than 1%; and the Permian Basin in the southeast, has about 35% of the total capacity. Oil and gas pools account for 3% of the total, coal-bed-methane sinks for about 4%; and deep saline aquifers for about 93%.

Oil and gas pools and coal-bed-methane sinks have approximately the same total capacity, but there are only two coal-bed-methane sinks in contrast to the 468 oil and gas pools. The average sequestration capacity for an oil and gas pool is 19 mmt, that for a coal-bed-methane sink is 5,500 mmt, and that of a deep saline aquifer is 36,897 mmt (Table 17).

However, averages do not tell the whole sequestration story. Oil and gas pools are much better characterized geologically than either of the other two sink types, although there is overlap among the sink types in that hydrocarbon production occurs in the same stratigraphic units that serve as both the coal–bed-methane and deep-saline-aquifer sinks. The Southwest Partnership's interactive database reflects this economic reality and contains much more geologic and engineering data on oil and gas pools.

In addition, saline aquifers and coal-bed-methane sinks tend to be basin size in area. Oil and gas pools are structure to trap size in area and are generally more than an order of magnitude smaller than a basin. Note, however, that the largest of the oil and gas pools has an estimated capacity of 867 mmt, more than 20 times the average capacity and equal to approximately 29 years of the annual CO_2 emissions from the two large San Juan Basin power plants in 2001 (Table 17).

Each of the three sink types will be discussed in detail in the sections of this report that follow. The information presented below is designed to give the interested user enough detail to be able to select particular sinks for further evaluation using the Southwest Partnership's interactive, online database. Many of the figures illustrating these sections came directly from the Partnership's database and were prepared by the Utah Automated Geolographic Reference Center (AGRC), the Partnership's database manager.

The three sink types will be discussed in descending order of geological characterization, beginning with oil and gas pools and finishing with deep saline aquifers. An in-depth discussion will be presented of the Southwest Partnership's San Juan Basin Enhanced Coal Bed Methane (ECBM) Pilot Test that was selected for Phase 2 work.

Oil and Gas Pools

The New Mexico Oil Conservation Division (OCD) uses the term "pool" in the same sense that the other states in the Partnership use the term "reservoir." A pool is single, discrete hydrocarbon accumulation within a single trap." Pools are areally continuous and can lie in vertical succession or side by side, or overlap laterally. The pool name has two parts: 1) a field name, usually a geographic location, and 2) a stratigraphic name based on the producing (reservoir) unit. An example of a pool is the Blanco Mesaverde. This pool of the Blanco Field produces hydrocarbons from the Upper Cretaceous Mesaverde Group. See Broadhead (1993a) for details.

The OCD assigns a unique number of three to five digits to each pool. For example, the Blanco Mesaverde pool has been assigned the number 72319; the stratigraphically higher pool, the Blanco Pictured Cliffs pool, has been assigned the number 72400. In the Southwest Partnership's database these pools have been assigned the unique codes of NM-072319 and NM-072400, respectively, so that the attributes in different databases or data tables can be assigned to the proper, legally defined pool.

Hydrocarbon production in New Mexico is reported by pool, not by field, providing an accurate record of the volume of hydrocarbons that have come from each reservoir. This fact is extremely important in estimating the sequestration capacity of a reservoir. If production statistics from two or more reservoirs in the same field were commingled, there would be no way to get an accurate estimate of how much came from each reservoir, nor how much carbon dioxide could be injected into a reservoir to replace the volume of produced hydrocarbons.

Of the more than 3,000 recognized hydrocarbon pools in New Mexico, only 468 are included in the Southwest Partnership's database because they had cumulative productions of more than 1 million barrels of oil (mmbo) and/or 10 billion cubic feet of gas (BCF). These 468 pools have an estimated sequestration capacity of almost 9 billion tons (Table 17). There are 66 pools (14% of the total) in the San Juan Basin that account for 2,742 mmt (31%) of the estimated sequestration capacity (Table 2) and 402 pools (86%) in the Permian Basin with 6,162 mmt (69%) of the estimated sequestration capacity (Table 3).

Figure 13 shows the areal distribution of the 468 largest pools by cumulative production in New Mexico. A circle whose diameter is proportional to the pool's sequestration capacity is shown at the centroid of each pool's area. Estimated capacities range from less than 1 mmt to more than 800 mmt. Most of the pools in both basins are in close proximity to the Cortez Pipeline, the major CO_2 pipeline that transports CO_2 from Colorado to west Texas for enhanced oil recovery projects. A few pools with small to mid-size capacities are closer to the Sheep Mountain Pipeline, which also transports CO_2 from Colorado to west Texas for enhanced oil recovery projects.

Table 17 indicates that the Permian Basin oil and gas pools possess more than twice the total estimated sequestration capacity of those in the San Juan Basin (6,162 mmt to 2,740 mmt), but have that capacity spread over six times as many pools (402 pools to 66 pools). As a result, the average sequestration capacity per pool in the San Juan Basin is about three times that in the Permian Basin (42 mmt to 15 mmt).

There is also a greater percentage of large capacity pools in the San Juan Basin. However, the largest pools, those with capacities greater than 400 mmt, are equally distributed between the two basins. Of the six pools in New Mexico with estimated sequestration capacities greater than 400 mmt, three are in the San Juan Basin–Blanco Mesaverde (867 mmt), Basin Fruitland Coal (739 mmt), and Basin Dakota (484 mmt)—and three are in the Permian Basin—Hobbs Grayburg–San Andres (533 mmt), Eunice Monument Grayburg–San Andres (484 mmt), and Vacuum Grayburg–San Andres (413 mmt). Although these large capacity pools could provide many more years of storage capacity than their smaller counterparts, the smaller pools could provide additional injection opportunities in the same injector well or leak-protection for a deeper target. In addition the smaller capacity pools may be attractive pilot sites.

The major assumptions made in calculating the CO_2 sequestration capacities for oil and gas pools (and that are built into the Partnership's interactive sequestration capacity calculator) are 1) that the storage capacity volume is created in the reservoir by the production of oil and gas and 2) that CO_2 at reservoir temperature and pressure will fill 100% of the volume originally occupied by the hydrocarbons. Minor amounts of CO_2 will also be dissolved completely in the oil and water remaining in the trap.

The San Juan Basin

The San Juan Basin is a 26,000 square mile, bowl-shaped depression primarily in northwest New Mexico, but also in southwest Colorado. This structural basin, formed during the early Tertiary Laramide Orogeny, contains more than 14,000 feet of sedimentary rocks ranging in age from Paleozoic to Recent. It is a major producer of gas in the United States, with cumulative production of more than 17 trillion cubic feet from 21,000+ wells. The first commercial oil well in New Mexico was drilled in the San Juan Basin near Farmington in 1922. Most of the hydrocarbon production is from fluvial, deltaic, and shallow-marine and near-shore rocks and coals associated with the Late Cretaceous Seaway. Hydrocarbons are also produced from carbonate buildups in the Pennsylvanian Paradox Formation. (See Allis et al. (2003) and Brister and Hoffman (2002) for recent summaries.)

For ease of comparison, the hydrocarbon pools in the San Juan Basin have been grouped into seven "plays" based on the stratigraphic unit that produces the hydrocarbons (Table 18). They have been arranged stratigraphically and numbered one through seven. Each has been given the prefix SJ on Table 2 and in the Partnership's database. These play numbers are similar to those assigned to the San Juan Basin Gas Plays by Whitehead (1993, p.118) in the Atlas of Major Rocky Mountain Gas Reservoirs. The Entrada Sandstone Play (SJ-6), an oil play, has been inserted into the original Atlas list to complete the plays in the San Juan Basin.

Table 20 is a simplified stratigraphic column of Pennsylvanian through Cretaceous rocks in the San Juan Basin showing where the seven plays fit relative to the overall stratigraphic framework. Fig.14 is a simplified cross section across the San Juan Basin.

The greatest oil and gas sequestration capacity in the San Juan Basin, and in New Mexico, lies within the rocks of the Mesaverde Group Play (SJ-3), where four pools have a total capacity of 889 mmt and an average capacity of 222 mmt (Table 18). This play contains the Blanco Mesaverde pool, which has the largest estimated sequestration capacity of any oil and gas sink in New Mexico. This pool will be discussed in detail below. The average depth for these Mesaverde Group pools is 3,788 ft, which puts them below the depth threshold of ~3,000 ft for supercritical CO_2 injection.

Seven hundred feet above the Mesaverde Group is another 339 mmt of total sequestration capacity in the Pictured Cliffs Formation (SJ-2), still below the supercritical depth-threshold. Above that, the Fruitland Formation (SJ-1) provides another 751 mmt of total capacity primarily in coals that are often above the depth threshold. The possibility of utilizing a single injector well that penetrates two or more horizons with high sequestration capacities at relatively shallow depths (less than 5,000 ft) is high in the San Juan Basin because of favorable geological conditions. This possibility can be investigated using the Partnership's interactive database.

The search engine in the Southwest Partnership's Database can be used to find pools that meet or exceed 50 key criteria; e.g. specified distance from power plants to the pool's centroid, thickness, porosity, cumulative production, estimated sequestration capacity, and depth. The following discussion illustrates the kind of data that can be found in the interactive database, using the Blanco Mesaverde pool as an example (Fig. 15). This pool was chosen because it has the largest estimated sequestration of any oil and gas sink in New Mexico and it extends into Colorado, where it is known as the Ignacio Blanco Mesaverde field, and, thus, involves two state-regulatory agencies.

Blanco Mesaverde Pool (NM-072319)

Advantages as a CO_2 sequestration target:

- Majority of production (>90%) is from the regressive Point Lookout Sandstone, a continuous marine sandstone reservoir.
- Several hundred feet of shale and coal seal the main reservoir.
- Cumulative production through Dec. 31, 2003 of more than 41million barrels of oil, 12 million barrels of water, and 10 trillion cubic feet of gas.
- Reservoir is at an average depth of more than 4,500 ft, well below the supercritical depth threshold.
- The discovery well was drilled in 1927. Since then, more than 2,400 wells have been drilled in the pool.
- Average reservoir is thickness is 140 ft; porosity range is 10–16%.
- Calculated storage capacity of CO_2 is more than 867 mmt.
- The Blanco Pictured Cliffs pool, which has produced 728 bcfg, is 1,700 feet above. If CO_2 were to leak out of the Mesaverde reservoirs, it could be trapped here (calculated storage capacity of about 113 mmt).
- The region is sparsely populated with few nearby population centers (e.g., Farmington, Bloomfield, and Aztec).
- Large areal extent (more than 1 million acres) means that sequestered CO_2 could be injected at wide spacing.

Issues needing further evaluation:

- The Pictured Cliffs pool (NM-072400), which is 1700 feet above, is near the depth cutoff for supercritical CO_2 (800 m = ~ 3,000 ft) and could possibility provide additional CO_2 storage from the same injector well.
- There will be regulatory issues related to pool's extension in two states.
- The pool is located on private, state, BLM, and tribal lands.
- The location, age, and status of every one of the 2,400+ wells in the pool need to be determined.

Figure 15 illustrates how some of the stored data on the Blanco Mesaverde pool can be visualized along with putting various aspects of that data into spatial context. Farmington, the largest city in the area, and Broomfield lie west of the pool's boundary. Aztec, on the other hand, lies just inside the western boundary of the pool. Surface ownership within the Blanco Mesaverde pool is a complex checkerboard of private, state, federal, and tribal lands. Negotiating the right of way for a CO_2 pipeline, for example, could involve many parties.

The centroid of the Blanco Mesaverde pool, which is the point location stored for the pool in the database, is shown with respect to its boundary to help put the capacity illustrations (Fig. 13) into perspective. The surface areas of the pools often overlap, creating possibilities for multiple targets from a single injector well. Pipeline distances for the Partnership's Integrated Assessment Model were measured from a power plant to the centroid of a pool. In some cases the power plant lies within the boundary of a pool; in other cases the power plant is closer to the edge of a pool than it is to the centroid, which is the case for the Blanco Mesaverde pool and either the San Juan or Four Corners power plants (Fig. 15). In either case, pipeline costs will be less than modeled.

Two other very large pools in the San Juan Basin are also appealing CO_2 sequestration targets: the Basin Dakota pool (NM-071599) with 484 mmt of estimated sequestration capacity, and the Basin Fruitland Coal (NM-071629) with 739 mmt of estimated sequestration capacity. Both pools cover almost the entire San Juan Basin, hence the field name, and are the result of OCD orders combining several smaller pools producing from either the Dakota Sandstone or the Fruitland Formation coals. The Dakota Sandstone is a more or less continuous near-shore marine sandstone body containing discrete traps; the Fruitland consists of a series of discontinuous, often vertically separated coal beds. The Southwest Partnership has chosen an Enhanced Coalbed Methane (ECBM) project in a Fruitland coal reservoir as one of the its three pilot tests for Phase 2. This project will be discussed in the section on coal-bed-methane sinks.

Data Sources

The following major sources of data were used to obtain the information on the San Juan Basin Oil and Gas pools in the Southwest Partnership's Database:

- The Four Corners Geological Society Oil and Gas Fields of the Four Corners Area (Fasset, J. E. (ed.), 1978a, 1978b, and 1983);
- The Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A. (ed.), 1993);
- State of New Mexico, Energy, Minerals, and Natural Resources Department, Oil Conservation Division Orders;
- New Mexico Oil and Gas Engineering Committee, 2003, Annual report of the New Mexico Oil and Gas Engineering Committee: v. 1A , Southeast New Mexico and v. 2A, Northwest New Mexico; and
- The detailed well and pool data housed at the New Mexico Bureau of Geology and Mineral Resource's Petroleum Records Section in Socorro, NM.

The Permian Basin

The Permian Basin of southeastern New Mexico is part of a larger, petroleum basin that extends into west Texas (Figs. 16 and 17). The greater Permian Basin is the third largest petroleum-producing area in the United States, accounting for 17% of the total United States oil production in 2002 (Dutton et al., 2005). It is primarily an oil-producing region, as opposed to the San Juan Basin, which is primarily a gas–producing region. The Permian Basin produces primarily from Paleozoic carbonate rocks; the San Juan Basin produces primarily from Mesozoic clastic rocks and coal.

Dutton et al. (2004 and 2005)) developed a new oil-play portfolio of the Permian Basin as part of the U.S. Department of Energy's Preferred Upstream Management Practices Program (PUMP) that defines 32 oil plays, numbered from 101 to 132, from oldest to youngest producing reservoir. Seventeen of those plays contain pools in the New Mexico portion of the basin that met the production cutoffs (Table 19). Dutton et al.'s (2004) play numbers have been assigned the prefix "PB" on Table 19. Their Mississippian Platform Carbonate oil-play (108) was expanded to include the primarily gas prone Lower Pennsylvanian Atoka–Morrow sequence on Table 19 so as not to change the play-number sequence that was provided prior to publication by R. F. Broadhead, NMBGMR, (personal communication, 2004).

Table 19 shows these 17 New Mexico plays arranged numerically, with the oldest reservoirs on the bottom and the youngest on the top. The largest number of qualifying pools

(100) occurs in the Lower Pennsylvanian Atoka-Morrow gas play (PB-108). However, the greatest capacities occur higher in the section in three plays in the Upper Permian that include the San Andres-Grayburg and Artesia Platform Sandstone reservoirs (PB-124, 125, and 132). The San Andres-Grayburg plays include three of the top six largest sequestration capacity pools in New Mexico: Hobbs Grayburg-San Andres (533 mmt), Eunice Monument Grayburg-San Andres (484 mmt), and Vacuum Grayburg-San Andres (413 mmt).

Unlike the San Juan Basin plays (Table 18), which, when arranged numerically by play code, deepen progressively downward, the depths of the Permian Basin plays show no systematic trend. This depth-trend loss is because of a more complex structural geology in the older Permian Basin and because the Permian Basin is subdivided into several sub-basins or bathymetric elements, each with a different geologic history and stratigraphic sequence (Figs. 16 and 17).

The New Mexico portion of the Permian Basin has been divided into the Northwest Shelf and the Delaware Basin (Figs. 16 and 17). The Delaware Basin is one of the deepest basins in North America with more than 24,000 ft of sedimentary rocks. A thinner section extends northwest of the basin margin across the Northwest Shelf. Rocks dip southeast from the Northwest Shelf into the deeper Delaware Basin. The Permian Capitan Reef Trend separates the Northwest Shelf from the Delaware Basin (Fig. 17).

The PUMP play names and numbers were applied in stratigraphic order, beginning with the oldest producing reservoirs in the Delaware Basin, then proceeding to same age reservoirs the Northwest Shelf. If the producing units were the same in both sub-basins, they received the same Play Code (number); if not, they received different, but sequential numbers. Then it was back to the Delaware Basin for the next youngest reservoir, and so forth. Thus, the play code numbers jump back and forth by age and depth from one sub-basin to the other (Tables 21 and 22).

Dutton et al. (2005, p. 568–570) note that four of these play reservoirs in the Texas portion of the basin have been subjected to CO_2 flooding, essentially being used to sequester CO_2 while enhancing oil production. The four reservoirs that have been flooded in Texas are equivalent to: PB-132 (Artesia Platform Sandstone); PB-130 (Delaware Mountain Group Basinal Sandstone); and PB-125 and PB-125 (Upper San Andres and Grayburg Platform). The CO_2 pipelines shown crossing New Mexico are carrying CO_2 to west Texas fields for enhanced recovery, not to southeast New Mexico pools.

The Partnership's database contains the same kinds of information on Permian Basin pools that it does for San Juan Basin pools. Thus, searches for and analyses of Permian Basin pools will be similar to those of the Blanco Mesaverde pool from the San Juan Basin that were discussed above. In addition, the database also contains data on the West Pearl Queen pool (PB-132), that was the subject of a CO_2 pilot test (Zhang et al., 2003).

Data Sources

The following major sources of data were used to obtain the detailed information on the Permian Basin Oil and Gas pools in the Southwest Partnership's Database:

- Roswell Geological Society (1956, 1960, 1967, 1977, and 1988) Symposia of oil and gas fields of southeastern New Mexico;
- The Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A. (ed.), 1993);
- State of New Mexico, Energy, Minerals, and Natural Resources Department, Oil Conservation Division Orders; and

- The detailed well and pool data housed at the New Mexico Bureau of Geology and Mineral Resource's Petroleum Records Section in Socorro, NM.

Natural CO_2 Accumulations

There are four fields in New Mexico that produce or have produced CO_2 from naturally occurring sources (Fig. 18). Two of these fields are abandoned; one is under development; and one supplies CO_2 to the Permian Basin for enhanced oil recovery. Two of the fields are in northeast New Mexico, one is in west-central New Mexico, and one is in western New Mexico on the Arizona border. All of the fields are located outside the major hydrocarbon-producing or coal-bearing basins.

The Bravo Dome Carbon Dioxide Gas Field (NM-096010 and NM-096387) is a naturally occurring CO_2 accumulation in Union and Harding County of northeast New Mexico. The field was discovered in 1916 by a petroleum exploration well that encountered CO_2 in the Permian Tubb Sandstone member of the Yeso Formation (see Table 21 for equivalent stratigraphic position in the Permian Basin) at a depth of 2,506 ft. The CO_2 is sealed in the Tubb sandstones by the stratigraphically higher Permian Cimarron anhydrite. The CO_2 is thought to be derived from a magmatic source in the mantle (Broadhead, 1993, p.7).

At Bravo Dome the Tubb sits on Precambrian basement, is up to 400 feet thick, and has an average porosity of 20%. It has produced more than 873 BCF of CO_2 from an average depth of 1,900 ft. Estimated reserves are in excess of 10 TCF. CO_2 from the field was used entirely for making dry ice and carbonation of soft drinks until the mid-1980s, when production was increased because of demand for CO_2 in enhanced oil recovery. The CO_2 is compressed into liquid form and fed into a pipeline that transports it to west Texas for enhanced oil recovery projects. See Broadhead (1993b) for details.

The two abandoned fields are the Des Moines CO_2 field in Union County and the Estancia CO_2 fields, Torrance County. The Des Moines field, discovered in 1935, was abandoned in 1966. The Estancia fields, discovered in 1928, were abandoned in 1942. Both fields were primarily involved in making dry ice.

The fourth accumulation, the Springerville-St. Johns CO_2 field, was discovered in 1959 and is presently under development. In 1998 by Ridgeway Arizona Oil Corporation leased 400,000 acres around Springerville, AZ, in connection with its CO_2 project. A small portion of the field is in Catron County, New Mexico. The gas-producing intervals are sealed by anhydrite and occur as discontinuous zones in the Permian Supai Formation, which sits on Precambrian granite. Drilling depths for Ridgeway's six New Mexico wells, which are shut-in, range from 2,540 ft to 3,211 ft. Rauzi (1999, p. 12) suggests a primarily juvenile source for the CO_2. This non-producing field could provide insight into the effects of CO_2 leakage into groundwater and the atmosphere from relatively shallow reservoirs. See Rauzi (1999) and Moore et al. (2005) for details. WESTCARB is considering the Springerville-St. Johns CO_2 field as a Phase 2 project.

Data Sources

The following major sources of data were used to obtain the information on the naturally occurring CO_2:

- Rauzi's (1999) open file report on the Springerville-St. Johns CO_2 field;
- Broadhead's (1993b) paper on carbon dioxide in northeast New Mexico; and
- Moore et al.'s (2005) paper on the consequences of the long-term presence of CO_2 in natural reservoirs.

Lesson Learned

The data used for this report took more than one person-year to compile, with most of the compilation effort focused on oil and gas pools. Data were entered into a Partnership modified GASIS (U.S. Department of Energy, 1999) database, which contained 321 datafields for each site. Not all of these datafields pertained to every pool.

The GASIS database was designed for gas, not oil, pools. Unfortunately, most of the information required to populate these 321 datafields turned out to be unimportant for the purposes of regional characterization of oil and gas pools for CO_2 sequestration. The Partnership selected the 50 most important datafields for its online, interactive database. Not every pool has a complete set of data because certain information was not available in the published literature.

However, the Partnership's oil and gas database, coupled with its GIS database, is the only publicly available, digital source of key information on the 468 largest producing oil and gas pools in New Mexico. (The same is undoubtedly true for the other states in the Partnership.) Otherwise, these data are scattered primarily in published (paper) reports of the Four Corners Geological Society, the Roswell Geological Society, and the American Association of Petroleum Geologists and in the Atlas of Major Rocky Mountain Gas Reservoirs. As such, the Partnership's complete databases could be invaluable resources for the oil and gas industry or for subsurface work associated with academic research.

The key lesson learned from Phase 1 is to design the database from the ground up for the problem at hand and not to rely on an already established model that can be made to work, but at a cost of decreased productivity.

<u>*Coalbed Methane Sinks*</u>

The total CO_2 sequestration capacity for coalbed methane sinks in New Mexico has been estimated by Reeves (2003) to be about 11 billion tonnes (Table 17), with about 95% of that capacity residing in the San Juan Basin and about 5%, in the Raton Basin (Fig. 19). The coalbed methane reservoirs are in the Upper Cretaceous Fruitland Formation in the San Juan Basin (Fig. 15) and in the Upper Cretaceous Vermejo Formation in the Raton Basin. Figure 19 shows all the coal-bearing areas of New Mexico; only the San Juan Basin and Raton Basin had sufficient methane content to warrant CO_2 capacity calculations.

The first CO_2-enhanced coalbed methane production occurred in the San Juan Basin in 1995. At Burlington Resources' Allison Unit near the New Mexico-Colorado border more than 100,000 tons of CO_2 were injected into the Upper Cretaceous Fruitland Formation over a three-year period to enhance production of coal-bed methane (Reeves, 2002). The CO_2 was injected by four injector wells and is now sequestered in the coal at depths in excess of 3,000 ft. Critical factors for sequestration include coal seam continuity, cleat permeability, coal shrinkage/swelling, gas adsorption/desorption, and seal integrity.

The San Juan Basin is one of the top ranked basins in the world for CO_2 coalbed sequestration because it has: 1) advantageous geology including coal beds with high methane contents; 2) abundant anthropogenic CO_2 from nearby power plants; 3) low capital and operating costs; 4) well developed natural gas and CO_2 pipeline systems; and 4) local companies with coal-bed methane (CBM) and enhanced coal-bed-methane (ECBM) expertise. Selection of a potential coal-bed methane CO_2 sequestration site in the San Juan Basin requires the more detailed reservoir studies of local operators than those that are available in the literature because: 1) the coal seams on a regional scale are discontinuous and 2) all coalbed methane production from the

Fruitland Formation in the San Juan Basin is now reported together, making it difficult to know how much methane has been produced from a single coalbed reservoir.

The Partnership's Phase I ranking of sequestration opportunities factored proximity to sources and/or pipeline infrastructure in addition to economic, safety, and risk mitigation potential. The result of the Phase I ranking process resulted in the selection of three geologic pilot tests within the Southwest Partnership that are located on the CO_2 pipeline infrastructure. One of those selections is an enhanced coalbed methane test with Burlington Resources as the operator in the San Juan Basin that will be discussed in detail in the next section.

San Juan Basin Enhanced Coal Bed Methane (ECBM) Pilot Test

The San Juan Basin ECBM/CO_2 sequestration field test site is located in San Juan County, New Mexico, in the heart of the San Juan Basin coalbed methane (CBM) fairway. This location is favorable for an ECBM/sequestration demonstration for several reasons. For example, the San Juan Basin has been assessed previously by Advanced Resources International (ARI) under the DOE-sponsored Coal-Seq project as one of the nation's top coal basins for sequestration (Reeves, 2003). The San Juan Basin has a potential storage capacity of 12 Gt of CO_2 (12% of the U.S. total), an ECBM potential of 16 TCF (10% of the U.S. total), and potential cost of storage at a predicted net profit of $4–8/ton of CO_2. The results of the Southwest Partnership's demonstration will be scalable directly to a large portion of the San Juan Basin.

The San Juan Basin is a mature CBM play, and thus much of the infrastructure and services required to implement large-scale sequestration are already in place (e.g., wellbores, gathering and distribution systems, and processing facilities). In addition, a well-established, reasonably priced service capability to maintain and expand that infrastructure exists. Finally, and perhaps most importantly, the infrastructure to deliver CO_2 to the region exists—the Cortez pipeline that delivers (natural) CO_2 from McElmo Dome to west Texas passes directly through the San Juan Basin (Fig. 20). If/when that pipeline begins transporting anthropogenic CO_2, the San Juan Basin will become a premier national sequestration site.

The coals in the San Juan Basin fairway area have exceptionally high permeabilities of 100s of millidarcies. Due to the tendency of coal to swell when in contact with CO_2, high initial coal-permeability is required to maintain high CO_2 injection rates over time. Maintaining high injectivity is an important requirement for large-scale, low-cost CO_2 sequestration in coal, and demonstrating this is an important DOE carbon sequestration program goal (as stated in DOE's 2004 Technology Roadmap and Program Plan). This demonstration represents an ideal opportunity to achieve that goal.

The San Juan Basin ECBM pilot site lies entirely on BLM land (Fig. 20), just west of the BLM's Simon Canyon Area of Critical Environmental Concern (ACEC). This 4,000 acre ACEC, which is managed for semi-primitive forms of recreation including fishing, hiking, and backpacking, was established in 1950 and is the oldest ACEC in New Mexico. The Partnership will be working closely with the BLM's Farmington Office to ensure that the entire project is done in an environmentally friendly manner and that all federal regulations concerning safety and environment are strictly followed. As part of a terrestrial sequestration pilot, we are proposing to desalinate produced water so that it can be used in nearby riparian areas within the ACEC.

The exact pilot site location is Section 33, T. 31 N., R. 8 W. in northeastern San Juan County, New Mexico (Fig. 20). The site will consist of four CBM producing wells drilled on 80-acre spacing and a CO_2 injector well to be drilled by Burlington Resources for the Partnership. The primary gas-producing horizons in this area are coal beds in the Upper Cretaceous Fruitland

Formation. The coals, which occur at depths of approximately 3,000 feet, are about 75 feet thick and are split among three seams over a 175-foot gross interval. This area of the fairway has undergone significant CBM production, and reservoir pressures at the test site are less than100 psi. Coal matrix shrinkage is significant at these low pressures, contributing to the high coal permeabilities that exist here. In addition, CO_2 injection pressures will be low, eliminating any potential CO_2 compression needs for the pilot project. The site is operated by Burlington Resources, San Juan Division, operator of more than 1,200 CBM wells in the San Juan Basin, more than any other company, and a pioneer in CO_2-ECBM technology. Burlington was the operator of the Allison Unit CO_2-ECBM pilot located in San Juan County, NM, north of the proposed test site near the New Mexico-Colorado border (Fig. 20). To date, the Allison Pilot is the largest and longest-running CO_2 injection project in coal for the purposes of ECBM. That project, analyzed by ARI as part of the DOE's Coal-Seq project (Reeves, 2002), has provided most of industry's experience and technical foundation regarding CO_2-ECBM. Burlington is the single most experienced and knowledgeable operator in the world regarding CO_2 injection in coal.

Data Source

The major data source for coal-bed-methane sinks is Scott's (2003) report on CO_2 sequestration and ECBM potential of U.S. coal beds.

Deep Saline Aquifers

The total maximum CO_2 sequestration capacity for the seven aquifers listed in Table 17 is conservatively estimated to be about 258,000 mmt, enough capacity to store more than 8,000 years of the annual 2001 CO_2 emissions from the San Juan and Four Corners power plants. The Cortez pipeline crosses all seven of the deep saline aquifers and the Sheep Mountain pipeline crosses the northeast portion of the San Andres aquifer, making access to these sinks cost effective should the pipelines ever transport anthropogenic CO_2 (Fig. 21).

In order to qualify as a deep saline aquifer, a saline-water-bearing rock-unit had to be at least 3,000 ft deep and have a total dissolved solids (tds) concentration of at least 10,000 ppm. Ground water with a salinity less than 10,000 ppm is protected by state law (W. J. Ford, OCD, personal communication, 2005).

Almost two-thirds of the 258 billion tons of sequestration capacity in deep saline aquifers in New Mexico is in the four deep saline aquifers in the San Juan Basin (Table 23 and Fig. 21). The remaining one-third is in the four aquifers in the Permian Basin. All seven of the formations produce hydrocarbons in New Mexico. This means that there is a considerable amount of well data available at least in the vicinity of the producing traps. In fact, well control was used to estimate the area within the 3,000 or 10,000 ft contour for each sink. All of the seven deep-saline-aquifer formations are important hydrocarbon-producers in New Mexico, setting up the possibility of CO_2 sequestration along with enhanced hydrocarbon recovery.

The capacity estimate for each sink is conservative estimate because it is based on a minimum thickness for the aquifer, a minimum area, and reservoir conditions at the top of the aquifer. Nonetheless, the total estimated sequestration capacity of saline aquifers in New Mexico dwarfs the combined total capacity for oil and gas pools and coal-bed-methane sinks by more than an order of magnitude, 258 to 20 billion tons (Table 17.)

Sequestration capacity was estimated using two methods: one assumed that the CO_2 would displace completely the saline water; the other, that the CO_2 would dissolve completely in the saline water. The first method relied on the Partnership's interactive capacity calculator to compute the density of carbon dioxide at reservoir pressure and temperature. The second method relied on the MIDCARB calculator to compute the solubility of CO_2 in the brine at reservoir pressure and temperature. The capacities shown on Table 1 are from the first method, which yielded the larger capacity estimates.

The total displacement estimate for saline aquifers in New Mexico is about an order of magnitude larger than that of the total solubility estimate, 258 to 26 billion metric tons (Table 23). Even so, the solubility estimate is about 40% larger than the combined total capacity for oil and gas pools and coalbed methane sinks, 26 to 20 billion metric tons. However, the oil and gas pools and coalbed methane sinks are much better characterized geologically than the deep saline aquifers. Much of the data used to characterize the deep saline aquifers comes from oil and gas wells.

The average thickness of the aquifer (Table 23) is the average thickness of the water-producing interval reported by the USGS in its Produced Waters Database, rather than the thickness of the potentially porous and permeable interval(s) in the formation. The area of each saline aquifer is that area within the 3,000 ft or 10,000 ft contour. Those contours were determined from the well data in the Produced Waters Database, supplemented by well picks from the literature.

Reservoir pressure and temperature for each aquifer were estimated for the top of each aquifer, either at the 3,000 ft or 10,000 ft depth. Hydrostatic pressure gradients were assumed for the both basins to estimate pressure. A geothermal gradient of 1.96 F°/100 ft was used to determine temperature in the San Juan Basin and a geothermal gradient of 1.00 F°/100 ft was used to determine temperature in the Permian Basin. These geothermal gradients were derived from data in the Partnership's database.

Reservoir pressures were estimated to be 1,410 psi at 3,000 ft and 4,665 psi at 10,000 ft. Reservoir temperatures were estimated to be 114° F at 3,000 ft in the San Juan Basin and 90°F and 160°F at 3,000 ft and 10,000 ft, respectively, in the Permian Basin. Porosity data are averages from the Partnership's oil and gas database. Salinity data are averages from the Produced Waters Database.

San Juan Basin

The four deep saline aquifers in the San Juan Basin have a maximum estimated CO_2 sequestration capacity of 168,454 mmt about two-thirds of the estimated deep-saline-aquifer capacity in New Mexico (Table 23 and Fig. 21). The Mesaverde, Dakota, and Entrada have estimated capacities between 40,000 and 70,000 mmt; the capacity of the Morrison is an order of magnitude less at approximately 6,000 mmt. All four formations produce hydrocarbons in the basin and all are Mesozoic in age. They will be discussed in descending stratigraphic order, youngest to oldest, beginning with the Mesaverde Group. The NE-SW cross section of the San Juan Basin (Fig. 14) highlights the basin's major aquifers in blue.

Two of the four aquifers shown in blue on Fig. 14, along with the Dakota Sandstone, are discussed below. Of the other two aquifers, the Gallup Sandstone is too restricted areally and the San Andres Limestone/Glorieta Sandstone lacks data. Stone et al. (1981, p 41) remark that "…Although there has been extensive drilling for petroleum in the San Juan Basin, most of these wells bottom in the Cretaceous section, and thus little is known of the deeper deposits of the area. The pre-Jurassic rocks are generally too deep to play a significant part in the energy-resource development or to be used extensively for water supply."

(1) The Upper Cretaceous Mesaverde Group has an estimated maximum sequestration capacity of 50,194 mmt. It consists of the following three formations listed in descending stratigraphic order: Cliff House Sandstone, Menefee Formation, and Point Lookout Sandstone. The Cliff House Sandstone forms the top (eastern) flank of the topographically prominent Hogback Monocline west of Farmington, but the Point Lookout Sandstone accounts for the majority of the hydrocarbon and water production and is the aquifer unit generally picked as "Mesaverde" on well logs.

The Point Lookout Sandstone is a coastal marine sandstone that ranges from 40 to 415 ft thick, has a maximum depth of 6,400 ft, and is not widely used as a source of potable water (Stone et al., 1983). The sand is sealed by shales and coals in the overlying Menefee Formation that can be a few hundred feet thick.

The estimated sequestration capacity for the Mesaverde was determined using a thickness of 319 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 114°F, a porosity of 14%, and a salinity of 20,000 ppm (Table 23).

(2) The Upper Cretaceous Dakota Sandstone has an estimated maximum sequestration capacity of 43,837 mmt. It is generally a marine to marginally non-marine sandstone that ranges from 200 to 350 ft thick, has a maximum depth of 8,500 ft, and is not widely used as a source of water although there are a few scattered stock and domestic wells (Stone et al., 1983). The sand is sealed by shales in the overlying Mancos Shale that can be a several hundred feet thick.

The estimated sequestration capacity for the Dakota Sandstone was determined using a thickness of 82 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 114°F, a porosity of 17%, and a salinity of 10,000 ppm (Table 23).

(3) The Upper Jurassic Morrison Formation has an estimated maximum sequestration capacity of 6,370 mmt, the smallest of the seven aquifers. It consists of a sequence of non-marine sandstones, mudstones, and minor limestone that ranges from 330 to 915 ft thick, has a maximum depth of 9,000 ft, and is a major source of ground water, including being the sole source of the public drinking water for Crownpoint and a major source for Gallup (Stone et al., 1983). The Morrison ground water has "some of the lowest specific conductances in the San Juan Basin…Values of less than 1,000 umhos [approximately equal to 1,000 ppm] occur in the Crownpoint-Church Rock area." (Stone et al., 1983, p.39-40) The Morrison Formation, as a result, may not meet the salinity requirement to be a viable CO_2 deep-saline-aquifer-sink.

The Morrison consists of the following four members in descending order: Bushy Basin Shale Member, Westwater Canyon Sandstone Member, Recapture Shale Member, and Salt Wash Sandstone Member. The Westwater Canyon Sandstone Member is the principal aquifer. Shales in the Bushy Basin Shale Member seal the unit.

The estimated sequestration capacity for the Morrison Formation was determined using a thickness of 28 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 114°F, a porosity of 8%, and a salinity of 10,000 ppm (Table 23).

(4) The Upper Jurassic Entrada Sandstone is an aeolian unit that has an estimated maximum sequestration capacity of 68,052 mmt, the greatest capacity of any aquifer in New Mexico. It consists of three informal members (an upper sandstone, a middle siltstone, and a lower sandstone) that range from 175 to 600 ft thick, has a maximum depth of 9,310 ft, and is the source of domestic and stock water between Smith Lake and Mariano Lake, although generally Entrada water is not suitable for drinking Stone et al., 1983). The Entrada is sealed by the overlying Summerville Formation and Todilto Limestone, which contains evaporites.

The estimated sequestration capacity for the Entrada Sandstone was determined using a thickness of 131 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 114°F, a porosity of 24%, and a salinity of 10,000 ppm (Table 23).

Permian Basin

The three deep saline aquifers in the Permian Basin have a total maximum estimated CO_2 sequestration capacity of 89,828 mmt (Table 23), about one-third of the estimated deep-saline-aquifer capacity in New Mexico. The San Andres Limestone, Glorieta Sandstone, and the Devonian have estimated capacities between 19,000 and 39,000 mmt with the estimated capacity increasing stratigraphically upward. All three formations produce hydrocarbons in the basin and all are Paleozoic in age. The average dissolved solids of these three aquifers are considerably greater than their younger counterparts in the San Juan Basin, increasing stratigraphically downward from 70,000 to 100,000 ppm. These aquifers will be discussed in descending stratigraphic order, youngest to oldest, beginning with the San Andres Limestone.

(1) The Upper Permian San Andres Limestone has an estimated maximum sequestration capacity of 38,676 mmt, the greatest estimated capacity of any aquifer in Permian Basin. The outcrop area of the San Andres extends for hundreds of square miles across eastern New Mexico, dominating the southeast quarter of the Geologic Map of New Mexico (Scholle, 2003).

Stratigraphic nomenclature problems make it difficult to pin down basic facts about the San Andres, such as its thickness and lithologies. In the older literature, the unit is referred to as the San Andres Formation and contains a sandstone member at its base that was later raised to formation status as the Glorieta Sandstone. Kelly (1971), using the older concept, measured sections that indicate that the thickness range of the (restricted) San Andres Limestone is 250 ft to more than 1,000 ft. He included three members in the San Andres Formation. The upper member includes dolomite and gypsum and is up to 700 ft thick. The middle member is dolomite and limestone and is up to 300 ft thick. The lower member includes limestone, dolomite, and sandstone (the Glorieta). The aquifer unit is probably in Kelley's middle member, which is sealed by gypsum in the upper member. Two facts about the San Andres are not in dispute: it is "…the major aquifer in the Roswell artesian basin and a major oil producer in the Northwest Shelf" (Johnson et al., 2003, p. 148).

The estimated sequestration capacity for the San Andres Limestone was determined using a thickness of 89 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 90°F, a porosity of 9%, and a salinity of 70,000 ppm (Table 23).

2) The Upper Permian Glorieta Sandstone has an estimated maximum sequestration capacity of 32,094 mmt, the second greatest estimated capacity of the three aquifers in Permian Basin. It ranges in thickness from 100 to 220 ft (Kelly, 1971). The Glorieta Sandstone underlies the San Andres Limestone and is sealed by tight carbonate beds at the base of the San Andres.

The estimated sequestration capacity for the San Andres Limestone was determined using a thickness of 75 ft, a depth of 3,000 ft, a pressure of 1410 psi, a temperature of 90°F, a porosity of 12%, and a salinity of 80,000 ppm (Table 23).

3) The Devonian aquifer has an estimated maximum sequestration capacity of 19,059 mmt, the smallest estimated capacity of any aquifer in Permian Basin, and its deepest aquifer at 10,000 ft. The extreme depth of this aquifer may make it economically unfavorable, although it is a major salt-water disposal unit (W. J. Ford, OCD, personal communication, 2005).

Davidson (2003, p. 116) noted that the Silurian and Devonian formations are often impossible to separate or distinguish on geophysical logs. The use of the generic assignment "Devonian" in the Produced Water's Database is probably to the Lower Devonian Thirtyone

Formation, which often infills an erosion surface on the Silurian Wristen Group (Dutton et al., 2005). The Thirtyone Formation is a deepwater, cherty carbonate that can be up to 1,000 ft thick. The Devonian aquifer is sealed by mudstones in the overlying Woodford Shale, which is also Devonian in age.

The estimated sequestration capacity for the Devonian aquifer was determined using a thickness of 100 ft, a depth of 10,000 ft, a pressure of 4,665 psi, a temperature of 160°F, a porosity of 6%, and a salinity of 100,000 ppm (Table 23).

Data Sources

Publicly available information on deep saline aquifers in New Mexico is scattered in the geologic and hydrologic literature. The Texas Bureau of Economic Geology (BEG) compiled most of the data in the Southwest Partnership's database on the Morrison Formation of the San Juan Basin (Hovorka et al., 2003). Data for the other six deep saline aquifers came from a variety of sources:

- The USGS's Produced Waters database;
- Stone et al.'s (1983) study of the hydrogeology of the San Juan Basin;
- Davidson's (2003) study of the water quality in the Permian Basin of southeast New Mexico;
- Kelly's (1971) study of the geology of the Pecos Country; and
- Statistics compiled in the Partnership's oil and gas database.

Oklahoma Geologic Sinks

The total carbon dioxide (CO_2) sequestration capacity of geologic sinks in Oklahoma, excluding mineralization, is very conservatively estimated to be in excess of 340,000 million metric tons (340 gigatonnes or 340 Gt – see Table 24). Since the total CO_2 emissions from power plants in the State is approximately 47 million tonnes (year 2000 data from the EPA EGRID database), the capacity of the State is about 7200 years worth of storage. The Upper Cambrian/Lower Ordovician age Arbuckle formation is the most far-reaching saline aquifer in the State and is the bulk of the sequestrable capacity (roughly 97%) with one smaller saline formation and the oil and gas reservoirs in the State accounting for the remaining 3%. Oil and gas systems form the bulk of the effort by the Oklahoma contingent and account for some 9 Gt of capacity or 191 years worth of storage.

Because of the Arbuckle aquifer and due to the widespread oil and gas production throughout the State, the total sequestration capacity is spread relatively evenly across Oklahoma with the exception of the eastern portion of the state where the depths to formations that would be suitable for sequestration are too shallow or the formations of interest have little oil and gas productive capacity and are therefore more poorly characterized. For the eastern portions of the State, other relatively thin saline formations may be the only option for sequestration.

Oil and Gas Systems

The total sequestrable capacity overwhelms the amount of anthropogenic CO_2 emitted in the State as it does in other states in the Partnership, The difference between Oklahoma and the other Partnership states is that there are some 500,000 holes that have been drilled exploring for oil and gas. This number is an estimate based on the wells that have been reported to the Oklahoma Corporation Commission since regulation of oil and gas wells began in 1914 and estimates of the number of wells completed between 1897 and 1914. Approximately 85,000 wells are currently producing in the State (Boyd, 2002a). It is fairly safe to say that not all of the 500,000 holes have been properly abandoned and are potential leak points for sequestration. Fortunately, a large percentage of the unregulated wells are in the eastern portions of the State where sequestration options are limited. In addition, a significant portion of the sequestration capacity is likely to be uneconomic for sequestration because of the current natural gas prices and/or geologic considerations. Several of the largest capacity sites in the State are the major gas fields (fields with greater 1 Tcf production). These are the Guymon-Hugoton, Mocane-Laverne, Watonga-Chickasha Trend, Putnam, Kinta, Wilburton and Red Oak-Norris gas reservoirs which are still producing significant quantities of natural gas. The Guymon-Hugoton and Mocane-Laverne areas are part of a much larger sequence of gas reservoirs in the southeastern part of Kansas and panhandles of both Oklahoma and Texas that are known as the Guymon-Hugoton-Panhandle gas fields and are some of the largest accumulations of natural gas in the world. If current natural gas prices continue, these reservoirs are likely to be economic for a considerable length of time and are not likely to be true sequestration candidates despite their size and ability to trap light hydrocarbons.

The majority of oil produced in the State is in the central portion along a geologic trend (Fig. 22) called the Cherokee Platform or Shelf along what is called the Nemaha Uplift. Additional significant accumulations are adjacent to the Cherokee Platform in an area called the Northern Shelf (sometimes called the Anadarko Shelf) and in the shallow portions of the Anadarko Basin prior to the basin dropping off to more of a gas province. The Anadarko Basin runs roughly from just northwest of the city of Ardmore in a northwesterly direction towards the Texas Panhandle. There are three other smaller basins in the State. The Arkoma Basin is in the eastern part of the state running from near an area called the Arbuckle Mountain Uplift eastwardly to the Arkansas state line. The Marietta Basin and the Ardmore Basin are south of Ardmore and often get lumped into one designation, typically called the Ardmore Basin. The Marietta Basin includes the supergiant (fields that have produced in excess of 100 million barrels) Healdton and Hewitt fields while the Ardmore Basin includes the supergiant Eola-Robberson field. The Anadarko Shelf region includes the Oklahoma City, Sooner Trend, Edmond West, Crescent-Lovell, Ringwood and Postle supergiant fields. The remaining supergiants are on the Cherokee Platform and include the Tonkawa, Burbank, Cushing, Avant, Bartlesville-Dewey, Glenn Pool, Stroud, Earlsboro, Seminole, St. Louis, Bowlegs, Holdenville, Little River, Fitts and Allen fields.

The primary focus for the evaluation of sequestration capacity in Oklahoma was to obtain data related to the oil and gas formations in the State. Very little public digital data exists for wells and fields in Oklahoma. The GASIS and TORIS database systems available from the Department of Energy formed the starting point for much of the collection with the GASIS system providing data on 725 fields in the State and the TORIS system providing data on 72 fields. This data was supplemented by searching through reports and field descriptions from the United States Geological Survey, the Oklahoma Geological Survey, the International Oil Scouts, the National Oil Scouts and Landmen's Association and a variety of Master’s theses and PhD Dissertations in the University of Oklahoma library system. Production data in the State is reported to the Oklahoma Corporation Commission (OCC) and to the Oklahoma Tax commission by lease. On-line data by lease is available from the OCC from 1998 on and is also available commercially from IHS Energy and Oil/Law Records (which markets the Natural Resource Information System (NRIS) database). Both the IHS Energy and the NRIS system allow searching and aggregation on designations other than lease. Utilizing these data systems would require a license and a fee to be paid to either IHS Energy or to Oil/Law Records. One of the predecessor companies acquired by IHS Energy was Dwights EnergyData and the Youngblood Library at the University of Oklahoma has the annual production report published by Dwights for 1999. It was this report that was used for most of the production data in the Partnership database for Oklahoma.

Data was collected on more than 5,500 hydrocarbon pools in Oklahoma. These 5500 pools were then aggregated by a field designation which provided 700 that had cumulative production amounts greater than 1 million barrels of oil (mmbo) and/or 10 billion cubic feet of gas (BCF). The number is further limited to pools that were at depths greater than 3000 feet. Taking the 3000 foot depth limitation into account reduced the number of fields to 590 which were included in the sequestration capacity calculation. These 590 fields have an estimated sequestration capacity of approximately 9 Gt. The distribution of the capacity is fairly ubiquitous across the State with at least one field that meets the criteria in 74% of the counties in the State. Figure 23 shows the counties in the State, while Table 25 lists the counties which have more than 50 mmt of sequestration capacity. Limiting the depth to 3000 feet also excluded from consideration seven of the 26 supergiant oil fields in the state (Bartlesville-Dewey, Burbank, Cushing, Glenn Pool, Allen, Fitts and Avant fields).

Table 25 shows that two of the top three most prolific counties are in the panhandle region of the State. This is primarily due to the two huge gas fields – the Guymon-Hugoton (Texas County) and Mocane-Laverne fields (Beaver County). Texas County also includes the Postle field and Beaver County includes the Camrick field. These two fields have both been highly responsive CO_2 floods. Much of the remaining capacity for both counties is tied up in gas fields. Carter County has three supergiant oil fields (Sho-Vel-Tum, Healdton and Hewitt) and Seminole has four (Seminole, Bowlegs, Earlsboro and Holdenville) which explains part of why those two counties are listed second and fourth respectively. The Oklahoma City field dominates the capacity in Oklahoma County and Garvin County includes both the Golden Trend field and the Eola-Roberrson field.

From Table 25 you can also see that there are essentially five counties listed that are considered to be in the eastern part of the State. Osage and Creek Counties are at the edge of the Cherokee Platform. Osage County has several other potential large targets if the 3000 foot depth limit for supercritical CO_2 were not strictly adhered to. Two supergiant fields, Burbank and Cushing are excluded due to this restriction. The Burbank field probably should be included as the average depth for that field is 2931 feet while the Cushing field would be a stretch to include as the depth there is around 2600 feet. These areas may still be highly prospective targets for immiscible, subcritical CO_2 flooding, but that possibility was not investigated in this study.

Latimer, Haskell and Pittsburg Counties are the other eastern counties in this list. All three are on the list due to gas fields. Latimer County has the Wilburton and Red Oak-Norris gas fields, Haskell County is on the list almost exclusively due to the Kinta gas field and Pittsburg County is a gas region with a number of moderately large gas fields.

To develop the estimates for the oil and gas fields shown in Table 25, a temperature gradient of 1.2°F per 100 feet of depth with a 60°F surface condition was used. In addition, an estimate for the pressure in the reservoirs used a 0.4 psi/ft gradient. The oil formation volume factor was assumed to be a constant 1.2 reservoir volumes to stock tank volumes for all reservoirs. The CO_2 density varied with the calculated temperature and pressure and used a correlation developed for this project at New Mexico Tech.

The oil recovery factor was assumed to be a constant value of 25% for all reservoirs. Actual recovery factors are sparsely available. Many of the larger reservoirs in the State have undergone waterflooding and hence have somewhat higher recovery factors. This is offset by two things for the calculation of sequestration capacity. First, the Oklahoma database has no water production values. Consequently any additional sequestration capacity that might be attributable to water production has been neglected. Secondly, most of the larger reservoirs in the State were discovered prior to the establishment of solid reservoir engineering practices. Conservation of reservoir energy was not a practice in place during the discovery of the early fields and as a result, excessive gas flaring caused the depletion of reservoir pressure and the lost of production.

In addition, waterflooding many of the larger reservoirs began very early in the development of the waterflooding process. Many of the fields have fairly complex reservoir architecture and, flood efficiencies are generally poor.

The 25% recovery factor was felt to be a reasonable compromise to prevent the time-consuming effort of evaluating the recovery factor of individual reservoirs. The 25% value was also used by Advanced Resources International in their recent study on the evaluation of "stranded oil" in Oklahoma (Advanced Resources International, Inc.). Variations in the recovery factors were evaluated. Using a 20% value rather than the 25% resulted in an increase in the sequestration capacity of about 8% while a similar increase in recovery factor to 30% resulted in a decrease in the estimated capacity of just less than 6%. Increasing the estimated recovery factor to 50% (an unreasonably high value) still resulted in a sequestrable capacity of more than 7 Gt. A more significant change in the sequestration capacity in the State occurs when you exclude the large gas reservoirs. Eliminating the largest 14 gas fields (2.3% of the total number of fields in the data set) reduces the capacity by about 40% (from 9 Gt to 5.5 Gt).

Evaluating areas of the State where sequestration and enhanced oil recovery would be most prospective shows that there are several areas with high potential. The area around Carter and Stephens Counties in south-central Oklahoma where there is current CO_2 flood activity is dominated by the Sho-Vel-Tum, Healdton and Hewitt fields. But as the existing CO_2 flood in the West Velma field shows, fields with 10 to 20 mmstb production are highly prospective as well both for enhanced oil recovery and for sequestration potential. If Garvin County is included, then the Golden Trend and Eola-Robberson fields could be included and 6 other fields that have recovered between 10 and 30 mmstb would come into play as well. Many of these fields are currently undergoing waterflooding and would be viable candidates for carbon dioxide flooding. Expansion of the floods in the Sho-Vel-Tum and the Golden Trend fields would provide the highest potential for sequestration and may also be economically viable as these fields are still producing at reasonable rates. This area is currently served by a CO_2 line from an ammonium nitrate (fertilizer) plant in Enid, OK and any expansion of CO_2 utilization would require additional (likely) anthropogenic sources. Any expansion of this pipeline to other fields in the area will depend primarily on the delivered cost of the CO_2. Flow rates in most of the States oil fields are generally low so project economics are going to be dominated by delivered CO_2 costs either through pipeline costs or through transportation costs in addition to the capital costs associated with CO_2 recycle facilities. At the time of the writing of this report, it is believed that the ammonium nitrate plant has suspended operations. This plant depends on natural gas and shuts down when natural gas prices reach a certain level. Thus, the operators of the pipeline as well as the CO_2 floods are currently investigating other opportunities to develop more stable supplies of CO_2.

Another interesting area would be Seminole, Pottawatomie, Oklahoma and possibly Lincoln Counties in central Oklahoma. Oklahoma County is dominated by the Oklahoma City field but there are other smaller fields in the area that are candidates for CO_2 flooding. Flooding of the Oklahoma City field will likely be limited to the southern and eastern portions of the field to avoid significant population centers. The southern portion of the field is near the open area around the Will Rogers Oklahoma City International Airport which is currently an active waterflood and shifting to a CO_2 flood in that area probably would not be too difficult. The possibility of injecting CO_2 in the northern portions of the field would seem fairly remote as those are under more populated areas and the potential risks would be significantly higher.

Pottawatomie and Seminole Counties are characterized by having supergiant oil fields providing a smaller percentage of the sequestrable capacity than many other counties in the State. In Seminole County, Seminole, Earlsboro, Bowlegs and Holdenville fields account for about 63% of the capacity in the county, leaving 37% in 18 other oil fields and one 22 Bcf gas field. In Pottawatomie County, the supergiant St. Louis field accounts for around 66% of the capacity in the county. There are 30 other oil fields and one 98 Bcf gas field that accounts for the remaining 34%. Oklahoma, Seminole and Pottawatomie Counties are primarily oil provinces while Lincoln County has both oil and gas accumulations. The reservoir depths and the light oils in these areas would make high quality candidates for CO_2 floods. The large numbers of high quality potential sites make this an interesting area for development of an infrastructure for enhanced recovery with CO_2. Again, an anthropogenic source would be the most likely source for the CO_2.

Another prospective area is based mainly on proximity to the Oklahoma Gas and Electric Sooner Power Plant in Noble County. This area would be Noble, Garfield, Kingfisher and possibly Major, Payne and/or Logan Counties. Kingfisher County is dominated by the Sooner Trend set of fields and Major County includes the Ringwood supergiant field. Garfield, Noble, Payne and Logan Counties again have a fairly large number of modest sized fields. Situating enhanced oil recovery infrastructure close to the power plant would be conducive to both the existing power grid as well as being near the CO_2 pipeline and ammonium nitrate plant, as well as being near the Sooner, Ringwood and Oakdale fields.

Extending the pipeline running from Enid to the Sho-Vel-Tum field to some of the oil fields that are on the shelf of the Anadarko Basin would also appear to be prospective. A number of these fields have high cumulative recoveries with secondary recovery and would likely be solid candidates for CO_2 recovery and storage. These fields include the Cement and Apache fields. Establishing an anthropogenic CO_2 source to service all of these areas is necessary.

As previously mentioned, the Panhandle region has a number of possible targets that depend on how serious the nation gets at developing sequestration as a business. However, if these gas fields did become serious sequestration targets, then note that the Sheep Mountain pipeline that terminates at the Postle field runs basically right over the Guymon-Hugoton field. There would be a fairly short extension that could be built to get to the Mocane-Laverne Gas Area. In addition, the pipeline from Borger, TX to the Camrick field could also supply the Camrick gas area should that be an opportunity. Thus, a reasonable infrastructure exists in this area to allow access to these sites.

Data Sources

The following major sources of data were used to obtain the information for the Oklahoma Oil and Gas pools in the Southwest Partnership's Database:

- Boyd's Oklahoma Oil: Past, Present and Future, *Oklahoma Geology Notes*, v. 62, no. 3, Fall 2002
- Boyd's Oklahoma Natural Gas: Past, Present and Future, *Oklahoma Geology Notes*, v. 62, no. 4, Winter 2002

Natural CO_2 Accumulations

There are no natural CO_2 accumulations in Oklahoma.

Coalbed Methane Sinks

Coal seams in the State are in the eastern third of the State and are both thin-bedded coal seams and shallow. There is currently active development of the coalbed methane in these coal seams. However due to their low net thickness and shallow depth to the coal seam, sequestration in Oklahoma coal seams was not considered in this study. Further evidence of lack of sequestration potential in Eastern Oklahoma coal seams is the fact that of the nearly 4000 wells completed in the coal seams in the State, approximately 100 of the wells have depths greater than the Partnership mandated 3000 feet (2.5%). The deepest coalbed methane well in the State is at 4400 feet. There has been a bit more exploration recently for deeper targets, but evaluation of the coal seams was deemed less important that the evaluation of oil and gas systems and saline aquifers.

Deep Saline Aquifers

The primary saline aquifer in the State is the Arbuckle group of formations that are carbonate sequences that reside just above basement rocks nearly everywhere in Oklahoma. The Arbuckle group is absent in the southeastern part of the State where the Ouachita Mountain Uplift pushes the basement rocks to the surface. The zone is also missing in the southwestern part of the State where the Wichita Mountain Uplift also pushes basement rocks to the surface. The Arbuckle on the southwest side of the Wichita Mountain Uplift is a groundwater source for Cotton and Tillman Counties. In the Arbuckle Mountain Uplift, the zone outcrops along the Arbuckle Anticline, the Tishomingo Anticline and the Hunton Anticline. Mineral springs around Davis and Sulphur have their origins in the Arbuckle formation. It is this area that has generated the most interest and study in the State on the Arbuckle formation as there are ongoing studies of the Arbuckle-Simpson Aquifer with support from the United States Geological Survey and the Oklahoma Water Resources Board.

To develop the estimate for the sequestrable capacity for the Arbuckle Formation, maps from the Texas Bureau of Economic Geology were utilized to find areas in Oklahoma where the formation was below 3000 feet (about 1000 m), well away from the formation outcrops. It was also assumed that where the formation drops in the Anadarko Basin, the porosity and permeability of the formation would be too tight to be of interest. These assumptions leave a region that roughly parallels the line on Fig. 22 for the northeastern edge of the Anadarko Basin slightly inside the basin and extending on to the Northern Shelf area. This area was estimated to be roughly 100 km by 275 km and had an average thickness of about 750 m. The area actually could have been opened up slightly to include more of the Cherokee Platform area and some of the deep Anadarko Basin may be prospective as well. However, to develop a conservative estimate of the capacity, these areas were excluded. Salt water disposal wells completed in the Arbuckle formation in the State have an average thickness of 572 feet based on data from the Oklahoma Corporation Commission (Daneshfar, 2006). Using an average 150,000 ppm salinity value, an average depth to the formation of 6562 feet (2000 m), an estimated temperature of the formation of 139°F, an average pressure of 2640 psi and an average porosity of 10%, the capacity of this area was calculated to be 344,277 mmt. The Arbuckle group projects north from the Oklahoma state line and runs almost completely throughout Kansas as well. The Kansas Geological Survey (KGS) has estimated the Kansas portion of the Arbuckle to have a capacity of 894,000 mmt. Thus, the value estimated for Oklahoma is within the order of magnitude of the value computed by KGS and is felt to be a very conservative estimate given the uncertainty in the data.

Other formations in the State also have potential for sequestration. Unfortunately, there are few public regional maps of the formations in question which makes estimating capacity almost impossible. Based on the data from the Oklahoma Corporation Commission (Table 26), the Arbuckle is certainly the largest disposal zone in the State. However, there are a number of other formations that are accepting significant amounts of salt water. The top 20 formations are shown in Table 26. Somewhat hidden in this table is that there again are few sites available in the eastern portions of Oklahoma and even fewer that would be suitable for sequestration. The depths to most of the saline formations are above the 3000 foot Partnership cutoff. Disposal sites that are below the cutoff include the Tonkawa and Osage in Lincoln County, the Cromwell and Booch zones in Hughes County, the Spiro formation in LeFlore County, the Cromwell, Hunton and Wilcox zones in Okfuskee County and the Arbuckle and Wilcox zones in Okmulgee County. Data from the Corporation Commission for disposal sites in the other counties are above the 3000 foot cutoff. Unfortunately, the eastern portion of Oklahoma is also home to most of the larger coal-fired power plants in the State.

In addition to the analysis of the Arbuckle, one additional area of interest was developed through this program. During the program an operator of four wells near Freedom, OK (Fig. 24) approached the Partnership to see whether there was interest in using the wells for a test site. The wells were originally drilled to extract iodine from the salt water. The wells are in a formation called the Woodward Trench which is a 1–2 mile wide by 70 mile incised valley fill of sand and shale of Pennsylvanian (Morrow) age. The channel is isolated from the surrounding (much tighter) Chester limestone with an approximate depth of 6,700 feet. The four wells have been cemented to surface and could likely receive EPA Class I status if tested, and it was proposed that they could be used to inject CO_2 into the trench. The wells have good porosity (published reports put the porosity values for the trench at approximately 14%) and permeability (published values are around 20-40 mD) in the zone of interest. Rates for both production and injection were in excess of 2000 barrels per day so reasonable rates of CO_2 injection should be expected. This site was withdrawn from consideration for a Phase II pilot by the operator about the time that proposals were being generated due to the high cost of CO_2 that would be necessary to obtain for the pilot. The operator sold to a consortium that is trying to redevelop the iodine extraction, but at least one of the consortium members is familiar with sequestration through some work he does with terrestrial sequestration at the US Department of Agriculture test sites near Woodward.

Assuming a 2 mile by 52.5 mile areal extent of the trench, a net thickness of the Morrow of 150 feet, a depth of 8000 feet, a pressure of 3735 psi, a temperature of 212°F, a porosity of 14% and a salinity of 16,000 ppm, this area has a sequestrable capacity of 1,022 mmt (nearly 22 years).

Utah Geologic Sinks

The total carbon dioxide (CO_2) sequestration capacity of geologic sinks in Utah, excluding mineralization, is estimated to be in excess of 2,100 million metric tons (mmt; see Table 27). To put this total sequestration capacity in perspective, we can compare to Utah's annual greenhouse gas emissions from fossil fuels for 2002, which totaled about 17.6 mmt of CO_2 (Allis et al., 2003). The 2,100 mmt of estimated sequestration capacity is equivalent to about 119 years of storage for the CO_2 released from fossil fuels burned in Utah in 2002.

The total sequestration capacity is spread unequally across Utah in four basins and three sink types. Figure 25 shows the distribution of the various oil and gas and coal-bed-methane reservoirs studied in Utah. The Uinta Basin in northeast quarter of the state has about 85% of the estimated total; the Paradox Basin in the southeast, has less than 9%; the Northern Thrust Belt in north central Utah has about 5% of the total capacity, and the Utah's small portion of the Green River Basin has less than 1% of the total capacity. Coal-bed-methane sinks, which only occur in the Uinta Basin, are the largest sink and account for about 42% of the total, while oil and gas reservoirs account for 30% of the total, and deep saline aquifers for the remaining 28%. Within Utah, four potential deep-saline-aquifer sinks have been identified in the Uinta Basin, and one in the Paradox Basin. Thus, the majority of the identified geologic sinks occur in the Uinta Basin.

In this study, 90 oil and gas reservoirs, 5 saline aquifers, and 3 coal-bed-methane sinks have been studied (Table 27). The oil and gas reservoirs and saline aquifers have approximately the same total capacity, but the coal-bed-methane sinks, while fewest in number have the greatest CO_2 storage capacity. Within Utah, the average sequestration capacity for a coal-bed-methane sink is 297 mmt, 107 mmt for a deep saline aquifer, and 7 mmt for an oil and gas reservoir (Table 27).

However, averages do not tell the whole sequestration story. Oil and gas reservoirs are much better characterized geologically than either of the other two sink types, although there is overlap among the sink types in that hydrocarbon production occurs in some of the same stratigraphic units that serve as both the coal–bed-methane and deep-saline-aquifer sinks. The Southwest Partnership's interactive database reflects this economic reality and contains much more geologic and engineering data on oil and gas reservoirs. Data on the average reservoir depth, temperature, and pressure for oil and gas, as well as coal-bed-methane sinks are archived in the SWP's geologic sinks database.

In addition, deep-saline-aquifer and coal-bed-methane sinks tend to be larger in area than oil and gas reservoirs. Oil and gas reservoirs are generally a size that is more than an order of magnitude smaller than the other two sink types. It is noteworthy that Utah's largest coal-bed-methane sink has an estimated sequestration capacity of 339 mmt, equal to approximately 19 years of the State's annual fossil-fuel based CO_2 emissions for the year 2002.

Each of the three sink types will be discussed in detail in the sections of this report that follow. The information presented below is designed to give the interested user enough detail to be able to select particular sinks for further evaluation using the Southwest Partnership's interactive, online database. The Partnership's database is managed and maintained by the Utah Automated Geological Reference Center (AGRC).

The three sink types will be discussed in descending order of geological characterization, beginning with oil and gas reservoirs and finishing with deep saline aquifers. A brief discussion is also included for the Southwest Partnership's Paradox Basin Enhanced Oil Recovery (EOR) Pilot Test at the Aneth unit that has been selected for Phase 2 field demonstration work.

Oil and Gas Reservoirs

The Utah Geological Survey (UGS) uses the term "reservoir" in the same sense that the New Mexico Oil Conservation Division uses the term "pool." A reservoir is a single discrete hydrocarbon accumulation within a single stratigraphic trap horizon. Reservoirs are areally continuous and can lie in vertical succession or side by side, or overlap laterally. The reservoir name in the Southwest Partnership's database has two parts: 1) a field name, usually a geographic location, and 2) a stratigraphic name based on the producing (reservoir) unit. An example of a reservoir is the Anschutz Ranch Twin Creek. This reservoir of the Anschutz Ranch field produces hydrocarbons from the Middle Jurassic Twin Creek Limestone. See Sprinkel and Chidsey (1993, Gas Atlas) for details.

The Utah Division of Oil, Gas and Mining (DOGM) assigns a unique number of three digits to each Utah field, regardless of whether it produces from one or more reservoirs. For example, while DOGM has assigned a single number, 500, for the Anschutz Ranch field, the Southwest Partnership's database recognizes the stratigraphically higher Twin Creek reservoir as the number 500A, while the deeper Nugget Sandstone reservoir has the number 500B. In the Southwest Partnership's database these reservoirs have been assigned the unique codes of UT-00500A and UT-00500B, respectively, so that the attributes in different databases or data tables can be assigned to the proper, legally defined field.

The DOGM reports some hydrocarbon production in Utah by reservoir, but those records only extend back as far as 1984. Also, since DOGM's records of Utah commercial hydrocarbon production only began to be compiled in 1948, we lack accurate pre-1948 production data for each individual reservoir for a number of the older fields in the state. In addition, some operators co-mingle production from several reservoir intervals and this also complicates anyone's ability to obtain an accurate record of the volume of hydrocarbons that have come from each individual reservoir. These factors are extremely important in estimating the sequestration capacity of a reservoir. Where possible, we used our best geologic judgment to divide co-mingled or older production statistics from two or more reservoirs in the same field in order to try to get an estimate of how much came from each reservoir, and thus, an estimate of how much carbon dioxide could be injected into each reservoir to replace the volume of produced hydrocarbons. However, such divisions of co-mingled production to each individual reservoir was not always possible, and in such instances all production from multiple reservoirs was simply assigned to the predominant producing reservoir.

Of the approximately 150 recognized hydrocarbon fields in Utah, only 66 are included in the Southwest Partnership's database because they had cumulative production of more than 1 million barrels of oil (mmbo) and/or 10 billion cubic feet of gas (BCF). These 66 fields have an estimated sequestration capacity of 629 mmt (Table 27). The 66 oil and gas fields can be further broken down into 90 reservoirs where some fields produce from more than one reservoir. There are 51 reservoirs in the Uinta Basin that account for 372 mmt (59%) of the estimated oil and gas field sequestration capacity, 26 reservoirs in the Paradox Basin that account for 138 mmt of capacity (22%), 10 reservoirs in the Northern Thrust Belt that account for 110 mmt of capacity (18%) and 3 reservoirs in the Green River Basin that account for 8 mmt of capacity (1%) in Utah (Table 27).

Figure 25 shows the areal distribution of the 66 largest conventional oil and gas fields in Utah (also included coal-bed-methane fields). Estimated individual field sequestration capacities range from less than 0.1 mmt to more than 170 mmt. Only the pools in the Paradox Basin are located near the ExxonMobil pipeline, an 8-inch pipeline that transports CO_2 from McElmo field in southwest Colorado to southeast Utah for EOR projects in the Aneth field. Table 27 indicates that the Uinta Basin oil and gas reservoirs possess more than twice the total estimated sequestration capacity of those in the Paradox Basin and Northern Thrust Belt (372 mmt compared to 138 and 110 mmt), and over 45 times the sequestration capacity of the reservoirs in the Green River Basin. However, the Uinta Basin also has the greatest number of reservoirs of all the areas characterized in Utah. As a result, the average sequestration capacity per reservoir in Utah is fairly consistent in magnitude for all areas studied, ranging from a low of 2.8 mmt in the Green River Basin to a high of 11.0 mmt in the Northern Thrust Belt, with an overall average of 7 mmt.

The percentage of large capacity reservoirs is greatest in the Paradox Basin at 15%. However, the percentage of the largest reservoirs, those with capacities greater than 10 mmt, is consistent at 10% in both the Uinta Basin and Northern Thrust Belt. The Green River Basin, with only three reservoirs, probably has no large reservoirs because there are too few reservoirs in the Utah portion of the basin to have encountered a large reservoir. Of the 10 Utah reservoirs with estimated sequestration capacities greater than 10 mmt, five are in the Uinta Basin, Ashley Valley Weber (172.0 mmt), Altamont Green River-Wasatch (84.4 mmt), Red Wash Green River (35.5 mmt), Bluebell Green River-Wasatch (22.6 mmt), and Wonsits Valley Green River (22.2 mmt); four are in the Paradox Basin, Greater Aneth Desert Creek (51.7 mmt), Upper Valley Kaibab (29.8 mmt), Lisbon Mississippian (29.1 mmt), and Greater Aneth Paradox (10.1 mmt); and one is in the Northern Thrust Belt, Anschutz Ranch East Nugget (96.7 mmt). Although these 10 large-capacity reservoirs provide 88% of the oil and gas field CO_2 storage capacity, the other 80 smaller reservoirs provide additional injection opportunities in the same injector well or up-section leak-protection for deeper reservoir targets.

The major assumptions made in calculating the CO_2 sequestration capacities for oil and gas reservoirs (and that are built into the Partnership's interactive sequestration capacity calculator) are 1) that the storage capacity volume is created in the reservoir by the production of oil and gas and 2) that CO_2 at reservoir temperature and pressure will fill 100% of the volume originally occupied by the hydrocarbons. Minor amounts of CO_2 will also be dissolved completely in the oil and water remaining in the trap.

The Uinta Basin

The Uinta Basin is a 26,000 square mile, bowl-shaped depression primarily in northeast Utah, but also extending slightly into northwest Colorado. This structural basin, formed during the early Tertiary Laramide Orogeny, contains more than 24,000 feet of sedimentary rocks ranging in age from Cambrian to Recent. It is a major oil- and gas-producing region in the United States, and through 2000 had cumulative production of more than 486 million barrels of oil and 1.9 trillion cubic feet from 10,000+ wells. The first commercial petroleum well in the Uinta Basin was a gas well drilled in the Ashley Valley field near Vernal in 1925. Most of the past hydrocarbon production has been from fluvial, deltaic, and lacustrine rocks of the Tertiary Wasatch and Green River Formations, but increasingly drilling has been testing deeper Mesozoic and Paleozoic reservoirs, and the U.S. Geological Survey's Uinta-Piceance Assessment Team (2002) identified substantial undiscovered resources in these deeper reservoirs.

For comparison purposes with reservoirs in other basins in Utah and other states, the hydrocarbon reservoirs in the Uinta Basin have been grouped into six "plays" based on the reservoir stratigraphic unit(s) that produces the hydrocarbons. They have been arranged stratigraphically from top to bottom and numbered one through six. These first three plays are similar to the Uinta Basin Gas Plays discussed in the Atlas of Major Rocky Mountain Gas Reservoirs (Chidsey, 1993, p.83). In addition, three deeper plays, the Ferron Sandstone Member of the Mancos Shale, the Dakota - Morrison Formations, and the Weber Sandstone plays have been added to the original Gas Atlas list to complete the plays in the Uinta Basin.

The oil and gas reservoir with the greatest sequestration capacity in the Uinta Basin is the Green River-Wasatch Formations Play (UN-2), where 21 reservoirs have a total capacity of 185.6 mmt and an average capacity of 8.8 mmt. This play includes the Altamont Green River-Wasatch reservoir, which alone has an estimated sequestration capacity of 84.4 mmt.

Seven thousand feet below the Green River-Wasatch Formations Play (UN-2) is the Weber Sandstone Play (UN-6), another major sink with 172.5 mmt of total sequestration capacity. Together these two play account for 96% of the oil and gas sink sequestration capacity in the Uinta Basin. Other small sinks in the Uinta Basin are found in the Uinta Formation (UN-1), the Wasatch-Mesaverde Formations (UN-3), the Ferron Sandstone Member of the Mancos Shale (UN-4), and the Dakota-Morrison Formations (UN-5). The possibility of utilizing a single injector well that penetrates two or more horizons with high sequestration capacity at relatively shallow depths (less than 5,000 ft) is slim in the Uinta Basin because the shallow portion of each reservoir occurs in ring-shaped areas that extend progressively farther from the center of the basin. The areas where these rings may overlap can be investigated using the Southwest Partnership's interactive database.

The Southwest Partnership's database can be used to find reservoirs that meet key criteria; e.g. specified distance from power plants to the pool's centroid, thickness, porosity, cumulative production, estimated sequestration capacity, and depth. The following discussion illustrates the kind of data that can be found in the interactive database, using the Red Wash Green River reservoir (UT-00665A) as an example. This reservoir was chosen because it is one of the largest estimated sequestration sinks in the Green River-Wasatch Formations Play in Utah.

Red Wash Green River Reservoir (UT-00665A)

Advantages as a CO_2 sequestration target:

- Majority of production is from the fluvial-deltaic sandstones of the Douglas Creek Member of the lower Green River Formation, a more continuous sandstone reservoir.
- Several hundred feet of shale and marlstone of the Parachute Creek Member of the Green River Formation seal the reservoir.
- Cumulative production through 12/31/2003 of more than 81million barrels of oil, 313 million barrels of water, and 343 billion cubic feet of gas.
- Reservoir is at an average depth of more than 5,100 feet, well below the supercritical depth threshold.
- The discovery well was drilled in 1951. Since then, more than 195 wells have been drilled in the pool.
- Average reservoir is thickness is 170 feet; porosity ranges from 10-22%.
- Calculated storage capacity of CO_2 is more than 35.5 mmt.
- The shallower Uinta Formation reservoir lies about 1,000 feet above the primary Green River reservoir. If CO_2 were to leak out of the Green River reservoir, it could be trapped here (uncalculated storage capacity).

- The region is sparsely populated with few nearby population centers (e.g., Myton, Roosevelt, Vernal).
- Reasonably large areal extent (more than 30 thousand acres) means that sequestered CO_2 could be injected at wide spacing.

Issues needing further evaluation:

- The shallower Uinta Formation reservoir, which is about 1,000 feet above, has not produced and is not well understood in this area. It could possibly provide backup protection for any CO_2 leakage from the primary Green River reservoir below.
- The pool is located on private, state, and BLM lands.
- The location, condition, and status of every one of the 195+ wells in the pool need to be investigated and verified.

Four other large reservoirs in the Uinta Basin are also appealing CO_2 sequestration targets: the Ashley Valley Weber (UT-00545C) with 172.0 mmt, the Altamont Green River-Wasatch (UT-00055B) with 84.4 mmt, the Bluebell Green River-Wasatch (UT-00065B) with 22.6 mmt, and the Wonsits Valley Green River (UT-00710A) with 22.2 mmt of estimated sequestration capacity. All of these reservoirs, except for the Ashley Valley Weber, cover at least 12,000 acres within the Uinta Basin, and some reservoirs are the result of DOGM orders combining several smaller reservoirs together. Various Green River Formation fields produce from a fairly continuous alluvial and near-shore marine sandstone trend containing discrete traps. The Southwest Partnership has not chosen a CO_2 sequestration demonstration project in the Uinta Basin as one of its pilot tests for Phase 2.

Data Sources

The following major sources of data were used to obtain the information on the Uinta Basin Oil and Gas pools in the Southwest Partnership's database:

- Four Corners Geological Society Oil and Gas Fields of the Four Corners Area (Fassett, J. E., editor, 1978a, 1978b, and 1983);
- Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A., editor, 1993);
- 1995 National Assessment of United States Oil and Gas Resources (Gautier, D. L. et al., DDS-30, 1996; Beeman, W. R. et al., DDS-35, 1996: Charpentier, R. R. et al., DDS-36, 1996);
- Petroleum Systems and Geologic Assessment of Oil and Gas in the Uinta-Piceance Province, Utah and Colorado (USGS Uinta-Piceance Assessment Team, DDS-69-B, 2003);
- U.S. Geological Survey Produced Waters Database, provisional release (Breit, G. N., compiler, 2002) available at Web site: http://energy.cr.usgs.gov/prov/prodwat/uses.htm;
- State of Utah Division of Oil, Gas and Mining, Oil and Gas Program Web site at: http://www.ogm.utah.gov/oilgas/default.HTM;
- Utah Geological Association Publication 22, Oil and Gas fields of Utah (Hill, B. G., and Bereskin, S. R., editors, 1993, 1996); and
- U.S. Department of Energy GASIS – Gas Information System release 2 (NETL version, 1999), CD or at Web site: www.netl.doe.gov/scng

The Paradox Basin

The Paradox Basin of southeastern Utah is part of a larger, petroleum basin that extends into western Colorado and a small part of northern Arizona. The Paradox Basin is one of the largest petroleum-producing areas in Utah, accounting for 30% of the total Utah oil and 6% of the gas production in 2004 (DOGM, 2005). It is primarily an oil-producing region, as opposed to the Uinta Basin, which is primarily a gas–producing region. The Paradox Basin produces primarily from Mississippian and Pennsylvanian carbonate rocks; the Uinta Basin produces primarily from Cretaceous and Tertiary clastic rocks and coal.

Morgan (1993) developed a portfolio of three Paradox Basin plays as part of the Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, 1993), numbered from PX-1 through PX-3, from oldest to youngest producing reservoir. Two of those plays, the Leadville and Paradox Formations, contain reservoirs in the Utah portion of the basin that met the production cutoffs. In addition, two other plays, the Aneth and Kaibab Formations, have sufficiently large sinks to meet the Southwest Partnership guidelines and have been added to the current study.

The Aneth Formation play (PX-4) covers the oldest producing unit in the Utah portion of the Paradox Basin, and oil has been produced from a few deeper wells in the Greater Aneth field.

The Mississippian Leadville Formation play (PX-3) includes four reservoirs that produce from buried-fault-block, carbonate reservoirs in the Paradox fold and fault belt of the northern Paradox Basin. Although most of these reservoirs comprise small sinks, one of the four fields in this play, Lisbon (UT-00385A), is among the ten largest CO_2 sinks in Utah at 29.1 mmt.

The next younger Paradox Formation play (PX-2) is primarily oil prone, and produces from 20 discrete porous carbonate buildup reservoirs from 18 fields in the southern part of the Paradox Basin. Two fields, Bluff and Greater Aneth, produce from two different zones of the Paradox Formation. At the Greater Aneth field, both the Desert Creek (UT-00365A) and Paradox (UT-00365C) reservoirs are included among the top ten largest CO_2 sinks in Utah at 51.7 mmt and 10.1 mmt, respectively. The giant Greater Aneth field, discovered in 1956, includes four production units that cover about 47,000 acres.

The youngest reservoir in the Paradox Basin is the Kaibab reservoir (PX-1), which produces mainly oil from a structural and combination trap found in association with the Permo-Triassic unconformity in the Kaiparowits sub-basin outside of the main Paradox Basin. Only one reservoir is productive in this play at Upper Valley field (UT-00155A), but this field is one of the top ten largest CO_2 sinks in Utah at 29.8 mmt. The largest number of qualifying reservoirs are in the Pennsylvanian Paradox Formation, and the greatest sequestration capacities also occur in this play. Only the Aneth and Paradox plays occur together in the same area at Greater Aneth field; each of the other plays occurs in separate geographic areas of the Paradox Basin.

The reservoirs of the Paradox Basin have the narrowest range of depths for all the Utah basins, and have the second shallowest average depths after the Uinta Basin plays.

Since the Paradox Basin plays area occur mostly in separate areas and are not superimposed on each other, when arranged numerically by play code, they do not deepen progressively downward in a systematic trend. This lack of a depth-trend for older reservoirs is the result of a greater structural complexity for the geologic history of the Paradox Basin.

The Greater Aneth field production unit run by ExxonMobil has already been subjected to CO_2 flooding, essentially being used to sequester CO_2 while enhancing oil production. The

CO_2 used in this enhanced oil recovery project is transported via an 8-inch pipeline from McElmo Dome in southwest Colorado. The Southwest Partnership has selected another production unit of the Greater Aneth field for a Phase 2 sequestration demonstration project. The lack of previous CO_2 injection in this area of the field allows the partnership to collect baseline information before CO_2 injection begins and provides a better opportunity to accurately monitor and verify the Paradox reservoir sequestration capability and capacity. In addition to the pipeline that transports CO_2 from Colorado to Utah, another natural source of CO_2 occurs in the Bluff field several miles to the northwest of the Greater Aneth field (Chidsey et al., 2005).

The Partnership's database contains the same kinds of information on Paradox Basin reservoirs that it does for Uinta Basin reservoirs. Thus, searches for and analyses of Paradox Basin reservoirs will be similar to those of the Red Wash Green River reservoir from the Uinta Basin that were discussed above. In addition, the database also contains data on the Greater Aneth Desert Creek reservoir (PB-132), that is the subject of ExxonMobil's enhanced oil recovery project in the northeastern part of the field.

Data Sources

The following major sources of data were used to obtain the detailed information on the Paradox Basin Oil and Gas pools in the Southwest Partnership's Database:

- Four Corners Geological Society Oil and Gas Fields of the Four Corners Area (Fassett, J. E., editor, 1978a, 1978b, and 1983);
- Utah Geological Association Publication 22, Oil and Gas fields of Utah (Hill, B. G., and Bereskin, S. R., editors, 1993, 1996);
- Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A., editor, 1993);
- 1995 National Assessment of United States Oil and Gas Resources (Gautier, D. L. et al., DDS-30, 1996; Beeman, W. R. et al., DDS-35, 1996: Charpentier, R. R. et al., DDS-36, 1996);
- Oil and Gas Fields Map of Utah (Chidsey and others, 2005);
- U. S. Department of Energy GASIS – Gas Information System release 2 (NETL version, 1999), CD or at Web site: www.netl.doe.gov/scng
- State of Utah Department of Natural Resources, Division of Oil, Gas and Mining completion files, Division Orders and well data Web site (http://www.ogm.utah.gov/oilgas/DATA_SEARCH/well_data_search.htm); and
- The well and reservoir data housed at the Utah Geological Survey's Petroleum Section in Salt Lake City, UT.

The Northern Thrust Belt

The Northern Thrust Belt of northeastern Utah is part of a larger, petroleum basin that extends into southwestern Wyoming (Figure 25). The Northern Thrust Belt is a smaller but significant producing area in Utah, accounting for nearly 4% of the total Utah oil and 8% of the gas production in 2004 (DOGM, 2005). It is primarily a gas-producing region, like the Uinta Basin. The Northern Thrust Belt produces primarily from Triassic and Jurassic clastic and carbonate rocks; the Uinta Basin produces primarily from Cretaceous and Tertiary clastic rocks and coal.

Doelger et al. (1993a) developed a portfolio of seven Thrust Basin plays as part of the Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, 1993), numbered from TB-1 through TB-7, from youngest to oldest producing reservoir. The youngest two of those plays, the Jurassic Twin Creek Limestone and Nugget Sandstone, contain reservoirs in the Utah portion of the Thrust Belt province that met the production cutoffs. A third play, the Triassic Phosphoria Formation, was included in the TB-5 (Weber Sandstone play) of Doelger et al (1993a), and has a sufficiently large sink to meet the Southwest Partnership guidelines. This play has been renumbered TB-3 for this study and is included in the current study.

The Jurassic Twin Creek Limestone play (TB-1) includes five reservoirs that produce from thrusted anticlinal carbonate reservoirs in the thrust belt of northeastern Utah. All of these reservoirs comprise small sinks, and none of the five fields in this play are among the ten largest CO_2 sinks in Utah.

The next older Nugget Sandstone play (TB-2) is primarily gas prone, and produces from eolian sandstone reservoirs in thrusted anticlinal traps from four fields in this play. Two fields, Lodgepole and Pineview, produce from both the Twin Creek and Nugget plays. At the Anschutz Ranch East field, the Nugget (UT-00505A) reservoir is included among the top ten largest CO_2 sinks in Utah at 96.7 mmt. The Anschutz Ranch East field was discovered in 1979, and covers between 1,900 and 5,000 acres.

The oldest reservoir in the Northern Thrust Belt is the Phosphoria Formation (TB-3), which produces mainly gas from interbedded shallow water clastics, carbonates, and phosphorites. The sour gas in this reservoir is trapped in thrusted anticlinal structures, and has been productive from only the Cave Creek field (UT-00515B) of the Northern Thrust Belt. The Jurassic Twin Creek play (TB-1) has the most qualifying reservoirs, and the greatest capacity is in the Jurassic Nugget Sandstone play (TB-2). The Phosphoria and Twin Creek plays are both productive at Cave Creek field, while the Nugget and Twin Creek plays are productive at Lodgepole and Pineview fields. The Nugget play is productive by itself at Anschutz Ranch East and Pineview North fields, and the Twin Creek play is productive by itself in Anschutz Ranch and Elkhorn fields.

The reservoirs of the Northern Thrust Belt have the deepest average and minimum depths of all the Utah basins, and also the highest reservoir temperatures. Since the Northern Thrust Belt plays occur mostly in the same area and are generally superimposed on each other, when arranged numerically by play code they deepen progressively downward in a systematic trend. This super-position of younger over older reservoirs provides additional injection opportunities in the same injector well or up-section leak-protection for deeper reservoir targets in the Northern Thrust Belt.

The Southwest Partnership has not selected a field from the Northern Thrust Belt for a Phase 2 sequestration demonstration project. However, the Partnership's database contains the same kinds of information on Northern Thrust Belt reservoirs that it does for the other Utah basin reservoirs. Thus, searches for and analyses of Northern Thrust Belt reservoirs will be similar to those of the Red Wash Green River reservoir from the Uinta Basin that were discussed above.

Data Sources

The following major sources of data were used to obtain the detailed information on the Northern Thrust Belt oil and gas reservoirs in the Southwest Partnership's Database:

- Utah Geological Association Publication 22, Oil and Gas fields of Utah (Hill, B. G., and Bereskin, S. R., editors, 1993, 1996);
- Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A., editor, 1993);
- Oil and Gas Fields Map of Utah (Chidsey and others, 2005);

- 1995 National Assessment of United States Oil and Gas Resources (Gautier, D. L. et al., DDS-30, 1996; Beeman, W. R. et al., DDS-35, 1996: Charpentier, R. R. et al., DDS-36, 1996);
- U. S. Department of Energy GASIS – Gas Information System release 2 (NETL version, 1999), CD or at Web site: www.netl.doe.gov/scng
- State of Utah Department of Natural Resources, Division of Oil, Gas and Mining completion files, Division Orders and well data Web site (http://www.ogm.utah.gov/oilgas/DATA_SEARCH/well_data_search.htm); and
- The well and reservoir data housed at the Utah Geological Survey's Petroleum Section in Salt Lake City, UT.

The Green River Basin

The Green River Basin of northeastern Utah is part of a larger, petroleum basin that extends into southwestern Wyoming (Figure 25). The Green River Basin is a very small producing area in Utah, accounting for less than 1% of the total Utah oil and gas production in 2004 (DOGM, 2005). It is primarily a gas-producing region, like the Uinta Basin. The Green River Basin also produces primarily from Cretaceous clastic rocks like the Uinta Basin.

Doelger et al. (1993b and c) developed two plays found in the Utah portion of the Green River Basin, an Upper Cretaceous play and a Lower Cretaceous play, as part of the Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, 1993). The Upper Cretaceous play (GB-1 in this study) covers the Frontier Formation reservoir, while the Lower Cretaceous play (GB-2 in this study) covers the Dakota Sandstone reservoir of the Green River Basin. The Frontier Formation play contains one reservoir in the Utah portion of the Green River Basin that met the production cutoffs. The Dakota Sandstone play contains two reservoirs that had production sufficiently large to meet the Southwest Partnership guidelines. This play has been renumbered TB-3 for this study and is included in the current study.

The Frontier Formation play (GB-1) includes one reservoir that produces from fluvial and near-shore marine sandstone reservoirs in anticlinal traps to the north of the Uinta Mountains in Utah. This play contains one small sink, and is not among the ten largest CO_2 sinks in Utah.

The older Dakota Sandstone play (GB-2) is primarily gas prone, and produces from near-shore deltaic sandstone reservoirs in anticlinal traps from two fields in this play. Again, these reservoirs are small sinks, and are not among the ten largest CO_2 sinks in Utah. The largest number of qualifying reservoirs (2) occurs in the Dakota Sandstone play, which also has the greatest sequestration capacity in this basin.

The reservoirs of the Green River Basin have the second deepest average reservoir depth among all the Utah basins, and have the highest average reservoir pressure. Since the Green River Basin plays occur mostly in the same area and are generally superimposed on each other, when arranged numerically by play code they deepen progressively downward in a systematic trend. This super-position of younger over older reservoirs provides additional injection opportunities in the same injector well or up-section leak-protection for deeper reservoir targets in the Green River Basin.

The Southwest Partnership has not selected a field from the Green River Basin for a Phase 2 sequestration demonstration project. However, the Partnership's database contains the same kinds of information on Green River Basin reservoirs that it does for the other Utah basin reservoirs. Thus, searches for and analyses of Green River Basin reservoirs will be similar to those of the Red Wash Green River reservoir from the Uinta Basin that were discussed above.

Data Sources

The following major sources of data were used to obtain the detailed information on the Green River Basin oil and gas reservoirs in the Southwest Partnership's Database:

- Utah Geological Association Publication 22, Oil and Gas fields of Utah (Hill, B. G., and Bereskin, S. R., editors, 1993, 1996);
- Atlas of Major Rocky Mountain Gas Reservoirs (Hjellming, C. A., editor, 1993);
- Oil and Gas Fields Map of Utah (Chidsey and others, 2005);
- 1995 National Assessment of United States Oil and Gas Resources (Gautier, D. L. et al., DDS-30, 1996; Beeman, W. R. et al., DDS-35, 1996: Charpentier, R. R. et al., DDS-36, 1996);
- U. S. Department of Energy GASIS – Gas Information System release 2 (NETL version, 1999), CD or at Web site: www.netl.doe.gov/scng
- State of Utah Department of Natural Resources, Division of Oil, Gas and Mining completion files, Division Orders and well data Web site (http://www.ogm.utah.gov/oilgas/DATA_SEARCH/well_data_search.htm); and
- The well and reservoir data housed at the Utah Geological Survey's Petroleum Section in Salt Lake City, UT.

Natural CO_2 Accumulations

Chidsey and Morgan (1993) describe seven reservoirs in the Utah portion of the Paradox Basin that produce, or have produced, CO_2-rich (greater than 57 mol%) gas from naturally occurring sources. Three of these reservoirs are older Mississippian and Devonian units that occur below the currently producing Pennsylvanian reservoirs the Bluff, Boundary Butte, and Desert Creek fields. The presence of these deeper naturally occurring CO_2 reservoirs indicates there is relatively good integrity to the seals in the Paradox Basin for sequestration or enhanced oil recovery purposes. Chidsey and Morgan (1993) also discuss the Farnham Dome field, in central Utah near the southwestern margin of the Uinta Basin, which contains substantial resources of CO_2-rich gas (greater than 97 mol %) in the eolian Jurassic Navajo Sandstone. This field, which produced CO_2 from 1931 through 1979 according to Chidsey and Morgan (1991), is located within 50 miles of some of the major oil-producing fields in the southwestern Uinta Basin Green River reservoir play.

Data Sources

The following major sources of data were used to obtain the information on the naturally occurring CO_2:

- Moore and Sigler's (1987) compilation of analyses of natural gas for the U.S. Bureau of Mines;
- Morgan and Chidsey's (1991) paper on Farnham Dome field in the Utah Geological Association's Guidebook 19 on the Geology of east-central Utah; and
- Chidsey and Morgan's (1993) paper on low-Btu gas in Utah.

Coalbed Methane Sinks

The total CO_2 sequestration capacity for coal-bed-methane sinks in Utah was estimated by Reeves (2003) to be about 1.9 billion tonnes, with all of that capacity residing in the Uinta Basin. Subsequent more detailed work in Utah for this study using a sequestration calculator developed for the Southwest Partnership by Advanced Resources International (Reeves, unpublished data) found that Utah coal-bed-gas reservoirs in the Uinta Basin could more conservatively sequester 0.9 billion tonnes of CO_2. The coal-bed-gas reservoirs are found in the Upper Cretaceous Ferron Sandstone Member of the Mancos Shale, the Blackhawk Formation, and the Neslen Formation in the Uinta Basin.

No CO_2-enhanced coal-bed-methane production has occurred in Utah. The closest such project is Burlington Resources' Allison Unit test near the New Mexico-Colorado border, where more than 100,000 tons of CO_2 were injected into the Upper Cretaceous Fruitland Formation over a three-year period to enhance production of coal-bed methane (Reeves, 2002). Four injector wells were used to sequester CO_2 in the coal at depths in excess of 3,000 ft. Critical factors controlling sequestration in coal beds include coal bed continuity, cleat permeability, coal shrinkage/swelling, gas adsorption/desorption capacity, and seal integrity.

The Uinta Basin is not one of the top ranked basins in the United States for CO_2 coal-bed sequestration. However, factors favoring sequestration of CO_2 in Utah coal beds are: 1) advantageous geology including coal beds with high methane contents; 2) abundant anthropogenic CO_2 from nearby power plants; 3) well developed natural gas and CO_2 pipeline systems; 4) potentially low capital and operating costs; and 4) local companies with coal-bed methane (CBM) experience. Selection of a potential coal-bed methane CO_2 sequestration site in the Uinta Basin requires more detailed reservoir studies of local operations than those that are available in the literature because: 1) the coal seams on a regional scale are lenticular discontinuous and 2) all coal-bed methane production from the Uinta Basin is now reported by well, which provides little information about the characteristics of the various individual coal-bed reservoirs.

The Southwest Partnership's Phase I ranked sequestration opportunities based on proximity to sources and/or pipeline infrastructure, as well as economic, safety, and risk mitigation potential. The result of the Phase I ranking process resulted in the selection of three geologic pilot tests within the Southwest Partnership that are located on the CO_2 pipeline infrastructure. No Utah site was selected as an enhanced coal-bed-methane test; such a site was selected in the San Juan Basin with Burlington Resources as the operator (see New Mexico section for detailed discussion).

- An Assessment of CO_2 Sequestration and ECBM Potential of U.S. Coalbeds (Reeves, 2003).

Deep Saline Aquifers

The total maximum CO_2 sequestration capacity for the five aquifers listed on Table 27 is conservatively estimated to be about 587 mmt, enough capacity to store more than 28 years of the annual 2002 CO_2 emissions from all of Utah's power plants. An 8-inch pipeline from McElmo Dome in southwest Colorado crosses only one of the deep saline aquifers, the Paradox Formation aquifer in the Paradox Basin of southeast Utah. None of the other four deep saline aquifers in Utah is served by an existing CO_2 pipeline, however the Uinta Basin deep saline aquifers are situated near existing power plants making access to these sinks cost effective should the pipelines ever transport anthropogenic CO_2 (Figure 25).

In order to qualify as a deep saline aquifer, a saline-water-bearing rock-unit had to be at least 3,000 ft deep. The aquifer also had to contain water with a total dissolved solids (TDS) concentration of at least 10,000 ppm since state laws generally protect groundwater with salinity less than 10,000 ppm.

Over 90% of the 587 million tons of sequestration capacity in deep saline aquifers in Utah is in the four deep saline aquifers in the Uinta Basin. The remaining 8% is in the one aquifer in the Paradox Basin. All five of the formations produce hydrocarbons in Utah and analyses of the water produced with the hydrocarbons were the source of available water chemistry data. This means that there is a considerable amount of well data available at least in the vicinity of the producing traps. In fact, petroleum play information was used to estimate the area underlain by each Utah aquifer sink. All of the five deep-saline-aquifer formations are important hydrocarbon-producers in Utah Mexico, setting up the possibility of CO_2 sequestration along with enhanced hydrocarbon recovery.

The capacity estimate for each sink is conservative estimate because it is based on a minimum thickness for the aquifer, a minimum area, and reservoir conditions noted for the associated petroleum reservoirs. Nonetheless, the total estimated sequestration capacity of saline aquifers in Utah provides a significant additional CO_2 sequestration capacity that is about the same order of magnitude for the total capacity for oil and gas reservoirs (Table 27).

Sequestration capacity in Utah was estimated using the MIDCARB calculator (Kansas Geological Survey, 2004) to compute the solubility of CO_2 in the brine at reservoir pressure and temperature, and the capacities shown in Table 27 rely on this method. This method assumed that the CO_2 would dissolve completely in the saline water. Another method, not calculated for Utah's aquifers, assumed that the CO_2 would displace completely the saline water; this second method could be calculated using the Partnership's interactive capacity calculator to compute the density of carbon dioxide at reservoir pressure and temperature (Zhang et al., 2003). The MIDCARB-based capacities are smaller than the capacities that could be estimated from the Partnership's interactive capacity calculator, which yields capacity estimates about an order of magnitude larger than the MIDCARB calculator (Kansas Geological Survey, 2004). Even so, the solubility estimate is about the same order of magnitude as the total capacity for either the oil and gas reservoirs or the coal-bed-methane sinks, several hundred million metric tons. However, the areas underlain by deep saline aquifers are typically not as well characterized geologically as the full areas of oil and gas pools and coal-bed-methane sinks. Much of the data used to characterize the deep saline aquifers comes from a fraction of the oil and gas wells in the two basins.

The average thickness of the five Utah aquifers ranges from 25 to 70 feet as reported by the USGS in its Produced Waters Database (Breit, 2002), and this thickness may not reflect the total thickness of the potentially porous and permeable intervals in the formations. The area of each saline aquifer is generally between the 3,000 ft and 10,000 ft depth contours, although the Dakota aquifer capacity was calculated to a depth of 20,000 ft. Those contours were determined from the well data in the U.S. Geological Survey's Produced Waters Database (Breit, 2002) or the USGS National Assessment of Oil and Gas projects (Beeman et al., 1996; Charpentier et al., 1996; Gautier et al., 1996; and USGS Uinta-Piceance assessment team, 2003)

Reservoir pressure for each aquifer was estimated for the top of each aquifer, assuming that normal hydrostatic conditions existed in both basins. Reservoir pressures were estimated to be 1,410 psi at 3,000 ft and 4,665 psi at 10,000 ft. Reservoir temperature data was gleaned from the bottom hole temperature data collected for the oil and gas reservoirs in the same formations in the Partnership's database. Average reservoir temperatures were estimated to range from be 123° to 180°F in the Uinta Basin and averaged 125°F in the Paradox Basin. Porosity data are averages from the Partnership's oil and gas database showed the five aquifers ranged from 6 to 12% porosity. Salinity data are averages from the U.S. Geological Survey's Produced Waters Database (Breit, 2002).

Uinta Basin

The four deep saline aquifers in the Uinta Basin have a combined estimated CO_2 sequestration capacity of about 537 mmt, over 90% of the estimated deep-saline-aquifer capacity in Utah (Table 27). The Green River, Wasatch, Mesaverde, and Dakota formation aquifers have estimated capacities between 16 and 312 mmt. All four formations produce hydrocarbons in the basin and the first two are Tertiary in age, while the second two are Mesozoic in age. They will be discussed in descending stratigraphic order, youngest to oldest, beginning with the Green River Formation.

The Green River Formation has an estimated sequestration capacity of 128.2 mmt. This formation consists marginal to open lacustrine sediments deposited in the center of a paleo-lake basin, and it overlies, and intertongues with the upper part of the fluvial to alluvial fan deposits of the Wasatch/Colton Formations that were deposited farther from the lake. Within the Uinta Basin, the total Green River Formation ranges in thickness from 2,000 to 6,000 feet, while the porous saline aquifer was estimated to comprise an interval only 25 feet thick because of the overall fine grained nature of the unit. While the Green River is thickest in the center of the basin, the best aquifer is likely to occur closer to the margins of the basin where there was a greater amount of coarser clastic deposition. The aquifer was estimated to lie between 3,000 and 8,500 feet deep, contain 12% porosity, and could potentially sequester 128.2 MMt of carbon dioxide.

The Wasatch (Colton) Formation was deposited as alluvial fans around the margins of paleo-Lake Uinta. This unit is up to 3,000 feet thick near the margin of the basin and thins to 300 feet thick, or less, near the center of the basin. The average thickness of the saline aquifer within this unit was estimated at 40 feet. The Wasatch aquifer was estimated to exist at depths from 3,000 to 11,000 feet, have an average porosity of 6%, an average salinity of 10,000 TDS, and could potentially sequester 16.4 mmt of CO_2.

The sequestration capacity of a 70-foot-thick Mesaverde Formation aquifer was estimated at 80.5 mmt. It was calculated for a unit at depths from 5,000 to 11,500 feet, containing 8% porosity, an average salinity of 30,000 TDS, and an average temperature of 180°F.
The Mesaverde Formation consist of non-marine shoreline, coastal plain, and palludal deposits

ranging in thickness from 3,000 to 1,200 feet that tend to thin to the east across the Uinta Basin. It consists of the following three formations listed in descending stratigraphic order: Price River Formation (equivalent to the Farrer and Neslen Formations and Sego Sandstone of the eastern Uinta Basin), Castlegate Sandstone, and Blackhawk Formation. The majority of the hydrocarbon and water production in the Uinta Basin comes from the Price River Formation and equivalent units.

The Upper Cretaceous Dakota Sandstone aquifer includes the Cedar Mountain Formation, and they have a combined estimated maximum sequestration capacity of 311.8 mmt. These units are generally non-marine to marginally marine sandstone that ranges from 200 to 500 feet thick, occur at depths from 3,000 to 20,000 feet, have an average temperature of 123° F, and have an average porosity of 12%. The 40-foot-thick Dakota aquifer unit is sealed by several thousand feet of the overlying Mancos Shale.

Paradox Basin

The single deep saline aquifers in the Paradox Basin has a total maximum estimated CO_2 sequestration capacity of 49.6 mmt (Table 27), less than 10% of the estimated deep-saline-aquifer capacity in Utah. The Pennsylvanian Paradox Formation has the highest average total dissolved solids (TDS) content of all the aquifers in Utah at 100,000 TDS. This is no doubt a fact because this unit consists of interbedded evaporites, black shale, and carbonates mounds formed in a shallow sea. The total thickness of the Paradox Formation ranges from 500 to 3,500 feet thick, and it generally thickens to the north in the Paradox Basin. The 30-foot-thick deep saline aquifer is confined to the Ismay and Desert Creek carbonate zones of the Paradox Formation, and is likely to be somewhat discontinuous. The aquifer occurs at depths from 4,000 to 6,500 feet, has an average temperature of 125°F, and has an average porosity of 12%.

Data Sources

Publicly available information on the five deep saline aquifers in Utah came from a variety of sources:

- The USGS's Produced Waters database;
- The Texas Bureau of Economic Geology's study of sequestration in brine (Hovorka et al., 2003)
- Gwynn's (1992; 1995; 1996) studies of the oil-well saline waters of the Utah; and
- Statistics compiled in the Partnership's oil and gas database.

Lessons Learned

The data used for this report took more than one person-year to compile, with most of the compilation effort focused on oil and gas reservoirs. Data were entered into a Partnership modified GASIS (U.S. Department of Energy, 1999) database, which contained 321 data fields for each site. Not all of these data fields pertained to every reservoir/sink type.

The GASIS database was originally designed for gas reservoirs, not oil. Unfortunately, while information in many of the 321 data fields may be useful in detailed sequestration pilot projects, a more restricted data set turned out to be all that was necessary for the purposes of regional characterization of oil and gas reservoir's CO_2 sequestration potential. The Southwest Partnership eventually selected 50 of the 321 data fields that were found to be most important to a regional screening effort for its online, interactive database. Not every pool has a complete set of data because certain information was not always available in the published literature.

However, the Partnership's oil and gas database, coupled with its GIS database, provide the only publicly available, digital source of key regional information on the 90 largest producing oil and gas reservoirs in Utah. As such, the Partnership's complete database could be invaluable resources for the oil and gas industry or for subsurface work associated with pilot project modeling and academic research.

The Partnership members learned from Phase 1 that the more comprehensive data set thought to be necessary for sequestration modeling turned out to be more data than was necessary for a regional screening effort to select Phase 2 pilot sequestration project sites. Extensive detailed reservoir data is only required to model and design site-specific sequestration projects, and the expanded Partnership database will be useful for the few pilot project selected from the region.

Terrestrial Sinks

Terrestrial carbon sequestration is an important component of a comprehensive greenhouse gas (GHG) management strategy in the southwest. The ability to transfer and store atmospheric C in soils and vegetation by manipulating the rate and magnitude of naturally occurring processes, such as photosynthesis, humification and aggregation by changing land management is an attractive alternative to reduce GHG levels because 1) results can be achieved quickly 2) technologies for enhanced sequestration can be implemented without major economic impact and are generally associated with improved management of resources and more efficient production systems and 3) delivery infrastructure (land management programs in extension and federal agencies) is in place, proven and relatively well-funded. However, the design and implementation of policies and programs to accelerate and realize the potential of terrestrial sequestration requires analyses that examine regional land use patterns, human activity systems and economic development objectives and how they affect ecological processes.

Within the Southwest Regional Partnership area, the range in ownership and land management patterns require that outreach and education activities must be broad-based, flexible and integrated with a wide variety of federal, state and local programs. Land cover varies considerably within the partnership region, ranging from deciduous forests at the easternmost extreme to desert shrublands in the lower elevation west and coniferous forests in higher elevations. Each soil/vegetation/land management combination has a unique potential to capture and store carbon that can only be assessed within an economic and social, as well as biophysical context.

The complex combination of land use, land management and natural conditions in the Southwest Regional Partnership area offers an opportunity to examine policy, program and operational alternatives to optimize terrestrial sequestration against a background of competing land use objectives. Meeting the challenge of integrating sequestration as another land management objective into agriculture and forestry production systems will require an analytical approach that draws upon existing expertise and information as well as a combination of analytical tools.

Methods

The Southwest Regional Partnership encompasses the states of Arizona, Colorado, Oklahoma, New Mexico, Utah, and portions of Kansas, Nebraska, Texas, and Wyoming (Fig. 26). To assess the regional sequestration potential of land areas within the partnership, a framework was developed that had two distinct phases (Fig. 27). The first phase involved the use of climate, soil, land tenure, land cover, and major land resource area spatial coverages that could be incorporated into a geographic information system (GIS) in order to define areas having greatest potential for implementing carbon sequestration programs in the region. Once these areas were identified, a second phase was initiated that used the COMET VR model to assess the amount of carbon that would be sequestered under land management and conservation programs available for the region (Fig. 27).

GIS Phase

For these analyses, the various data layers were acquired from online data sources and the datasets were classified into categories of potential to allow for spatial indexing. The data layers acquired included: 1) long-term precipitation, 2) land tenure; 3) soils, 4) land Cover, 5) major land resource areas, and 5) administrative boundaries. Long-term precipitation was used to define climatic potential and was defined as precipitation amounts that would be of sufficient quantity to allow for suitable plant growth or success in revegetation. To assess climate potential, the long term average precipitation (1971-2000; Spatial Climate Analysis Service, Oregon State University, http://www.ocs.oregonstate.edu/prism/) was classified as follows: No Potential (0 to13 cm), Low Potential (13 to 23 cm), Moderate Potential (23 to 46 cm) and High Potential (>46 cm) (Fig. 28).

Land tenure was used to delineate private/non-federal, federal, and Indian reservation lands (Fig. 29). This spatial coverage was acquired from the national atlas website (www.nationalatlas.gov). This allowed separation of land areas where carbon sequestration programs could be targeted for private/non-federal land and Indian reservations, since incentive programs will not be implemented on Federal Lands.

Soils data were classified based on three characteristics that influence soil carbon. These were Soil Organic Carbon (SOC), Calcium Carbonate ($CaCO_3$), and the Wind Erodibility Index (WEI). The data layers used were acquired from the Natural Resources Conservation Services (NRCS) Soil Survey Geographic (SSURGO) and State Soil Geographic (STATSGO) soil databases. The SSURGO data (higher resolution) were used where available. STATSGO was used to fill in areas not covered by SSURGO. SOC was classified for indexing as follows: Low (0 to 0.75%), Moderate (0.75 to 1.75%), High (1.76 to 10%) and Very High (>10%) (Fig. 30). CaCO3 content was classified as follows: Low (0 to 15%), Moderate (15 to 30%) and High (>30%) (Fig. 31). The WEI was indexed as follows: Low (0 to 100 t/ha/yr), Moderate (100 to 200 t/ha/yr) and High (> 200 t/ha/yr) (Fig. 32).

The climate, land tenure, and soil data layers were intersected in the GIS to create a coverage that would allow spatial queries based on these attributes. Boundaries of interest—major land resource areas (MLRA), and counties—were also included in the GIS to allow aggregation. We identified sites where management could reliably increase soil carbon by first identifying locations with high or moderate baseline levels and then focusing on sites that have lost, through tillage practices or land conversion, a portion of that carbon. It is unlikely that we can increase soil carbon beyond that identified by soil and climate limitations, but changes in land use or management can restore soil carbon to baseline levels. The land areas identified through this query were designated as target areas for carbon sequestration programs/interventions (Fig. 33). These target areas were then cross indexed with the National Land Cover Data (NLCD, http://landcover.usgs.gov) to determine land cover. NLCD is a 21-class land cover classification scheme applied consistently over the US. The data were reclassified into four major classes to reflect land cover types where government programs could be implemented: Grazinglands, Row Crops, Small Grains, and Forests. Spatial queries were then conducted to acquire the data needed by the COMET-VR model. These included acreages of each land cover category, soil textures, county, and MLRA.

COMET VR Phase

COMET-VR, an on-line interface to the Century model, was used to assess baseline carbon and management induced carbon changes in areas identified as having high to moderate potential for carbon sequestration. The COMET-VR interface allows a user to select a location (state and county), soil texture, landuse history, and a proposed 10-year future management alternative. Based on these choices, COMET-VR accesses information on climate and landuse from database sources and runs the Century model. The results are calculated and presented as ten year annual averages of soil carbon sequestration or emissions with associated statistical uncertainty values.

Areas identified during the GIS Phase that had sufficient acreage in either grazinglands, small grains, or row crops were modeled. For grazinglands, three practices were compared: continuous grazing (heavy or moderate), seasonal reduced grazing, and CRP (Conservation Reserve Program; a cropland retirement program)-grass-legume mixture (no grazing). For row crops and small grains five practices were compared: intensive tillage, reduced tillage, no-till tillage, CRP-100% grass, and CRP-grass-legume mixture. Weighted averages for carbon capture were calculated for each MLRA in order to identify MLRAs with higher sequestration potentials that could be targeted for government incentive programs.

Results

The results will be presented on a state by state basis and are aggregations of Major Land Resource Area (MLRA) and County level information. MLRAs are geographic associations of land based on climate, topography, land use, water, soils and potential natural vegetation (http://soils.usda.gov/survey/geography/mlra/mlra_definitions.html).
Because of the unique nature of many land management decisions and their interactions with government programs, activities at the county level may restrict the amount of incentive funding that can be used influence land owners decisions. Whenever county level limits on land use change or management are important in determining the potential for state level carbon sequestration activities, it will be noted.

Arizona
There were 2, 197, 869 hectares subjected to analysis for the potential to increase carbon storage. No county level constraints on land use change under federal programs were identified, so results will be presented at the MLRA level. The spatial distribution of MLRA is shown in Fig. 34.

MLRA 30, Sonoran Basin and Range (15559 ha)
The primary limitation on the potential to sequester carbon in this area is low rainfall. The dominant land use is livestock grazing at light stocking rates, and maintaining that land use will result in stable carbon fluxes within the area. Improving species composition and net primary productivity by adding legumes to existing rangeland offers the potential to increase soil carbon storage by about 0.10 T C/ha/y over a 10 year period. However, the uncertainty associated with the model applications of this land management practice is extremely high.

MLRA 35, Colorado and Green River Plateaus (965, 035 ha)
Adding a legume to existing rangeland has the potential to increase carbon storage from 0.10 to 0.25 T C/ha/y. Sandy loam soils were identified as the soils with highest potential (0.17 to 0.25) while heavier textured soils (clays) were typically below 0.10 T C/ha/y. Silty soils and clay loam soils were intermediate.

MLRA 36, New Mexico and Arizona Plateaus and Mesas (21, 093 ha)
Legume addition to existing rangelands can increase carbon storage between 0.15 and 0.24 T C/ha/y depending on soil texture. Sandy loam soils have greater potential than heavier textured clay soils. The uncertainty associated with these potential gains is extremely high.

MLRA 38, Arizona Interior Chaparral (356, 987 ha)

Legume addition to existing rangeland has the potential to increase carbon storage between 0.10 and 0.65 T C/ha/y depending on soil texture. The range in potential is similar to other MLRAs (sandy loam>loam>clay>silt). The uncertainty associated with these estimates is extremely high.

MLRA 39, Arizona and New Mexico Mountains (171, 151 ha)
Legume addition to existing good condition or degraded rangeland should increase carbon storage from 0.13 to 0.64 T C/ha/y depending on soil texture (clay loam>loam>sandy loam). However, the uncertainty associated with model outputs for this practice in these areas is extremely high.

MLRA 40, Central Arizona Basin and Range (105, 417 ha)
Potential for increased carbon sequestration in soils ranged from negligible on arid loam soils to 0.60 T C/ha/y on sandy loam soils in more mesic areas. These areas are spatially limited in extent (< 9000 ha). The model results were associated with very high uncertainty.

MLRA 41 Southeastern Arizona Basin and Range (521, 091 ha)
Adding a legume to heavily and moderately grazed rangeland would result in an increase in soil carbon storage of up to 0.34 T C/ha/y in loamy textured soils in the wetter portions this area (Cochise and Graham Counties). Again, model results had a high level of uncertainty associated with this practice.

There are very limited possibilities for increasing carbon sequestration in Arizona soils. This analysis identified only those rangelands having a favorable climate, soils and land use change, yet the vast majority of these areas were estimated to have the potential to sequester less than 0.10 T C/ha/y. Although there were some areas with relatively fertile soils and favorable rainfall, the practices required to achieve these estimates are unreliable and not yet proven. In addition, the uncertainty associated with the model estimates that exceeded 0.2 T C/ha/y were very high.

Colorado
There were 3, 871, 478 ha subjected to the analysis described in the methods to identify areas with high potential for carbon sequestration. The results are reported by MLRA (Fig. 35).

MLRA 34 Central Desertic Basins, Mountains and Plateaus (152, 250 ha)
In general, the potential for sequestration is low throughout MLRA 34. Loamy soils in Rio Blanco and Moffat counties (108, 513 ha) have potential to sequester between 0.16 and 0.48 T C/ha/y when legumes are added to existing grazed rangelands.

MLRA 39 Arizona and New Mexico Mountains (15, 748 ha)
Sequestration potential is limited in this MLRA. Addition of legumes to existing rangelands has the potential to increase soil carbon storage 0.29 T C/ha/y on loam soils.

MLRA 48A Southern Rocky Mountains (498, 927 ha)
Rangelands on loam soils in San Miguel (23, 127 ha) and Rio Blanco (11, 112 ha) counties have the potential to increase carbon storage by 0.16 to 0.24 T C/ha/y with the addition of legumes to

existing grazed rangelands. However, the uncertainty associated with these estimates is extremely high.

MLRA 48B Southern Rocky Mountain Parks (225, 868 ha)
Sequestration potential is very limited in this MLRA, typically less than 0.10 T C/ha/y. Sandy loam soils with rangeland cover in Jackson county (23843 ha) can increase carbon storage by up to 0.24 T C/ha/y with the addition of legumes to existing plant communities. This estimate of sequestration potential is highly uncertain.

MLRA 49 Southern Rocky Mountain Foothills (629, 804 ha)
There is substantial potential to increase soil carbon sequestration in MLRA 49, primarily due to the large proportion of the area in small grains. Converting small grain to perennial vegetative cover in Weld (7599 ha) and Elbert (4036 ha) counties can increase carbon storage between 1.30 and 1.60 T C/ha/y. Alternatively, adopting no till tillage on those areas currently under conventional tillage could increase soil carbon between 0.23 and 0.66 T C/ha/y. Adopting reduced tillage would have little impact on soil carbon levels. The uncertainty associated with these estimates is relatively low (<15%). Adding legumes to currently grazed rangelands has the potential to increase soil carbon on much of the area in this MLRA by up to 0.25 T C/ha/y, but the uncertainty is extremely high.

MLRA 51 High Intermountain Valleys (32, 633 ha)
The potential for carbon sequestration is very limited in this MLRA, primarily due to the high elevation and short growing season. Addition of legumes to rangelands with loam soils could increase soil carbon levels by up to 0.14 T C/ha/y, but uncertainty is extremely high.

MLRA 67 Central High Plains (1, 568, 188 ha)
The 437, 110 ha of small grains in the area offer substantial opportunity to increase carbon storage. Converting cropland to perennial cover (including legumes) in this area will increase soil carbon storage an average of 1.3 T C/ha/y. Converting to perennial grass cover without a legume would increase soil carbon uptake an average of 0.6 T C/ha/y. The uncertainty associated with this practices on these soils is relatively high, especially on silty and clay soils. Adopting no till tillage on these acres would only slightly increase soil carbon uptake (generally <0.05 T C/ha/y). Adopting reduced tillage would not affect the soil carbon levels in this MLRA. Counties included in this MLRA are Adams, Arapahoe, Baca, Cheyenne, Elber, Kiowa, Kit Carson, Lincoln, Morgan, Prowers, Washington and Weld.

MLRA 69 Upper Arkansas Valley Rolling Plains (125, 887 ha)
Carbon sequestration potential is very limited in this area because of low annual precipitation. The greatest opportunity is in converting small grains in Lincoln County (1660 ha) to perennial cover with legumes (1.3 T C/ha/y). Adopting no till tillage gains very little increase in carbon storage (<0.05 T C/ha/y)

MLRA 70 Pecos Canadian Plains and Valleys (19, 562 ha)
This is a relatively small area entirely within Las Animas county. Potential to increase carbon storage is limited by low annual precipitation and current land use patterns (current use is rangeland).

MLRA 72 Central High Tableland (659, 581 ha)
Converting small grain croplands to perennial vegetation cover with legumes offers the greatest potential to increase carbon storage in this area (1.1 to 1.35 T C/ha/y). There are currently 248, 149 ha of small grain cropland in Cheyenne, Kiowa, Kit Carson, Logan, Phillips, Sedgewick, Washington and Yuma counties included in this MLRA. Adopting no till tillage offers only slight potential (<0.05 T C/ha/y). Adding legumes to existing rangelands (328, 806 ha) can increase soil carbon storage an average of 0.03 T C/ha/y, but the uncertainty is extremely high.

Many Colorado counties are near or fully subscribed under existing USDA land conversion programs (Conservation Reserve Program). In the program regulations, 25% of existing cropland enrolled in CRP was established as an upper limit. Realizing the potential carbon sequestration associated with cropland conversion to perennial cover in counties that are currently over the limit would require a change in program rules. Those counties are: Baca, Bent, Cheyenne, Crowley, Dolores, Kiowa, Las Animas, Lincoln, Moffat, Morgan, Prowers, Pueblo, Washington and Weld.

Kansas
The procedure described in the Methods section identified 9, 922, 433 ha as having high potential for carbon sequestration in Kansas. The results are reported by MLRA (Fig. 36).

MRLA 72 Central High Tableland (7, 422, 668 ha)
Throughout this MLRA, there is substantial potential for increasing soil carbon by converting small grain cropland (2, 913, 518 ha; 1.1 to 1.3 T C/ha/y), continuous cotton cropland (128, 897 ha; 0.9 to 1.1 T C/ha/y) and irrigated corn cropland (1,318,874 ha; 0.9 to 1.1 T C/ha/y) to perennial grass cover with a legume. Converting these areas to perennial grass cover without a legume reduces the potential per ha by approximately one-half. The uncertainty associated with these practices is relatively low (<15%). Adopting either no till or reduced till tillage offers minimal opportunity to sequester increased amounts of carbon (<0.05 T C/ha/y).

The remaining area of grazing land (3.06 m ha) can increase carbon uptake an average of approximately 0.20 T C/ha/y with the addition of legumes to existing grazing lands. However, the uncertainty associated with this practice is very high.

MLRA 73 Rolling Plains and Breaks (1,726,252 ha)
Converting small grain cropland (679, 744 ha) to perennial cover with legumes has the potential to increase soil carbon storage from 1.1 T C/ha/y (wheat:milo rotation) to 1.4 T C/ha/y (wheat:fallow rotation). Converting these areas to perennial grass cover without legumes will reduce the potential by approximately one-half. Converting irrigated corn cropland (284, 990 ha) to perennial vegetation cover has the potential to increase soil carbon by an average of 1.1 T C/ha/y throughout the region. Adopting no till tillage on this corn cropland could increase the soil carbon storage an average of 0.45 T C/ha/y. There is little advantage to adopting reduced tillage on irrigated corn cropland. Similarly, adopting no till or reduced till tillage on small grain offers little potential to increase soil carbon.

Adding legumes to existing rangelands has the potential to increase soil carbon storage an average of 0.15 T C/ha/y, but the uncertainty associated with this practice is very high.

Improved management of grazing on existing rangelands also offered very little potential to increase soil carbon (<0.05 T C/ha/y).

MLRA 77 Southern High Plains (249, 689 ha)
Converting winter wheat:milo rotations (90,504 ha) to perennial vegetation with legumes has the potential to increase soil carbon an average of 1.0 T C/ha/y. Adopting no till tillage on these lands will increase soil carbon by 0.13 T C/ha/y. Reduced till tillage will not increase soil carbon significantly. Converting continuous cotton cropland (33, 645 ha) to perennial vegetation with legumes has the potential to increase soil carbon by an average of 1.0 T C/ha/y. Adopting no till tillage on these lands offer little improvement to soil carbon levels.

Changes to species composition (adding legumes) on rangelands (125, 240 ha) offer limited potential to increase soil carbon (<0.15 T C/ha/y), although the uncertainty associated with this practice is very high. There is little potential to increase soil carbon by improving grazing management.

MLRA 78 Central Rolling Red Plains (459, 764 ha)
Converting small grain cropland (118, 543 ha; wheat:milo rotation) to perennial vegetation cover with legumes in this area has the potential to increase soil carbon by an average of 1.1 T C/ha/y. Conversion to perennial vegetation without legumes has the potential to increase soil carbon an average of 0.5 T C/ha/y. Adopting no till tillage on these areas will increase soil carbon storage an average of 0.10 T C/ha/y. There is no carbon benefit to adopting reduced till tillage.

Adding legumes to existing rangelands (341, 221 ha) will only slightly increase soil carbon levels (<0.10 T C/ha/y). Improved grazing management offers no opportunity to increase soil carbon levels.

MLRA 79 Great Bend Sand Plains (48172 ha)
This MLRA is dominated by sandy soils under perennial vegetation cover and used primarily for livestock grazing. There is little opportunity to improve soil carbon by altering species composition or managing livestock.

Clark, Comanche, Hamilton, Hodgeman, Kiowa, Morton, Ness, Stanton and Wallace counties are at or near the limit for Conservation Reserve Program participation. All are in MLRA 72.

<u>*Nebraska*</u>
There were 637, 932 ha subjected to analysis in MLRAs 71, 72 and 73 (Fig. 37).

MLRA 71 Central Nebraska Loess Hills (13, 211 ha)
Livestock grazing on native rangeland occupies 8778ha within this area. There is little opportunity to increase soil carbon sequestration through manipulating species composition or managing grazing. The 4433 ha of irrigated corn for silage also have limited potential to increase soil carbon storage (no till tillage < 0.03 T C/ha/y).

MLRA 72 Central High Tableland (532, 948 ha)

Livestock grazing on native rangeland occupies 208, 238 ha in this area and has some opportunities to increase soil carbon storage. The addition of a legume to existing native plant communities can increase sequestration between 0.20 and 0.35 T C/ha/y, but the uncertainty is very high. Improved grazing management offers little opportunity to improve soil carbon.

Row crops on 175, 817 ha offer a wide variety of options and substantial potential to increase soil carbon. Converting to perennial grass cover with or without legume offers the potential to increase soil carbon levels between 1.0 and 1.2 T C/ha/y on sandy, loamy and clay soils. Silty textured soils have slightly less potential (0.5 to 0.6 T C/ha/y). Adopting no till tillage on these lands will increase soil carbon storage between 0.4 and 0.5 T C/ha/y. About 35, 700 ha of this land category are currently in corn silage:alfalfa rotations and would not benefit from reduced tillage practices.

Small grain cropland (148, 893 ha) in this area is typically farmed as a small grain:fallow rotation. Converting these croplands to perennial grass cover could increase soil carbon between 1.3 and 1.5 T C/ha/y if legumes are added. Conversion without legumes would increase soil carbon by about half that amount. There is little soil carbon benefit to adopting any form of reduced tillage in these wheat:fallow rotations.

MLRA 73 Rolling Plains and Breaks (91, 803 ha)
Livestock grazing is the dominant land use in the area and has limited potential to increase soil carbon through species additions or grazing management. Converting row crops (8536 ha) or small grains (2712 ha) to perennial cover could increase soil carbon between 1.0 and 1.4 T C/ha/y.

<u>New Mexico</u>
In New Mexico, 3, 120, 965 ha were subjected to the analysis described in the Methods section. The land was located in MLRAs 36, 39, 70 and 77D (Fig. 38). Curry, Harding, Lee, Quay and Roosevelt counties are near the limit

MLRA 36 New Mexico and Arizona Plateaus and Mesas (182, 799 ha)
Land use in this area is dominated by grazing on native rangeland. The opportunities for increasing soil carbon storage are limited. Adding legumes to existing rangeland plant communities may increase net primary productivity and soil carbon, but uncertainty is extremely high.

MLRA 39 Arizona and New Mexico Mountains (24, 140 ha)
Rangeland grazing is the dominant land use in this area and there is little potential to increase soil carbon because of the low annual precipitation.

MLRA 70 Pecos Canadian Plains and Valleys (2, 250, 308 ha)
Livestock grazing on native rangeland is the dominant land use in this area (2, 238, 157 ha) and there is little potential for increasing soil carbon due to low precipitation. Cropland with row crops, primarily irrigated corn (8677 ha) offers some potential to increase soil carbon by converting to perennial cover, but the majority of this land use is currently in corn:alfalfa rotations and only moderate increases in soil carbon (0.6 T C/ha/y) could be expected from the conversion. In addition, the majority of this land is in Quay county, which is already exceeding

program limits within the Conservation Reserve Program. Adoption of reduced tillage offers little opportunity for increasing soil carbon.
Cropland with dryland small grains (3474 ha) also offers moderate potential to increase soil carbon. Converting to perennial grass cover with a legume would increase soil carbon 1.1 T C/ha/y; without legumes about half that. However, this option is currently limited because all of this land category is within Quay country, which is currently over the program limit for CRP. Because the crop rotation is primarily wheat:fallow, there is little opportunity to increase soil carbon by adoption of no till tillage.

MLRA 77D Southern High Plains (663,718 ha)
Livestock grazing on rangeland is the dominant land use in this MLRA (599, 877 ha). The only land management option that consistently exceeded 0.10 T C/ha/y, although with very high uncertainty, was the addition of legumes to existing rangeland plant communities. Grazing management offered little opportunity to increase soil carbon storage.

Row crops (42, 019 ha) offer some opportunity to increase soil carbon storage, but will require changes in land use that is limited under current federal programs. Irrigated corn:alfalfa rotations (5446 ha) could be converted to perennial grass cover and increase soil carbon between 0.4 and 0.65 T C/ha/y depending on the use of legumes. Dryland cotton makes up the remainder of the row crop category (36, 573 ha). Increasing soil carbon on this land use can be achieved by conversion to perennial grass with or without legume (0.65 vs 0.4 T C/ha/y). The adoption of reduced tillage offers little opportunity to increase soil carbon on row crops in this area.

Small grain cropland (21, 823 ha), either wheat:fallow or wheat:grain sorghum rotations, have substantial potential to increase soil carbon, either through land use change or changes in tillage practices. Converting wheat:fallow rotations (10, 636 ha) to perennial grass cover with legumes could increase soil carbon by 1.1 T C/ha/y. Converting wheat:milo rotations would sequester about half that amount. Adopting no till tillage on wheat:milo rotations could sequester 0.14 T C/ha/y, while no till tillage on wheat:fallow rotations could increase soil carbon by 0.05 T C/ha/y.

A substantial barrier exists to achieving high rates of sequestration in the MLRA. All of the row crop and small grain cropland is located in Lea, Roosevelt and Quay counties. All of these counties are already at or near participation limits in the Conservation Reserve Program. A more effective strategy to reduce emissions might be to increase incentives to keep land with expiring CRP contracts (10 years in length) enrolled in the program. There are currently more than 3500 ha of land enrolled in CRP on which contracts will expire in 2005 or 2006.

Oklahoma
The methodology previously described identified 2, 086, 517 ha in Oklahoma that had high potential for increasing carbon sequestration. This land was located in MLRAs 70, 77, 78 and 80 (Fig. 39).

MLRA 70 (67, 339 ha)
Land use in this area is dominated by livestock grazing on rangeland within Cimarron county. Adding legumes to existing rangeland plant communities has the potential to increase soil carbon between 0.16 and 0.23 T C/ha/y depending on soil texture (loamy sand>sandy loam>loam).

MLRA 77 (796, 597 ha)
In this area, livestock grazing on rangeland dominates land use (540, 140 ha). The only practice identified to consistently increase soil carbon was the addition of legumes to existing rangeland plant communities (0.10 to 0.20 T C/ha/y). However, the uncertainty associated with this practice is extremely high.

Converting row crops, primarily continuous cotton (26, 392 ha), to perennial grass cover with legumes could increase soil carbon storage by 1.0 to 1.2 T C/ha/y. However, all of this land use in this MLRA is within Cimarron county and that county currently exceeds the level of participation allowed for federal program incentives to convert cropland to perennial cover.

There are 231, 920 ha of small grains in this MLRA, dominated primarily by wheat:grain sorghum rotations. Conversion to perennial grass cover with legumes could increase soil carbon by an average of 1.0 T C/ha/y, about half that without legumes. However, the uncertainty associated with these practices is very high. Also, all of these lands are located in Beaver, Cimarron, Ellis, Harmon, Harper and Texas counties, which already exceed program limits for incentives to convert cropland to perennial cover. A more viable option might be the adoption of no till tillage, which could increase soil carbon levels from 0.10 to 0.15 T C/ha/y.

MLRA 80 Central Rolling Red Prairies (54, 545 ha)
There were no options identified to increase soil carbon on rangelands (18914 ha) in this area. The conversion of small grain cropland (35631 ha) to perennial cover could increase soil carbon by 1.1 to 1.2 T C/ha/y with legumes; about half that without legumes. Adopting no till tillage on these lands could increase soil carbon by 0.10 T C/ha/y.

Texas
Within MLRAs 42, 77, 78 and 81 there were 4, 889, 184 ha identified as having high potential for carbon sequestration (Fig. 40).

MLRA 42 Southern Desertic Basin, Plains and Mountains (34, 927 ha)
The dominant land use in this area is livestock grazing on rangeland. The area is entirely within Brewster County. Very low annual precipitation limits the impact of any land use or management change to increase soil carbon levels. There were no practices identified that could consistently increase soil carbon.

MLRA 77 Southern High Plains (2, 840, 164 ha)
A widespread land use in the area is livestock grazing on rangelands (635, 522 ha). Restoring heavily grazed rangelands with grazing management and the addition of legumes could increase soil carbon storage by an average of 0.10 T C/ha/y. However, the uncertainty associated with this practice is very high.

The dominant land use in the area is cropland with row crops, primarily continuous cotton (1, 338, 038 ha). Converting this land to perennial grass cover with legume could increase soil carbon by 1.0 T C/ha/y throughout the area; without legumes, conversion could increase soil carbon by 0.50 to 0.60 T C/ha/y. However, many of the counties in this area currently exceed or are near the program limits for Conservation Reserve Program participation (Armstrong, Briscoe, Deaf Smith, Floyd, Garza, Hockley, Howard, Lamb, Randall, Sherman and Swisher). Together the amount of land in these counties within this analysis total 222, 315 ha. Other counties within the MLRA are not restricted by program limits. Adopting no till tillage offers little opportunity to increase soil carbon (<0.05 T C/ha/y).

Converting small grain cropland (866, 605 ha), primarily wheat:milo rotation, offers substantial opportunity to increase soil carbon. Establishing perennial vegetation with legume can increase soil carbon by an average of 1.0 T C/ha/y; half that without legumes. Again, participation in federal land retirement programs, such as CRP is high in this area and there is limited potential to increase participation. Armstrong (15, 918 ha), Briscoe (7937 ha), Deaf Smith (41, 366 ha), Floyd (13, 872 ha), Oldham (10, 731 ha), Randall (17, 112 ha), Sherman (14, 160 ha) and Swisher (30, 262 ha) counties currently exceed or are near limits on program participation, limiting the impact of land conversion as a means to increase soil carbon in this area. Adopting no till tillage offers the potential to increase soil carbon storage an average of 0.12 T C/ha/y across the area.

MLRA 81 Edwards Plateau (336, 900 ha)
Grazing is the only land use in this MLRA that was extensive enough to be analyzed for carbon sequestration potential. There is very limited potential to increase soil carbon on grazed rangelands in this area. Only clay loam soils (51, 563 ha)within the area would respond to additions of legumes with an increase of more than 0.10 T C/ha/y. The uncertainty associated with this practice is very high.

<u>*Utah*</u>
Major Land Resource Areas within Utah (Fig. 41) that were identified has having land with high carbon sequestration potential were:

- 25 Owyhee High Plateau (84, 123 ha)
- 28 Great Salt Lake Area (982, 805 ha)
- 34 Central Desertic Mountains, Basins and Plateaus (119, 357 ha)
- 35 Colorado and Green River Plateaus (28, 135 ha)
- 39 Arizona and New Mexico Mountains (64, 887 ha)
- 47 Wasatch and Uinta Mountians (423, 406 ha)
- 48 Southern Rocky Mountains (43, 609 ha).

Regardless of soil and land form classification, the low annual precipitation was the overriding factor limiting response to management in all of the MLRAs. Only the addition of legumes to existing rangeland livestock grazing systems were identified has having a positive effect on soil carbon storage (generally 0.10 to 0.20 T C/ha/y). However, this practice is associated with very high uncertainty.

Regulatory Summary

The objective of Phase 1 regulatory activities was to determine the regulatory frameworks of each state, specifically as they relate to carbon sequestration. This information serves both as a tool for future sequestration projects, including the Pilot Tests of Phase II, and to identify regulatory gaps that may be obstacles to such projects. The Southwest Partnership began developing regulatory and permitting action plans during Phase I for possible Pilot Tests, and this effort is being continued and integrated seamlessly with Phase II activities.

Researchers in Arizona, Colorado, New Mexico, Oklahoma, Texas, and Utah reviewed the relevant State statutes and rules, and consulted with respective State regulators to assess current regulatory framework for carbon sequestration. The general consensus is that because most of the partnership States have oil production, often handling CO_2 injection for Enhanced Oil Recovery (EOR), the existing regulatory framework is sufficient to handle the Pilot Test scale projects. As discussed below, however, it is possible that these test projects will reveal gaps that must be closed through regulatory action.

A significant start in assessing the current regulatory framework has been made by the IOGCC Geological Sequestration Task Force, who during the time period of Phase I assembled a regulatory framework for carbon capture and geological storage at the request of the Department of Energy Its report summarizes the current regulatory regime for CO_2 on a state-by-state basis. One of our partnership researchers also participated in the Interstate Oil and Gas Compact Commission (IOGCC) Geological Sequestration Task Force (detailed below), assisting by providing information and guidance.

Our expectation is that as carbon sequestration activities intensify the current regulatory environment will shift to accommodate emerging technologies and realities. An area where this is particularly important is the realm of measurement, monitoring, and verification (MMV). The development of MMV protocols is an evolutionary process, and activities in Phase II will likely involve new regulatory requirements. During Phase I we were able to develop close working relationships with several State regulators, keeping them informed of our progress and new developments. These relationships should enable effective technology transfer.

A product of the Phase I project was identification of three geological and one terrestrial sequestration validation project: (1) Aneth Field, Paradox basin; (2) San Juan basin Coal fairway; (3) SACROC-Claytonville fields, Permian basin; (4) San Juan basin terrestrial project. Fortunately, Utah, New Mexico, and Texas already have existing regulatory regimes handling CO2 injection for EOR projects, which should streamline the permitting process for the geological sequestration projects. The terrestrial project would be permitted in accordance with USDA regulations.

Aneth Field, Paradox basin – In Utah, wells that are used for the enhanced recovery of oil and gas are considered Class II wells under the Underground Injection Control (UIC) program, and normally regulated by the Utah Division of Oil, Gas, and Mining of the State's Department of Natural Resources. However, the regulation of Class II injection on Native American tribal lands is retained by the federal government through the U.S. Environmental Protection Agency, specifically the Region 8 office in Denver, Colorado. The proposed Aneth Field project is in the Navajo Nation, and therefore falls under EPA jurisdiction.

San Juan Basin Coal fairway – New Mexico already has an existing regulatory construct for CO_2 injection, and classifies EOR and EGR injection activity as Class II under UIC. The State has also adopted specific rules and regulations governing long-term CO_2 storage through the Oil Conservation Division. Thus, the enhanced coalbed methane project in the San Juan Basin will be permitted under rules and regulations developed and administered by the New Mexico Oil Conservation Division (IOGCC, 2005)

SACROC-Claytonville fields, Permian basin – In Texas CO_2 is currently being injected for EOR, and such activity is classified as Class II injection under UIC. Furthermore, the industry partner for this project, Kinder Morgan, has extensive experience transporting and injecting CO_2, and is familiar with the permitting requirements.

Attached to the end of this report are a series of Appendices A through F that summarize the current regulatory framework applicable to the oil and gas industry and geologic sequestration of carbon:

1. Appendix A – Arizona
2. Appendix B – Colorado
3. Appendix C – New Mexico
4. Appendix D – Oklahoma
5. Appendix E – Texas
6. Appendix F – Utah

CO_2 Sources in the Southwest Region

The Gas Technology Institute (GTI) prepared an extensive report, for this project, "Source Location Data for SW Regional Carbon Sequestration Partnership – Phase I," comprises a summary of various databases assembled to help locate and quantify the CO_2 emissions in the Southwest Region. These point sources in the southwest region are mainly coal-fired power plants. Other sources include natural gas processing plants, refineries, ammonia/fertilizer production, ethylene and ethanol plants, and cement plants. Because of its size (more than 300 pages) and scope, GTI's report will be presented in full at the end of the Final Report, as Appendix G.

Separation and Capture Technologies in the Southwest Region

The Regional Partnerships for Carbon Sequestration programs were required to identify the best carbon sequestration options in their respective regions, consisting of a CO_2 source, applicable CO_2 capture technology, transportation logistics (if applicable) and destination formation for non-terrestial sequestration approaches. In most cases the carbon capture step is the most costly, and selecting the appropriate least-cost options will be of particular importance. GTI was selected to provide advice and consultation on capture technologies for the Southwest Partnership.

This report consists of a summary of commercial technology and costs applicable to point sources in the southwest region, which are mainly coal-fired power plants. Other sources include natural gas processing plants, refineries, ethanol plants, and cement plants. Research in progress to develop new technologies for carbon dioxide capture will also be briefly summarized.

This information will assist in identifying candidate projects for Phase II.

The objective of this section is to delineate technologies applicable to capturing carbon dioxide from point sources and to provide estimates from various sources of the specific costs of such technologies. Research and Development on new technologies will be reviewed and a listing of those that appear promising and are sufficiently in the development cycle will be presented.

Background Information about CO_2 Capture

The capture of CO_2 must occur before CO_2 can be sequestered. Several excellent reviews of the subject have been published (see particularly Curt M. White et al., 2003 Critical Review: Separation and Capture of CO_2 from Large Stationary Sources and Sequestration in Geological Formations—Coalbeds and Saline Aquifers, presented at A&WMA's 96th Annual Conference & Exhibition in San Diego, CA, June 2004.)

The approach to capture has been delineated into three major approaches: post-combustion, oxycombustion, and precombustion (or decarbonization). Figure 42 (courtesy Carbon Capture Project) illustrates these approaches in a simplistic way.

Post Combustion Decarbonisation

Post-combustion approaches refer to the application of various technologies to removing the carbon dioxide from the flue gases resulting from combustion. As will be discussed in more detail in the following sections, amine (a weak base) absorption processes are commercially available to effect this removal. Drawbacks are residual oxygen in the flue gas, which degrades the amine, low concentration of oxygen, low working pressures resulting in large equipment, and low concentration of CO_2 to be removed (<15%) also resulting in large equipment sizes and high solvent circulation rates. This approach is generally the only one available to remove CO_2 from already existing power plants and other large "point sources". Both Fluor and ABB offer commercial embodiments of this technology based on the amine MEA; monoethanolamine. Mitsubishi offers a newer solvent KS-1, but the basic process is the same. Relatively limited experience exists with coal fired flue gases in "PC" or pulverized combustion power stations.

Precombustion Decarbonisation

Precombustion decarbonisation refers to various processes which convert the fuel at high-pressure into a synthesis gas, mainly CO, CO_2 and H_2. The non-hydrogen species can be more readily and inexpensively removed at the high pressure, high concentration, oxygen-free conditions that result. Typically this approach is coal gasification followed by CO_2 removal using a physical solvent and possibly chemical reactors conducting water gas shift to produce additional hydrogen from the H_2O and CO in the syngas. Reforming, where natural gas and certain liquid hydrocarbon fuels, e.g., naphtha, are heated over a catalyst at moderate pressures of several hundred pounds is currently widely employed to make synthesis gas for fertilizer manufacture or hydrogen for chemical and refinery operations, is another prominent example of precombustion decarbonisation. Integrated Gasification Combined Cycle (IGCC) is an advanced approach along these lines to produce electricity at large central stations, replacing the conventional approach of PC-fired boilers. EPRI was instrumental in developing this technology by funding the first commercial demonstration plant, Cool Water, in California, a few decades ago. Seven early adopter plants of this type have been built worldwide but further adoption has been hampered by a perception of risk unacceptable to the utility industry and higher costs (in the absence of a current requirement to remove CO_2 and other trace substances). AEP has nonetheless announced it will build an IGCC plant in the near future. A photograph of a Selexol installation at a new IGCC plant in Italy is shown in Fig. 43.

Removal of naturally occurring CO_2 from natural gas in the course of preparing natural gas for pipeline transport is another example of precombustion decarbonisation, although the carbon inherent in the fuel molecular structure is not affected. Ultimately, an end user fuel of pure hydrogen could be produced. The product of combustion of hydrogen is water only. Provided the CO_2 capture and sequestration was carried out at the hydrogen production plant, there would not be any net carbon emissions from the combustion of fuels processed in this manner.

Oxycombustion

The third major approach is oxyfiring or oxycombustion. Since all fuels are hydrocarbons, the products of complete combustion are H_2O and CO_2. If oxygen is used instead of air in the combustion process, then no nitrogen, N_2, will be present in the combustion offgas or flue gas, which will increase the concentration of CO_2 in the flue gas and simplify and make less expensive the process to remove or capture CO_2 from the flue gas. In order to avoid the excessive temperatures that will occur in the complete combustion of a fuel in oxygen, recycle of cooled flue gas or injection of water to the inlet of the system is required. This technology is in trials in California being conducted by Clean Energy Systems at the nominal 5 Mwe scale.

MEA for CO_2 Capture from Post-combustion

Since the major sources of CO_2 in the southwest region are coal-fired power plants, any approach to lowering the emissions significantly must ultimately deal with these sources. At present the only technology which is near enough to commercialization is the Mitsubishi offers an advanced solvent, KS-1, that has a number of advantages over MEA, but this is in early commercialization at this point. Fluor and ABB both market a technology based on MEA. Fluor has the larger installed capacity of the two. They refer to their process as the Econamine FG process, which was developed by DOW and was previously available as the GAS/SPEC FT-1 process. Sixteen commercial plants were built of which seven are still operating. None of the large plants are operating on coal-fired systems, but several pilot units were tested with coal. Applications of this process to cement plants should be straightforward. A flow diagram of this process is shown in Fig. 44.

MEA (a solution of 30% MEA in water) is circulated to the top of the absorber tower where it contacts upflowing flue gas. This flue gas needs to have been cooled to approximately 50°C, so in plants without wet FGD units a direct contact cooler will need to be added. Also a blower is required to provide the "head," or to overcome the pressure drop that flowing through the absorber tower entails. It reacts with the CO_2, which is then carried out of the absorber along to a regenerator or stripper. Steam is used to heat the solution, which boils off some of the solution water and "strips" out the CO_{2}, which is then captured, polished, dried and compressed, usually to 2000 psi, for transport. The stripped or lean MEA solution is then pumped back to the absorber for reuse. The process needs steam for the stripping operations and this steam will come from steam that would otherwise be available in the power plant steam circuit; thus, there is a "parasitic" power loss. The compressor, blower and solvent circulation pumps also introduce parasitic power losses. The total loss of power due to addition of CO_2 capture is on the order of 20%.

Drawbacks of this process are high corrosion potential, large MEA losses due to vaporization and degradation, inefficiency, and parasitic power loss.

Estimation of Costs of CO_2 Capture

It is to be understood that CO_2 capture from large stationary sources has been very sparsely applied and usually in unique situations, for example where there was a particularly robust market for the CO_2, such as for food grade use, or for EOR in a particularly amenable reservoir. Since capture from electric power stations will be the largest source in most regions, we need mainly to be concerned with those costs including the costs from near-term power generation technology such as IGCC and possibly natural gas-fired turbine plants. Costs for such applications can be presently estimated with accuracy probably on the order of ±25% and no better, and not considering site specifics which will further broaden the range of estimation accuracy. Estimating the costs of CO_2 capture and related metrics (see below) for hypothetical processes and processes in early stages, R&D cannot be done within a range of even 200%. Rand Corporation studied the accuracy of cost estimation of pioneer plants in DOE funded studies in the 1980s (E.W. Merrow, K.E. Phillips, and C.W. Myers, Understanding Cost Growth and Performance Shortfalls in Pioneer Process Plants (Santa Monica, CA: The RAND Corporation, 1981). Even with technology that is proven and well understood, cost estimates can differ widely based on assumptions of fuel costs, inflation, financing costs, capacity factors, reliability, sparing philosophy, location, site specifics, design philosophy, tax basis, depreciation approach, tax credits and other factors.

In order to bring some sense of order to this a transparent, common basis needs to be established setting down the assumptions and values of as many parameters as possible. NETL, recognizing this, commissioned the Carnegie Mellon University Center for Energy and Environmental Studies to produce a computer software to produce consistent estimates for major power generation approaches with a variety of fuels (natural gas, various coals). Using this program apple-to-apple comparisons can be made and the necessary comparison metrics for different processes, such as cost of CO_2 avoidance (see below) can be generated relatively easily. The model, IECM or Integrated Environmental Control Model, is publicly available from the CMU Center for Energy and Environmental Studies website http://www.iecm-online.com/cees_download.htm and is currently in version 4.0.4.1, released in September 2004. The program is not complete; for example, at present the only IGCC scheme is Texaco cold quench, but despite these limitations, representative costs can currently be generated. GTI has developed similar information for the cost of CO_2 removal from natural gas using various processes and at various plant capacities.

Metrics for Evaluation of CO_2 Capture

Important metrics for evaluation of CO_2 capture are the "cost of CO_2 removal" and the "cost of CO_2 avoidance". The former metric is simply the cost of removal of CO_2 per unit mass removed. Since there are efficiency penalties associated with removing CO_2, the net power from any plant fitted with CO_2 capture will be lowered, so the cost per net kWh delivered will be higher than the cost of CO_2 removal. Thus, additional investment may be required to bring the plant back up to the rated capacity or alternatively, add incremental power by some other acceptable approach without adding to the CO_2 emissions. The cost of CO_2 avoidance can also be interpreted as the value of the carbon tax (fixed and proportional to C emissions) at which the "power plant" is indifferent, at a fixed level of CO_2 capture, to paying the carbon tax or the cost of CO_2 mitigation. The plant would therefore prefer the CO_2 mitigation costs at any higher level of carbon taxes.

Other metrics are the cost of electricity (COE) with and w/o carbon capture and the total plant annualized investment.

Costs for CO_2 Capture from Power Plants

Results from applying the IECM model (see above) to a number of scenarios were presented by Rubin at the Third International Conference on Carbon Sequestration held in May 2004 in Alexandria, VA USA. Figures 45 through 47 are significant slides excerpted from his paper "Comparative Assessments of PC, NGCC, and IGCC Power Plants with and without CO_2 Capture and Storage".

The comparison is based on 2% S bituminous coal and assumes a capacity factor of 75% for all of the plants. PC plants are supercritical (but not ultra supercritical) design and the IGCC is based on Texaco cold quench and the Selexol process for CO_2 removal. The NGCC uses two GE frame 7 turbines. All reference power plants are 560 MW. Since current natural gas prices are so high, the COE form NGCC is also high and actual capacity factors for NGCC plants has been below 35% in the past year or two. Therefore the calculations and charts are unrealistic for current natural gas prices. NGCC would not be the preferred option for least cost electricity and actual reductions of CO_2 emissions would not be realized at the low capacity factors.

Figure 45 plots CO_2 emission rates as kg/MWh for the three plant types. As can be easily seen, PC and IGCC have similar emission rates, mainly because of using the same fuel, coal. The NGCC plant has an emission rate less than half of the coal-fired units. The values for emission rates are of course less when capture is added at the nominal 90% capture level but the advantage of NGCC at less than half the emission rate for the coal-fired units is maintained.

Figure 46 illustrates the cost of electricity from the three power plant types as well as the respective contributions of the reference plant, capture and transport+storage, showing that the differences in the three plant types is not pronounced when there is no CO_2 capture. IGCC is slightly more expensive but by less than 10% of the COE for the PC plant and less than 15% of the COE of the NGCC plant. The COE with capture is significantly higher than w/o capture, more than 50% higher for the PC plant and if transportation and storage is taken into account, 75% higher. We see the increase due to capture and due to capture plus storage for the IGCC plant is much less and in fact the COE of the IGCC plant with capture and storage is less than the PC plant with capture and storage and is therefore preferred. NGCC is still the preferred option on the COE metric. If EOR utilization of the CO_2 is a possibility, all of the COEs are reduced but the IGCC produces more CO_2 than the NGCC and receives a larger offsetting credit with the result that it now becomes the preferred option. The cost of CO_2 capture in this case for IGCC represents only a 10% increase over the cost without capture. The avoided cost of CO_2 for these cases is shown in Fig. 47. For the prevalent PC-fired plants we are looking at \$50 per ton, nominally. The avoided cost for IGCC plants is approximately 50% of that for PC plants. NGCC plants have the highest avoided cost. The absolute values of these costs are reduced significantly for the EOR case, but the trends remain and IGCC is still the lowest cost option in this instance.

It should be recognized that these charts are merely an example and depending on assumptions taken, particularly for fuel costs, we can get different absolute values and draw different conclusions. For this set of assumptions, we can fairly well conclude that IGCC is a preferred option provided the relatively minor increase in electricity cost (COE) over the cost of electricity from NGCC would be acceptable to PUCs and the public in exchange for the societal benefits of reduced CO_2 emissions. Barring any legislation or other requirement to capture CO_2, it should be clear that capturing CO_2 is still an expensive proposition with high costs to the economy and society and results in 40% more expensive electricity.

This confirms the need to develop advanced technologies to lower the incremental cost of CO_2 capture. The approaches currently being pursued worldwide are listed in the next section.

Ongoing Research

DOE has an aggressive R&D Program with the objective of reducing the costs of CO_2 capture. Table 28, with links to more detailed information (from DOE's website) summarizes the research program.

The IEA Greenhouse Gas Programme has developed a website of Carbon Capture and Sequestration Projects (http://script3.ftech.net/~ieagreen/co2sequestration.htm). The Carbon Capture R&D listing from their database as of 10/30/04 is shown in Table 29. (links in the title column are to more detailed information) and includes many of the DOE projects listed in Table 28. Additionally, the IEA database lists 11 "commercial-scale" projects (shown in Table 30).

The Carbon Capture Project has devoted considerable effort to optimizing the process schemes used for CO_2 capture. They selected three cases to evaluate: North European Refining and Petrochemical Complex, Alaska Open Cycle Gas Turbines, and a Norwegian 400MW NGCC power plant. Their study confirmed the ballpark figures for CO_2 capture cost – their reference case was set at \$60/tonne of CO_2 avoided. Through a series of value engineering and design integrations, estimated avoidance costs were reduced ultimately to \$28/tonne.

Conclusions

Technology exists to remove CO_2 from major stationary sources such as power plants, refineries, gas plants and chemical plants. CO_2 is already being removed from natural gas if it is present in the raw gas (about 30% of natural gas contains significant amounts of CO_2), but this CO_2 is vented to the atmosphere except in a few instances where the gas is needed for EOR. Power plants are the most significant source of CO_2 emissions in the southwest region. The estimated cost with current technology would result in a nominal \$50 per tonne CO_2 avoided cost. Unless a CO_2 emissions tax of this magnitude (or in the alternative an available trading credit) is imposed, utilities will not implement CO_2 capture.

New technology under development from numerous parties worldwide will likely lower the cost of CO_2 capture. Most such technology is many years away and some may never be realized for a variety of reasons.

IGCC electricity generation is, in many situations, a relatively inexpensive approach to effective CO_2 capture in the near-term. Although the cost is slightly higher (and the risk higher) than standard PC power plants, utilities are now beginning to include these in their generation forward planning since they provide a hedge against future emissions regulations more stringent than today's (whether including CO_2 emissions requirements or not). Additional implementations of IGCC in several utility territories will increase the broad acceptance of this approach and should be encouraged by government incentives.

Many of the new, advanced technologies which can potentially offer lower-cost capture will require field experiment testing and demonstrations. These technologies will be screened in the southwest region in conjunction with the region's source/sink database to identify a suitable candidates for Phase II projects. The baseline information described above is essential to identify current opportunities for CO_2 capture in the region and to determine, when coupled with cost information or estimates for the new technology, the most promising options compared to current state-of-the-art technology.

Table 28. Summary of U.S. DOE's CO_2 Capture R & D Program

CO_2 Capture

- **PRE-COMBUSTION DE-CARBONIZATION** There are currently 10 oxygen-fired gasifiers in operation in the U.S. today. Syngas from an oxygen-fired gasifier can be shifted to provide a stream of primarily H_2 and CO_2 at 400-800 psi. Glycol solvents can capture CO_2 and be regenerated via flash (no steam use) to produce pure CO_2 at 15-25 psi.

Supporting Program R&D Projects:

- **CO_2 Selective Ceramic Membrane:** Develop a high temperature CO_2-selective membrane to enhance the water-gas-shift reaction efficiency, while recovering CO_2 for sequestration. The improved membrane is suited to integrated gasification combined-cycle power generation systems. *[Media and Process Technology Inc (MPT) University of Southern California]*

    - Fact Sheet: CO_2 Selective Ceramic Membrane for Water-Gas-Shift Reaction with Simultaneous Recovery of CO_2 [PDF-61KB]

- **CO_2 Hydrate Capture Process:** Develop a process that captures CO_2 by combining it with water at low temperature and high pressure, thus forming CO_2/water hydrates, ice-like macromolecular structures of CO_2 and water. Laboratory experiments seek to determine the level of CO_2 removal achievable, measure energy requirements, and assess any negative effects attributable to hydrogen sulfide and methane gases. *[Los Alamos National Laboratory, Nexant, Inc. (A Bechtel Technology and Consulting Firm), Simteche]*

    - Fact Sheet: CO_2 Hydrate Process for Gas Separation from a Shifted Synthesis Gas Stream [PDF-239KB]

- **High Temperature Polymer Membrane:** Manufacture a thermally optimized membrane with better separation capabilities than current polymer membranes. The project focuses on the separation of CO_2, methane, and nitrogen gases in the range of 100 to 400°C. *[Los Alamos National Laboratory, University of Colorado, Idaho National Energy and Environmental Laboratory, Pall Corporation, and Shell Oil]*

    - Fact Sheet: CO_2 Separation Using a Thermally Optimized Membrane [PDF-197KB]

- **Evaluation of CO_2 Capture/Utilization/Disposal Options:** Develop engineering evaluations of technologies for the capture, use, and disposal of CO_2. This project emphasizes CO_2-capture technologies combined with integrated gasification combined-cycle (IGCC) power systems that produce both merchant hydrogen and electricity. *[Argonne National Lab]*
    - Fact Sheet : CO_2 Capture for PC-Boiler Using Flue-Gas Recirculation: Evaluation of CO_2 Capture/Utilization/Disposal Options [PDF-81KB]

- **OXYGEN-FIRED COMBUSTION** No oxygen-fired PC plants in commercial operation. Current minimum CO_2 recycle is 5 lbs CO_2 per lb coal feed. 90% pure CO_2 is produced from the boiler at 10-15 psi. Oxygen combustion requires roughly three times more oxygen per kWh of electricity generation than gasification.

Supporting Program R&D Projects:

- **Advanced Oxy-fuel Boilers and Process Heaters:** Design a novel "oxy-fuel" boiler that incorporates a membrane to separate oxygen from the air which is then used for combustion. *[Praxair]*

    - Fact sheet: Advanced Oxyfuel Boilers and Process Heaters for Cost Effective CO2 Capture and Sequestration [PDF-147KB]

- **Oxygen Firing in Circulating Fluidized Bed Boilers:** Build on international work in advanced combustion in mixtures of oxygen and recycled flue gas. *[Alstom Power]*

  - Fact sheet: Greenhouse Gas Emissions Control by Oxygen Firing in Circulating Fluidized Bed Boilers [PDF-563KB]

- **Oxygen-enriched Combustion:** Conduct pilot-scale tests of oxygen enhanced coal combustion with the objective of lowering the cost of retrofit systems. *[CanMet Energy Technology Center, and a consortia of industrial companies including McDermott Technology, Trans Alta Corp., Saskatchewan Power, Air Liquide Canada, Nova Scotia Power, Ontario Power Generation, and Edmonton Power]*

- **POST-COMBUSTION CAPTURE** 300 GW of PC boiler capacity in the United States. Flue gas from a PC boiler is exhausted at 10-15 psi and contains 12-18 volume percent CO_2. Amine scrubbing with CO_2 compression to 1200 psi costs roughly 2000 $/kW and reduces the net power plant output by 12.5%.

Supporting Program R&D Projects:

- **Dry Regenerable CO_2 Sorbents:** Develop a CO_2 separation technology that uses a regenerable, sodium-based sorbent to capture CO_2 from flue gas. Thermodynamic analysis and preliminary laboratory tests indicate that the technology is viable. Process data will be collected to assess the technical and economic feasibility of various process configurations. This retrofit process is amenable to all conventional steam-generating power plants. *[Research Triangle Institute, Church and Dwight, Inc.]*

  - Fact sheet: Carbon Dioxide Capture from Flue Gas Using Dry Regenerable Sorbents [PDF-112KB]

- **Electrochemical Devices for Separating CO2 from Flue Gas:**
Develop cost effective electrochemical devices for the separation (electrochemical pumps) and detection (sensors) of CO_2. Tasks include separation of CO_2 from a simulated flue gas, comparison of electrode and electrolyte performance, and a mechanism of CO_2 transport/ development of new solid electrolyte separators and sensors. *[Carbon Sequestration Science Focus Area, CSSFA]*

- **Integrated R&D:** Integrated collaborative technology development project aimed at proving the feasibility of advanced CO_2 separation and capture technologies. *[BP Amoco Corporation, Anchorage, AK, CCP]*

  - Fact Sheet: CO_2 Capture Project: Collaborative Technology Development Project for Next Generation CO_2 Separation, Capture and Geologic Storage [PDF-206KB]

- **Amine Enriched Adsorbents:** These sorbents will be prepared by chemical treatment of high surface oxide surface materials with various amine compounds. Tasks include modification of oxidized solid surfaces, chemical characterization of the amine-enriched sorbents, determination of CO_2 capture capacity, and examination of the performance durability of amine-enriched adsorbents. Optimize chemical scrubbing processes for CO_2 separation. Develop improved gas-liquid mass transfer; develop improved amine absorbent systems which require less thermal energy for regeneration; increase the loading of the absorbent within the aqueous amine solution, and reduce the content of water in the amine solution. *[CSSFA]*

  - Fact sheet: Sorbent and Catalyst Preparation Facilities [PDF-659KB]

- **Carbonate-based CO_2 Capture:** Simultaneous removal of CO_2 and SO_2 by ammonia solution, recover pure CO_2 by converting ammonium carbonate to ammonium bicarbonate solution.

Ammonia is recycled for CO_2 capture. This allows simultaneous capture of CO_2, SO_2, and NOx. *[CSSFA]*

- o Fact sheet: Small Scale Facilities for Air Pollution Research [PDF-987KB]

- **CO_2 capture by absorption with potassium carbonate:** Predict performance of absorption/stripping of CO_2 with aqueous K_2CO_2 promoted by piperazine *[University of Texas at Austin]*

- **An Integrated Modeling Framework for Carbon Management Technologies:** Develop an integrated modeling framework for evaluating alternative carbon sequestration technologies for electric power plants *[Carnegie Mellon]*

- **Zero Emissions Power Plants Using SOFCs and Oxygen Transport Membranes:** Modify the design of the tubular solid oxide fuel cell (SOFC) module to incorporate an afterburner stack of tubular oxygen transport membranes, oxidizing the SOFC depleted fuel in the anode exhaust to CO2 that can then be easily separated *[Siemens Westinghouse Power Corp.-Pittsburgh]*

- **Conceptual Design of Optimized Fossil Energy Systems with Capture and Sequestration of CO_2:** The project aims to develop viable technological solutions for the safe and economic capture and storage of CO_2 underground. *[Princeton University]*

- **Sorbent Development for CO_2 Separation and Removal: Pressure and/or Temperature Swing Adsorption:** Modification of surface area and pore structure of the sorbents, modification of the chemical properties of the sorbents, and characterization and solid/surface reactions. *[CSSFA]*

  - o Fact sheet: Sorbent Development for Carbon Dioxide Separation and Removal - Pressure Swing Adsorption & Temperature Swing Adsorption [PDF-50KB]

  - o Fact sheet: Modular Carbon Dioxide Capture Facility [PDF-113KB]

  - o Fact sheet: Carbon Sequestration Science Focus Area [PDF-57KB]

  - o Fact sheet: Advanced Analytical Instrumentation and Facilities for In-Situ Reaction Studies [PDF-529KB]

- **ADVANCED CONVERSION** There are a limited number of promising ideas in this area. None of them are at the commercial or demonstration phase.

Supporting Program R&D Projects:

- **Electricity Generation Using a Metal Oxide Reducing Agent:** Develop a method to use gasified coal or natural gas to reduce a metal-oxide sorbent, thereby producing steam and high pressure CO_2. The steam condenses in a heat-recovery steam generator, and the CO_2 is sequestered using compressed energy. The metal oxide sorbent is treated in a secondary reactor, where the reduced metal is oxidized in air and recycled. Sorbent materials with desirable properties will be developed and tested, and the economics and emissions performance of integrated electricity generation systems based on the various sorbents will be estimated. *[TDA Research, Inc. Louisiana State University]*

Table 29. IEA Greenhouse Gas Programme Carbon Capture and Sequestration Projects

Project Title	Project Overview	Location
The Capture and Storage of Carbon Emissions	The project is examining improvements to the chemical absorption process (using a variety of solvents) as well as developing new technology and carrying out technology screening studies	Boundary Dam Power Plant University of Regina
CO2 Capture Project (CCP)	The project is a joint initiative carrying out a development programme leading to the reduction in the cost of CO_2 capture from combustion sources, followed by its safe, economical underground storage	Various Locations
NorCap Project	The project is developing and testing promising technologies for reducing the costs of separating and capturing CO2 from fossil fuel combustion sources, plus its transport and storage	Europe
Power Generation with CO2 Capture	The project aims to improve the energy conversion of natural gas in power cycles that significantly reduce CO_2 emissions.	Europe
Future Energy Plants	The project is developing and testing a concept for co-production of power and hydrogen from natural gas with integrated CO2 capture.	Europe
Separation of CO2 Using Membrane Gas/Liquid Contactors	N/A	Europe
Advanced Zero Emissions Power Plant (AZEP)	This multi-partner project is developing an advanced, gas turbine-based power generation system that will produce no emissions to	Europe

	atmosphere	
Advanced CO2 Separation and Geologic Storage Technologies	The project will demonstrate the feasibility of capturing CO_2 from a variety of fuel types and combustion sources and storing it in unminable coal seams and saline aquifers	North America
CO2 Separation Using Thermally Optimized Membranes	Los Alamos National Laboratory and Idaho National Engineering and Environmental Laboratory are collaborating with the University of Colorado, Pall Corp. and Shell Oil Co, in a 3-year project to develop an improved high-temperature polymer membrane for separating carbon dioxide from methane and nitrogen gas streams.	Los Alamos
Dry Regenerable CO2 Sorbents	The project will investigate and develop a separation technology that uses a regenerable, sodium-based sorbent to capture CO_2 from flue gas	North America
CO2 Dioxide Process for Gas Separation from Shifted Syngas	The project will develop a process that captures CO_2 by combining it with water at low temperature and high pressure, thus forming CO_2/water hydrates	North America
A Novel CO2 Separation System	The project aims to develop a novel electricity generation and CO_2 separation system based on the reduction of a metal oxide	North America
Vortex Tube Design and Demonstration for the Removal of Carbon Dioxide from Natural and Flue Gas	The project is studying CO_2-liquid absorption kinetics, solvent generation requirements, and scaleup parameters for Vortex Tube contactors	North America
Carbon Dioxide Capture by Absorption with Potassium Carbonate	The project will develop an alternative solvent that captures more CO_2 whilst using 25-50% less energy than conventional, state-of-the-art	Austin, Texas

	MEA (monoethanol amine) scrubbing	
Development of oxy-fuel boiler concept	The project will develop a novel oxy-fuel boiler - a new design that incorporates a membrane to separate oxygen from the air which is then used for combustion	Tonowanda, New York
Development of inorganic palladium-based membranes	The project is developing an advanced palladium-based membrane for the reforming of hydrocarbon fuels	North America
Development of a computer model for the evaluation of different CO2 capture from power plant options	The project is developing a model for the systematic evaluation and comparison of different technological options for CO_2 capture from power plant	Pittsburgh
Detailed cost analysis of three options for CO2 capture from an existing coal-fired power plant	The project is examining several technological options for the capture of CO_2 from coal-fired power plants	North America
Research on Physical Adsorption Method for CO2 Recovery	The present project forms part of an on-going programme examining the Pressure Temperature Swing Adsorption technique for CO_2 capture	Yokosuka, Japan
Development of the HiOx Technology	The project is developing a power generation technology whereby oxygen if firstly separated from the air, followed by the combustion of natural gas and concentrated oxygen in an atmosphere of recirculated exhaust gases. A concentrated CO_2 stream is produced	Norway
FutureGen	A US$1 billion, 10 year research project to build the world's first coal-fuelled plant to produce electricity and hydrogen with zero emissions. The FutureGen plant will establish the technical and economic feasibility	U.S.A.

	of producing electricity and hydrogen from coal while capturing and sequestering CO_2 generated in the process.	
Grangemouth Advanced CO2 Capture Project (GRACE)	Cost effective environmental abatement technologies for power production.	UK and Europe
Cooperative Research Centre for Greenhouse Gas Technologies (CO2CRC)	In December 2002, the Australian Minister for Science announced the approval of a new Cooperative Research Centre for Greenhouse Gas Technologies (CO2CRC). CO2CRC will undertake research into existing and new capture technologies to reduce the cost of capture and to assess and enhance their suitability for Australian industrial and power generation activities.	Australia
CO2 Capture, Transport and Storage in the Netherlands (CATO)	Several institutions in the Netherlands have worked on a number of aspects or components of Clean Fossil Fuel (CFF) systems. Often these institutions have very different perspectives but CATO aims to streamline the objectives and perspectives of these activities and integrate them into a comprehensive programme and network, closely connected to international networks in which the partners of CATO participate.	Netherlands
CASTOR, "CO2 from Capture to Storage"	The project's objective is to make possible the capture and geological storage of 10% of European CO_2 emissions, or 30% of the emissions of large industrial facilities (mainly conventional power stations). To accomplish this, two types of approach must be validated and developed: new technologies for the capture and separation of CO_2 from flue gases and its geological storage,	Europe

	and tools and methods to quantify and minimize the uncertainties and risks linked to the storage of CO_2. In this context, the Castor project program is aimed more specifically at reducing the costs of capture and separation of CO_2 (from 40-60€/ton CO_2 to 20-30€/ton), improving the performance, safety, and environmental impact of geological storage concepts, and, finally, validating the concept at actual sites.	
Clean Energy Systems (CES), Kimberlina demonstration plant	CES is a privately funded company based in California that is develop-ing an oxy-combustion process based on rocket propulsion technology. The company is conducting a series of developments aimed at demon-strating a complete oxy-combustion, zero-emissions power generation system. The first step involved the development of a high-pressure gas generator (burner) that burns natural gas with pure oxygen in the pres-ence of a large water recycle to control flame temperature. The gas generator produces a mixture of high-pressure steam and CO_2 that drives an expansion turbine to generate power. The second part of the development is to demonstrate the complete power cycle by adding the turbine, condensing the steam, recycling the condensate, and capturing the CO_2. The final stages of development will involve developing tur-bines capable of operating at higher temperatures and pressures in order to maximise the efficiency of the power cycle. Successful tests of up to three minutes duration have been achieved on a gas generator of 20 MW thermal capacity.	CES Base at Rancho Cordova CA, USA. Demonstration facility at Kimberlina Power Plant, near Bakersfield, CA, USA
Enhanced Capture of CO2 (ENCAP)	The ENCAP project is a research	Europe

	project for the development of Pre-combustion technologies for Enhanced Capture of CO_2 in large power plants.	

Table 30. Commercial-Scale Projects Listed by IEA.

Project Title	**Project Overview**	**Location**
Shady Point Power Plant	The plant generates electricity and produces food-grade CO_2 from flue gases	Oklahoma
Sleipner Project	The storage in underground geological formations is an attractive option for the removal, essentially permanently, of very large quantities of CO_2 generated from a variety of industrial operations. One promising technological option is that of capturing CO_2 and injecting it into deep underground saline aquifers, found in many parts of the world. One such formation is located above the Sleipner field, one of the larger natural gas producers in the North Sea.	Europe
Warrior Run Power Plant	The plant generates electricity and produces food-grade CO_2 from flue gases	Cumberland, Maryland
Bellingham Cogeneration Facility	The plant generates electricity and produces food-grade CO_2 from flue gases	Bellingham, Massachusetts
Sumitomo Chemicals Plant, Chiba, Japan/Kokusai Carbon Dioxide	The plant generates electricity and produces food-grade CO_2 from flue gases	Chiba, Japan
Prosint Methanol Production Plant	The plant uses an MEA-based scrubber to capture CO_2 from boiler flue gas for use in beverage	Rio de Janeiro, Brazil

	production	
IMC Global Inc. Soda Ash plant, Trona	Part of this large soda ash production plant comprises a coal-fired power generation plant featuring CO_2 capture from the flue gas. The CO_2 is used for the carbonisation of brine	Trona, California
The Indo Gulf Fertilizer Company Plant, India	The fertiliser plant incorporates a CO_2 capture facility that feeds a urea manufacturing unit	Jagdishpur, Uttar Pradesh
Luzhou Natural Gas Chemicals (Group)	The plant produces urea and ammonia for the fertiliser industry in China. Part of the plant features a scrubber system that captures CO_2 from the process for urea production	Luzhou City
Petronas Fertilizer Co, Malaysia	The plant features an amine-based scrubbing system, operating with a novel solvent, as part of its operations producing ammonia and urea for the fertiliser market	Malaysia
Great Plains Synfuels Plant (GPSP) CO2 Capture and Compression	The GPSP is the only commercial-scale coal gasification plant in the United States that manufactures natural gas. Located five miles northwest of Beulah, North Dakota, the GPSP has been owned and operated by Dakota Gasification Company (DGC), a subsidiary of Basin Electric Power Cooperative, Bismarck, North Dakota, since 1988. This $2.1-billion plant began operating in 1984. Using the Lurgi process, the GPSP gasifies lignite coal to produce valuable gases, liquids, and byproducts (including CO_2). Delivers CO_2 to the Weyburn Unit in Canada	Five miles northwest of Beulah, North Dakota

Outreach and Education

The *goal* of the outreach component of the Southwest Regional Partnership for Carbon Sequestration was to *identify current public opinion and knowledge, and enable the public to more effectively evaluate costs and benefits* associated with carbon sequestration.

We subdivided that goal into the following *objectives*:
(1) identify and respond to constituent needs, fears, and desires;
(2) inform constituents about carbon sequestration strategies;
(3) involve constituents in a joint discovery of opportunities associated with carbon sequestration;
(4) enable constituents to negotiate opportunities for mutual benefit among the diverse parties with an interest in carbon sequestration.

As is the case with many public policy processes, the Southwest Regional Partnership on Carbon Sequestration is a complex situation involving multiple stakeholders. The interests of these stakeholders must be recognized if the Southwest Partnership is to successfully integrate best science and practice (Daniels & Walker, 2001). Each stakeholder group has varying levels of and interests for participation in the process. The negotiation among their interests is thoroughly integrated into the outreach plan for participation. Furthermore, these various interests groups enter the carbon sequestration process with differing degrees of scientific background, which impacts their ability to participate (Kinsella, 2004). This presents a challenge to public participation for the integration of science and practice to be both feasible and desirable (Daniels & Walker, 2001).

Our constituents constituted multiple audiences, all of which have different motivations for their responses (or non-responses) to carbon sequestration. These audiences include (1) private industry, (2) environmental groups, (3) the general public, and (4) governments. We did not designate nongovernmental organizations (NGOs) as a distinct category, because we found that the motivational base of NGOs representing private industry (for example coal) is quite different from the motivational base of NGOs representing environmental groups (for example the Sierra Club). These multiple audiences come to the table with vastly different knowledge levels and skills, and they care about carbon sequestration for different reasons. We attempted to design, and begin implementation of, an outreach program that responds directly to them.

Communication

We define communication not as a psychological task of putting two minds together, but as a political challenge of establishing conditions under which mutual recognition of self-conscious individuals is possible (Peters). This shifts the crux of communication from fidelity to responsibility. Rather than using communication primarily for the purpose of sharing absolute truth with our constituents, we focused on how our words and deeds might play before them—what our activities would mean to our audience. This seemed an essential move given the scientific and technological uncertainties involved with carbon sequestration itself, and the inherent uncertainties associated with attempts to forecast the future of anything (including, but not limited to climate change).

Dissemination and dialogue are the fundamental communication strategies employed to achieve our objectives. By dissemination, we refer to the transmission, or broadcasting of information. This information is available to everyone, without prejudice. The risk associated with dissemination is that information may fall into the wrong hands, or that people might interpret it differently than we would like them to. If we really want broad public involvement, we have to be willing to take that risk. Dialogue, on the other hand, refers to personal interaction and direct connection among people. To engage in dialogue with someone requires that we spend considerable effort getting to know that person. The advantages are that we can design information to specifically respond to that person's needs, and we are able to learn from that person. The disadvantage is that we reach only a very small audience through this mode.

The communication techniques we identified to achieve our goals were formal presentations, learning activities, and process training. Formal presentations allowed us to share information about infrastructure requirements, different technical possibilities, and opportunities for both specific industries and location-based communities to become involved. The learning activities focused on mediated modeling, which enables participants to share their learning with each other. The process training was built into the modeling activities, and was designed to help participants become more effective communicators.

The tools, or media, through which we implemented these techniques included a web page, mediated modeling workshops, and an information packet disseminated for virtual town hall meetings and for various face-to-face presentations.

The web page provides an opportunity to disseminate information about our partnership activities, the regional partnership program, carbon sequestration, and its relationship to global climate change. It allows us to disseminate information to a broad range of potential constituents, even reaching those who have never heard of carbon sequestration. Secondarily, it generated possibilities for dialogue with audiences we might fail to identify. For the benefit of anyone who chooses to initiate a dialogue, the web site provides information on how to contact the partnership. The information packet fulfills similar functions, but, because it is print based, both its spatial and temporal boundaries are more rigid. We took advantage of the relative stability of this platform to disseminate information that focuses on operational possibilities suggested by scientific and technical research. Our target audience for this medium was industry. The two media are most effective when used together. For example, the information packet directs readers to specific parts of the database, which can be accessed through the web page. Although people do not have to possess the information packet to access these data, the interpretive information in the information packet will make the data much more useful.

Our second communication medium is a variant on the town hall meeting. We conducted two virtual town hall meetings in several sites throughout the area covered by the Southwest Partnership. These meetings incorporated both face-to-face and electronic interaction. Meetings were electronically facilitated through a central source, which ensured consistency among all informational presentations. Each meeting, on the other hand, encouraged participants to introduce perspectives unique to their communities (whether spatial or interest-based) as they engaged each other in embodied interaction. Participants had an opportunity to interact others in the same physical setting, at the same time they interacted (electronically) with participants from other communities throughout the region. This medium facilitated both information dissemination and group dialogue.

Our third communication medium was the mediated modeling workshop. Mediating modeling is designed to facilitate additional group learning (Vennix). This venue for face-to-face interaction provides opportunities for embodied relationship building, open discussion, and information sharing. Thus, although dialogue is the primary strategy here, some dissemination also occurs. Using this tool, we involved the participants in active learning exercises to identify key issues, concerns, and interrelationships within the system. Participants worked together to develop a conceptual model, and then reframed it as a quantitative model. This involved translating the conceptual model into a series of mathematical equations that collectively form the quantitative model. Ultimately, the model evolved into a communication interface between project scientists, regional decision makers, and industry partners, as constituents developed a sense of joint ownership, thus making the modeling process more important than the model itself (Peterson, Kenimer, and Grant).

The outreach system built through integrating these media facilitated a substantive interaction between all constituents, enabling them to more effectively evaluate costs and benefits associated with alternative carbon sequestration strategies, both as an economically viable technology and as a useful component in a national greenhouse gas reduction portfolio.

These processes have occurred as distinct efforts to contact and serve sometimes similar and sometimes different publics; taken together they substantiate a broad-based approach to public outreach and education.

Summary: The public participation process developed opportunities for various interest-groups (industry, utility, environmental advocates, and environmental policy decision-makers, and scientists) to learn fundamental information about carbon capture and sequestration, and then to collaborate in deciding how best to manage the implementation of this technology in the Southwest Region.

Below we report the objectives, process, and results of these programs beginning with the website.

Website Development and Implementation

http://www.southwestcarbonpartnership.org/

The goal of the Southwest Regional Partnership on Carbon Sequestration website was to utilize the World Wide Web as a medium to communicate information on the issue of carbon sequestration to internal and external project stakeholders. The website, **http://www.southwestcarbonpartnership.org/**, was a part of the larger public participation initiative to engage stakeholders.

Objective: The objective of the website design phase was to create a website that communicates scientific information in an accessible manner and to design the website in a way that allows the user to easily get the information they need.

Process: The development of the Southwest Regional Partnership on Carbon Sequestration website was informed by a review of existing websites on the topic of carbon sequestration, and similar topics such as energy. The existing websites provided information on what works and what does not work in terms of communicating information on carbon sequestration. The information from this website review was communicated to the principle stakeholders to assist them in understanding some of the design implications for the Southwest Regional Partnership on Carbon Sequestration website. The term principle stakeholders is used here to describe those individuals and agencies that are responsible for meeting the objectives and milestones outlined in the Department of Energy grant application.

Meetings were set up with the principle stakeholders to go over their interests and concerns regarding the website. If a principle stakeholder was unable to attend a meeting, he or she received updates via email regarding what was discussed. The initial meetings were an opportunity to understand some of the users of the website. These meetings occurred prior to writing content for the site and its web pages. Communication occurred with the host of the website, the state of Utah, Information Technology Services (ITS) data center regarding the requirements for the web layout and content. The ITS department is responsible for maintaining the website on their server.

Once there was an understanding of the scope and overall goal of the website, categories were developed for the website. These categories were approved by the principle stakeholders prior to writing text for the website. The categories were consistent with the goals of the project overall and with the principles of the public participation plan for the project. Writing text for the website was the next step, and this process was informed by the review of the existing websites, the views and messages of the funding agency, and the goals of the principle stakeholders. The overall goal of the website, category construction, and the content were combined in the development stage of the website. The development and implementation of these elements were consistent with the principles of human-computer interface design and usability. Changes and modifications will be made to the website based upon the users' experiences.

Results: The website design and implementation went well. The design and writing of copy occurred January through March 2004, and the website was functional by April 2004. Feedback from project partners was very positive about the website and its functionality. There were a few technical difficulties with implementing the "Partners Only" web page but these issues were resolved by June 2004.

The website was advertised to both the internal and external audiences through email, meetings, and the workshops. The website was reviewed on a weekly basis, and updates are posted as needed. The website was used to disseminate information about the workshops. Agendas and presentations were posted under the "Workshops/Get Involved" page. News stories and other current information were posted on the homepage and also on the "Carbon in the News" page. This page represented our effort to maintain interest in the issue of carbon sequestration in relationship to climate change. Project partners were also encouraged to contribute to the website and suggest updates.

Background

The next section provides background on the theories and principles of web design that were used in the development of the SW Partnership website.

Computer Mediated Communication

The Internet has become an important medium for communication and the dissemination of information. With so many websites available to people, it is important to assess a website in terms of usability and good web design. Good web design includes elements that draw the audience into the web and break down barriers for the user to access the information. This compliments the public participation goals to inform and involve the public. Good design was important to allow the user to learn about the project from the SW Partnership project partners. In the area of website development the research areas of hypertext, usability, and human-computer interface provide answers to some of those questions. Hypertext theory creates an understanding of how users manage the huge amount of information that is available on the Internet and manage information within a website. Human-computer interface relies upon cognitive psychology in order to better understand how people use computers and websites. Each of these areas will be touched upon, with an additional focus on usability. The user is the focus of web design and by maintaining this perspective it is possible to create websites that inform and interest users.

General information on who uses the web and for what purpose is readily available, but as an agency thinks about how it will interface with the public through the web some basic questions may include "who will be using the website?" This is similar to the development of a public participation plan; target audiences are the primary focus when deciding on the development of the plan. All aspects of the web design (including content, style and text) are influenced by the intended audience. The area of public relations and mass communication provides techniques to identify, segment, and target audiences in order to better develop messages. The categories of the audiences that should be captured include age, gender, ethnicity, income and financial information, educational background and area of the country in which they live. These variables will have different levels of importance depending on the type of site being constructed (Thompson, 1996).

By segmenting the audience, it is possible to offer different links for each type of audience that may visit the website (Farkas & Farkas, 2001). Segmenting can be useful for the look and usability of the website.

Hypertext theory

Hypertext theory is the basis for the World Wide Web and web design. The web can easily confuse and disorient users; users may lose their place and become unsure of their direction and navigation (Landow, 1997). Hypertext, the term for interactive content, provides a mechanism for the user to move throughout a website; it provides the means for the user to navigate. The concept of hypertext was conceptualized by Vannevar Bush in the 1940s as he described a need to manage and organize massive amounts of information. His idea for the device called the "memex" enabled users to access a lot of information with a few keystrokes (Bush, 2003). But it was not until 1965 that Ted Nelson coined the term *hypertext*. Hypertext theory describes how text nodes, or words, graphics, and sounds are linked to other relevant pieces of information. Hypertext links the text nodes to one or more other text nodes and holds websites together and supports user navigation (Neilsen, 2003). The nodes and links can be arranged into both hierarchical and non-hierarchical structures and information structures (Farkas & Farkas, 2001; Nielsen, 2000). Most people who work with web design draw upon hypertext theory. Hypertext works by association rather than indexing and is nonlinear and dynamic (Nielson, 2000). Nielsen believed that computers will continue to have a presence in people's lives and they should learn as much as they can about them; computers should be embraced as a personal device. Nelson advocated for making computers as easily understood as a camera (Nielsn, 2000).

Usability

In addition to hypertext, usability is an important area for consideration. Jakob Nielsen is a prominent proponent of ensuring that websites are as usable as possible. Nielsen suggests that appropriate design ideas comes from watching users and seeing what they like, what they find easy, and where they have difficulties. This will help in the design phase (Nielsen, 2000).

Site design is important because the reason users are using the web page is to access information. Once they leave the homepage and start navigating, it is important that they are able to find what they are looking for. The home page is the first page and should include a directory of the main areas and news. Navigation is an essential element of site design. "Navigation interfaces need to help users answer the three fundamental questions of navigation: Where am I? Where have I been? Where can I go?" (Nielsen, 2000, p. 188). Some considerations for web design and usability include allowing the user to freely navigate the site, the technological limitations of the user, speed of web page loading, and writing for the web.

Users have little tolerance for slow loading web pages, and web pages should be designed with speed in mind. Research has shown that the audience wants response times of less than one second when moving among pages. The response time goal when building web pages should be that it should take no more than ten seconds for users to get to other pages (Farkas & Farkas, 2002; Nielsen, 2000). Slow response times can lead to feelings of dissatisfaction with the site, people will go elsewhere for the information believing the site does not provide a good service.

Writing for the web is as important, if not more important, than some of the previously mentioned usability recommendations. The first rule is to be succinct: "Research has shown that reading from computer screens is about 25 % slower than reading from paper" (Nielsen & Tahir, 2002, p. 101). Because people do not want to scroll through pages, all the information should fit without having to scroll to see the end. When people read on the web, they scan and look for keywords. Consequently, designers should use short paragraphs with subheadings and bulleted lists. It is a good idea to structure articles with two or even three levels of headlines, with one idea per paragraph. Again, hypertext can be useful for splitting up long information into multiple pages. Although each page may be brief, with hypertext links a lot of information can be made available (Nielsen, 2002).

Linking is another function of usability; it allows users to go to other pages and sites on the Web. The use of link titles offers a short explanation that helps the user understand where he or she will be directed. By reading what they will be linked to prior to using the link, the user can understand the content of the destination pages (Nielsen, 2000). Hypertext is useful for splitting up long information into multiple pages, each page can be brief, but with hypertext links a lot of information can be available and users can scan the information quickly (Nielsen, 2000; Thompson, 1996).

Human-computer interface

The focus of human-computer interface is on the user and the design of technologies with the user in mind. In the case of websites, the focus is to make websites more responsive to the users' needs within the website. Human-computer interface has been applied in the areas of computers, virtual realities, video games, and websites. Where hypertext provides a mechanism for the user to navigate the website, human-computer interface design focuses on the users' needs and cognitive abilities during the design phase. One researcher suggests that "Users should set the pace of an interaction" (Raskin, 2000, p. 8).

It is important for computer users and, consequently web users, to be able to find the information they need to conduct their work. As technology has evolved people's patience for slow, non-user friendly computers has dramatically decreased. Computer technology needs to be hassle-free and fast; this is also true for websites. Human-computer interface has many implications for the study of web design.

As people interact with computers and the web, everything the user reads and sees will affect how the user will interact with the system. Consequently, it becomes important to prevent as many barriers as possible to enhance the users' experience. The role of the interface is to find and display information and support the user as they navigate the website (Farkas & Farkas, 2001). Buttons and text links are examples of user interface. Some criteria for interface design include usability, functionality, visual communication, and aesthetics (Laurel, 1990).

Computers and websites should be sensitive to the needs of the users. The emotional and cognitive needs of the user should be incorporated into computer and web design: "Such disciplines as cognitive psychology, ergonomics, and optics have been drawn in to support computer scientists in the task of designing interfaces for their application" (Laurel, 1992, p.xvii). Part of this challenge is to identify the users and define them in order to build a product to suit their needs-a website cannot be built in isolation. Some of the questions that should be posed include: what does the user need the website for, what is the information they are seeking, and what tools would be useful for people to do their work (Laurel, 1990)?

Communication Goals and Objectives of the SW Partnership Website

Three communication goals for the website were developed: use the website as a communication medium for outreach and other communication, use the website as a public participation tool, and use the website to communicate scientific information in an accessible way to a variety of stakeholders. Within the three communication goals, there were two planned outcomes for the Southwest Regional Partnership on Carbon Sequestration website (SW Partnership website): develop the overall design of the website, including color scheme, content categories and layout, and create a usable website.

The SW Partnership wanted a website in order to communicate with both the internal and external stakeholders. External stakeholders, including Clean Air Coalition and Sierra Club, needed information about the issue, upcoming meetings, and the project partners. Internal stakeholders, including New Mexico Tech at Socorro and University of Utah, needed a tool that had enough information that they could direct external stakeholders and project partners to for additional information. The website was created to disseminate information and create dialogue by getting feedback from the participants.

Website Development

The website was developed using hypertext theory (Farkas & Farkas, 2001; Nielson, 2000), usability (Nielson, 2000), and the principles of human-computer interface (Farkas & Farkas, 2001; Laurel, 1990). A review of carbon sequestration and energy related websites was performed (Global Energy Technology Strategy Program, 2005; National Energy Technology Laboratory, 2005; U.S. Department of Energy, 2005). The websites were evaluated in terms of their visual appeal, ease of navigation, ability to understand the content, and type of information provided. The existing websites provided information on what works and what does not work when communicating information regarding energy related issues. The information from the website review was communicated to the principle stakeholders to assist them in understanding some of the design implications for the SW Partnership website.

The overall goal of the website was to create a communication medium for outreach and education for primary and secondary audiences (see *Table 1*). Categories or themes were developed for the website. These categories were approved by the principle stakeholders prior to writing the website text. The categories were consistent will the goals of the project and with the principles of the public participation plan for the project. A conceptual map was generated in a stakeholder meeting, and was used to guide the development of the website and communicate information about the website to the project partners and stakeholders. Figure 48 shows this SW Partnership website conceptual map.

Stakeholder involvement

Meetings with the principle stakeholders of the SW Partnership were established in order to communicate information about the website development. The term *principle stakeholders* is used here to describe those individuals and agencies that were responsible for meeting the objectives and milestones outlined in the DOE grant application. The initial meetings created a better understanding of the scope of the SW Partnership and the project's goals and objectives. The meetings provided an opportunity to go over interests and concerns regarding the website. If a principle stakeholder was unable to attend a meeting, he or she received updates via email regarding what was discussed. The initial meetings were an opportunity to understand some of the users of the website as discussed in human-computer interface design (Laurel, 1990, 1993; Raskin, 2000).

Evaluation

The website was evaluated and tested using the principles outlined by Farkas and Farkas (2001) and Nielsen (2000). The evaluation occurred once the majority of the website was posted for at least three months. Evaluation included querying the stakeholders regarding their user experience by asking the questions: are you able to find information regarding the workshop, what is confusing about the website, and what is most interesting? People who were similar to the eventual users were asked these questions. The number of people was four and they represented a variety of education and web experience levels. This is consistent with Neilson's (2000) observation that most usability errors can be noticed by four to six users. Most used the web for basic tasks such as Google searches and email; others used the web more frequently for purchasing products, research, and news information. The people had varying degrees of knowledge of the issue of carbon sequestration, some had no knowledge at all and others were familiar with issue from conversations I had had with them. They were also asked to perform tasks such as finding the names of the project stakeholders, workshop dates and locations, and the main issues related to carbon sequestration.

Development Process

The content and text of the website was written after the website's conceptual map was approved by the stakeholders. This process was informed by the review of existing websites, the views and messages of the funding agency, and the goals of the principle stakeholders as defined in the DOE grant proposal (McPherson, 2003; U.S. Department of Energy, 2005). Once a draft of the content for the website was available, the principle stakeholders and the funding agency had ample opportunity to review it and make suggestions. The suggestions were incorporated in the draft document. Communication occurred with the host of the website, the state of Utah, Information Technology Services (ITS) data center regarding the requirements for the web layout and content, and loading the data on to the website. ITS was responsible for maintaining the website on their server. Once the website was populated with the content, the stakeholders had opportunity to view the content and make additional suggestions based upon their user experience.

The website was advertised to both the internal and external audience. I reviewed the website on a weekly basis and made updates as needed. Updates were collected from the stakeholders and posted to the website.

Evaluation

Evaluation occurred in the planning phase and throughout the project. Similar to getting feedback in the pre-design phase to identify the audiences, it was a good idea to get the input of the people who would use the system or a least a representative sample of the typical user. Formal evaluation included testing the site against other well-designed and published guidelines (Farkas & Farkas, 2001). It was also possible to have the users test the prototype of the site and observe what interested them and caused difficulties. It was possible to ask the users to guess what different buttons and links would do. Tasks were designed for the user to work through the website and try to locate an item (Farkas & Farkas, 2001).

Mediated Modeling

The objective of these modeling efforts is to develop a working model of sources, capture, storage, and sequestration issues in the Southwest Region. Given this applied focus, the model needs to be useful to industry participants, policy makers, and other decision makers regarding carbon sequestration. The modeling, then, is an integration of best science and best practice. To this end, the outreach committee formed a series of workshops and on-line meetings to collaborate between multiple stakeholder and interest groups. The mediated modeling process began at the January 2004 workshop in Salt Lake City, and reconvened at the June 2004 workshop in Albuquerque. At that time, participants were invited to meet virtually for a series of on-line meetings. After participating in two on-line meetings, participants met for a final workshop in Albuquerque in January 2005. At this time the participants refined the model, and then presented it to the larger partnership team.

Workshop 1

Objective: The objective of the first workshop was to join scientific and various publics (industry and local stakeholders) in an effort to conceptualize sequestration issues in the Southwest Region.

Process: Consistent with mediated modeling processes, the first session included information presentations given by experts in various fields, including carbon sources and capture technology; sinks and sequestration, including various terrestrial and geological options; and data needs and availability, including GIS and modeling processes.

With these presentations as information sources, participants were then divided into groups and discussed the key aspects of implementing sequestration in the Southwest Region. After thoroughly discussing their respective and similar vantage points, groups developed conceptual models of these issues. This initial step encourages cross-disciplinary communication as the groups are comprised of people from different sectors—e.g., a team is likely to contain a geologist, various industry experts, and an environmental advocate.

After coming to agreement on this group model, each group presented their model to the entire group. The large group then discussed similarities and differences between the various models. This secondary step encourages a better understanding of the desirability and feasibility of various aspects of sequestration.

Results: The models developed at this workshop were transferred into Stella© modeling software and presented again to the participants at the June workshop in Albuquerque, New Mexico. This provided continuity to the modeling process and served as a starting point for workshop 2.

Workshop 2

Objective: The objective of workshop 2 in Albuquerque was to move from conceptual modeling to more substantive and specific modeling of sequestration issues. Working in conjunction with the modeling committee from Sandia Laboratories in New Mexico, our purpose was to get participants to begin modeling sequestration using computer modeling software—PowerSim©.

Process: The two-day workshop was a collaborative effort between the modeling and outreach committees with the outreach committee providing the tutorials on systems modeling and facilitating the workshop and the modeling committee overseeing specific modeling issues and helping participants move toward a better understanding of how to model.

The beginning of the first day was spent on modeling tutorials. Modeling software is useful but only after participants develop an understanding what the icons of the software represent.

After the tutorials were complete, the outreach team made available the conceptual models developed in Salt Lake City. Participants then formed groups and spent the remainder of the first day and the beginning of the second day developing models using PowerSim.

In the last portion of the second day, Leonard Malczynski—the modeler with whom the outreach committee organized this workshop—took all four group models and connected them to create a single model. Consistent with mediated modeling processes, this was done with significant feedback from and discussion among participants. For example, one discussion brought about by an industry participant focused on the difference between modeling energy consumption and energy production. This discussion ensured greater legitimacy to issues the model focused on and, in turn, the likelihood it would serve as a useful decision tool as the Southwest Partnership for Carbon Sequestration completes Phase I and begins Phase II, as well as other decision makers examining the prospects of sequestration in this region.

Results: This workshop was of significant import as it provided a bridge between the conceptual modeling of workshop 1 and the continued development of the model in preparation for workshop 3. Specifically, two things were gained from this workshop: First, a model was developed which a broad-range of participants (e.g., environmental policy experts, coal, and energy/utility company representatives) agreed traced the key aspects of capture, transfer, sequestration, and storage. Second, participants were engaged and committed enough to the process that they volunteered to continue working on the model between workshops 2 and 3.

Online Workshops

The model which emerged from workshop 2 was qualitative in nature and needed considerable data before it would be of substantive value. The modeling was scheduled to be completed for workshop 3, January 2005 in Albuquerque. Additional interaction was needed prior to this final meeting.

Objective: The objective of the online workshops was to facilitate communication between participants and partners (specifically the participants from workshop 2 and the technical modeling team at Sandia Laboratories in New Mexico) to continue building the Carbon Sequestration model. The difficult aspect of this need was that participants and partners were dispersed throughout the Southwest Region.

Process: Working in conjunction with New Mexico State University and Tom Freelove of WERC—a consortium for environmental education and technology development—we utilized WERC's on-line webcast software Centra. Centra has been useful both from a public participation and a modeling standpoint because (a) it allows the modeler to present the model, (b) engages all in a discussion of the model's parameters and data, (c) enhances participants' ability to make alterations to the model while in session (using application share, the modeler and participants can alter the model on-line), and (d) permits participants and modelers to view the Centra meeting after it has ended as the sessions are recorded.

Results: We conducted three Centra meetings, with the final one held on November 15, 2004. These meetings have been particularly useful because they provide an opportunity for participants to give feedback to the modeling committee very quickly after they make alterations to the model. In turn, it allows the modeling committee to respond quickly to participants' questions and suggestions. At the close of the October 4 meeting, for example, one participant sent the modeler some suggestions regarding the GIS data that would be needed to connect geological issues to economic concerns in an effort to discriminate between sequestration options. Members of the technical team took this suggestion under consideration, and used it to revise the version that was presented in the November 1 meeting. All participants understood and supported the changes.

<u>Workshop 3</u>

Objective: The objective of workshop 3 was to finalize a model that participants could use as an educational tool, and that regional partners could use as a basis for moving from phase 2 into phase 3 of the project.

Process: Most of this one-day workshop was held in a computer lab, so that each participant was able to manipulate the model as desired. The workshop was facilitated by Leonard Malczynski, with assistance from other Sandia colleagues, as well as members of the outreach committee. By this point all participants were familiar with modeling software, and everyone worked on the model individually. Participants spent the morning and early afternoon refining the model that had emerged from the three Centra meetings, and then prepared to present it to other members of the partnership.

Results: In the late afternoon, the model was presented to the full partnership at the final review meeting. It then became the basis for negotiation over appropriate activities and sites to be considered for phase 2. Workshop participants became teachers for other partnership members during this phase.

<u>Background</u>

There is a growing tendency to shift environmental management away from individual planning tools for separate economic sectors or management for single issues and towards an ecosystem management approach where a range of different stakeholders are included. To improve decision-making for sustainable development, new tools to facilitate common goal development and to test alternative scenarios are needed. These tools have to be able to communicate the complexity and uncertainties of the decisions and allow for broad stakeholder participation, while integrating different aspects (economic and ecological) of the situation involved. Integrated assessments use tools and inputs from multi-disciplinary, multi-scale and multi-social backgrounds to support decision making processes. (van Asselt, 2000). Rather than the equilibrium-based view of decision and policy making, adaptive environmental management (Holling, 1987) adds the emphasis on the ever evolving cyclic goal for societal organization structures centered on the behavior of ecological systems. Collaborative Learning emphasizes a process oriented approach from a team learning perspective (Daniels & Walker, 1996).

Addressing today's complex environmental challenges deals with finding balance between different sides of an issue. There is constant tension between the opposite sides of the same coin and the game is played with a variety of coins with varying values and even varying currencies. For example, should decisions be made by one person or should all stakeholders be involved? Should we strive for a single answer to a problem or instead should we not commit to any answers in the face of overwhelming uncertainty? Should we rely on answers generated within the borders of individual disciplines or do we need to move beyond disciplinary analysis? Many different forces are at work at the same time. Most likely there is no black or white choice involved, but rather the need to choose an appropriate position along many different continua. For example, rather than having decisions made by one or by all, we can examine the trade offs and chose a position where relevant stakeholders can participate in designing an answer. Rather than assuming one compartmentalized answer that fits the static legislative structure or becoming overwhelmed by uncertainty, a complex dynamic situation can be acknowledged and managed in an adaptive manner. Rather than relying on a single discipline or doing away with deep analysis, we can chose a format where relevant disciplines can constructively contribute toward synthesis and practical problem solving. This does require some looking outside the usual boxes, revising the roles of the stakeholders, original thinking and learning and effective communication. In order to make the different forces at work more tangible, they need to be labeled. Only when they are identified will these tensions enter the conscious domain, where they can be faced and incorporated into our communications with others. Left in the unconscious domain they will remain out of balance, driven by habit, fear or hope.

Mediated modeling is an experimental process that is useful in such complex situations. It is best initiated at the scoping level, when a problem arises or as a way to support an ongoing research program. In the case of the Southwest Partnership, we used it as a means for supporting and gaining additional participation in an ongoing research program.

Potential results for the participating groups or communities include the following.

- *Team learning*. The industry partners who chose to participate in these sessions developed a higher level of understanding.
- *Consensus.* A successful process generates a workable level of consensus. Ideally, every participant is equally enthusiastic about the resulting recommendations. However, a situation where everyone can "live with" the recommendations can still be considered a success, and is much more common. While our participants all were enthusiastic about the model that resulted from their efforts, that enthusiasm differed between individuals.
- *Communication tool.* Every participant should be able to operate the final model. The resulting model can be used as a basis for discussion with stakeholder groups and as an educational and communication tool. Although every participant in our workshops was able to operate the model with guidance, the timing (conclusion of phase 2), mitigated against additional training sessions that would have enabled them to independently use the model as a communication tool. We intend to continue this activity in the next phase.

- *Decision aid for policy and management.* A basis for more equitable, resilient and sustainable policies and management options is established because stakeholders have effectively been involved. The model was used by the larger partnership group as a basis for negotiating activities and sites for Phase II of the project.
- *Adaptive management.* The resulting model was flexible and can be updated and changed as new information is available due to monitoring and assessment of the implemented recommendations. Again, this flexibility will be used as we begin Phase II.

Virtual Town Meetings

Personnel from WERC, a Consortium for Environmental Education and Technology Development at New Mexico State University, developed the materials for, and facilitated 2 virtual town hall meetings, using CENTRA (see description of online modeling above). Members of the Southwest Partnership's technical team made oral presentations that were telecast to various sites in Colorado, New Mexico, and Utah. Participants in the meetings came from every state in our partnership. Written informational materials were provided to all audience members. All participants also had opportunities to ask questions of all presenters.

Recommendations and Summary

We began by attempting to design and disseminate appropriate outreach materials for external stakeholders. Our efforts evolved to include an examination of the process of communicating information within an interdisciplinary and cross-sector team. The literature related to public participation, computer mediated communication, and organizational communication is revisited here in terms of recommendations.

The primary communication goals were achieved. Based upon these positive experiences three recommendations can be made to anyone attempting to design and implement outreach programs for governmental agencies:

(1) Meet regularly with stakeholders to ensure everyone is informed about the progress of the project;

(2) Spend more time than you think necessary in the beginning, to understand the overall scope of the project; and

(3) Review potentially relevant theoretical and applied literature to understand what works and what does not work.

The first recommendation, meet regularly with stakeholders to ensure everyone is informed about the progress of the project, is important because as elements of the project progressed, the concerns of individuals were quickly addressed. Regular meetings also helped establish rapport which led to a better working relationship.

The completion of the outreach materials also depended on spending a significant amount of time understanding the overall scope of the project, before beginning to develop materials. The preliminary meetings not only established rapport, but provided a framework for what different stakeholders were responsible for in order to accomplish the project objectives. As issues relating to organizational communication became apparent, I was able to put those issues in context of the overall project scope. General readings on energy, climate change/global warming, US energy policy, and environmental controversy were critical to increasing understanding and enabling us to design appropriate outreach materials (Gellici, 2003; Kojimaa, 1998; LVC, 2003; McPherson, 2003; NETL, n.d.; NRDC, n.d.a). The time spent up front was also consistent with public participation recommendations of understanding stakeholders and the issues (Daniels & Walker, 2001).

It was important to review existing literature and similar projects to gain an understanding of what works and does not work. The review was particularly helpful because it provided background on how other agencies communicated information regarding energy policy and carbon sequestration via the web, and helped us better understand the multiple aspects of the carbon sequestration issue. This understanding led to better informed web content. This review was also consistent with web design and web usability literature (Farkas & Farkas, 2002; Nielsen, 2000).

More generally speaking, by utilizing basic organizational communication theory as a guide, outreach personnel can help develop positive and supportive working relationships within a team, thus enabling team members to devote more energy to their own tasks (such as developing educational materials). The fact that all major participants (including, but not limited to, the DOE, industry partners, university partners, etc.) have generically bureaucratic structures suggests several recommendations that can be consistently applied across a variety of outreach efforts that involve large and complex stakeholders, such as the U.S. federal government (Hamilton, 1991; Perrow, 1990; Weber, 1903-1904/1958). Note that we do not intend the word “bureaucratic” as a pejorative term. Rather, it describes the most commonly occurring and most thoroughly researched form taken by complex organizations. Many researchers have concluded that bureaucracy evolved because it was the most efficient organizational form (Perrow, Weber). The contemporary political and socio-economic scene, however, is increasingly chaotic, and may pose challenges to traditional (bureaucratic) forms of organizing, which do not cope well with rapid and erratic changes in their environments.

It makes sense to apply what we know of organizational theory to increase the efficiency of teams such as the regional partnerships. An organization’s structure occurs as a result of communication and, at the same time shape the organization’s communication processes. All organizations have structures, which creates efficiency by minimizing the need for organizations to reinvent themselves. Bureaucracy is a specific organizational structure that incorporates elements of hierarchy, specialization, and formalization. Understanding bureaucracy is helpful for understanding how decisions are made in organizations.

All organizations need to communicate within themselves and with other organizations in order to get work accomplished. In a bureaucracy the process necessary for that transmission of information is defined and constrained by certain elements. Individuals with specialized expertise divide up the work and operate within a defined hierarchy (Cheney, et al. 2004). Max Weber (1903-1904/1958) showed that information in organizations was controlled by a small number of people at the top of the organization, where the power was located. Bureaucracies legitimize power and authority within institutions, especially large institutions (Hamilton, 1991; Weber, 1903-1904/1958). Weber also suggested that control was especially important in the area of scientific research and political administration.

Weick (1990) notes that “there is ambivalence within organizations toward being open and closed, . . . suspicious and trusting” (p.132). . Weik further suggests, than when working with large bureaucratic organizations it is important to provide constant communication, even to the point of redundancy, because, “there can be enormous differences among organizations and industries with respect to the level of clarity that they regard as sufficient for action. Members of organizations spend considerable time negotiating among themselves an acceptable version of what is going on (p.127). These differences can be recognized and mitigated with planning. It does take a lot of time and that should be anticipated.

We offer the following additional recommendations as relevant to similar projects:
(1) Understand how organizational structures within each stakeholder organization work and keep abreast of any changes;
(2) Send information and requests to the funding agency early in the project development phase, request input and suggestions, and repeatedly provide feedback;
(3) Include a funding agency representative in all communications regarding opportunities to review material
(4) Review all project deliverables with all the stakeholders prior to beginning work on the project; and frequently throughout the project;
(5) Provide project management opportunities to participate in all discussions with other contractors, and ensure that they take advantage of this opportunity for any discussions directly related to key decisions. .

This project demonstrates that, beyond producing outreach materials, communication research can bring greater understanding of both internal and external relationships relevant to complex projects such as this one. Areas of communication theory had were directly relevant for this project included public participation (Craig, 2003; Daniels & Walker, 2001; Hawkins, 2001;

Susskind, Moomaw, & Gallagher, 2002), computer mediated communication (Farkas & Farkas, 2002; Nielsen, 2000), and organizational communication (Cheney, et al., 2004; Corman, et al., 1990; Weitz, 1990). Interdisciplinary and cross-sector partnerships are becoming increasingly common as we seek the best ways to manage large and complex issues such as climate change. Despite the fact that we have much to learn, these partnerships hold great promise.

Integrated Assessment of Sequestration Options

A team of collaborators within the Southwest Regional Partnership for Carbon Sequestration developed an interactive software tool to help facilitate discussions involving the science, engineering, economics and policy analyzed throughout the larger Partnership community. The integrated assessment team, largely based at Sandia National Laboratories, developed a dynamic simulation computer model to help interested parties understand the potential screening criteria necessary to develop a carbon sequestration project. The screening criteria include geologic considerations for underground storage of carbon dioxide (CO_2), the relative size of the CO_2 flow from the source to the sink, and the associated economics with the system.

With these screening criteria, the test case model has successfully been used to bring together participants across the Southwest Regional Partnership (SRP). Workshops with the collective participation of the SRP provided feedback regarding the model's framework, and allowed for the multidisciplinary team to begin thinking about where the important aspects of such a project may lie (e.g., the geological science, the industry collaboration, the public involvement) and how the SRP could address these aspects in subsequent analytical efforts. In the earlier workshops of the SRP, the Integrated Assessment team discussed a companion model of the economy of the Southwestern United States. Based on the SRP community's feedback regarding how the software tool could be used to highlight the overarching issues within the region (e.g., high level costs, distance between the sources and sinks for CO_2) it was decided to focus the modeling effort. The focus efforts developed into a "String of Pearls"-based model that allows the SRP to explore multiple source and sink combinations for potential pilot projects.

The methodological framework developed for the integrated assessment was first applied to four power plants in New Mexico and several geologic sinks in the San Juan Basin as a test case for the framework. Using this framework, the Integrated Assessment team then developed a path forward towards characterizing the whole state of New Mexico, and laying the groundwork to cover additional regions both within the Partnership, and beyond where appropriate. The initial findings suggest that the capture costs of CO_2 at the power plant may comprise a large component of the systems costs, but Measurement, Monitoring and Verification (MMV) costs could change the overall system's cost balance depending upon the length of time the sinks are to be monitored.

Timeline of the Integrated Assessment and Modeling Efforts

The purpose of the integrated assessment in Phase I was to bring together the large amounts of quantitative data and qualitative issues from the SRP. To achieve this goal, several workshops were held by the SRP to solicit ideas, insights and general knowledge from the larger body of collaborators as to what, why and how the partnership should include. It was collectively decided the analysis should help 'tell the story' involving the multitude of science, economic and policy issues involved with the educational outreach aspects of the partnership. A user-friendly dynamic simulation model was developed to help facilitate these discussions. The model was developed through an interactive process which included several interactive web-based sessions and annual workshops as a basis from which to work. As the partnership's collaborators developed additional information and questions regarding the project's overall scope and level of detail, the modelers built, modified and developed the integrated assessment around this information. Table 31 shows a timeline of the major events used to develop the Integrated Assessment's analysis.

The Integrated Assessment Model

The Southwest Regional Partnership on Carbon Sequestration Integrated Assessment Model is a high level, dynamic simulation model that is meant as a learning tool for policy makers and members of the public who would like to understand some of the implications for future energy demand and the potential corresponding stationary CO_2 sequestration options. Figure 49 illustrates that the majority of the stationary CO_2 emissions from a few states within the SRP were from utility (electricity generation) sources, while smaller amounts were from other non-utility sources.

The modeling team decided to focus on electricity production by utilities from coal and gas fired power plants as a point source for CO_2 emissions for the initial test case model framework. The test case region focused on the San Juan Basin in Northwestern New Mexico and Southeastern Colorado.

The Integrated Assessment model team worked closely with the geologic sinks, physical infrastructure, and sources teams to characterize the power plants and geologic sinks, and the costs associated with sequestration options in the test case. Sources were characterized by accounting for their annual CO_2 emissions and other select attributes. Sink characterization included location, depth, volume, relative risk of leaks (based on geologic features), and other select features. The distances between sources and sinks were calculated using a great circle distance (GCD) formulation.

The model structure allows the user broad flexibility in changing key assumptions, and the base case assumptions were developed from the topical experts of the SRP and information drawn from the literature. The test case cost equations for CO_2 separation and capture at the source were developed using historical power plant data from the 2002 version of the Emissions and Generation Resource Integrated Database (eGRID), and the Integrated Environmental Control Model (IECM) (EPA, 2005; CMU, 2004). The Integrated Assessment model employs transport and injection equations for storage based on the relevant literature, and they were assessed by members of the physical infrastructure and sources team (Ogden, 2002, Williams, 2002, Hirl, 2004). The model develops prototype cost algorithms for the Integrated Assessment model from this information. Figure 50 depicts the overall structure of the modeling effort, and Fig. 51 illustrates the stages of the test case model.

The basic framework allows interested parties to assess different regional sequestration options for CO_2 emissions sources, and to evaluate the total CO_2 emissions in the region. The model has an additional role to help the public gain insight to the tradeoffs between different sequestration strategies by providing opportunities to perform 'what if' analyses of different approaches to CO_2 sequestration.

Four workshops/meetings and several web-based conferences have been held, involving individuals from the electric power industry and state regulatory agencies. Members of the Integrated Assessment team presented aspects of the test case model at the third and fourth annual Carbon Capture and Sequestration conferences, and attended the MIT Carbon Sequestration Forum VI to further expose the analysis for additional vetting and professional feedback (Paananen, 2004; Kobos et al., 2005a). The model's analytical capabilities and interface development process incorporated the feedback from the workshops and conferences to help guide the ongoing development of the Integrated Assessment model.

First Results: Applying the Integrated Assessment Model Framework

Four CO_2 emissions sources – all electric power plants – were selected from the Emissions and Generation Resource Integrated Database (eGRID) for the initial test case. Power plant capacity ranges from approximately 13 megawatts (MW) to 2300 MW. Seven geologic sinks have been identified in the test area by the geologic sinks team. The variable inputs to this dynamic simulation model (largely an illustrative tool) include the percentage of CO_2 captured from the four power plants. The Integrated Assessment aligns the CO_2 emissions from the four power plants with the seven sinks to calculate sink lifetime given these conditions. The criteria for test case sink selection included those that are ≥ 3000 feet deep, have desirable geological characteristics (e.g., low chance of CO_2 escaping into surrounding strata or the surface), and are within varying distances from the power plant(s) used in the test case analysis.

The CO_2 sources and sinks selected for the model test case result in many combinations of potential sequestration actions, with associated sequestration rates and capital, operation and maintenance costs. These combinations provided the initial high-level 'what if' analysis opportunities for sequestration in the test case area. Figure 52 shows the locations of the power plants and the geologic sinks in the test case area.

Figure 53 illustrates the summary screen model interface for the test case's base case results. The summary screen offers the base case scenario results that include the lowest total capture, pipeline transport and well-associated costs (upper left-hand graph), the kilometers (km) to the sink used for the base case within the test case region (upper right-hand graph), the overall lifetime of the sink selected (lower left-hand graph), and the annual amount of CO_2 captured at each plant (lower right-hand graph).

The capture costs for CO_2 at the Animas, Raton, Four Corners and San Juan power plant sites represents 94, 91, 93 and 95 % of the total capture, transport and injection cost total for each of the base case systems, respectively. The model calculates all of the illustrative cost and CO_2 flow combinations between the four power plants, and the seven geological sequestration sites, and ranks them from lowest to highest. At the 90% level of capture for CO_2, the Animas, Raton, Four Corner and San Juan working results indicate the cost of electricity could roughly double. This, however, is related to the plant's size, derating of capacity, and other salient variables.

The model's framework has also been extended to include future cost and CO_2 flow calculations for the Escalante, Carlsbad, Cunningham, Maddox, Reeves, and Rio Grande power plants as of December, 2005. Combined with the initial four power plants, these plants represent the coal and gas-fired power plants in New Mexico.

Discussion

This section discusses the test case model's sensitivities and provides several examples of additional work both underway and to be completed as appropriate for the larger analysis. The initial observations are listed below.

Model Results are Sensitive to Carbon Capture Percentage

The model results are sensitive to the percentage of CO_2 captured from the power plants. Based on the results of the IEGM model, several levels of percent CO_2 captured illustrate the affects on the dollars per tonne of CO_2 ($/t$CO_2$) and annual amount of CO_2 captured. The cost to capture additional CO_2 increases as the percentage captured at the plant decreases. The costs for the overall systems, driven largely by the capture costs under the current working results, are high because the test case uses existing plants to calculate capture costs from the IECM. A recent study reports carbon capture costs may range from approximately 15 $/t$CO_2$ for integrated gas combined cycle plants to 30 $/t$CO_2$ for pulverized coal facilities (DOE/EPRI, 2000).

Amount of CO_2 Accounted for in the Test Case is Small Relative to the Total for the Region

To add perspective to the regional aspects of the project, Fig. 54 illustrates the total CO_2 stationary source emissions for the Southwestern Region of the U.S., the state of New Mexico, and the four initial test case power plants. The four power plant-based test case analysis represents only 11% of the region's total, and 69% of that from New Mexico (EPA, 2005).

Additionally, several states within the SRP have net exports of electricity. The states of Arizona, New Mexico, Oklahoma and Utah, for example, exported approximately 26, 41, 3 and 30 % of their electricity outside of the state's borders in 2000, respectively (EIA, 2005). This poses both a modeling, and more importantly policy challenge as to how and who will be held responsible for CO_2 emissions in a carbon-constrained world; the electricity producers or the users. Figures 55 and 56 illustrate the installed megawatts and the corresponding CO_2 emissions within the selected Southwestern states.

The "String of Pearls" pipeline network tool in the Integrated Assessment Model

The Integrated Assessment team expanded the initial test case model to include all New Mexico sinks and sources in a new, revised prototype model in the latter half of 2005. The Integrated Assessment team developed the "String of Pearls" in response to feedback from the Final Project Review in January of 2005. The model calculates the distance to transport CO_2 from the source to the closest sink to be utilized. An algorithm was developed to calculate a route of pipelines from the source of CO_2 (e.g., power plant) to each of the geologic sinks and then can calculate the total (Great Circle) distance (and eventually cost) of the pipelines (Stephens, 1998).

The sinks are used in such a way that as each one fills to capacity the transportation network extends to the next viable sink, and then to the next to eventually develop a pipeline network system. This allocation mechanism or "String of Pearls" concept is also known as a minimal spanning tree approach. The links between all combinations of the particular source selected to various sinks are the potential pipeline routes. This technique serves as a linear proxy for pipeline length, and lays the groundwork for future, additional "String of Pearls" analysis throughout both the Southwestern Regional Partnership area in the United States, and other regions interested in carbon capture and sequestration analysis. With this technique, the model could address additional metrics (e.g. lowest overall cost, largest sink volume, etc.) for systems insight. Figure 57 illustrates a prototype pipeline route within the Integrated Assessment model.

The "String of Pearls" model builds on the original test case model that involved four power plants and seven geological sinks in New Mexico. The larger "String of Pearls" model now includes four coal fired power plants, six gas fired power plants, and twenty nine geological sinks in New Mexico. The prototype "String of Pearls" model now can determine the source to sink distances and associated economics (various components remain to be refined) for any of the source sink combinations between these ten power plants, and the twenty nine geological sinks. The prototype model as of December 2005 can illustrate up to the top ten closest sinks to any of the ten power plants. Additionally, the model now includes high-level MMV costs based on Benson et al. (2004) of approximately \$0.16 to \$0.31 per tonne of CO_2 to begin assessing how these costs will affect the overall system's economics. Figure 58 illustrates the source and sink input options on the left and right of the graphic, respectively for the coal-fired power plants in New Mexico.

The prototype, illustrative results of Fig. 58 indicate that using the coal-fired San Juan power plant, the "String of Pearls" algorithm determined that the sink categorized as number 5 is the closest to the power plant. The next closest sink to sink number 5 among all the remaining 28 sinks is sink number 26, and so on. The user may also select sinks that are within a certain distance from the source, sinks that are of at least a certain capacity, or the specific sinks the "String of Pearls" algorithm should consider. The cost metrics will likely change as more site-specific installation and technology scenarios develop. For example, the carbon capture community is looking to reduce the uncertainty regarding overall carbon capture systems' cost and performance parameters. Recent work suggests the cost to capture carbon dioxide using an amine (MEA)-based system holds substantial potential to reduce the cost to half or less of their current costs (Rao, 2002; Rao and Rubin, *in press*).

The model can also be used to determine the closest sinks to any given gas-fired power plant in New Mexico. Figure 59 illustrates the results of a gas-fired power plant, the Maddox plant, and the combinations with carbon sequestration sinks.

Finally, the user is able to select a 'custom' location for a power plant by specifying the latitude and longitude coordinates of the power plant. With this ability, the interested model user can determine where to cite a new power plant when considering carbon sequestration infrastructure (existing CO_2 pipelines are to be added to the "String of Pearls" in Phase II) and geological sinks. Figure 60 illustrates a map of the CO_2 sources and sinks considered in the "String of Pearls" prototype model for New Mexico.

Regional Energy and Economic Issues: Addressing Carbon Intensity

In 2002, the current U.S. administration announced the 'Global Climate Change Initiative' to help achieve a reduction in greenhouse gas intensity throughout the U.S. economy (Bush, 2002). The goal is to reduce greenhouse gas intensity, a ratio of the amount of greenhouse gases emitted divided by the gross economic output of the economy in the same time period (e.g., emissions for 2002 divided by the economic output from 2002), by 18% between 2002 and 2012 (EIA, 2003). Carbon dioxide emissions from power plants are one of the several greenhouse gases included in the initiative. Addressing these emissions, through carbon sequestration, clean coal technologies, and other potential greenhouse gas reduction emissions, will help the U.S. to achieve this goal.

In the United States, the amount of energy consumed throughout the economy has been increasing over the last several decades. Additionally, the amount of energy consumed to generate electricity has also been increasing. Figure 61 illustrates total energy consumption for the U.S., and the total energy consumed by fuel type to generate electricity, respectively.

Regionally, the Southwestern United States represents one of the fastest growing areas of the country. With this economic and population growth comes a growing demand for energy, including electricity. Figure 62 highlights both the increasing levels of energy required for the state of New Mexico, as well as the relatively large share that coal-fired power plants represent of the electricity generation base.

Combined, coal and natural gas-fired power plants represented 99.9% of the electricity generation in New Mexico in 2000 (EPA, 2000). These plants represent opportunities to sequester the carbon dioxide from the existing infrastructure (e.g., retrofit) or potential future technological options (e.g., replace the existing electricity generation infrastructure as it reaches retirement with advanced coal, gas or other electricity generation technologies).

Ultimately, opportunities exist to address the 18% greenhouse gas intensity target by both increasing the economic output from the economy, and also by reducing the amount of carbon dioxide from sources throughout both the regional partnership, and the country.

Ongoing Modeling Efforts and Applications in Phase II

The Integrated Assessment Team will address the larger region covered by the Southwest Regional Partnership beyond the initial "String of Pearls" model for New Mexico. As the data develops for both the sources and the sinks from the Southwest Partnership's several thematic committees, the Integrated Assessment team will include it in the "String of Pearls" model. The model will also address additional developing Measurement, Monitoring and Verification (MMV) cost metrics, evolving system economics, and suggestions from the larger Southwest Partnership body of participants.

Additionally, the Southwest Regional Partnership on Carbon Sequestration has proposed a Phase 2 program that would carry out several field pilot tests to validate the most promising sequestration technologies and infrastructure concepts in the region. The Integrated Assessment Model may include metrics and information for these pilots as appropriate to continue to develop a 'systems view' of Southwest Regional Partnership's full analytical scope. The Integrated Assessment model will continue to play an important role in the Southwest Regional Partnership outreach and education plans in Phase 2, with a focus on mediated modeling. Potential future meetings or web-based meetings were discussed at the December 15 and 16, 2005 Phase II project kickoff meeting in Socorro, NM to demonstrate the working "String of Pearls" model to members of the Southwest Partnership who were unable to attend the kickoff meeting. This would allow additional participants to provide suggestions for model improvements and extensions, based on their interests and concerns about CO_2 sequestration, leading to an integrated model that is constructed collaboratively with the broader SRP.

The Integrated Assessment will also address risk issues as they relate to costs, MMV, and related topics. Specifically, the analysis will address levels of economic risk (e.g., what are the price thresholds for projects to move forwards and/or continue), performance risk (e.g., how might the plant (CO_2 source) life affect the CO_2 volumes captured and sequestered), and address what leak rates might be to integrate this information with MMV issues where appropriate. The Integrated Assessment team will continue to include work from the MMV team, with leading contributions from Julianna Fessenden of Los Alamos National Laboratories and David Borns of Sandia National Laboratories. Several broader issues will be explored as they relate to the types of technologies used for MMV, when their use is more appropriate, and what the potential costs might be. Figure 63 illustrates how the integrated assessment may characterize technologies and the central issues involving MMV. Additionally, questions the MMV cost modeling activities might consider include; Can the MMV costs be linked to the current model parameters (e.g., number of wells, costs, and their depth, sink capacity, length of the pipeline, power plant or other

CO_2 source capacity / technology); Could the MMV costs relate to the sinks (e.g., geology, depth, surface area)?

Several tasks and ideas remain to be fully developed as part of the Integrated Assessment as appropriate to meet the Southwest Regional Partnership's goals. These ideas include the following:

- Plan for and extend the model where appropriate to additional datasets to allow for increased model flexibility (e.g., potentially utilize the underlying framework for other CO_2 source and sink combinations/regions).
- Within the Integrated Assessment Model, allow users to implement a 'search space' option where they can determine where a potential power plant (or other carbon dioxide source) should be developed within the region given the distribution of the sinks.
- Potentially break down the region into grids to allow for a higher resolution model to be developed
- More fully integrate the existing CO_2 pipeline infrastructure into the model's calculations, thereby effectively treating the infrastructure like a CO_2 sink when planning connections and routing of CO_2 for sequestration and other purposes
- Explore additional cost reduction potential for amine-based carbon capture systems – this will add perspective on where the most efficient use of Research and Development spending may decrease the overall carbon capture and sequestration system's cost. A relatively small reduction in capture costs will translate into a relatively large percentage decrease in the overall system's costs. (Rao, *in press*; Rao, 2002).
- Look to other existing CO_2 capture and sequestration projects for geologic and economic lessons learned that could be applied to the Southwest Regional Partnership (Gunter et al., 1996; Thambimuthu, 2002; Bachu and Shaw, 2004; Dahowski et al., 2004; Wilson et al., 2004;).
- Explore how a carbon credit system would affect the overall economic attractiveness of select carbon sequestration system planning scenarios
- Include additional metrics on the altered performance (derating of the power plants) and electricity costs often characteristic of power plants with carbon capture systems when compared to their base case (no capture) counterparts. O'Dowd (2005), for example, explained that interested individuals would like to understand more fully how carbon capture technologies on power plants might affect electricity prices.

Final Remarks

The Integrated Assessment team solicited and addressed questions regarding the overall Southwest Regional Partnership's initial tasks in Phase I regarding geological constraints, spatial distribution of CO_2 sinks and sources, and the associated economics of scenario-based planning. The initial results indicate the capture costs represent by far the largest component of the overall carbon capture, transportation and sequestration system's cost. It was important for the Integrated Assessment team to calculate and demonstrate this result, similar to that found in other studies (Rao and Rubin, 2002), for a potential carbon sequestration system in New Mexico as a lead-in toward characterizing the larger Southwestern United States.

The modeling framework developed in Phase I through the multi-stakeholder process serves as the basis for more specific pilot projects in Phase II. In addition to refining the "String of Pearls" modeling technique and capabilities, the Integrated Assessment team strives to bring together the science, engineering and economics developed for the greater body of collaborators within the Southwest Regional Partnership for Carbon Sequestration.

This summary of the integrated assessment effort draws from the following select SAND documents and meetings as part of the Southwest Regional Partnership for Carbon Sequestration Integrated Assessment efforts, and serves as the basis for future Integrated Assessment:

Summary of Database Compilation

The Southwest partnership GIS data is maintained in an ESRI ArcSDE (spatial database engine) database utilizing Microsoft SQL Server as the underlying relational database application. The data can be accessed by partners directly providing they have access to ArcGIS 9.1 software. All of the layers can also be output in ESRI Geodatabase format for distribution on CD or by FTP download. Shapefiles, which are readable by a number of widely available GIS programs can also be output from the database.

Oil and Gas Sinks

Oil and gas sink layers with capacities have been created using the capacity calculator tables provided by the partners in Arizona, Colorado, New Mexico, Oklahoma and Utah. The data in these tables were added to the GIS layers using a standardized data model which defines 34 characterization attributes including sequestration capacity. This data model insures attribute consistency between the layers and makes it possible to combine them into one layer for certain uses, including the simplification of the sharing of data layers with NATCARB.

Saline Aquifers

These layers were also created from the data provided by the partners in Arizona, Colorado, New Mexico, Oklahoma and Utah in the form of tables and in most cases shapefiles delineating the boundaries of the aquifers. AGRC created the outlines for New Mexico's aquifers based on criteria provided by Stephen Hook. As with the oil and gas fields, a standardized data model was developed with 17 characterization attributes including the estimated sequestration capacity.

Coalbed Methane

Generalized boundaries for coal bed methane sinks are included in the database. These will be refined as more data becomes available. More detailed coalbed methane areas for Utah were provided by the Utah Geological Survey.

Point Sources

A GIS layer portraying power plants in the region has been created. This layer includes total CO_2 emitted annually as an attribute. Layers representing smaller sources have also been created. Also included in the database are layers showing areas within 10, 25, 50, 75, and 100 miles of major sources. These layers help give a quick view of what features, including sinks, are within the respective distances of these sources.

All source and sink data in the database has been shared with the integrated assessment team at Sandia National Laboratory. This entailed writing scripts to provide output in the format required by Sandia's assessment application. AGRC also wrote a program to calculate true distances given the latitude and longitude used by the application.

AGRC helped Stephen Hook calculate preliminary capacity figures for saline aquifers and oil and gas fields before more refined methods became available. AGRC has also produced many maps and figures for use in posters and presentations.

The source and sink layers can be explored via an interactive internet map, http://atlas.utah.gov/co2sw , which has been developed and maintained by AGRC. Anyone with internet access can view this map. The various data layers can be queried. For example, all oil and gas fields with a capacity of greater than 100 million tonnes can be selected. The data layers can also be interactively explored with the map navigation tools and any feature can be clicked on for a list of its attributes to be displayed. Other tools are available to allow the user to measure distances and find features within a specified distance of another feature. Printable maps can be generated from the site as well. Upgrades to the usability of this map, as well as the addition of more layers are planned for the coming weeks.

In addition to the partnership's interactive map, AGRC has cooperated with NATCARB by creating a map service and adding the source and sinks layers in the database to the NATCARB interactive map via their administration interface. In addition to sharing this data, AGRC has participated in conference calls as well as meetings in Kansas and California with the NATCARB team.

Conclusions

The Southwest Regional Partnership on Carbon Sequestration is pleased to present this summary of its Phase 1 program, which concluded in December, 2005. The Partnership was tasked to evaluate and demonstrate plans for achieving an 18% reduction in carbon intensity by 2012. To achieve this objective, the Partnership carried out the following tasks:

(1) analysis of CO_2 storage options in the region, including characterization of storage capacities and transportation options,

(2) analysis and summary of CO_2 sources,

(3) analysis and summary of CO_2 separation and capture technologies employed in the region,

(4) evaluation and ranking of the most appropriate sequestration technologies for capture and storage of CO_2 in the Southwest Region,

(5) dissemination of existing regulatory/permitting requirements, and

(6) assessment and initiation of public knowledge and acceptance of possible sequestration approaches.

A conclusion of the Southwest Partnership's Phase I program is that the most convenient and practical "first opportunities" for sequestration would lie with existing CO_2 pipelines in the region. The Partnership also developed action plans for six Phase II validation tests in the region. The suite of tests includes four geologic pilot tests distributed among Utah, New Mexico, and Texas, in addition to a regional terrestrial sequestration pilot program focusing on improved terrestrial MMV methods and reporting approaches specific for the Southwest region. The remaining validation test consists of a local-scale terrestrial pilot involving restoration of riparian lands for sequestration purposes. The validation test will use desalinated waters produced from one of the geologic pilot tests.

Phase I regional characterization efforts, including and especially better resolved estimates of storage capacities and identification of ideal storage sites, is continuing in Phase II.

TITLE 12. NATURAL RESOURCES

CHAPTER 7. OIL AND GAS CONSERVATION COMMISSION

(Authority: A.R.S. § 27-514 et seq.)

ARTICLE 1. OIL, GAS, HELIUM, AND GEOTHERMAL RESOURCES

ARTICLE 2. REPEALED

Article 2, consisting of R12-7-201 through R12-7-221, R12-7-231 through R12-7-234, R12-7-241 through R12-7-246, R12-7-251, R12-7-252, R12-7-261 through R12-7-264, R12-7-271, R12-7-272, R12-7-281, R12-7-291 through R12-7-294, and Appendix 1, repealed effective January 2, 1996 (Supp. 96-1).

ARTICLE 1. OIL, GAS, HELIUM, AND GEOTHERMAL RESOURCES

R12-7-101. Definitions

In this Chapter, unless the context otherwise requires:

"API" means American Petroleum Institute.

"Barrel" means 42 (US) gallons measured at 60° F and atmospheric pressure at sea level.

"BTU" means British thermal unit and represents the quantity of heat required to raise the temperature of 1 pound of water 1° F at or near 39.2° F.

"Condensate" means liquid hydrocarbons recovered at the earth's surface as a result of condensation due to reduced pressure or temperature of petroleum hydrocarbons that exist in a gaseous phase in subsurface reservoir rocks.

"Cubic foot of gas" means the volume of gas contained in 1 cubic foot of space at a standard pressure base of 14.73 pounds per square inch absolute and a standard temperature base of 60° F.

"Gas well" means a well that produces with a gas-oil ratio in excess of 50,000 cubic feet of gas per barrel of oil.

"Injection well" means a well used to inject air, gas, water, or other substance into an underground stratum.

"Mcf" means 1000 cubic feet of gas reported at a pressure base of 14.73 pounds per square inch absolute and a standard temperature base of 60° F.

"Oil well" means a well that produces with a gas-oil ratio less than 50,000 cubic feet of gas per barrel of oil.

"Operator" means any person authorized by an owner to control the day-to-day activities of a well or production or refining facility.

"Shut-in well" means a well that is capable of production in paying quantities, is completed as a producing well, and is not presently being operated.

"Stratigraphic test or core hole test" means drilling a hole for the sole purpose of obtaining geological information.

"Temporarily abandoned well" means a well that is not capable of production in paying quantities and is not presently being operated.

Historical Note

Former B; Former Section R12-7-101 renumbered and amended as Section R12-7-102, former Section R12-7-100 renumbered and amended as Section R12-7-101 effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1). Amended by final rulemaking at 6 A.A.R. 4827, effective December 7, 2000 (Supp. 00-4).

R12-7-102. Repealed

Historical Note

Former 101; Former Section R12-7-102 renumbered and amended as Section R12-7-103, former Section R12-7-101 renumbered and amended as Section R12-7-102 effective September 29, 1982 (Supp. 82-5). Repealed effective January 19, 1994 (Supp. 94-1).

R12-7-103. Bond

A. An operator shall file a performance bond with the Commission prior to approval of a permit to drill a new well, re-enter an abandoned well, or assume responsibility as operator of existing wells. The bond amount shall be $10,000 for a well drilled to a total depth of 10,000 feet or less, $20,000 for a well drilled deeper than 10,000 feet, or $25,000 as a blanket bond to cover all wells and shall be payable to the Oil and Gas Conservation Commission, State of Arizona, and conditioned upon the faithful performance by the operator of the duty to drill each well in a manner to prevent waste, plug each dry or abandoned well, repair each well causing waste or pollution, and maintain and restore the well site.

B. The Commission shall accept a bond in the form of a surety bond, executed by the operator as principal and a corporate surety authorized to do business in Arizona, a certified check, or a certificate of deposit at a federally insured bank authorized to do business in Arizona.

C. Transfer of property does not release the bond. If a property is transferred and the principal desires to be released from the bond, the procedure shall be as follows:

1. The principal on the bond shall notify the Commission in writing of the proposed transfer, giving the location of each well, the date and number of each permit to drill, and the name, address, and telephone number of the proposed transferee.
2. The transferee of any well or of the operation of any well shall declare to the Commission in writing acceptance of the transfer and of the responsibility of each well and shall submit a new bond or bonds unless the transferee's blanket bond applies to the well or wells.
3. When the Commission approves the transfer, the transferor is released from all responsibility with respect to the well or wells, and the Commission shall notify the principal and the bonding company in writing that the transferor's applicable bond or bonds are subject to release.

Historical Note

Former Rule 102; Former Section R12-7-103 renumbered and amended as Section R12-7-104, former Section R12-7-102 renumbered and amended as Section R12-7-103 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-104. Application for Permit to Drill

A. Before drilling or re-entering any well or conducting any surface disturbance associated with such activity, the operator shall submit to the Commission an application for permit to drill or re-enter and obtain approval. The complete application package shall contain:

1. An application for permit to drill on a form provided by the Commission, which shall include the operator's name, address, and phone number, and a description of the proposed well and its location;
2. A well and well-site construction plan that meets the requirements of R12-7-108 through R12-7-118;
3. A plat, prepared and certified by a registered surveyor bearing the surveyor's certificate number, on which is shown the exact acreage or legal subdivision allotted to the well as required by R12-7-107, the well's exact location, and its ground-level elevation;
4. An organization report as required by R12-7-194;
5. A performance bond, as required by R12-7-103; and
6. A fee of $25.00 per well.

B. The Commission shall mail to the applicant, within 30 days of receipt of the application required in subsection (A), written notice of administrative completeness or a detailed list of deficiencies. Within 30 days of receipt of all items required in subsection (A), the Commission shall review the application and:

1. Issue a permit to drill, or
2. Provide a written explanation in compliance with A.R.S. § 41-1076 to the applicant if the application is not approved.

C. Time-frames
1. The administrative review period is 30 days. The substantive review period is 30 days. The overall time-frame is 60 days.
2. For the purpose of this subsection, intermediate Saturdays, Sundays, and legal holidays shall be included in the time-frame computation. The last day of the notice period shall be included in the computation unless it is a Saturday, Sunday, or legal holiday.

D. Unless operations are commenced within 180 days after date of approval, the permit to drill shall become null and void unless an extension in writing is granted by the Commission.

E. In case of imminent danger to public safety or of contamination of the environment, the Commission may authorize the drilling of an emergency relief or offset well to reduce the danger or hazard. Within 10 days of commencing an emergency relief or offset well, the operator shall file an application as required in subsection (A). No well drilled under this subsection shall be used for production unless it conforms to the provisions of R12-7-107.

Historical Note

Former Rule 103; Former Section R12-7-104 renumbered and amended as Section R12-7-105, former Section R12-7-103 renumbered and amended as Section R12-7-104 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1). Amended effective June 6, 1997 (Supp. 97-2).

R12-7-105. Change of Location

A. No operator shall drill a well in a location other than that authorized by the permit issued pursuant to R12-7-104 until the following requirements have been met:
1. If the operator decides to change the location before drilling the well, an amended application for permit to drill shall be filed showing the new location.
2. If it is determined that the location is erroneously described on the permit after drilling has begun, the operator shall obtain a new permit showing the correct location.

B. If the new location is at an authorized point in the approved drilling unit as provided in the initial permit, the application may be made by electronic communication and the Commission may by electronic communication authorize the commencement or continuance of drilling operations. Within ten days after obtaining such authorization, the operator shall file an amended application showing the new location. An amended permit may be issued and the old permit cancelled without payment of additional fee.

C. If the new location is located outside the approved drilling unit covered by the initial permit, no drilling shall be commenced or continued until a new application for permit to drill is filed and approved as required by R12-7-104, including payment of an additional fee.

Historical Note

Former Rule 104; Former Section R12-7-105 renumbered and amended as Section R12-7-106, former Section R12-7-104 renumbered and amended as Section R12-7-105 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-106. Identification of Wells, Producing Leases, Tanks, Refineries, Buildings, and Facilities

A. The operator shall mark each drilling, producing, injection, or shut-in well in a conspicuous place with the operator's name, lease name or number, well number, and the legal description of the well's location.

B. The operator shall mark each abandoned well as required in R12-7-127(F).

C. The operator shall mark all tank batteries, gasoline plants, structures, storage buildings, compressors, and compressor buildings, and all other storage or transportation equipment with the operator's name, address, telephone number, lease name or number, and location. All structures within a fenced yard may be identified by a single sign at the principal outside entrance to the yard.

D. The operator of a storage-well facility shall clearly mark each well with the operator's name, lease name or number, and well number. Each outside entrance to the facility shall be marked with the operator's name, address, and one or more emergency response telephone numbers.

E. The operator of a refinery shall mark each facility at each outside entrance with the operator's name, address, and one or more emergency response telephone numbers.

F. Sign lettering shall contrast strongly with the background and be large enough to be legible under normal conditions at a distance of 25 feet. The operator shall preserve these markings and keep them legible and up to date.

Historical Note

Former Rule 105; Former Section R12-7-106 renumbered and amended as Section R12-7-107, former Section R12-7-105 renumbered and amended as Section R12-7-106 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-107. Spacing of Wells

A. Every well drilled for oil shall be located on a drilling unit consisting of approximately 80 contiguous surface acres within two governmental quarter-quarter sections or lots having one side in common, upon which there is not located, and of which no part is attributed to, any other well completed in or drilling to, the same pool.
1. In areas not covered by United States Public Land Surveys, the oil drilling unit shall consist of an area bounded by four sides intersecting at angles of not less than 85 degrees or more than 95 degrees. The unit shall contain at least 76 contiguous surface acres and its maximum dimension shall not exceed 3,000 feet.
2. No well drilled for oil shall be located closer than 330 feet to any boundary of the drilling unit or closer than 330 feet to the shortest center line of the drilling unit.
3. No well drilled for oil shall be located within a quarter-quarter section or lot having one side in common with another quarter-quarter section or lot upon which there is located a well completed in or drilling to the same pool.

B. Every well drilled for gas shall be located on a drilling unit consisting of approximately 640 but not less than 600 contiguous surface acres within one governmental section upon which there is not located, and of which no part is attributed to, any other well completed in or drilling to the same pool.
1. In areas not covered by United States Public Land Surveys, the gas drilling unit shall consist of an area bounded by four sides intersecting at angles of not less than 85 degrees or more than 95 degrees. The unit shall contain at least 600 contiguous surface acres and its maximum dimension shall not exceed 8,500 feet.
2. No well drilled for gas shall be located closer than 1,660 feet from any boundary of the drilling unit.

C. Every well drilled for geothermal resources shall be located on a drilling unit approved or as modified by the Commission. The Commission may require modification to minimize well interference and provide the necessary volume of geothermal resources for the intended use, to protect correlative rights, and to protect the environment.

D. If the operator drills a horizontal segment, that horizontal segment shall be located:
1. At least 330 feet from the boundary of the spacing unit in the case of an oil well;
2. At least 1,660 feet from the boundary of the spacing unit in the case of a gas well; and
3. As approved or modified by the Commission in the case of a geothermal well.

E. The Commission may grant exceptions to the regular locations specified in subsections (A), (B), and (C) only after notice and hearing.
1. Applications for exception shall fully state the reasons why the exception is necessary and shall include a plat prepared and certified by a registered surveyor bearing the surveyor's certificate number showing all other completed, drilling, and permitted wells on the property and all adjoining surrounding properties and wells.
2. Exceptions shall be granted only after the operator provides by certified mail a copy of the application to all adjoining lessees, and only after the Commission deter mines in a duly noted public hearing that the application is valid.
3. The Commission may grant an exception location without notice or hearing when topography prohibits drilling at a regular location on the drilling unit.
4. If an existing well's classification changes due to its recompletion or due to a change in the nature of the product being produced, the Commission may approve an irregular location application with supporting data and ten days' notice and hearing, provided that the operator furnish the Commission with proof of mailing of a copy of the application to all operators within a one-mile radius of the acreage to be dedicated.

F. In order to prevent waste, the Commission may, after notice and hearing, fix different spacing requirements and require lesser or greater acreage for drilling units in any specific oil, gas, or geothermal resource pool notwithstanding the provisions of subsections (A), (B), and (C).

G. The Commission may order pooling and integration of interests pursuant to A.R.S. §§ 27-505 and 27-666.

Historical Note

Former Rule 106; Former Section R12-7-107 renumbered and amended as Section R12-7-108, former Section R12-7-106 renumbered and amended as Section R12-7-107 effective September 29, 1982 (Supp. 82-5). Correction, paragraph (1) "No well drilled for oil shall be located within the bounds of a quarter-quarter section or lot . . ." (Supp. 82-6). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-108. Pit for Drilling Mud and Drill Cuttings

A. Each operator shall maintain an adequate supply of drilling mud to confine oil, gas, or water to its native stratum during the drilling of any well and shall provide, before drilling is commenced, an adequate pit, either earthen or portable, for the drilling mud or the accumulation of drill cuttings.

B. An earthen pit used for drilling, deepening, testing, reworking, or fracturing shall be constructed of or sealed with an impervious material and shall be maintained to prevent escape of any contained substance. Earthen pits shall be fenced on all sides at all times.

C. Earthen pits shall be constructed and maintained to prevent the entrance of outside runoff water and the fluid level in earthen pits shall be kept at all times at least 18 inches below the lowest point of the embankment.

D. Any mud contained in an earthen pit shall be water-based and contain no more than one pound per barrel of thinner for each 25 pounds per barrel of barite or hematite. Mud containing chromium lignosulfonate, ferrochrome lignosulfonate or other chromium compounds shall not be used.

E. Drilling mud shall be disposed of by either recycling or commercial off-site disposal. Mud described in subsection (D) may be disposed of by evaporation and subsequent leveling of the pits.

Historical Note

Former Rule 107; Former Section R12-7-108 renumbered and amended as Section R12-7-109, former Section R12-7-107 renumbered and amended as Section R12-7-108 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-109. Repealed

Historical Note

Former Rule 108; Former Section R12-7-109 renumbered and amended as Section R12-7-110, former Section R12-7-108 renumbered and amended as Section R12-7-109 effective September 29, 1982 (Supp. 82-5). Repealed effective January 19, 1994 (Supp. 94-1).

R12-7-110. Surface Casing Requirements

A. Surface casing shall be set at a sufficient depth to protect and isolate all known or reasonably estimated freshwater zones and to prevent blowouts or uncontrolled flows. The surface casing shall:
1. Be of sufficient size to permit the use of an intermediate string or strings of casing;
2. Be set in or through an impervious formation and shall be cemented by the pump and plug, displacement, or other method approved by the Commission;
3. Be cemented back to surface either during the primary cement job or by remedial action; and
4. Have API-approved centralizers on the bottom three joints as a minimum.

B. Cement shall be allowed to set a minimum of 12 hours under the lowest necessary pressure before drilling the cementing plugs or initiating tests.

C. Surface casing shall be pressure tested for at least 30 minutes to 70% of internal yield pressure or one psi per foot of casing depth, whichever is less. If a drop of more than 10% of the test pressure should occur, the casing shall be considered defective and corrective measures shall be applied. In wells drilled with cable tools, casing may be tested by bailing the well dry. The hole shall remain satisfactorily dry for one hour before commencing further operations. Results of the above test and any remedial action shall be reported in writing to the Commission within 15 days following the test.

D. The operator of a well shall notify the Commission at least 48 hours before setting surface casing so that a representative of the Commission may witness all or a part of the operations required in this Section.

Historical Note

Former Rule 109; Former Section R12-7-110 renumbered and amended as Section R12-7-111, former Section R12-7-109 renumbered and amended as Section R12-7-110 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-111. Intermediate and Production Casing and Tubing Requirements

A. All producing wells shall be completed with production casing set directly above or through the producing interval and cemented by the pump and plug method, or other method approved by the Commission, to protect the zones to be produced. An intermediate string of casing may be required to seal off all potentially productive, lost circulation, and abnormally pressured zones that may be encountered in the well, except those to be produced. The Commission may require casing strings to be cemented from the maximum depth of the casing to at least 50 feet inside the previously run string of casing. For liners, a minimum of 100 feet of overlap between a string of casing and the next larger casing is required.

B. Strings of casing shall stand cemented for at least 12 hours before drilling out the cementing plugs or initiating such tests as the Commission may require.

C. Strings of intermediate and production casing shall be pressure tested to 70% of the manufacturer's rated internal yield pressure or one psi per foot of casing depth, whichever is less. In cases where combination strings utilizing casing of varied grades and weights are used, the above test pressures shall apply to the lowest pressure rated component used. If pressure declines more than 10% in 30 minutes, the casing shall be considered defective and corrective measures shall be applied.

1. In wells drilled with cable tools, casing may be tested by bailing the well dry, in which case the hole shall remain satisfactorily dry for at least one hour before commencing further operations on the well. Results of the above test and any remedial action shall be reported in writing to the Commission within 15 days following the test.

D. All flowing oil wells shall have tubing set as near the bottom as practical with tubing perforations not more than 250 feet above the top of the zone to be produced. Wells may be completed with small-diameter casing, which is generally understood in the industry to be "slim hole" or "tubingless" completions, in lieu of tubing.

E. The operator shall notify the Commission at least 48 hours before setting any casing string so that a representative of the Commission may witness all or a part of the operations required in this Section.

Historical Note

Former Rule 110; Former Section R12-7-111 renumbered and amended as Section R12-7-112, former Section R12-7-110 renumbered and amended as Section R12-7-111 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-112. Defective Casing or Cementing

A. The operator shall take immediate steps to correct the casing condition of any well that may cause, or is causing, underground waste of oil, gas, or geothermal resources or contamination of fresh waters. These steps shall restore the integrity of the casing to the standards set in R12-7-110(C) and R12-7-111(C).

B. The operator shall report the corrective actions taken in writing to the Commission within 15 days of the completion of the work. If the condition of the casing cannot be corrected, the well shall be plugged and abandoned in compliance with R12-7-127.

Historical Note

Former Rule 111; Former Section R12-7-112 renumbered and amended as Section R12-7-113, former Section R12-7-111 renumbered and amended as Section R12-7-112 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-113. Blowout Prevention and Related Well-control Equipment

A. When drilling in areas where pressures are unknown or high pressures do or are likely to exist, a blowout preventer, control head and related lines, and connections necessary to control the pressures and to keep the well under control at all times shall be installed as soon as the surface casing is set.

B. Upon installation, all ram-type blowout preventers and related equipment shall be pressure tested to the lesser of the manufacturer's full working pressure rating of the equipment, 70% of the minimum internal yield pressure of any casing subject to test, or one psi per foot of the last casing string depth. Annular or bag-type preventers shall be tested to the lesser of 1000 psi or 50% of full working pressure on installation. The blowout preventer and related equipment shall be tested:

1. After each string of casing is set in the well,
2. Not less than once each 14 days from each control station, and
3. Following repairs that require disconnection of any pressure seal in the assembly. Only the component repaired or replaced needs be tested unless alteration or repair occurs at a normal full blowout preventer test period.

C. The operator shall maintain records of the tests required in this Section until the well is completed and shall submit copies of these records to the Commission if required.

Historical Note

Former Rule 112; Former Section R12-7-113 renumbered and amended as Section R12-7-114, former Section R12-7-112 renumbered and amended as Section R12-7-113 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-114. Recovery of Casing

Recovery of inside or outside strings of casing is prohibited unless written approval is obtained from the Commission. Approval shall be given only for wells where mudding and plugging operations can be carried out safely and the well abandoned in compliance with R12-7-127.

Historical Note

Former Rule 113; Former Section R12-7-114 renumbered and amended as Section R12-7-115, former Section R12-7-113 renumbered and amended as Section R12-7-114 effective September 29, 1982 (Supp. 82-5). Section repealed, new Section adopted effective January 19, 1994 (Supp. 94-1).

R12-7-115. Deviation of Hole and Directional Drilling

A. No drilling well may be intentionally deviated from its normal vertical course unless the operator shall first file application and obtain approval from the Commission after notice and hearing. The normal vertical course of a well is defined by a tolerance wherein the maximum deviation of the well does not exceed a 100-foot radius from the surface location. Deviation from the vertical for short distances is permitted in the drilling of a well without special approval only to straighten the hole, sidetrack junk, or correct other mechanical difficulties.

B. An application for directional drilling shall include:

1. The name, address, and phone number of the operator;
2. The field name, lease name, well number, state permit number, reservoir name, and county where the proposed well is located;
3. A plat or sketch showing the distance from the surface location to section and lease lines and to the target location within the intended producing interval;
4. The reason for the intentional deviation; and
5. The signature of the operator.

C. The operator of any well capable of production and whose producing interval or any portion thereof is located 330 feet or less in the case of an oil well or 1,660 feet or less in the case of a gas well from the boundary of any drilling unit shall run a directional survey before running the production casing.

D. In order to ensure compliance with this Section, the Commission may require the operator to run a directional survey of any hole at the operator's expense. The Commission may require an operator to run a directional survey of any hole at the request of an offset operator at the expense and risk of the offset operator unless the survey shows that the well is completed at a point outside the drilling unit, or at an unauthorized point.

E. Within 30 days following the completion of a directionally drilled well, the operator shall file with the Commission a complete angular deviation and directional survey of the well obtained by a well survey company.

F. Nothing in these rules shall be interpreted to permit the drilling of any well in such manner that it crosses the drilling unit lines, except by approval obtained after notice and hearing.

Historical Note

Former Rule 114; Former Section R12-7-115 renumbered and amended as Section R12-7-116, former Section R12-7-114 renumbered and amended as Section R12-7-115 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-116. Multiple Zone Completions

A. Completions to include production from more than one common source of supply from a single well are prohibited except as authorized by the Commission after notice and hearing. After notice and hearing, the Commission shall maintain a list of zones or reservoirs, by fields, for which multiple completions have been authorized.

B. Operators shall file an application for multiple completion with the Commission and shall demonstrate the method to be used to keep the production streams separate. The application shall be accompanied by:

1. An electrical log or other acceptable log with tops and bottoms of formations or producing zones and perforated intervals shown and marked;
2. A diagrammatic sketch of the multiple completion installation indicating make, type, and setting depths of packer or packers;
3. A plat showing the location of the well and all offset wells and the names and addresses of operators of all leases offsetting acreage dedicated to applicant's well; and
4. Proof of mailing of application for multiple completion to all offset operators.

C. The Commission may approve subsequent applications for multiple completion of the same zones or reservoirs in a field administratively without a hearing, provided that:

1. The applicant can show that the Commission has approved and listed the zones or reservoirs as required in subsection (A);
2. The subsequent application is filed as required in subsection (B); and
3. The Commission receives no protest to the application after a 15-day holding period. A hearing shall be called if a protest is received.

D. Within 15 days of setting the final packer or packers, the operator shall file a report with the Commission identifying the well and its location showing the make, type, and depth set of each packer and the signature of the supervisor of the work. This report shall include the results of a packer leakage test and detail for each separate common source of supply, its stabilized shut-in pressure, producing pressure, and the simultaneous shut-in pressure on each other separate common source of supply. The operator shall notify the Commission at least 48 hours in advance of performing the tests required in this subsection.

E. Every operator of a multi-completed well shall operate, produce, and maintain the well to prevent commingling of production from the separate sources of supply. The Commission may require any multi-completed well to be tested at any time to demonstrate the effectiveness of the separation of sources of supply. These tests may be witnessed by representatives of the Commission and by offset operators.

Historical Note

Former Rule 115; Former Section R12-7-116 renumbered and amended as Section R12-7-117, former Section R12-7-115 renumbered and amended as Section R12-7-116 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-117. Artificial Stimulation of Oil and Gas Wells

A. An operator shall report the artificial stimulation of any well to the Commission in writing within 15 days of the stimulation showing the type of stimulation, the amounts and types of materials used, stimulation pressures applied, and the flow and pressure results before and after stimulation.

B. If the artificial stimulation of a well results in any damage to the producing formation, a freshwater formation, casing, or casingseat that permits communication between fluid-bearing zones, the operator shall immediately notify the Commission and proceed with diligence to correct the damage. If the artificial stimulation results in irreparable damage to the well, the operator shall plug and abandon the well pursuant to R12-7-127.

Historical Note

Former Rule 116; Former Section R12-7-117 renumbered and amended as Section R12-7-118, former Section R12-7-116 renumbered and amended as Section R12-7-117 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1). Amended effective June 5, 1998 (Supp. 98-2).

R12-7-118. Operations in Hydrogen Sulfide Environments

A. When drilling, redrilling, deepening, or plugging back operations in areas where the formations to be penetrated are known to contain or are expected to contain hydrogen sulfide gas (H_2S) in excess of 10 ppm and in areas where the presence or absence or H_2S is unknown, the operator shall contract the services of an approved H_2S safety company to be on location at the known or expected depths.

B. A written contingency plan providing details of actions to be taken to alert and protect operating personnel and members of the public in the event of an accidental release of H_2S gas shall be submitted to the Commission as part of the initial application for a permit to drill or as a sundry notice.

Historical Note

Former Rule 117; Former Section R12-7-118 renumbered and amended as Section R12-7-119, former Section R12-7-117 renumbered and amended as Section R12-7-118 effective September 29, 1982 (Supp. 82-5). Amended effective January 19, 1994 (Supp. 94-1).

R12-7-119. Wellhead and Lease Equipment

A. The operator shall install and maintain valves, fittings, and wellhead connections that

1. Have a rated working pressure equivalent to at least 100% of the calculated or known surface pressure to which they may be subjected from the producing zone;
2. Allow well production, productivity, deliverability, and transient pressure tests;
3. Permit pressures to be obtained on both casing and tubing; and
4. Control the flow of the oil, gas, or geothermal resources on a flowing well.

B. The operator shall produce flowing oil wells into tanks equipped with high-low pressure and high-low level shut-in controls and shall install a safety valve that automatically closes on the wellhead in the event of surface production equipment malfunctions.

C. The operator shall equip artificial lift wells with wellhead safety sensors to shut off the source of power in the event of abnormally high or low flowline pressures.

Historical Note

Former Rule 118; Former Section R12-7-119 renumbered and amended as Section R12-7-120, former Section R12-7-118 renumbered and amended as Section R12-7-119 effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-120. Notification of Fire, Leaks, Spills, and Blowouts

A. Each operator shall notify the Commission within 24 hours of any fire, break, leak, spill, overflow, or blowout that occurs at any oil, gas, or geothermal drilling, producing, or transportation facility, or at any injection, disposal, or storage facility.

B. Each operator shall file a final written report within 15 days of resolving incidents described in subsection (A) giving the location by quarter-quarter section, township, and range; date and time of occurrence; specific nature and cause of the incident; resultant damage; action taken to correct the situation and prevent its reoccurrence; and losses of hydrocarbons or geothermal resources.

Historical Note

Former Rule 119; Former Section R12-7-120 renumbered and amended as Section R12-7-121, former Section R12-7-119 renumbered and amended as Section R12-7-120 effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-121. Well Completion and Filing Requirements

A. An operator shall file a completion report with the Commission within 30 days after a well is completed. The completion report shall contain a description of the well and lease, the casing, tubing, liner, perforation, stimulation, and cement squeeze records, and data on the initial production. The operator shall submit other well data to the Commission within 30 days of the date the work is done, including any:

1. Lithologic, mud, or wireline log;
2. Directional survey;
3. Core description and analysis;
4. Stratigraphic or faunal determination;
5. Formation or drill-stem test;
6. Formation fluid analysis; or
7. Other similar information or survey.

B. An operator shall furnish samples of drilled cuttings, at a maximum interval of 10 feet, to the Commission within 30 days after drilling is completed. The operator may furnish samples of continuous core in chips at 1-foot intervals. The operator shall:

1. Wash and dry all samples;
2. For each sample, place approximately 3 tablespoons of the sample in an envelope with the following identifying information: the well from which the sample originates, the location of the well, the Commission's permit number for the well, and the depth at which the sample is taken; and
3. Package sample envelopes in protective boxes and ship prepaid to:

   Oil & Gas Administrator
   Arizona Geological Survey
   416 West Congress, Suite 100
   Tucson, AZ 85701

C. The Commission shall keep all well information required by this Section confidential for 1 year after the drilling is completed unless the operator gives written permission to release the information at an earlier date. The Commission shall provide notice to the operator 60 days before confidential records become subject to public inspection and, at the operator's request, extend the confidential period for 6 months to 2 years if the Commission finds that the operator has demonstrated that release would harm the operator's competitive position with respect to unleased land in the vicinity of the well.

Historical Note

Former Rule 120; Former Section R12-7-121 renumbered and amended as Section R12-7-122, former Section R12-7-120 renumbered and amended as Section R12-7-121 effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1). Amended by final rulemaking at 6 A.A.R. 4827, effective December 7, 2000 (Supp. 00-4).

R12-7-122. Recompletion and Routine Maintenance Operations

A. After a well has been completed, it shall not be deepened, redrilled, plugged back, reworked, or recompleted in a different zone, without prior approval by the Commission of a written application showing the character of the proposed work and the time it will begin. The Commission shall notify the applicant in writing whether the proposed work is approved or disapproved.

B. In the case of an emergency, an application may be made by electronic communication, and the Commission may by electronic communication authorize the work; however, written application required in subsection (A) shall be filed with the Commission within 10 days after emergency authorization is given, even though the work has already been commenced or completed. The Commission shall confirm the emergency authorization in writing upon receipt of the written application.

C. Written approval from the Commission is not required on acidizing, fracturing, and reperforating, or other routine well operations designed to restore or maintain production.

D. Within 15 days following the completion of any work described in this Section, the operator shall file a written report with the Commission identifying the well and fully describing the work performed. If the well is recompleted, a completion report shall be filed as required by R12-7-121.

Historical Note

Former Section R12-7-121 renumbered and amended as Section R12-7-122 effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-123. Reserved

R12-7-124. Reserved

R12-7-125. Temporarily Abandoned and Shut-in Wells

A. If drilling, injection, or production operations at a well are suspended, or have been suspended for 60 days, an operator shall plug the well under R12-7-127 unless the Commission permits the well to be temporarily abandoned or shut-in. The Commission shall not classify a well as shut-in until the operator submits a completion report under R12-7-121.

B. An operator may temporarily abandon or shut-in a well for up to 5 years if the operator demonstrates to a quorum of the Commission a future beneficial use of the well and submits a Sundry Notice to the Commission containing the following information:
1. Evidence of casing integrity as required in R12-7-112 including a complete description of the current casing, cementing, and perforation record of the well;
2. The stimulation and cement squeeze record and complete data on the results of any well tests performed to date; and
3. All other well data required in R12-7-121(A).

C. Before an approved time-frame for a temporarily abandoned or shut-in well expires, the operator shall return the well to beneficial use under a plan approved by the Commission, permanently plug and abandon the well, or apply for an extension to temporarily abandon or shut-in the well. If the integrity of the well casing is in question, the Commission may require the operator to:
1. Prove casing integrity in accordance with R12-7-112;
2. Plug any well that fails to meet the casing integrity required by R12-7-112; and
3. Re-test the well in accordance with R12-7-150 to continue shut-in status.

D. An operator shall ensure that no work begins on a temporarily abandoned or shut-in well until approved by the Commission. The operator shall give at least 24 hours' notice to the Commission before any work begins. Within 15 days of completing the proposed work, the operator shall file a written report with the Commission fully describing the work performed including a copy of all test rates, pressures, and fluid analyses.

Historical Note

Adopted effective January 2, 1996 (Supp. 96-1). Amended by final rulemaking at 6 A.A.R. 4827, effective December 7, 2000 (Supp. 00-4).

R12-7-126. Application to Plug and Abandon

A. Before abandoning any well, the operator shall submit an application to plug and abandon to the Commission and obtain approval. The application shall set forth the name and location of the well, the mechanical condition of the well, the productive zone and latest production, and a complete description of the proposed work. The plan shall provide for the protection of all formations containing usable-quality water, oil, gas, or geothermal resources.

B. In the case of a drilling well or an emergency, the application may be made by electronic communication, and the Commission may by electronic communication authorize the work; however, the operator shall file a written application within 10 days after the emergency authorization is given even though the work has already been commenced or completed. The Commission shall confirm the emergency authorization in writing upon receipt of the written application.

Historical Note

Former Rule 201; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-127. Plugging Methods and Procedures

A. Before abandoning any well, the operator shall submit an application to plug and abandon to the Commission for approval as required in R12-7-126. All down-hole plugging shall be conducted through drill pipe or tubing, unless otherwise approved by the Commission.

B. Open hole
1. A cement plug shall be placed to extend at least 50 feet below the bottom, except as limited by total depth or plugged back total depth, to 50 feet above the top of any zone containing fluid with a potential to migrate, any zone of lost circulation, and any zone containing potentially valuable minerals, including noncommercial hydrocarbons, coal, and oil shale.
2. All freshwater zones shall be plugged with a continuous cement plug which shall extend from at least 50 feet below to at least 50 feet above the freshwater zone, or a 100-foot plug shall be centered across the base of the freshwater zone and a 100-foot plug shall be centered across the top of the freshwater zone.
3. Open hole below the shoe of cemented casing shall be plugged with cement which shall extend from at least 50 feet below to at least 50 feet above the shoe.

C. Cased hole
1. A cement plug shall be placed opposite all open perforations and extend to a minimum of 50 feet below, except as limited by total depth or plugged back total depth, to 50 feet above the perforated interval. In lieu of the cement plug, a bridge plug may be placed within 50 to 100 feet above the open perforations and followed by at least 50 feet of cement.
2. If any casing is cut and recovered, a cement plug shall be placed to extend at least 50 feet above and below the stub.
3. No annular space that extends to the surface shall be left open to the drilled hole below. If this condition exists, a minimum of the top 100 feet of each annulus shall be plugged with cement.

D. Plugging mud having the proper weight and consistency to prevent movement of other fluids into or within the bore hole shall be placed across all intervals not plugged with cement. In the absence of other information at the time plugging is approved, plugging mud shall be made up with a minimum of 15 pounds per barrel of sodium bentonite and a nonfermenting polymer, have a minimum consistency of 9 pounds per gallon, a minimum viscosity of 50 seconds per quart, and mixed with fresh water.

E. A cement surface plug of at least 50 feet shall be placed in the smallest casing which extends to the surface. The top of this plug shall be placed as near the eventual casing cut-off point as possible.

F. The abandoned well shall be marked by a piece of metal pipe not less than 4 inches in diameter securely set in cement and extending at least 4 feet above the general ground level. The well location and identity shall be permanently inscribed as required in R12-7-106(A). An abandoned well location on tilled or otherwise unique land shall be marked in a manner approved by the Commission.

G. The drill site of an abandoned well shall be restored as nearly as possible to its natural state, to the satisfaction of the Commission. All pits shall be filled and all equipment and debris shall be removed from the location.

H. The operator shall notify the Commission at least 48 hours before starting abandonment operations to allow a representative of the Commission to witness the operations required in this Section. To ensure the integrity or placement of any plug, the representative may order the plug to be tested.

I. Within 15 days after the plugging of any well, the operator shall file with the Commission a plugging record setting forth in detail the method used in plugging the well, including the casing record; the size, kind, and depth of plugs used; and the name and depth interval of each formation containing fresh water, oil, gas, or geothermal resources.

J. Seismic shot holes
1. All seismic shot holes shall be plugged and abandoned within 30 days of firing.
2. Seismic shot holes which do not encounter freshwater zones shall be filled with a high-grade bentonite slurry or some other comparable plugging material as approved by the Commission.
3. Seismic shot holes which do encounter freshwater zones shall be plugged with cement in accordance with the applicable provisions of subsections (B) and (D).
4. Seismic shot-hole locations shall be restored in accordance with subsection (G) and the operator shall file a plugging record in accordance with subsection (I).

Historical Note

Former Rule 202; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-128. Stratigraphic, Core, and Seismic Holes

A. Any hole drilled for stratigraphic, core, or seismic purposes shall comply with all rules in this Chapter pertaining to the drilling of a well except the spacing provisions of R12-7-107.

B. Each hole drilled for stratigraphic, core, or seismic purposes shall be plugged in accordance with R12-7-126 and R12-7-127. The operator of a stratigraphic or core hole shall submit samples and cores and file a completion report in accordance with R12-7-121.

Historical Note

Former Rule 203; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-129. Wells to be Used as Water Wells

A. The landowner, landowner's agent, or lessee may use any well or exploratory hole as a water well provided that:
1. Written approval is obtained from the Arizona Department of Water Resources;
2. The operator plugs the well in accordance with R12-7-127 to a point immediately below the freshwater strata; and
3. The landowner, landowner's agent, or lessee assumes responsibility for the well and compliance with the provisions of A.R.S. Title 45, Chapter 2 in a signed and notarized water-well responsibility form provided by and filed with the Commission.

B. After filing the notarized water-well responsibility form with the Commission, the landowner, landowner's agent, or lessee shall comply with A.R.S. Title 45, Chapter 2 before modification or abandonment of the well.

C. Upon filing the notarized water-well responsibility form with the Commission, the Commission shall notify the bonding company and operator in writing so that the bond may be cancelled or made no longer effective with respect to that well.

Historical Note

Former Rule 204; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1). Amended by final rulemaking at 8 A.A.R. 3363, effective July 15, 2002 (Supp. 02-3).

R12-7-131. Reserved

R12-7-132. Reserved

R12-7-133. Reserved

R12-7-134. Reserved

R12-7-135. Gas-oil Ratio and Potential Tests

A. Each operator shall conduct a gas-oil ratio test between 5 and 15 days after the completion or recompletion of any well located in a pool which contains both oil and gas. The average daily oil production, the average daily gas production, and the average gas-oil ratio shall be recorded.

B. The results of the gas-oil ratio test shall be reported in writing to the Commission within 15 days after completion of the test.

C. Each operator shall conduct a potential test within 30 days following the completion or recompletion of any well for the production of oil. The results of this test shall be reported in writing to the Commission within 15 days after completion of the test.

Historical Note

Former Rule 301; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-136. Subsurface Pressure Tests and Reservoir Surveys

A. Each operator shall conduct a test, within 30 days after completion, to determine the reservoir pressure on the discovery well of any new pool. The test shall be made after the well has been shut-in for at least 24 hours, and the results shall be reported in writing to the Commission within 15 days after the completion of the test.

B. The Commission may require subsurface pressure measurements on a number of wells in any pool to provide data to determine reservoir characteristics. The survey shall be made by the operator and shall provide a description of the test method and results including fluids, temperature, and pressure data and may require supervision by a qualified agent of the Commission. The results shall be reported in writing to the Commission within 15 days of the completion of the survey.

Historical Note

Former Rule 302; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-137. Commingling of Production from Pools

A. Unless authorized by the Commission, each pool shall be produced as a single common reservoir, with the wells completed, cased, maintained, and operated as the producing media for that pool. Oil production from each pool shall at all times be segregated into separate, identified tanks. The commingling of production from different pools is prohibited, unless authorized by order of the Commission after notice and hearing.

B. The Commission may approve commingling of production upon demonstration by the applicant that such commingling shall not cause waste of reservoir energy or diminish recovery of the resource. Application for approval of commingling shall include the following:
1. Electric or porosity log with tops and bottoms of formations or producing zones and perforated intervals shown and marked;
2. Diagrammatic sketch of the proposed well structure, including make, type and setting depths of packers;
3. The reservoir pressure for each zone or formation pro posed for commingling, the specific gravity and BTU content of the gas if the zone produces gas, and the API gravity and gas-oil ratio of the oil if the zone produces oil;
4. Plat showing the location of the well and all offset wells, and a list of the names and addresses of operators of all leases offsetting the acreage dedicated to the applicant's well;

5. Waiver consenting to the proposed commingling from each offset operator, or in lieu thereof, copies of letters requesting such waiver; and
6. Proof of mailing of notice of application for commingling to all offset operators.

C. The first application for commingling of pools in a field shall be approved by the Commission only after notice and hearing. Subsequent applications, completed as required in subsection (B), for commingling of the same zones in the same field may be approved administratively if, after a 15-day holding period, there are no protests from offsetting operators.

Historical Note

Former Rule 303; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-138. Casinghead Gas

A. All casinghead gas produced and sold or transported away from a lease, except amounts of flare gas, shall be metered and reported monthly in writing to the Commission in standard Mcf and gallons of liquids per Mcf. If the casinghead gas is sold as supply stock for a gasoline plant, the gallons of liquids per Mcf shall be reported. The operator of a lease shall not be required to measure the exact amount of casinghead gas produced and used for fuel purposes in the development and normal operation of the lease.

B. Pending arrangements for disposition of some useful purpose, all casinghead gas that is authorized to be vented shall be burned, and the estimated volume reported monthly as required by R12-7-161.

Historical Note

Former Rule 304; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-139. Use of Vacuum Pumps

A. The use of any device for the purpose of putting a vacuum on any stratum containing oil, gas, or geothermal resources is prohibited unless authorized by the Commission.

B. The Commission may, after notice and hearing, authorize the use of vacuum pumps if the applicant can show that use of the vacuum will not create waste or infringe on correlative rights.

Historical Note

Former Rule 305. Amended effective February 23, 1993 (Supp. 93-1).

R12-7-140. Pollution, Surface Damage, and Noise Abatement

A. An operator of a well, production facility, gasoline plant, gas plant, or pipeline shall conduct operations in a manner that prevents surface or subsurface pollution.

B. An operator shall conduct operations in a manner that prevents oil, gas, salt water, fracturing fluid or any other substance from polluting any surface or subsurface waters.

C. During swabbing and bailing operations or when purging a well, all substances removed from the bore hole shall be placed in a pit or tank and shall not be allowed to pollute any surface or subsurface waters.

D. An operator shall maintain all wellhead connections, surface equipment, lease flow lines, and tank batteries at all times to prevent the escape of oil, gas, produced water, or any other substance.

E. An operator shall report any fire, leak, or blowout to the Commission in accordance with R12-7-120. An operator shall ensure that any pit is constructed and operated in accordance with R12-7-108.

F. An operator shall minimize noise when conducting air drilling operations or when the well is allowed to produce while drilling. An operator shall ensure that the welfare of the operating personnel and the public is not negatively affected by the noise created by the expanding gases.

Historical Note

Former Rule 306. Amended effective February 23, 1993 (Supp. 93-1). Amended by final rulemaking at 8 A.A.R. 3363, effective July 15, 2002 (Supp. 02-3).

R12-7-141. Renumbered

Historical Note

Former Rule 307; Language transferred and amended, see Section R12-7-176 (Supp. 82-5).

R12-7-142. Measurement of Oil

Oil or condensate shall not be transported from a lease until it has been measured. Each transporter shall file a monthly report of the amount of oil or condensate transported from the lease as required by R12-7-185.

Historical Note

Former Rule 308; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-143. Oil Tanks, Fire Walls, and Fire Hazards

A. Oil shall not be stored or retained in an earthen reservoir or an open receptacle. The Commission may require dikes or fire walls to protect life, health, or property. All dikes or fire walls shall be erected and continuously maintained around all permanent oil tanks or batteries that are within the corporate limits of any city, town or village, or where such tanks are closer than 150 feet to any highway or inhabited dwelling, or closer than 1,000 feet to any school or church. The capacity of the dike or firewall shall be 1 1/2 times the capacity of the tank or tanks that it surrounds. The reservoir so formed within the dike shall be kept free from vegetation, water and oil.

B. Anything that might constitute a fire hazard, including potentially flammable items and reckless behavior such as smoking, shall be moved at least 150 feet from the well, tanks, separator, or other equipment.

Historical Note

Former Rule 309. Amended effective February 23, 1993 (Supp. 93-1).

R12-7-149. Reserved

R12-7-150. Capacity Tests of Gas Wells and Geothermal Wells

A. The operator of a producing gas well shall determine its open-flow capacity within 30 days following completion. Additional tests shall be taken as requested by the Commission. When a pipeline connection is available, gas wells shall not be tested by open-flow method, but the open-flow capacity shall be determined by the multipoint or single-point back-pressure test method.

B. The Commission may require tests to determine the quantity and quality of geothermal resources or reservoir energy.

C. The results of the tests required in this Section shall be reported in writing to the Commission within 15 days after the completion of the test.

Historical Note

Former Rule 401; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-151. Measurement of Gas from Gas Wells and Geothermal Resources

A. All gas produced for whatever purpose in gaseous form from gas wells shall be accounted for by metering as approved by the Commission. If the gas is sold, the purchaser shall report the volume purchased as required by R12-7-186. If the gas is delivered to a transportation facility, the transporter shall report the volume transported as required by R12-7-185. The operator shall report the volume produced as required by R12-7-161.

B. Each operator of a geothermal lease shall measure the quantity and quality of all production in accordance with the standard practices, procedures, and specifications generally used in the industry. The operator shall report the production as required in R12-7-161 and the purchaser shall file a report as required in R12-7-186.

Historical Note

Former Rule 402; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-152. Utilization of Gas

A. No gas from any completed gas well shall be:
1. Permitted to escape into the air except for testing when no pipeline connection is available.
2. Used expansively in engines or pumps and then vented, or
3. Used to gas-lift in oil wells unless all gas produced from such gas-lift operations is processed in a gasoline plant, and the residue gas is used in the manufacture of carbon black or for some other profitable use.

B. Utilization of gas in the manufacture of carbon black may be made only if approved by the Commission, after notice and hearing, based on a finding that a more profitable use is not available or will not be available in a reasonable time.

Historical Note

Former Rule 403. Amended effective February 23, 1993 (Supp. 93-1).

R12-7-153. Non-hydrocarbon Gas

The rules of this Chapter shall also apply to helium, carbon dioxide, and any other non-hydrocarbon gas.

Historical Note

Former Rule 404. Amended effective February 23, 1993 (Supp. 93-1).

R12-7-160. Regulation of Production

If the Commission determines that oil, gas, or geothermal resources production in the state is causing waste, the Commission shall limit, allocate, and apportion the total amount of oil, gas, or geothermal resources which may be produced.

Historical Note

Former Rule 501; Amended effective September 29, 1982. See also Section R12-7-170 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-161. Producer's Monthly Report

A. Each operator shall file a producer's monthly report for each producing lease for each calendar month, setting forth the operator's name, each well's lease name or number, well number, state permit number, the actual amounts of oil, gas, water, or geothermal resources produced, the number of days each well produced, and the disposition of the produced oil, gas, water, or geothermal resources. The report shall be filed on or before the 25th day of the next succeeding month.

B. If a well is off production for a period exceeding 30 days, the Commission shall be notified in writing with the reasons given.

Historical Note

Former Rule 502; Amended effective September 29, 1982. See also Section R12-7-171 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-175. Injection Wells Including Enhanced Recovery, Disposal, and Storage Wells

A. The following injection wells used for enhanced recovery, disposal, or storage shall require a permit from the Commission:
1. Class II injection wells
   a. Saltwater disposal wells: wells used to return salt water associated with oil and gas production to the subsurface.
   b. Enhanced oil recovery wells: wells used to inject salt water, gases, enhanced waters, and steam in order to maintain and extend oil production;
   c. Hydrocarbon storage wells: wells used for the underground storage of crude oil, liquified petroleum gas (LPG), and other liquid hydrocarbon products in naturally occurring rock formations.
2. Other injection wells

a. Geothermal injection wells: Class V wells used to reinject groundwater or geothermal fluids that are used in or are associated with the production of geothermal energy;
b. Other wells: wells used for the underground storage of any hydrocarbons or nonhydrocarbons that are gaseous at standard temperature and pressure, wells used to dissolve salt to create a cavity to be used for underground storage, and wells used to dispose of brine produced in the course of creating a solution-mined salt cavity.

B. In addition to being subject to the applicable provisions of this Chapter, the wells listed in subsection (A) shall be subject to the following specific regulation:
1. Injection wells listed in subsections (A)(1)(a) and (b) and (A)(2)(a) shall be regulated by R12-7-176, R12-7-178, and R12-7-179.
2. Injection wells listed in subsections (A)(1)(c) and (A)(2)(b) shall be regulated by R12-7-176, R12-7-178, R12-7-179, R12-7-180, R12-7-181, and R12-7-182.

C. No permits for injection wells other than those described in this Section shall be issued by the Commission.

Historical Note

Adopted effective January 2, 1996 (Supp. 96-1).

R12-7-176. Permits for Injection Wells

A. The injection of any substance into any geologic formation is prohibited unless 1st authorized by the Commission after notice and hearing. The Commission shall give at least 15 days' notice before a hearing is held for drilling a new injection well or for converting an existing well into an injection well. A permit shall not be required for routine well operations pursuant to R12-7-122(C) whose physical effects are confined to the area near the well bore.

B. The application for a permit for an injection well as defined in R12-7-175 shall be prepared in accordance with R12-7-104, shall meet all the applicable requirements of this Chapter, and shall contain the following requirements, where applicable:
1. A plat showing the location of each proposed injection well and the location and status of all wells, including drilling wells and dry holes, within 1/2 mile of the proposed well. The plat shall include the lease boundary lines, the names of the surface and subsurface lessees and owners within 1/2 mile of the injection well or wells, and the name of each offset operator.
2. A geologic study, including:
   a. A contour map drawn on a geologic marker at or near the top of each injection zone in the project area;
   b. A thickness map of each injection zone in the project area;
   c. A geologic cross-section drawn through the site of an injection well in the project area showing structural details, any wells that may be affected by the project, and the location of the base of any freshwater strata, defined as water having 10,000 ppm or less of total dissolved solids, or a statement that no fresh water exists; and
   d. A representative electric log to a depth below the deepest producing zone identifying all geologic units including the injection and confining zones, freshwater aquifers, and oil, gas, or geothermal zones.
3. An engineering study, including:
   a. A statement of the primary purpose of the project;
   b. The characteristics of the injection and confining zones including porosity, permeability, thickness, areal extent, fracture gradient, original and present temperature and pressure, and residual oil, gas, and water saturations;
   c. The reservoir fluid data for each injection zone including oil gravity and viscosity, water quality, and specific gravity of gas;
   d. A description of each injection well's casing, or the proposed casing and cementing program, and the proposed method of testing the casing before use of the injection well. The casing shall be designed and tested in accordance with R12-7-181(C) with respect to the injection zone;
   e. A diagram of the proposed wellhead;
   f. A casing diagram, including cement plugs, and the actual or calculated cement fill behind the casing of all wells within the area affected by the project, including abandoned wells, showing that they will not cause damage to life, health, property, or natural resources;
   g. The well stimulation program if stimulation is planned; and
   h. The planned well-drilling and abandonment program to complete the project, including a flood-pattern map showing all injection, production, and abandoned wells, and unit boundaries.
4. An injection plan, including:
   a. A diagram and plan of the injection facilities;
   b. The maximum surface injection pressure expected during the life of the project and the estimated daily rate of fluid injection, by well. The operator shall provide calculations showing that the maximum injection pressure will not initiate fractures in the confining zone;
   c. A description of the area affected by the volumetric method and by the pressure-buildup method and the radius affected during the life of the project;
   d. The monitoring system or method to be used to ensure that no damage is occurring and that the injection fluid is confined to the permitted injection zone and to the area controlled by the operator;
   e. The method of injection such as casing, tubing, tubing with packer, between strings;
   f. The protective methods to be used on each injection line and well and a contingency plan for well failure or a shut-in period, including a plan for disposition of fluids not injected as a consequence of well failure;
   g. The source and chemical analysis of the injection fluid, and chemical analysis of the water in the injection zone. If the water in the injection zone has 10,000 ppm or less of total dissolved solids, the applicant shall provide evidence of commercial oil or gas producibility of the zone by means of historical production in the field or by log information, core data, and values for the porosity and permeability of the zone; and
   h. The location and depth of each water-source well that will be used in conjunction with the project.
5. Proof of notification to neighboring operators and surface owners within 1/2 mile of the proposed well.
6. Supplementary data as required in R12-7-180 for storage-well projects.
7. Any additional information that the Commission may determine is necessary to adequately clarify the informa-

tion submitted pursuant to R12-7-176(B)(1) through (B)(6).

8. All maps, diagrams, and exhibits required in this subsection shall be clearly labeled as to scale and purpose and shall clearly identify wells, boundaries, zones, contacts, and other relevant data.

C. Permits may be issued for a period up to the operating life of the well with review once every 5 years. Permits may be modified or terminated during their term if the Commission determines that the operator is not in compliance with the requirements of this Chapter.

Historical Note

Former Rule 701; Amended effective September 29, 1982. See also Section R12-7-141 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-177. Repealed

Historical Note

Former Rule 702; Amended effective September 29, 1982 (Supp. 82-5). Repealed effective January 2, 1996 (Supp. 96-1).

R12-7-178. Notice of Commencement, Discontinuance, and Transfer of Injection Operations

The following provisions apply to all injection projects defined in R12-7-175:

1. The operator shall notify the Commission of the date that injection operations will begin.
2. The operator shall notify the Commission of the date that injection operations will cease and provide the reasons for discontinuing the injection operations.
   a. The temporary abandonment of any injection well shall be in accordance with R12-7-125. Temporarily abandoned injection wells shall meet the testing requirements of R12-7-179(D).
   b. All injection wells shall be plugged and abandoned, in accordance with R12-7-126 and R12-7-127.
3. An injection well shall not be transferred from 1 operator to another without the written approval of the Commission.
   a. The operator shall file the request for transfer of ownership of an injection well in triplicate with the Commission at least 45 days before the proposed transfer date. The request shall include the name, address, and telephone number of the proposed new operator and provide the location and status of each well involved.
   b. The proposed new operator shall file with the Commission an organization report as required in R12-7-194 and bond as required in R12-7-103 before the request for transfer will be considered.
   c. The Commission shall return 1 copy of the request for transfer to the operator and 1 to the proposed new operator within 30 days after receipt of the information required in subsections (3)(a) and (b), designating approval or denial of the transfer of authority to inject for the subject well.
      i. If the proposed transfer is approved, a copy of the order authorizing injection shall be attached to the approved request for transfer.
      ii. If the proposed transfer is denied, the Commission shall return 1 copy of the request to the operator and 1 copy to the proposed operator together with the reasons for the denial and the steps necessary for its approval.

Historical Note

Former Rule 703; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-2).

R12-7-179. Testing and Monitoring of Injection Wells

A. The operator of an injection well shall file a weekly sundry report with the Commission on all drilling, completion, recompletion, and workover operations.

B. The operator of an injection well shall monitor operations to ensure that injection pressure at the wellhead does not exceed the maximum pressure authorized in the permit, and that no injection shall cause movement of injection or formation fluids into an underground source of drinking water.

C. The operator shall keep accurate records of the amount of oil, gas, water, or geothermal resources produced, the volume of substances injected, the average and maximum pressure used for injection, and the nature of the injected fluid. The operator of an enhanced recovery or disposal well shall submit a report as required in R12-7-187. The operator of a storage well shall submit a report as required in R12-7-185.

D. The operator shall run the following pressure or monitoring tests on new injection wells to establish the mechanical integrity of the tubing, casing, and packer. Existing wells being converted to an injection well shall be tested in the same manner and shall maintain the same mechanical integrity as a new well.

1. The casing-tubing annulus above the packer shall be tested upon completion and at least once every 5 years, under the supervision of the Commission, at a pressure equal to the lesser of the maximum authorized injection pressure or 1,000 psi, provided that no testing pressure shall be less than 300 psi. Documentation of the test shall be submitted to the Commission. Test pressures shall be applied for a period of 30 minutes. If a drop of more than 10% of the test pressure should occur, corrective measures shall be applied. If the tubing, casing, or packer cannot be brought up to standard, the well shall be plugged and abandoned in accordance with R12-7-126 and R12-7-127.
2. The Commission may require the operator to run a tracer survey, a temperature log, or a noise log to demonstrate the absence of fluid movement in vertical channels adjacent to the injection well.

E. Mechanical failure or downhole problems which indicate an injection well is not, or may not be, directing the injected fluid into the permitted injection zone may be cause to shut in the well. The operator shall notify the Commission within 24 hours of any such failure or problem. A written notice shall be filed within 5 days of the occurrence, with a plan for testing and repairing the well. If the well cannot be brought up to the standard required in subsection (D), it shall be plugged and abandoned in accordance with R12-7-126 and R12-7-127.

Historical Note

Former Rule 704; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-180. Supplementary Requirements for Storage Wells

The application for a storage well as defined in R12-7-175(B)(2) shall be prepared in accordance with R12-7-176 and shall contain the following, where applicable:

1. Information on any oil or gas production within 5 miles of each proposed well;
2. Information on the oil and gas reserves of each storage zone before starting injection, including calculations;

3. A comprehensive plan for disposition of brine and salt produced in the course of creating a solution-mined salt cavity. Cavities shall be designed and constructed in accordance with R12-7-181;
   a. Surface disposition shall be subject to the rules of the Department of Water Resources and the Department of Environmental Quality;
   b. Saltwater disposal wells shall be permitted in accordance with R12-7-176;
   c. Surface brine reservoirs used in the operation of the storage system and disposal reservoirs shall be designed to prevent the contamination of air, fresh water, and soil;
4. A list of proposed surface and subsurface safety devices, tests, and precautions to be taken to ensure safety of the project. The operator shall install a flare or other safety system acceptable to the Commission at or near each brine pit or any other location where escape of gases is likely to occur.

Historical Note

Former Rule 705; Amended effective September 29, 1982 (Supp. 82-5). Amended effective January 2, 1996 (Supp. 96-1).

R12-7-181. Design and Construction of Storage Wells and Cavities

A. Before drilling a storage well for storing liquid or gaseous hydrocarbons, or any other substances under the jurisdiction of the Commission, in an underground cavity, the applicant shall demonstrate to the Commission that the proposed storage will preserve the structural integrity of the host rock, including halite, and the overlying sediments. The evidence presented shall include:
   1. An investigation to determine the feasibility of a storage system at the particular site; and
   2. An assessment of the stability of each proposed cavity design, particularly with regard to the size, shape and depth of the storage cavity, the amount of separation between storage cavities, and the amount of separation between the storage cavity and the periphery of the host rock.

B. The design of a solution-mined storage system shall be based on site-specific geologic and engineering parameters including type of storage use, location of each cavity, number of cavities, cavity capacity, and maximum development diameter of each cavity. The design shall ensure that project development can be conducted in a reasonable, prudent, and systematic manner and shall stress physical and environmental safety and the prevention of waste. The design and solution mining shall be continually reviewed throughout the construction phase to account for any new subsurface information and shall include provisions for protection from damage caused by hydraulic shock. The original development and operational plans shall be modified, as necessary, to conform with good engineering practice. The design shall incorporate the standards outlined below:
   1. The minimum separation between the nearest outer walls of adjacent storage cavities as measured in any direction shall be established considering:
      a. The properties of the host rock;
      b. The elevation of the top and bottom of the adjacent cavities;
      c. Their maximum development diameter relative to the spacing of the cavities; and
      d. Other considerations deemed appropriate for the specific site; however, in no case shall such separation at any time during the storage project be less than 200 feet.
   2. The walls of a storage cavity shall be no less than 200 feet from the boundary of the lands included in the storage project on which the chambers are located.
   3. If the design involves the intentional subsurface connection between 2 adjacent storage cavities under 1 property (that is, a “U”-tube storage-cavity system), the minimum separation between cavities specified in subsection (B)(1)(d) shall not apply.

C. The borehole shall be dually cased from the surface into the cavity in accordance with R12-7-110 and R12-7-111. At least 2 strings of casing shall be fully cemented from the surface into the host rock either during the primary cement job or by remedial action. The Commission may administratively grant an exception to the requirement for 2 strings of cemented casing if the applicant can show that the exception is reasonable, justified by site-specific geologic or engineering parameters, is no less stringent, and consistent with the intent of these rules regarding physical and environmental safety, conservation of the resource, and the prevention of waste.
   1. The final cemented casing string shall have tensile and collapse strengths, as approved by the Commission, for the setting depth and shall be set a minimum of 200 feet into the formation to be used for the storage cavity.
   2. The casing seat of the final cemented casing string shall be pressure-tested after drilling at least 10 feet into the formation below the casing seat. The test pressure calculated at the casing seat shall equal the proposed maximum operating pressure at that point and shall not exceed 0.9 psi per foot of depth.
   3. After the wellhead has been installed and before products are stored, the system shall be pressure-tested as a unit.
   4. All tests required in this subsection shall meet the integrity standards set in R12-7-179(D).

D. Storage facilities in existence prior to June 1, 1978, shall not be required to meet the planning and construction requirements of subsections (B) and (C), except for future expansions or additions.

Historical Note

Adopted effective August 31, 1978 (Supp. 78-4). Amended effective September 29, 1982 (Supp. 82-5). Amended (and subsections (A)(1)(h) through (m) moved to Section R12-7-182) effective January 2, 1996 (Supp. 96-1)

R12-7-182. Operation, Inspection, and Closure of Storage-well Systems

A. The maximum and minimum operating pressures of a storage system shall be determined in consideration of the lithologic characteristics of the host rock. The maximum operating pressure at the shallower of the casing seat or cavity ceiling shall not exceed 0.9 psi per foot of depth.
   1. The storage system shall not be subjected to pressures exceeding the maximum operating pressure even for short periods of time, including pressure pulsation peaks and abnormal operating conditions.
   2. The wellhead, flowlines, valves, and all related connections shall have a test pressure rating equivalent to 125% of the maximum pressure which could be exerted at the surface. All valves shall be periodically inspected and maintained in good working order.
   3. The wellhead and storage system shall be protected with safety devices to prevent pressures exceeding the maximum operating pressure from being exerted on the stor-

age system and to prevent backflow of stored products in the event of flowline rupture.

4. Personnel shall be at either the well or other control sites for the well during injection or withdrawal from any storage well.

B. The flare, as required in R12-7-180(4), shall be burned continuously when a liquified gas or other flammable substance is being injected into a cavern.

C. Each operator of a storage well shall conduct semiannual safety inspections of the operator's facility and file with the Commission a written report on the inspection procedures and results within 5 days following the inspection. The operator shall notify the Commission at least 5 days before an inspection to allow a representative of the Commission to witness the inspection. Inspections shall include, the following:

1. Operation of all manual valves;
2. Operation of all automatic shut-in safety valves, including sounding or alarm devices;
3. Examination of flare system or other safety system installation;
4. Examination of earthen brine pits, tanks, firewalls, and related equipment;
5. Examination of flowlines, manifolds, and related equipment;
6. Examination of warning signs and safety fences;
7. Examination of housekeeping practices including the removal of weeds, used equipment, and debris from the area of operations;
8. The Commission may require additional inspections at any time during regular working hours and upon reasonable notice to the operator.

D. A capacity determination for each storage cavity shall be made and filed with the Commission upon completion of the storage cavity. These determinations shall be verified at least once every 5 years.

E. Safety precaution signs shall be displayed and unauthorized personnel kept out of the storage area. Each storage wellhead shall be visibly marked in accordance with R12-7-106(D). Guard rails shall be installed where the Commission determines it is necessary to ensure safety.

F. Storage wells shall be plugged and abandoned in accordance with R12-7-126 and R12-7-127.

G. If the Commission determines that the continued operation of a storage well or associated facilities, including valves, brine tanks or pits, flares, dehydrators, and loading and docking facilities, would cause unsafe operating conditions, waste, pollution, or contamination of air, fresh water, or soil, or encroachment on adjacent property, the Commission shall order discontinuance of operations of the storage facility or any part thereof until the Commission determines that the project can and will be conducted in a physically and environmentally safe manner.

H. The operator shall notify the Commission within 24 hours of every accident or equipment malfunction which causes loss of life or requires hospitalization of personnel; threatens the public health and safety; pollutes the air, soil, or fresh water; or causes loss of the stored substance. A final written report shall be filed with the Commission in accordance with R12-7-120(B).

I. The Commission may administratively grant exceptions to the guidelines and requirements of this Section if the applicant can show that the exception is reasonable, justified by site-specific geologic or engineering parameters, are no less stringent, and consistent with the intent of these rules regarding physical and environmental safety, conservation of the resource, and the prevention of waste. An applicant may request a hearing pursuant to A.R.S. § 27-517.

Historical Note

Adopted by moving subsections (A)(1)(h) through (m) of R12-7-181 and amending the text effective January 2, 1996 (Supp. 96-1).

R12-7-183. Certificate of Compliance and Authorization to Transport

A. Each producer or operator of any well shall execute under oath and file with the Commission an operator's certificate of compliance and authorization to transport oil, gas, or geothermal resources from lease provided by the Commission for each well.

B. The certificate, when properly executed and approved by the Commission, shall constitute authorization to the pipeline or other transporter to transport oil, gas or geothermal resources from the developed unit named. The Commission may provide written permission for the transportation of production in order to prevent waste, pending execution and approval of the certificate.

C. The certificate shall remain in full force and effect until:

1. The operating ownership of the developed unit changes, or
2. The transporter changes, or
3. The certificate is cancelled by the Commission.

D. When a change occurs in operating ownership of any developed unit, or when a change occurs in the transporter from any developed unit, the operator shall file a new certificate with the Commission within 10 days of the change. With respect to a temporary change in transporter which involves less than the production of one month, the producer may, in lieu of filing a new certificate, notify the Commission and the transporter in writing of the estimated amount of oil, gas, or geothermal resources to be moved by the temporary transporter, and the name of the temporary transporter. The operator shall furnish a copy of the notice to the temporary transporter.

E. The temporary transporter shall not move any greater quantity of oil, gas, or geothermal resources than the estimated amount shown in the notice.

F. Time-frames

1. The Commission shall mail to the producer or operator, within 10 days of receipt of the certificate required in subsection (A), written notice of administrative completeness or a detailed list of deficiencies. Within 10 days of receipt of an administratively complete certificate, the Commission shall approve the certificate or provide a written explanation in compliance with A.R.S. § 41-1076 to the producer or operator if the certificate is not approved. The overall time-frame is 20 days.
2. For the purpose of this subsection, intermediate Saturdays, Sundays, and legal holidays are not included in the time-frame computation.

Historical Note

Former Rule 801; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1). Amended effective June 6, 1997 (Supp. 97-2).

R12-7-184. Recovered Load Oil

Recovered load oil may be run from a lease on which it is recovered only upon approval by the Commission of a certificate for load oil credit and permit to transport recovered load oil showing the source and amount of the load oil. Upon approval, the Commission shall forward one copy to the designated transporter as authority to transport the oil. This rule applies only to oil obtained from a source other than the lease on which it is used.

Historical Note
Former Rule 802; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-185. Transporter's and Storer's Monthly Report

A. Each transporter of oil and condensate shall furnish for each calendar month a report containing information and data respecting stocks of oil and condensate on hand and all movements within the state of oil and condensate by pipeline, trucks, or other conveyances except railroad, from leases to storers or refiners; movements between transporters within the state; movements between storers within the state; movements between refiners within the state; and movements between storers and refiners within the state.

B. Each storer of oil and condensate shall furnish for each calendar month a report containing information and data respecting the storage of oil and condensate within the state.

C. Each storer of natural gas, liquified petroleum gas, or other hydrocarbon or nonhydrocarbon gases in storage wells shall furnish for each calendar month a report containing information and data respecting the storage, including receipts and deliveries, of such products within the state.

D. Transporters and storers shall file reports required in this Section with the Commission on or before the 25th day of the next succeeding month.

Historical Note
Former Rule 803; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-186. Gas or Geothermal Purchaser's Monthly Report

A. Each purchaser or taker of gas in gaseous form or geothermal resources from any well, lease, pool or proration unit shall file for each calendar month a report detailing acquisition and disposition of all gas in gaseous form or geothermal resources purchased or taken during that month.

B. Purchasers and takers shall file reports required in this Section with the Commission on or before the 25th day of the next succeeding month.

Historical Note
Former Rule 804; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-187. Injection Project Report

A. Each operator of an injection project shall furnish for each injection well for each calendar month a report of injection project containing information and data including the lease and well number, the well's state permit number, average injection pressure during the month, amount of fluid in barrels injected during the month, the total amount of fluid injected to date, the source of the injected fluid, and the number of days the injection well was operated during the month.

B. Operators of injection projects shall file reports required in this Section with the Commission on or before the 25th day of the next succeeding month.

Historical Note
Adopted effective February 23, 1993 (Supp. 93-1).

R12-7-188. Refinery Reports

A. Each refiner of oil or condensate shall furnish for each calendar month a refinery monthly report containing information and data respecting oil, condensate and products involved in the refiner's operations during each month.

B. Refiners shall file reports required in this Section with the Commission on or before the 25th day of the next succeeding month.

Historical Note
Former Rule 901; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-189. Repealed

Historical Note
Former Rule 902; Amended effective September 29, 1982 (Supp. 82-5). Repealed effective February 23, 1993 (Supp. 93-1).

R12-7-190. Gasoline Plant Reports

A. Each operator of a gasoline plant, cycling plant, or any other plant at which gasoline, butane, propane, condensate, kerosene, oil or other liquid products are extracted from gas shall furnish for each calendar month a gasoline plant or pressure maintenance plant monthly report containing information and data respecting gas and products involved in the operation of each plant during each month.

B. Operators shall file reports required by this Section with the Commission on or before the 25th day of the next succeeding month.

Historical Note
Former Rule 903; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-191. Reserved

R12-7-192. Books and Records to Substantiate Reports

A. Each operator, producer, transporter, storer, refiner, processor, gasoline or extraction or geothermal generating plant operator, and initial purchaser of oil, gas, or geothermal resources shall make and keep books and records covering operations in Arizona, from which are made and which will substantiate all reports required by the Commission.

B. Books and records required in this Section shall be available for inspection by the Commission for at least a six-year period.

Historical Note
Former Rule 1001; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1).

R12-7-193. Repealed

Historical Note
Former Rule 1002. Amended effective February 23, 1993 (Supp. 93-1). Repealed effective September 22, 1993 (Supp. 93-3).

R12-7-194. Organization Reports

A. Before any person shall engage in any activity covered by this Chapter, that person shall file with the Commission an organization report that includes a statement under oath giving the following information:
1. The name under which the business is being operated or conducted;
2. The name and post office address of the person and the business or businesses engaged in;
3. The plan or organization, and, if a reorganization, the name and address of the previous organization;
4. The state where incorporated, if a foreign corporation, and the name and post office address of the Arizona

agent, together with the date of permit to do business in Arizona; and

5. The names and addresses of the principal officers or partners and the names and addresses of the directors.

B. When a change occurs, as to facts stated in the report filed, a new organization report shall be filed with the Commission within ten days of the change.

Historical Note

Former Rule 1003. Amended effective February 23, 1993 (Supp. 93-1).

R12-7-195. Repealed

Historical Note

Former Rule 1004; Amended effective September 29, 1982 (Supp. 82-5). Amended effective February 23, 1993 (Supp. 93-1). Repealed effective September 22, 1993 (Supp. 93-3).

Appendix 1. Repealed

Historical Note

(For the convenience of the operator, the forms and reports in common use by the United States Geological Survey, and for the purpose for which each form was designed, may be submitted in lieu of similar Commission forms. Commission forms No. 1, 2, 3, 4, and 27 must be used for their designated purpose and no substitutes will be acceptable.) Repealed effective January 2, 1996 (Supp. 96-1).

Former Rule G-802. Repealed effective January 2, 1996 (Supp. 96-1).

R12-7-293. Repealed

Historical Note
Former Rule G-803. Repealed effective January 2, 1996 (Supp. 96-1).

R12-7-294. Repealed

Historical Note
Former Rule G-804. Repealed effective January 2, 1996 (Supp. 96-1).

Appendix 1. Repealed

Historical Note
Repealed effective January 2, 1996 (Supp. 96-1).

Appendix B – Colorado Regulatory Summary (General)

RULES AND REGULATIONS

DEFINITIONS
(100 Series)

ACT shall mean the Oil and Gas Conservation Act of the State of Colorado.

APPLICANT shall mean the person who institutes a proceeding before the Commission, which it has standing to institute under these rules.

AQUIFER shall mean a geologic formation, group of formations or part of a formation that can both store and transmit ground water. It includes both the saturated and unsaturated zone but does not include the confining layer, which separates two (2) adjacent aquifers.

ASSEMBLY BUILDING shall mean any building or portion of building or structure used for the regular gathering of fifty (50) or more persons for such purposes as deliberation, education, instruction, worship, entertainment, amusement, drinking or dining, or awaiting transport.

AUTHORIZED DEPUTY shall mean a representative of the Director as authorized by the Commission.

BATTERY shall mean the point of collection (tanks) and disbursement (tank, meter, lease automated custody transfer [LACT] unit) of oil or gas from producing well(s).

BARREL shall mean forty-two (42) gallons (U.S.) at sixty degrees fahrenheit (60^{o} F) at atmospheric pressure.

BRADENHEAD TEST AREA shall mean any area designated as a bradenhead test area by the Commission under Rule 207.b.

BUILDING UNIT shall mean a building or structure intended for human occupancy. A dwelling unit is equal to one (1) building unit, every guest room in a hotel/motel is equal to one (1) building unit, and every five thousand (5,000) square feet of building floor area in commercial facilities, and every fifteen thousand (15,000) square feet of building floor area in warehouses, or other similar storage facilities, is equal to one (1) building unit.

CEASE AND DESIST ORDER shall mean an order issued by the Commission pursuant to §34-60-121(5), C.R.S.

CENTRALIZED E&P WASTE MANAGEMENT FACILITY shall mean a facility, other than a commercial disposal facility exclusively regulated by the Colorado Department of Public Health and Environment, that is: (1) used exclusively by one owner or operator; or (2) used by more than one operator under an operating agreement and which receives for collection, treatment, temporary storage, and/or disposal of produced water, drilling fluids, drill cuttings, completion fluids, and any other exempt E&P wastes that are generated from two or more production units or areas or from a set of commonly owned or operated leases. This definition includes the surface storage and disposal facilities that are present at Class II disposal well sites. This definition also includes oil-field naturally occurring radioactive materials (NORM) related storage, decontamination, treatment, or disposal.

COMMERCIAL DISPOSAL WELL FACILITY shall mean a facility whose primary objective is disposal of Class II waste from a third party for financial profit.

COMMISSION shall mean the Oil and Gas Conservation Commission of the State of Colorado.

COMPLETION. An **oil well** shall be considered completed when the first new oil is produced through wellhead equipment into lease tanks from the ultimate producing interval after the production string has been run. A **gas well** shall be considered completed when the well is capable of producing gas through wellhead equipment from the ultimate producing zone after the production string has been run. A **dry hole** shall be considered completed when all provisions of plugging are complied with as set out in these rules. Any well not previously defined as an oil or gas well, shall be considered completed ninety (90) days after reaching total depth. If approved by the Director, a well that requires extensive testing shall be considered completed when the drilling rig is released or six (6) months after reaching total depth, whichever is later.

CORNERING AND CONTIGUOUS UNITS when used in reference to an exception location shall mean those lands which make up the unit(s) immediately adjacent to and toward which a well is encroaching upon established setbacks.

CROP LAND shall mean lands which are cultivated, mechanically or manually harvested, or irrigated for vegetative agricultural production.

CUBIC FOOT of gas shall mean the volume of gas contained in one (1) cubic foot of space at a standard pressure base and a standard temperature base. The standard pressure base shall be fourteen point seventy three (14.73) psia, and the standard temperature base shall be sixty degrees fahrenheit (60°F).

D-J BASIN FOX HILLS PROTECTION AREA shall mean that area of the state consisting of Townships 5 South through Townships 5 North, Ranges 58 West through 70 West, and Township 6 South, Ranges 65 West through 70 West.

DAY shall mean a period of twenty-four (24) consecutive hours.

DEDICATED INJECTION WELL shall mean any well as defined under 40 C.F.R. §144.5 B, 1992 Edition, (adopted by the U.S. Environmental Protection Agency) used for the exclusive purpose of injecting fluids or gas from the surface. The definition of a dedicated injection well does not include gas storage wells.

DESIGNATED AGENT when used herein shall mean the designated representative of any producer, operator, transporter, refiner, gasoline or other extraction plant operator, or initial purchaser.

DESIGNATED OUTSIDE ACTIVITY AREAS shall mean a well-defined outside area (such as a playground, recreation area, outdoor theater, or other place of public assembly) that is occupied by twenty (20) or more persons on at least forty (40) days in any twelve (12) month period or by at least five hundred (500) or more people on at least three (3) days in any twelve (12) month period.

DIRECTOR shall mean the Director of the Oil and Gas Conservation Commission of the State of Colorado or any member of the Director's staff authorized to represent the Director.

DOMESTIC GAS WELL shall mean a gas well that produces solely for the use of the surface owner. The gas produced cannot be sold, traded or bartered.

DRILLING PITS shall mean those pits used during drilling operations and initial completion of a well, and include:

ANCILLARY PITS used to contain fluids during drilling operations and initial completion procedures, such as circulation pits and water storage pits.

COMPLETION PITS used to contain fluid during initial completion procedures, and not originally constructed for use in drilling operations.

RESERVE PITS used to store drilling fluids for use in drilling operations or to contain E&P waste generated during drilling operations and initial completion procedures.

EDUCATIONAL FACILITY shall mean any building used for legally allowed educational purposes for more than twelve (12) hours per week for more than six (6) persons. This includes any building or portion of building used for licensed day-care purposes for more than six (6) persons.

EMERGENCY ORDER shall mean an order issued by the Commission pursuant to §34-60-108(3), C.R.S.

EMERGENCY SITUATION for purposes of §34-60-121(5), C.R.S., and the rules promulgated thereunder shall mean a fact situation which presents an immediate danger to public health, safety or welfare.

EXPLORATION AND PRODUCTION WASTE (E&P WASTE) shall mean those wastes associated with operations to locate or remove oil or gas from the ground or to remove impurities from such substances, and which are uniquely associated with and intrinsic to oil and gas exploration, development or production operations of which are exempt from regulation under Subtitle C of the Resource Conservation and Recovery Act (RCRA), 42 USC Sections 6921, et. seq. For a waste to be considered an E&P waste, it shall be associated with operations to locate or remove oil or gas from the ground or to remove impurities from such substances and it shall be intrinsic to and uniquely associated with oil and gas exploration, development or production. For natural gas, primary field operations include those production-related activities at or near the wellhead and at the gas plant (regardless of whether or not the gas plant is at or near the wellhead), but prior to transport of the natural gas from the gas plant to market. In addition, uniquely associated wastes derived from the production stream along the gas plant feeder pipelines are considered E&P wastes, even if a change of custody in the natural gas has occurred between the wellhead and the gas plant. In addition, wastes uniquely associated with the operations to recover natural gas from underground storage fields are considered to be E&P waste.

FIELD shall mean the general area which is underlaid or appears to be underlaid by at least one (1) pool; and "field" shall include the underground reservoir or reservoirs containing oil or gas or both. The words "field" and "pool" mean the same thing when only one (1) underground reservoir is involved; however, "field", unlike "pool", may relate to two (2) or more pools.

FINANCIAL ASSURANCE shall mean a surety bond, cash collateral, certificate of deposit, letter of credit, sinking fund, escrow account, lien on property, security interest, guarantee, or other instrument or method in favor of and acceptable to the Commission. With regard to third party liability concerns related to public health, safety and welfare, the term encompasses general liability insurance.

FLOWLINES shall mean those segments of pipe from the wellhead downstream through the production facilities ending at:

In the case of gas lines, the gas metering equipment; or
In the case of oil lines, the oil loading point or LACT unit; or

GAS FACILITY shall mean those facilities that process or compress natural gas after production-related activities which are conducted at or near the wellhead and prior to a point where the gas is transferred to a carrier for transport.

GAS STORAGE WELL means any well drilled for the injection, withdrawal, production, observation, and/or monitoring of natural gas stored in underground formations. The fact that any such well is used incidentally for the production of native gas or the enhanced recovery of native hydrocarbons shall not affect its status as a gas storage well.

GAS WELL shall mean a well, the principal production of which at the mouth of the well is gas, as defined by the Act.

GROUND WATER means subsurface waters in a zone of saturation.

HIGH DENSITY AREA shall mean any tract of land determined to be a high density area in accordance with Rule 603.b.

HOSPITAL, NURSING HOME, BOARD AND CARE FACILITIES shall mean buildings used for the licensed care of more than five (5) in-patients or residents.

INACTIVE WELL shall mean any shut-in well from which no production has been sold for a period of twelve (12) consecutive months; any well which has been temporarily abandoned for a period of six (6) consecutive months; or, any injection well which has not been utilized for a period of twelve (12) consecutive months.

INDIAN LANDS shall mean those lands located within the exterior boundaries of a defined Indian reservation, including allotted Indian lands, in which the legal, beneficial, or restricted ownership of the underlying oil, gas, or coal bed methane or of the right to explore for and develop the oil, gas, or coal bed methane belongs to or is leased from an Indian tribe.

INTERVENOR shall mean a local government intervening solely to raise environmental or public health, safety and welfare concerns in which case the intervention shall be granted of right, or a person who has timely filed an intervention in a relevant proceeding and has demonstrated to the satisfaction of the commission that the intervention will serve the public interest, in which case the person may be recognized as a permissive intervenor at the Commission’s discretion.

JAIL shall mean those structures where the personal liberties of occupants are restrained, including but not limited to, mental hospitals, mental sanitariums, prisons, reformatories.

LAND APPLICATION shall mean the disposal method by which E&P waste is spread upon or sometimes mixed into soils.

LAND TREATMENT shall mean the treatment method by which E&P waste is applied to soils and treated to result in a reduction of hydrocarbon concentration by biodegradation and other natural attenuation processes. Land treatment may be enhanced by tilling, disking, aerating, composting and the addition of nutrients or microbes.

LOCAL GOVERNMENT means a county, home rule or statutory city, town, territorial charter city or city and county, or any special district established pursuant to the Special District Act, §32-1-101, C.R.S. to §32-1-1505, C.R.S.

LOCAL GOVERNMENTAL DESIGNEE means the office designated to receive, on behalf of the local government, copies of all documents required to be filed with the local governmental designee pursuant to these rules.

LOG or WELL LOG shall mean a systematic detailed record of formations encountered in the drilling of a well.

MULTI-WELL PITS shall mean pits used for treatment or disposal of E&P wastes generated from more than one (1) well.

MULTI-WELL SITE shall mean a common well pad from which multiple wells may be drilled to various bottomhole locations.

NON-CROP LAND shall mean all lands which are not defined as crop land, including range land.

OIL AND GAS OPERATIONS means exploration for oil and gas, including the conduct of seismic operations and the drilling of test bores; the siting, drilling, deepening, recompletion, reworking, or abandonment of an oil and gas well, underground injection well, or gas storage well; production operations related to any such well including the installation of flowlines and gathering systems; the generation, transportation, storage, treatment, or disposal of exploration and production wastes; and any construction, site preparation, or reclamation activities associated with such operations.

OIL WELL shall mean a well, the principal production of which at the mouth of the well is oil, as defined by the Act.

ORPHANED SITE shall mean a site, where a significant adverse environmental impact may be or has been caused by oil and gas operations for which no responsible party can be found, or where such responsible party is unwilling or unable to mitigate such impact.

ORPHAN WELL shall mean a well for which no owner or operator can be found, or where such owner or operator is unwilling or unable to plug and abandon such well.

OWNER shall mean the person who has the right to drill into and produce from a pool and to appropriate the oil or gas produced therefrom either for such owner or others or for such owner and others, including owners of a well capable of producing oil or gas, or both.

PIT shall mean any natural or man-made depression in the ground used for oil or gas exploration or production purposes. Pit does not include steel, fiberglass, concrete or other similar vessels which do not release their contents to surrounding soils.

PLUGGING AND ABANDONMENT shall mean the cementing of a well, the removal of its associated production facilities, the removal or abandonment in-place of its flowline, and the remediation and reclamation of the wellsite.

POINT OF COMPLIANCE means one (1) or more points or locations at which compliance with applicable ground water standards established under Water Quality Control Commission Basic Standards for Ground Water, §3.11.4, must be achieved.

POLLUTION means man-made or man-induced contamination or other degradation of the physical, chemical, biological, or radiological integrity of air, water, soil, or biological resource.

The words **POOL, PERSON, OWNER, PRODUCER, OIL, GAS, WASTE, CORRELATIVE RIGHTS and COMMON SOURCE OF SUPPLY** are defined by the Act, and said definitions are hereby adopted in these rules and Regulations. The word "operator" is used in these rules and regulations and accompanying forms interchangeably with the same meaning as the term "owner" except in Rules 301., 325., and 401. where the word "operator" is used to identify the persons designated by the owner or owners to perform the functions covered by those rules.

PRODUCED AND MARKETED as used in the Act, shall mean, when oil shall have left the lease tank battery or when natural gas shall have passed the metering point and entered into the stream of commerce as its first step toward the ultimate consumer.

PRODUCTION FACILITIES shall mean all storage, separation, treating, dehydration, artificial lift, power supply, compression, pumping, metering, monitoring, flowline, and other equipment directly associated with oil wells, gas wells, or injection wells.

PRODUCTION PITS shall mean those pits used after drilling operations and initial completion of a well, including natural gas gathering, processing and storage facility pits, multi-well pits and:

SKIMMING/SETTLING PITS used to provide retention time for settling of solids and separation of residual oil.

PRODUCED WATER PITS used to temporarily store produced water prior to injection for enhanced recovery or disposal, off-site transport, or surface-water discharge.

PERCOLATION PITS used to dispose of produced water by percolation and evaporation through the bottom and/or sides of the pits into surrounding soils.

EVAPORATION PITS used to contain produced waters which evaporate into the atmosphere by natural thermal forces.

PROTESTANT shall mean a person who has timely filed a protest in a relevant proceeding and has demonstrated to the Commission's satisfaction that the person filing the protest would be directly and adversely affected or aggrieved by the Commission's ruling in the proceeding, and that any injury or threat of injury sustained would be entitled to legal protection under the Act.

RELEASE shall mean any unauthorized discharge of E&P waste to the environment over time.

REMEDIATION shall mean the process of reducing the concentration of a contaminant or contaminants in water or soil to the extent necessary to ensure compliance with the allowable concentrations and levels in Table 910-1 and other applicable ground water standards and classifications.

RESERVE PITS shall mean those pits used to store drilling fluids for use in drilling operations or to contain E&P waste generated during drilling operations.

RESPONDENT shall mean a party against whom a proceeding is instituted, or a **PROTESTANT** who protests the granting of the relief sought in the application as provided in Rule 509.

RESPONSIBLE PARTY shall mean a person who conducts an oil and gas operation in a manner which is in contravention of any then-applicable provision of the Act, or of any rule, regulation, or order of the Commission, or of any permit, that threatens to cause, or actually causes, a significant adverse environmental impact to any air, water, soil, or biological resource. **RESPONSIBLE PARTY** includes any person who disposes of any other waste by mixing it with exploration and production waste so as to threaten to cause, or actually cause, a significant adverse environmental impact to any air, water, soil, or biological resource.

SEISMIC OPERATIONS shall mean all activities associated with acquisition of seismic data including but not limited to surveying, shothole drilling, recording, shothole plugging and reclamation.

SENSITIVE AREA is an area vulnerable to potential significant adverse ground water impacts, due to factors such as the presence of shallow economically usable ground water or pathways for communication with deeper economically usable ground water; proximity to surface water, including lakes, rivers, perennial or intermittent streams, creeks, irrigation canals, and wetlands. The procedure for identifying Sensitive Areas is set forth in the Sensitive Area Identification Decision Tree and Guidance Document.

SHUT-IN WELL shall mean a well which is capable of production or injection by opening valves, activating existing equipment or supplying a power source.

SIMULTANEOUS INJECTION WELL shall mean any well in which water produced from oil and gas producing zones is injected into a lower injection zone and such water production is not brought to the surface.

SPECIAL FIELD RULES shall mean those rules promulgated for and which are limited in their application to individual pools or fields within the State of Colorado.

SPECIAL PURPOSE PITS shall mean those pits used in oil and gas operations, including natural gas gathering, processing and storage facility pits, multi-well pits, and:

BLOWDOWN PITS used to collect material resulting from, including but not limited to, the emptying or depressurizating of wells, vessels, or gas gathering systems.

FLARE PITS used exclusively for flaring gas.

EMERGENCY PITS used to contain liquids on a temporary basis due to process upset conditions.

BASIC SEDIMENT/TANK BOTTOM PITS used to temporarily store or treat the extraneous materials in crude oil which may settle to the bottoms of tanks or production vessels and which may contain residual oil.

WORKOVER PITS used to contain liquids during the performance of remedial operations on a producing well in an effort to increase production.

PLUGGING PITS used for containment of fluids encountered during the plugging process.

SPILL shall mean any unauthorized sudden discharge of E&P waste to the environment.

STRATIGRAPHIC WELL means a well drilled for stratigraphic information only. Wells drilled in a delineated field to known productive horizons shall not be classified as "stratigraphic". Neither the term "well" nor "stratigraphic well" shall include seismic holes drilled for the purpose of obtaining geophysical information only.

SUBSURFACE DISPOSAL FACILITY means a facility or system for disposing of water or other oil field wastes into a subsurface reservoir or reservoirs.

TEMPORARILY ABANDONED WELL shall mean a well which is incapable of production or injection without the addition of one or more pieces of wellhead or other equipment, including valves, tubing, rods, pumps, heater-treaters, separators, dehydrators, compressors, piping or tanks.

VOLUNTARY SELF-EVALUATION shall mean a self-initiated assessment, audit, or review, not otherwise expressly required by environmental law, that is performed by any person or entity, for itself, either by an employee or employees employed by such person or entity who are assigned the responsibility of performing such assessment, audit, or review or by a consultant engaged by such person or entity expressly and specifically for the purpose of performing such assessment, audit, or review to determine whether such person or entity is in compliance with environmental laws.

WATERS OF THE STATE mean any and all surface and subsurface waters which are contained in or flow in or through this state, but does not include waters in sewage systems, waters in treatment works of disposal systems, water in potable water distribution systems, and all water withdrawn for use until use and treatment have been completed. Waters of the state include, but are not limited to, all streams, lakes, ponds, impounding reservoirs, wetlands, watercourses, waterways, wells, springs, irrigation ditches or canals, drainage systems, and all other bodies or accumulations of water, surface and underground, natural or artificial, public or private, situated wholly or partly within or bordering upon the state.

WELL when used alone in these Rules and Regulations, shall mean an oil or gas well, a hole drilled for the purpose of producing oil or gas, a well into which fluids are injected, a stratigraphic well, a gas storage well, or a well used for the purpose of monitoring or observing a reservoir.

WELL SITE shall mean the areas which are directly disturbed during the drilling and subsequent operation of, or affected by production facilities directly associated with, any oil well, gas well, or injection well.

WILDCAT (Exploratory) WELL means any well drilled beyond the known producing limits of a pool.

ZONE OF INCORPORATION shall mean the soil layer from the soil surface to a depth of twelve (12) inches below the surface.

ALL OTHER WORDS used herein shall be given their usual customary and accepted meaning, and all words of a technical nature, or peculiar to the oil and gas industry, shall be given that meaning which is generally accepted in said oil and gas industry.

GENERAL RULES

201. EFFECTIVE SCOPE OF RULES AND REGULATIONS

All rules and regulations of a general nature herein promulgated to prevent waste and to conserve oil and gas in the State of Colorado shall be effective throughout the State of Colorado and be in force in all pools and fields except as may be amended, modified, altered or enlarged generally or in specific individual pools or fields by orders heretofore or hereafter issued by the Commission, and except where special field rules apply, in which case the special field rules shall govern to the extent of any conflict.

202. OFFICE AND DUTIES OF DIRECTOR

The office of Director of the Commission is hereby created. It shall be the duty of the Director to aid the Commission in the administration of the Act, as may be required of the Director from time to time and to act as Hearing Officer when so directed by the Commission.

203. OFFICE AND DUTIES OF SECRETARY

The office of Secretary to the Commission is hereby created. The duties of the Secretary shall be as determined from time to time by the Commission.

204. GENERAL FUNCTIONS OF DIRECTOR

The Director and the authorized deputies shall also have the right at all reasonable times to go upon and inspect any oil and/or gas properties, disposal facilities, or transporters facilities and wells for the purpose of making any investigation or tests to ascertain whether the provisions of the Act or these rules or any special field rules are being complied with, and shall report any violation thereof to the Commission.

205. ACCESS TO RECORDS

All producers, operators, transporters, refiners, gasoline or other extraction plant operators and initial purchasers of oil and gas within this state, shall make and keep appropriate books and records covering their operations in the state from which they may be able to make and substantiate the reports required by the Commission. Such books, records and copies of said reports required by the Commission shall be kept on file and available for inspection by the Commission for a period of at least five (5) years. The Director and the authorized deputies shall have access to all well records wherever located. All owners, drilling contractors, drillers, service companies, or other persons engaged in drilling or servicing wells, shall permit the Director, or authorized deputy, at the Director's or their risk, in the absence of negligence on the part of the owner, to come upon any lease, property or well operated or controlled by them, and to inspect the record and operation of such wells and to have access at all times to any and all records of wells; provided, that information so obtained shall be kept confidential and shall be reported only to the Commission or its authorized agents.

206. REPORTS

All producers, operators, transporters, refiners, gasoline and other extraction plant operators and initial purchasers of oil and gas within the state shall from time to time file accurate and complete reports containing such information and covering such periods as the Commission shall require.

207. TESTS AND SURVEYS

a. **Tests and surveys**. When deemed necessary or advisable, the Commission is authorized to require that tests or surveys be made to determine the presence of waste or occurrence of pollution. The Commission, in calling for reports under Rule 206. and tests or surveys to be made as provided in this rule, shall designate the time allowed the operator for compliance, which provisions as to time shall prevail over any other time provisions in these rules.

b. **Bradenhead monitoring**.

(1) The Director shall have authority to designate specific fields or portions of fields as bradenhead test areas within which, on any well, the bradenhead access to the annulus between the production and surface casing, as well as any intermediate casing, shall be equipped with fittings to allow safe and convenient determinations of pressure and fluid flow. Any such proposed designation shall occur by notice describing the proposed bradenhead test area. Such notice shall be given to all operators of record within such area and by publication. The proposed designation, if no protests are timely filed, shall be placed upon the Commission consent agenda for the regular monthly meeting of the Commission following the month in which such notice is given, and shall be approved or heard by the Commission in accordance with Rule 520. Such designation shall be effective immediately, upon approval by the Commission.

(2) All operators within any bradenhead test area shall have thirty (30) days after the effective date of the designation to commence the taking of bradenhead pressure readings in all wells located therein which are equipped for such readings. The operator shall equip any well which is not so equipped within ninety (90) days of the effective date, and within thirty (30) days thereafter the operator shall take the required reading. Such readings shall include the date, time and pressure of each reading, and the type of fluid reported. Such readings shall be taken in bradenhead test areas annually, maintained at the operator's office for a period of five (5) years, and shall be reported to the Director upon written request.

208. CORRECTIVE ACTION

The Commission shall require correction, in a manner to be prescribed or approved by it, of any condition which is causing or is likely to cause waste or pollution; and require the proper plugging and abandonment of any well or wells no longer used or useful in accordance with such reasonable plan as may be prescribed by it.

209. PROTECTION OF COAL SEAMS AND WATER-BEARING FORMATIONS

In the conduct of oil and gas operations each owner shall exercise due care in the protection of coal seams and water-bearing formations as required by the applicable statutes of the State of Colorado.

Special precautions shall be taken in drilling and abandoning wells to guard against any loss of artesian water from the stratum in which it occurs and the contamination of fresh water by objectionable water, oil, or gas. Before any oil or gas well is completed as a producer, all oil, gas and water strata above and below the producing horizon shall be sealed or separated in order to prevent the intermingling of their contents.

210. SIGNS AND MARKERS

The operator shall mark each and every well in a conspicuous place, from the time of initial drilling until final abandonment, as follows:

a. **Drilling and Recompletion Operations**. Directional signs, no less than three (3) and no more than six (6) square feet in size, shall be provided during any drilling or recompletion operation, by the operator or drilling contractor. Such signs shall be at locations sufficient to advise emergency crews where drilling is taking place; at a minimum, such locations shall include (i) the first point of intersection of a public road and the rig access road and (ii) thereafter at each intersection of the rig access route, except where the route to the rig is clearly obvious to uninformed third parties. Signs not necessary to meet other obligations under these rules shall be removed as soon as practicable after the operation is complete.

b. **Permanent Designations**.

(1) **Wells**. Within sixty (60) days after the completion of a well, a permanent sign shall be located at the wellhead, which shall identify the well and provide its legal location, including the quarter quarter section. When no associated battery is present, the additional information required under Rule 210.b.(2) shall be required on the sign.

(2) **Batteries**. Within sixty (60) days after the installation of a battery, a permanent sign shall be located at the battery. At the option of the operator, or at the request of local emergency response authorities, the sign may be placed at the intersection of the lease access road with a public, farm or ranch road if the referenced battery is readily apparent from such location. Such sign, which shall be no less than three (3) square feet and no more than six (6) square feet, shall provide: the name of the operator; a phone number at which the operator can be reached at all times; a phone number for local emergency services (911 where available); the lease name or well name(s) associated with the battery; the public road used to access the site; and, the legal location, including the quarter-quarter section. In lieu of providing the legal location on the permanent sign, it may be stenciled on a tank in characters visible from one hundred (100) feet.

c. **Centralized E&P Waste Management Facilities**. The main point of access to a centralized E&P waste management facility shall be marked by a sign captioned “(operator name) E&P Waste Management Facility”. Such sign, which shall be no less than three (3) square feet and no more than six (6) square feet shall provide: a phone number at which the operator can be reached at all times; a phone number for local emergency services (911 where available); the public road used to access the facility; and the legal location, including quarter quarter section, of the facility.

d. **General sign requirements**. No sign required under this Rule 210. shall be installed at a height exceeding six (6) feet. Operators shall maintain signs in a legible condition, and shall replace damaged or vandalized signs within sixty (60) days. New operators shall update signs within sixty (60) days after change of operator approval is received from the Commission.

211. NAMING OF FIELDS

All oil and gas fields discovered in the state subsequent to the adoption of these rules and regulations shall be named by the Director or at the Director's direction.

212. SAFETY

For safety regulations regarding industry personnel, contact the U.S. Department of Labor, Occupational Safety and Health Administration, Regional Administrator, Colorado Region VIII, 1999 Broadway, Suite 1690, Denver, Colorado 80202, telephone (303) 391-5858. For State Safety regulations regarding public safety see Rules 601-607.

213. FORMS UPON REQUEST

Forms required by the Commission will be furnished upon request. (Please see Procedures and Forms Guidelines)

214. LOCAL GOVERNMENTAL DESIGNEE

Each local government which designates an office for the purposes set forth in the 100 Series shall provide the Commission written notice of such designation, including the name, address and telephone number, facsimile number, electronic mail address, local emergency dispatch and other emergency numbers of the local governmental designee. It shall be the responsibility of such local governmental designee to ensure that all documents provided to the local governmental designee by oil and gas operators and the Commission or the Director are distributed to the appropriate persons and offices.

DRILLING, DEVELOPMENT, PRODUCING AND ABANDONMENT

301. RECORDS, REPORTS, NOTICES-GENERAL

Any written notice of intention to do work or to change plans previously approved must be filed with the Director, and must reach the Director and receive approval before the work is begun, or such approval may be given orally and, if so given, shall thereafter be confirmed to the Director in writing.

In case of emergency, or any situation where operations might be unduly delayed, any notice or information required by these rules and regulations to be given to the Director may be given orally or by wire, and if approval is obtained the transaction shall be promptly confirmed in writing to the Director, as a matter of record.

Immediate notice shall be given to the Director when public health or safety is in jeopardy. Notice shall also be given to the Director of any other significant downhole problem or mechanical failure in any well within ten (10) days.

The owner shall keep on the leased premises, or at the owner's headquarters in the field, or otherwise conveniently available to the Director, accurate and complete records of the drilling, redrilling, deepening, repairing, plugging or abandoning of all wells, and of all other well operations, and of all alterations to casing. These records shall show all the formations penetrated, the content and quality of oil, gas or water in each formation tested, and the grade, weight and size, and landed depth of casing used in drilling each well on the leased premises, and any other information obtained in the course of well operation. Such records on each well shall be maintained by any subsequent owner.

Whenever a person has been designated as an operator by an owner or owners of the lease or well, such an operator may submit the reports as herein required by the Commission.

302. COGCC Form 1. REGISTRATION FOR OIL AND GAS OPERATIONS

a. Prior to the commencement of its operations, all producers, operators, transporters, refiners, gasoline or other extraction plant operators, and initial purchasers who are conducting operations subject to this Act in the State of Colorado, shall, for purposes of the Act, file a Registration For Oil and Gas Operations, Form 1, with the Director in the manner and form approved by the Commission. Any producer, operator, transporter, refiner, gasoline or other extraction plant operator, and initial purchaser conducting operations subject to the Act who has not previously filed a Registration For Oil and Gas Operations, Form 1 shall do so. Any person providing financial assurance for oil and gas operators in Colorado shall file a Form 1 with the Director. All changes of address of the parties required to file a Form 1 shall be immediately reported by submitting a new Form 1.

b. Any party may act on or for the behalf of the owner/operator provided the owner/operator has filed a Designation of Agent, Form 1A. This agent shall remain in effect until it is terminated in writing by the owner/operator. All changes of address of the agent shall be immediately reported by submitting a new Form 1A.

303. COGCC Form 2. APPLICATION FOR PERMIT-TO-DRILL, DEEPEN, RE-ENTER, OR RECOMPLETE, AND OPERATE

a. Before any person shall commence operations for the drilling or re-entry of any well, such person shall file with the Director an application on Form 2 for a permit-to-drill, along with a filing and service fee established by the Commission (see Appendix III), and shall secure the Director's approval before commencement of operations with heavy equipment. The permit-to-drill shall be binding with respect to any conflicting local governmental permit or land use approval process. Wells drilled for stratigraphic information only shall be exempt from paying the filing and service fee. The re-entry of a well in a unitized, storage, or secondary recovery operation is exempt from the provisions of this rule and notice of intent to re-enter a well shall be filed on a Sundry Notice, Form 4.

b. A request to recomplete or deepen a well to a different reservoir shall be filed on an Application for Permit-to-Drill, Form 2, with a filing and service fee established by the Commission (see Appendix III), along with a Sundry Notice, Form 4, detailing the work, and a wellbore diagram.

c. Attached to and part of the Permit-to-Drill, Form 2, as filed shall be a current 8 1/2" by 11" scaled drawing of the entire section(s) containing the proposed well location with the following minimum information:

(1) Dimensions on adjacent exterior section lines sufficient to completely describe the quarter section containing the proposed well shall be indicated. If dimensions are not field measured, state how the dimensions were determined.

(2) For directional drilling into an adjacent section, that section shall also be shown on the location plat and dimensions on exterior section lines sufficient to completely describe the quarter section containing the proposed productive interval and bottom hole location shall be indicated. (Additional requirements related to directional drilling are found in Rule 321.)

(3) For irregular, partial or truncated sections, dimensions will be furnished to completely describe the entire section containing the proposed well.

(4) The field-measured distances from the nearer north/south and nearer east/west section lines shall be measured at ninety (90) degrees from said section lines to the well location and referenced on the plat. For unsurveyed land grants and other areas where an official public land survey system does not exist, the well locations shall be spotted as footages on a protracted section plat using Global Positioning System (GPS) technology and also reported as latitude and longitude in accordance with the requirements set forth below:

A. All GPS data reported to the Commission shall be differentially corrected using base station data or other correction sources. The base station or other correction source shall be identified and reported with the coordinate values.

B. Coordinates shall be reported as latitude and longitude in decimal degrees to an accuracy of at least five (5) decimal places (e.g.; latitude 37.12345 N, longitude 104.45632 W).

C. All data shall be referenced to the North American Datum (NAD) of 1927.

D. The date of the survey shall be reported.

(5) A map legend.

(6) A north arrow.

(7) A scale expressed as an equivalent (e.g. - 1" = 1000').

(8) A bar scale.

(9) The ground elevation.

(10) The basis of the elevation (how it was calculated or its source).

(11) The basis of bearing or interior angles used.

(12) Complete description of monuments and/or collateral evidence found; all aliquot corners used shall be described.

(13) The legal land description by section, township, range, principal meridian, baseline and county.

(14) Operator name.

(15) Well name and well number.

(16) Date of completion of scaled drawing.

(17) All visible improvements within two hundred (200) feet of a wellhead (or, in a high density area within four hundred (400) feet of a wellhead) shall be physically tied in and plotted on the well location plat or on an addendum, with a horizontal distance and approximate bearing from the well location. Visible improvements shall include, but not be limited to, all buildings, publicly maintained roads and trails, major above-ground utility lines, railroads, pipelines, mines, oil wells, gas wells, injection wells, water wells, visible plugged wells, sewers with manholes, standing bodies of water, and natural channels including permanent canals and ditches through which water flows. If there are no visible improvements within two hundred (200) feet of a wellhead (or in a high density area within four hundred (400) feet of a wellhead), it shall be so noted on the Permit-to-Drill, Form 2.

(18) Surface use shall be described within the two hundred (200) foot radius of a wellhead (or in a high density area within the four hundred (400) foot radius of a wellhead).

(19) In addition to the scaled drawing, the applicant shall attach to the Permit-to-Drill, Form 2, an 8½" by 11" vicinity or U.S.G.S. topographic map of at least a three (3) mile radius around the proposed well which clearly shows access from one (1) or more public roads, a map showing surface and mineral lease ownership within two hundred (200) feet of a wellhead (or in a high density area within four hundred (400) feet of a wellhead). Where the applicant is not the lessee, mineral ownership shall be described for the entire drilling and spacing unit.

303.d. Form 2/2A application and copies to local governmental designees. In addition to the above, an applicant filing a Permit-to-Drill, Form 2, shall also attach a completed Form 2A, except that the Form 2A shall not be required on federal or Indian owned surface lands when a Federal 13 Point Surface Use Plan is included. The Form 2A requires the attachment of a minimum of two (2) color photographs; one (1) of the staked location and one (1) of the existing or proposed access road. Each photograph shall be identified by: date taken, well name, location and direction of view. Permit-to-Drill, Form 2, shall be filed with the Director in triplicate for wells on all patented, state and federal surface lands. A single, informational (not official notice) copy of the Permit-to-Drill, Form 2 and Form 2A and all attachments shall be delivered by the applicant to the local governmental designee(s) of the county or municipal corporation within whose jurisdiction the activity is occurring or is proposed to occur at or before the time of filing with the Director. It shall be the responsibility of the Director to promptly provide the local governmental designee(s) with formal notification of the filing of the Permit-to-Drill, Form 2. Such notice is to be sent by facsimile if requested, and, if not, then by first class U.S. Mail. Any comments from the local government designee concerning the Permit-to-Drill, Form 2, and Form 2A as filed shall be provided to the Director and to the applicant in writing within ten (10) days after the date on which the Permit-to-Drill, Form 2 was sent to the local government designee(s) by the Director. The Director shall take no action with respect to the Permit-to-Drill, Form 2, prior to the expiration of the ten (10) day period, except under the circumstances provided for in Rule 303.j(1) and (2), or when the Director has received notice from the local governmental designee(s) waiving the ten (10) day period. Upon written request to the Director received prior to the expiration of the ten (10) day period, the local government designee shall be granted an extension of up to twenty (20) additional days to consider the application. If, prior to the expiration of the comment period provided herein and after participation in an onsite consultation under Rule 306.a.(3), the local governmental designee files an application for hearing on the permit-to-drill, Form 2, under Rule 503.b.(6), alleging significant impacts on public health, safety and welfare, including the environment, the director shall withhold the issuance of such permit and the provisions of Rule 303.k. shall apply.

e. **Well sites and access roads in wetlands.** In the event that an operator acquires an Army Corps of Engineers permit pursuant to 33 U.S.C.A. §1342 and 1344 of the Water Pollution and Control Act (Section 404 of the federal Clean Water Act) for construction of a wellsite, access road, or production facility, the operator shall so indicate on the Form 2A.

f. **Revisions to Form 2/2A.** Prior to approval of the Form 2/2A, minor revisions or requested information may be provided by contacting the COGCC staff. After approval, any substantive changes shall be submitted for approval on a Form 2/2A. A Sundry Notice, Form 4, shall be submitted when non-substantive revisions are made after approval, and no additional fee shall be imposed.

g. **Incomplete applications.** Applications for permit-to-drill which are submitted without the necessary attachments, the proper signature or the required information shall be considered incomplete and shall not be approved. The COGCC staff shall notify the applicant in not more than thirty (30) days of permit application receipt of such inadequacies. The applicant shall then have thirty (30) days from the date which they were contacted to correct and/or provide requested information for that well, otherwise the permit application shall be considered withdrawn and the fee shall not be refunded.

h. **Permit expiration.** If operations are not commenced on the permitted well within one (1) year after date of approval, the permit shall become null and void. The Director shall not approve extensions to applications for Permit-to-Drill, Form 2.

i. **Permits in areas pending Commission hearing.** The Director may withhold the issuance of a permit and the granting of approval of any Permit-to-Drill, Form 2, for any well or proposed well that is located in an area for which an application has been filed, or which the Commission has sought, by its own motion, to establish drilling units or to designate any tract of land as a high density area, in which case the hearing thereon shall be held at the next meeting of the Commission at which time the matter can be legally heard.

j. **Special circumstances for permit issuance without notice or consultation.** The Director may issue a permit at any time in the event that an operator files a sworn statement and demonstrates therein to the Director's satisfaction that:

(1) The operator had the right or obligation under the terms of an existing contract to drill a well; and the owner or operator has a leasehold estate or a right to acquire a leasehold estate under said contract which will be terminated unless the operator is permitted to immediately commence the drilling of said well; or

(2) Due to exigent circumstances (including a recent change in geological interpretation), significant economic hardship to a drilling contractor will result or significant economic hardship to an operator in the form of drilling standby charges will result.

In the event the Director issues a permit under this rule, the operator shall not be required to meet obligations to surface owners and local governmental designees under Rules 303.d., 305.b.(1) & (3), and 306.a. The Director shall report permits granted in such manner to the Commission at regularly scheduled monthly hearings.

k. **Withholding Permit-to-Drill, Form 2, approval.** The Director may withhold the issuance of a permit and the granting of approval of any Permit-to-Drill, Form 2, for any proposed well when, based on information supplied by a surface owner or by staff analysis, and where appropriate as confirmed by an onsite inspection, the Director has reasonable cause to believe that a proposed well location raises significant concerns regarding potential significant adverse impacts to public health, safety and welfare, including the environment. If a request is made by a local governmental designee under Rules 303.d. and 503.b.(6), such application shall be granted and the director shall withhold issuance of the permit-to-drill, Form 2, unless the local government has been disqualified from making such request under Rule 501.b. Any hearing granted pursuant to this rule shall be expedited and the matter shall be heard at the next scheduled commission hearing, and all parties shall be deemed to have waived any notice requirements to the contrary. In the event such approval is not granted, when requested by the operator, the Director shall ask the Commission to issue an emergency order under Rule 502.a. suspending approval of the Permit-to-Drill for such well and setting the matter for the next hearing. The Director shall use best efforts to notify the applicant, local governmental designee, surface owner and other interested parties as applicable of such request in order that such parties may participate in the Commission's emergency consideration of the matter

l. **Reclassification of stratigraphic well.** If a test for productivity is made in a stratigraphic well, the well must be reclassified as a well drilled for oil or gas and is subject to all of the rules and regulations for a well drilled for oil or gas, including filing of reports and mechanical logs.

304. FINANCIAL ASSURANCE REQUIREMENTS

Prior to drilling or assuming the operations for a well an operator shall provide financial assurance in accordance with the 700 Series rules. When an operator's existing wells are not in compliance with the 700 Series, the Director may withhold action on an Application for Permit-to-Drill, Form 2, until such time as a hearing on the permit application is held by the Commission. Such hearing shall be held at the next regularly scheduled Commission hearing at which time the matter can be legally heard.

305. NOTICES OF OIL AND GAS OPERATIONS

a. The provisions of this Rule 305. shall not be applicable on federal or Indian owned surface lands.

b. **Notices.**

(1) **Notice of drilling.** Before an operator shall commence operations for the drilling of any well, such operator shall evidence its intention to conduct such operations by giving the surface owner and local governmental designee written notice thereof as provided in subparagraph c. below. Such notice of drilling shall be mailed or hand delivered to the surface owner not less than thirty (30) days prior to the date of estimated commencement of operations with heavy equipment as set forth in the notice and shall be mailed to the local governmental designee not less than thirty (30) days prior to the date of estimated commencement of operations with heavy equipment as set forth in the notice. Operators shall retain a record of such notice of drilling for a minimum of one (1) year. Such written notice also shall be posted on or near the proposed drillsite at least thirty (30) days prior to commencement of operations with heavy equipment. If notice for the commencement of operations is waived by the surface owner under this rule, the local governmental designee notice under this Rule 305.b. shall be received no later than the business day preceding commencement of operations with heavy equipment. The operator shall confirm that the surface owner notice requirements of this Rule 305.b. have been completed or waived before the Director approves an Application for Permit-to-Drill, Form 2.

(2) **Notice of subsequent well operations.** Before an operator shall commence subsequent well operations, such operator shall evidence its intention to conduct such operations by giving the surface owner

written notice thereof in accordance with paragraph c. below. **Subsequent well operations** shall mean those operations that will materially impact surface areas beyond the existing access road or well site for any well, including operations such as fracturing or recompletion of the well but shall not include routine service and maintenance operations including but not limited to the changing of pumps. The notice of subsequent operations shall be mailed or hand delivered not less than seven (7) days prior to the date of estimated commencement of operations with heavy equipment as set forth in the notice.

(3) **Notice during irrigation season.** If a well is to be drilled on irrigated crop lands between March 1 and October 31, the operator, in addition to meeting the consultation requirements of Rule 306., shall contact the surface owner, or at the request of the surface owner, the tenant at least fourteen (14) days prior to the commencement of surface activities by the operator and arrange to coordinate drilling operations to avoid unreasonable interference with irrigation plans and activities.

(4) **Final reclamation notice.** The following notice requirements shall apply only to final reclamation operations commenced more than thirty (30) days after the completion of a well.

A. Not less than thirty (30) days before any final reclamation operations are to take place pursuant to Rule 1004., the operator shall notify the surface owner in accordance with paragraph c. below. Final reclamation operations shall mean those reclamation operations to be undertaken when a well is to be plugged and abandoned or when production facilities are to be permanently removed.

B. Not less than seven (7) days before any final reclamation operations are to take place, the operator shall notify the Director on a Sundry Notice, Form 4.

c. **Notice requirements.** As to notices to be given pursuant to this Rule 305., included with each such notice shall be the following:

(1) The estimated date that the operations for which notice is being given are to commence.

(2) The name of the operator and the name, address and phone number of the individual representing the operator who can be contacted concerning the proposed operations.

(3) The legal description (or plat) indicating the quarter quarter section upon which the operations will be conducted.

(4) A statement that the surface owner has responsibility for notifying any affected tenant of the proposed operations.

(5) With respect to the notices of drilling, the notice mailed or hand delivered to the surface owner shall also include a return addressed, postage prepaid postcard upon which surface owners may request their preference with respect to the consultation requirement under Rule 306., including the preference to appoint a tenant for consultation. If the surface owner appoints a tenant for consultation, that person's name, address, and telephone number must be provided to the operator by the surface owner on the postcard.

(6) A copy of the Commission's informational brochure for surface owners, containing the rules pertaining to notice of oil and gas operations and opportunities for consultation thereon, as well as the rules of procedure for filing complaints and making applications for hearing. The brochure shall provide contact information for the Commission's main office, field offices and website, and shall describe the services and information available to the public, including access to a listing of local governmental designees. The brochure shall contain a prominent disclaimer advising surface owners to obtain legal advice as may be appropriate to their particular circumstances.

d. **Identifying surface owner.** In determining the identity and address of a surface owner for the purpose of giving all notices under this Rule 305., the records of the assessor for the county in which the lands are situated may be relied upon.

e. **Tenants.** With respect to notices given under this Rule 305., it shall be the responsibility of the notified surface owner to give notice of the proposed operation to the tenant farmer, lessee or other party that may own or have an interest in any crops or surface improvements that could be affected by such proposed operation.

f. **Waiver.** Any and all of the surface owner notice requirements set forth in this Rule 305. may be waived by the affected surface owner at any time. Any and all local governmental designee notice requirements set forth in this Rule 305. may be waived by the affected local governmental designee(s) at any time.

306. CONSULTATION.

In locating roads, production facilities and well sites, and in preparation for reclamation and final abandonment, the operator shall use its best efforts to consult in good faith with the affected surface owner, or the surface owner's appointed tenant as provided for in Rule 305. Consultation with local governmental designees is addressed in Rule 306.a. (3) below. The following shall apply to each such consultation:

a. **Drilling consultation.** The good faith effort to consult shall occur at a time mutually agreed to by the parties prior to the commencement of operations with heavy equipment upon the lands of the surface owner. The operator shall confirm that the surface owner consultation requirements of this Rule 306. have been completed or waived before the Director approves an Application for Permit-to-Drill, Form 2.

(1) **Information provided by operator.** When consulting with the surface owner or appointed tenant, the operator shall furnish a description or diagram of the proposed drilling location; dimensions of the well site; and, if known, the location of associated production or injection facilities, pipelines, roads and any other areas to be used for oil and gas operations (if not previously furnished to such surface owner or if different from what was previously furnished).

(2) **Good faith consultation.** Such good faith consultation shall allow the surface owner or appointed tenant the opportunity to provide comments to the operator regarding preferences for the timing of oil and gas operations and preferred locations for wells and associated facilities.

(3) **Local government consultation.** Local governments which have appointed a local governmental designee and have indicated to the Director a desire for onsite consultation shall be given an opportunity to engage in such consultation concerning the location of roads, production facilities and well sites prior to the commencing of operations with heavy equipment.

b. **Final reclamation consultation.** In preparing for final reclamation and plugging and abandonment, the operator shall use its best efforts to consult in good faith with the affected surface owner (or the tenant when the surface owner has requested that such consultation be made with the tenant). Such good faith consultation shall allow the surface owner (or appointed tenant) the opportunity to provide comments concerning preference for timing of such operations and all aspects of final reclamation.

c. **Tenants.** Operators shall have no obligation to consult with tenant farmers, lessees, or any other party ("tenant") that may own or have an interest in any crops or surface improvements that could be affected by the proposed operation unless the surface owner appoints such tenant for such purposes. Nothing shall prevent the surface owner from including the tenant during the consultation.

d. **Waiver.** The requirement to consult with the surface owner under this Rule 306. may be waived by the affected surface owner or the surface owner's appointed tenant at any time.

307. COGCC Form 4. SUNDRY NOTICES AND REPORTS ON WELLS

The Sundry Notice, Form 4, is a multipurpose form which shall be used by an operator to request approval from or provide notice to the Director as required by rule or when no other specific form exists, i.e., well name or number change. The rules requiring the use of the Sundry Notice, Form 4, are listed in Appendix I.

308A. COGCC Form 5. DRILLING COMPLETION REPORT

Within thirty (30) days of the setting of production casing, the plugging of a dry hole, the deepening or sidetracking of a well, or any time the wellbore configuration is changed, the operator shall transmit to the Director the Drilling Completion Report, Form 5, and one (1) copy of all logs run, be they mechanical, mud, or other. Additionally, if drill stem tests, core analyses, or directional surveys are run, they shall be submitted at the same time and together with this completion report. All Sections 1 - 22 (if applicable) and the attachment checklist shall be completely filled out.

Within thirty (30) days of the suspension of commenced drilling activities prior to reaching total depth, the operator shall file a Drilling Completion Report, Form 5, notifying the Director of the date of such suspension of drilling activity stating the reason for suspension and the anticipated date and method of resumption of drilling, showing the details of all work performed to date. In cases of an uncompleted well, the initial Drilling Completion Report, Form 5, shall state "preliminary" at the top of the form. A supplementary Form 5 shall be submitted within thirty (30) days of reaching total depth.

308B. COGCC Form 5A. COMPLETED INTERVAL REPORT

The Completed Interval Report, Form 5A, shall be submitted within thirty (30) days of completing a formation (successful or not), when a formation is temporarily abandoned or permanently abandoned, for a recompletion, reperforation or restimulation, or when a formation is commingled.

In order to resolve completed interval information uncertainties, the Director may require an operator to submit a Completed Interval Report, Form 5A.

308C. CONFIDENTIALITY

Upon submittal of a Sundry Notice, Form 4, request by the operator, completion reports, including Drilling Completion Reports, Form 5 and Completed Interval Reports, Form 5A, and mechanical logs of exploratory or wildcat wells shall be marked "confidential" by the Director and kept confidential for six (6) months after the date of completion, unless the operator gives written permission to release such logs at an earlier date.

309. COGCC Form 7. OPERATOR'S MONTHLY PRODUCTION REPORT

Each producer or operator of an oil or gas well shall file with the Commission, within forty-five (45) days after the month in which production occurs, a report on Operator's Monthly Production Report, Form 7, containing all information required by said form. In addition, all fluids produced during the initial testing and completion shall be reported on Operator's Monthly Production Report, Form 7 within forty-five (45) days after the month in which testing and completion occurs.

310A. COGCC Form 8. MILL LEVY

On or before March 1, June 1, September 1 and December 1 of each year, every producer or purchaser, whichever disburses funds directly to each and every person owning a working interest, a royalty interest, an overriding royalty interest, a production payment and other similar interests from the sale of oil or natural gas subject to the charge imposed by §34-60-122 (1) (a) C.R.S., 1973, as amended, shall file a return with the Director showing by operator, the volume of oil, gas or condensate produced or purchased during the preceding calendar quarter, including the total consideration due or received at the point of delivery. No filing shall be required when the charge imposed is zero mill ($0.0000) per dollar value.

The Levy shall be an amount fixed by order of the Commission. The levy amount may, from time to time, be reduced or increased to meet the expenses chargeable against the oil and gas conservation fund. The present charge imposed, as of July 1, 2002, is one and one tenth mill ($0.0011) per dollar value.

310B. COGCC Form 8A. ENVIRONMENTAL RESPONSE FUND LEVY

On or before March 1, June 1, September 1 and December 1 of each year, every producer or purchaser, whichever disburses funds directly to each and every person owning a working interest, a royalty interest, an overriding royalty interest, a production payment and other similar interests from the sale of oil or natural gas subject to the charge imposed by §34-60-122 (1) (b) C.R.S., 1973, as amended, shall file a Form 8A, Environmental Response Fund report with the Director showing the total volume of oil, gas or condensate produced or purchased during the preceding calendar quarter, including the total consideration due or received at the point of delivery from all leases listed on the corresponding mill levy, Form 8. No filing shall be required when the surcharge imposed is zero.

The Environmental Response Fund surcharge shall be an amount fixed by order of the Commission. The surcharge amount may, from time to time, be reduced or increased to meet the expenses chargeable against the oil and gas Environmental Response Fund. As of October 1, 1996, the surcharge shall be zero mill ($0.0000) on the dollar.

311. COGCC Form 6. WELL ABANDONMENT REPORT

Notice shall be given to the Director, and approval obtained in advance of the time the operator expects to abandon a well on Form 6. When filing an intent to abandon, the form shall be completed and attachments included to fully describe the proposed operations. This includes the proposed depths of mechanical plugs and casing cuts, the proposed depths and volumes of all cement plugs, the amount, size and depth of casing and junk to be left in the well, the volume and weight of fluid to be left in the wellbore and the nature and quantities of any other materials to be used in the plugging. If the well is not plugged within six (6) months of intent approval a new intent shall be filed.

Within thirty (30) days after abandonment, the Well Abandonment Report, Form 6, shall be filed with the Director. The abandonment details shall include an account of the manner in which the abandonment or plugging work was performed. Additionally, plugging verification reports detailing all procedures are required. A Plugging Verification Report shall be submitted for each person or contractor actually setting the plugs. The Well Abandonment Report, Form 6, and the Plugging Verification Reports shall detail the depths of mechanical plugs and casing cuts, the depths and volumes of all cement plugs, the amount, size and depth of casing and junk left in the well, the volume and weight of fluid left in the wellbore and the nature and quantities of any other materials used in the plugging. Plugging Verification Reports shall conform with the operator's report and both shall show that plugging procedures are at least as extensive as those approved by the Director. When filing a subsequent report of abandonment, the entire form shall be completed except for the second block, background information. (See Rule 319 for well abandonment requirements and procedures.)

312. COGCC Form 10. CERTIFICATE OF CLEARANCE AND/OR CHANGE OF OPERATOR

a. Each operator of any oil or gas well completed after April 30, 1956, shall file with the Director, within thirty (30) days after initial sale of oil or gas a Certificate of Clearance and/or Change of Operator, Form 10, in accordance with the instructions appearing on such form, for each well producing oil or gas or both oil and gas. A Certificate of Clearance shall be filed for any well from which oil, gas or other hydrocarbon is being produced.

A Certificate of Clearance shall be filed within thirty (30) days should the producing formation(s), the oil transporter (first purchaser) and/or the gas gatherer (first purchaser) change. In addition, within fifteen (15) days of an operator change for any well, a Change of Operator, Form 10, shall be filed with a filing and service fee as set by the Commission. (See Appendix III)

b. Each operator of a Class II injection well shall file a new Certificate of Clearance and/or Change of Operator, Form 10 with the Director within fifteen (15) days of the transfer of ownership.

c. Whenever there shall occur a change in the producer or operator filing the certificate under Rule 312.a. hereof, or whenever there shall occur a change of transporter from any well within the state, a new Certificate of Clearance and/or Change of Operator, Form 10 shall be executed and filed within fifteen (15) days in accordance with the instructions appearing on such form. In the case of temporary use of oil for well treating or stimulating purposes, no new form need be executed. In the case of other temporary change in transporter involving the production of less than one (1) month, the producer or operator may, in lieu of filing a new certificate, notify the Commission and the transporter authorized by the certificate on file with the Commission by letter of the estimated amount to be moved by the temporary transporter and the name of such temporary transporter. A copy of such notice shall also be furnished such temporary transporter.

d. In no instance shall the temporary transporter move any quantity greater than the estimated amount shown in said notice.

e. The certificate, when properly executed and approved by the Commission, shall constitute authorization to the pipeline or other transporter to transport the authorized volume from the well named therein; provided that this section shall not prevent the production or transportation in order to prevent waste, pending execution and approval of said certificate. Permission for the transportation of such production shall be granted in writing to the producer and transporter.

f. The certificate shall remain in force and effect until:

(1) The producer or operator filing the certificate is changed; or
(2) The transporter is changed; or
(3) The certificate is canceled by the Commission.

g. A copy of each Certificate of Clearance and/or Change of Operator, Form 10 to be filed hereunder shall be sent by the Director to those local governmental designees who so request.

h. It is the operator's responsibility to mail approved copies of the Certificate of Clearance and/or Change of Operator, Form 10, to the transporter and/or gatherer for each well listed.

313. COGCC Form 11. MONTHLY REPORT OF GASOLINE OR OTHER EXTRACTION PLANTS

All operators of gasoline or other extraction plants shall make monthly reports to the Director on Form 11. Such forms shall contain all information required thereon and shall be filed with the Director on or before the twenty-fifth (25th) day of each month covering the preceding month.

314. COGCC Form 17. BRADENHEAD TEST REPORT

Results of bradenhead tests, as required by Rule 207.b., shall be submitted to the Director within ten (10) days of completion. A wellbore diagram shall be submitted if not previously submitted or if the wellbore configuration has changed. If sampled, then the results of any gas and liquid analysis shall be submitted.

315. REPORT OF RESERVOIR PRESSURE TEST

Where the Director believes it is necessary to prevent waste, protect correlative rights, or prevent a significant adverse impact, the Director may require subsurface pressure measurements. Whenever such measurements are made, results shall be reported on Sundry Notice, Form 4, within twenty (20) days after completion of tests, or submitted on any company form approved by the Director containing the same information.

316A. COGCC Form 14. MONTHLY REPORT OF FLUIDS INJECTED

Except for fluids involved with fracturing, acidizing or other similar treatment elsewhere required to be reported on a Completed Interval Report, Form 5A, all operators engaged in the injection of fluids into any formation in dedicated injection wells shall file monthly with the Commission a detailed account of such operation on Form 14, or any company form containing the same information previously approved by the Director. Types of chemicals used to treat injection water, as well as the date of initial fluid injection for new injection wells, are to be reported on said form under Remarks. The type and amount of fluids received from transporters shall be included on the report. Operators of simultaneous injection wells shall, by March 1 of each year, report to the Director the calculated injected volume for the previous year by month on Form 14. Operators of gas storage projects shall, by March 1 of each year, report to the Director the amount of gas injected and withdrawn for the previous year and the amount of gas remaining in the reservoir as of December 31 of that year.

316B. COGCC Form 21. MECHANICAL INTEGRITY TEST

Results of mechanical integrity tests of injection wells or shut-in wells shall be submitted on Form 21, within thirty (30) days after the test. A pressure chart shall accompany this report. Not less than ten (10) days prior to the performance of any mechanical integrity test, the Director shall be notified, in writing, of the scheduled date on which the test will be performed. The form shall be completely filled out except for Part II, which is required only if the well is a permitted or pending injection well.

317. GENERAL DRILLING RULES

Unless altered, modified, or changed for a particular field or formation upon hearing before the Commission the following shall apply to the drilling or deepening of all wells.

a. **Blowout preventer equipment ("BOPE")**. The operator shall take all necessary precautions for keeping a well under control while being drilled or deepened. BOPE, if any, shall be indicated on the Application for Permit to Drill, Form 2, as well as any known subsurface conditions (e.g. under or over-pressured formations). The working pressure of any BOPE shall exceed the anticipated surface pressure to which it may be subjected, assuming a partially evacuated hole with a pressure gradient of 0.22 psi/ft. (For BOPE requirements in high density areas see Rule 603.b(4)B. For statewide BOPE specification, inspection, operation and testing requirements see Rule 603.f.)

(1) The Director shall have the authority to designate specific areas, fields or formations as requiring certain BOPE. Any such proposed designation shall occur by notice describing the area, field or formation in question and shall be given to all operators of record within such area or field and by publication. The proposed designation, if no protest is timely filed, shall be placed on the Commission consent agenda for its next regularly scheduled meeting following the month in which such notice was given. The matter shall be approved or heard by the Commission in accordance with Rule 520. Such designation shall be effective immediately upon approval by the Commission, except as to any previously approved Permit to Drill, Form 2.

(2) The Director shall have the authority, outside areas designated pursuant to Rule 317.a.(1), to condition approval of any Application for Permit to Drill by requiring BOPE which the Director determines to be necessary for keeping the well under control. Should the operator object to such condition of approval, the matter shall be heard at the next regularly scheduled meeting of the Commission, subject to the notice requirements of Rule 507.

b. **Bottom hole location**. Unless authorized by the provisions of Rule 321., all wells shall be so drilled that the horizontal distance between the bottom of the hole and the location at the top of the hole shall be at all times a practical minimum.

c. **Requirement to post permit at the rig and provide spud notice**. A copy of the approved Application for Permit to Drill, Deepen, Re-enter, or Recomplete and Operate, Form 2, shall be posted in a conspicuous place on the drilling rig or workover rig. A notice shall be provided to the Director on a Sundry Notice, Form 4, no later than five (5) days following the spudding of a well. The Director may apply a condition of approval for Application for Permit to Drill, Deepen, Re-enter, or Recomplete and Operate, Form 2 requiring not less than twenty-four (24) hours nor more than seventy-two (72) hours verbal or written notice prior to spud.

d. **Casing program to protect hydrocarbon horizons and ground water.** The casing program adopted for each well must be so planned and maintained as to protect any potential oil or gas bearing horizons penetrated during drilling from infiltration of injurious waters from other sources, and to prevent the migration of oil, gas or water from one (1) horizon to another, that may result in the degradation of ground water. A Sundry Notice, Form 4, including a detailed work plan and a wellbore diagram, shall be submitted and approved by the Director prior to any routine or planned casing repair operations. During well operations, prior verbal approval for unforseen casing repairs followed by the filing of a Sundry Notice, Form 4, after completion of operations shall be acceptable.

e. **Surface casing where subsurface conditions are unknown**. In areas where pressure and formations are unknown, sufficient surface casing shall be run to reach a depth below all known or reasonably estimated utilizable domestic fresh water levels and to prevent blowouts or uncontrolled flows and shall be of sufficient size to permit the use of an intermediate string or strings of casings. Surface casing shall be set in or through an impervious formation and shall be cemented by pump and plug or displacement or other approved method with sufficient cement to fill the annulus to the top of the hole, all in accordance with reasonable requirements of the Director. In the D-J Basin Fox Hills Protection Area surface casing will be set in accordance with Rule 317A. (See also subparagraph g.).

f. **Surface casing where subsurface conditions are known**. In wells drilled in areas where subsurface conditions have been established by drilling experience, surface casing size, at the owner's option, shall be set and cemented to the surface by the pump and plug or displacement or other approved method at a depth and in a manner sufficient to protect all fresh water and to ensure against blowouts or uncontrolled flows. In the D-J Basin Fox Hills Protection Area surface casing will be set in accordance with Rule 317A. (See also subparagraph g.).

g. **Alternate aquifer protection by stage cementing**. In areas where fresh water aquifers are of such depth as to make it impractical or uneconomical to set the full amount of surface casing necessary to comply fully with the requirement to cover or isolate all fresh water aquifers as required in subparagraph e. and f., the owner may, at its option, comply with this requirement by stage cementing the intermediate and/or production string so as to accomplish the required result. If unanticipated fresh water aquifers are encountered after setting the surface pipe they shall be protected or isolated by stage cementing the intermediate and/or production string with a solid cement plug extending from fifty (50) feet below each fresh water aquifer to fifty (50) feet above said fresh water aquifer or by other methods approved by the Director in each case. In the D-J Basin Fox Hills Protection Area any stage cementing shall occur only in accordance with Rule 317A. If the stage cement is not circulated to surface, a temperature log or cement bond log shall be run to determine the top of the stage cement to ensure aquifers are protected.

h. **Surface and intermediate casing cementing**. The operator shall ensure that all surface and intermediate casing cement required under this rule shall be of adequate quality to achieve a minimum compressive strength of three hundred (300) psi after twenty-four (24) hours and eight hundred (800) psi after seventy-two (72) hours measured at ninety-five degrees fahrenheit (95°F) and at eight hundred (800) psi. All surface casing shall be cemented with a continuous column from the bottom of the casing to the surface. After thorough circulation of the wellbore, cement shall be pumped behind the intermediate casing to at least two hundred (200) feet above the top of the shallowest known production horizon and as required in 317.g. Cement placed behind the surface and intermediate casing shall be allowed to set a minimum of eight (8) hours, or until three hundred (300) psi calculated compressive strength is developed, whichever occurs first, prior to commencing drilling operations. If the surface casing cement level falls below the surface, to the extent safety or aquifer protection is compromised, remedial cementing operations shall be performed.

i. **Production casing cementing**. The operator shall ensure that all cement required under this rule placed behind production casing shall be of adequate quality to achieve a minimum compressive strength of at least three hundred (300) psi after twenty-four (24) hours and eight hundred (800) psi after seventy-two (72) hours measured at ninety-five degrees fahrenheit (95°F) and at eight hundred (800) psi. After thorough circulation of a wellbore, cement shall be pumped behind the production casing two hundred (200) feet above the top of the shallowest known producing horizon. All fresh water aquifers which are exposed below the surface casing shall be cemented behind the production casing. All such cementing around an aquifer shall consist of a continuous cement column extending from at least fifty (50) feet below the bottom of the fresh water aquifer which is being protected to at least fifty (50) feet above the top of said fresh water aquifer. Cement placed behind the production casing shall be allowed to set seventy-two (72) hours, or until eight hundred (800) psi calculated compressive strength is developed, whichever occurs first, prior to the undertaking of any completion operation.

j. **Production casing pressure testing**. The installed production casing shall be adequately pressure tested for the conditions anticipated to be encountered during completion and production operations.

k. **Protection of aquifers and production stratum and suspension of drilling operations before running production casing**. In the event drilling operations are suspended before production string is run, the Commission shall be notified immediately and the owner shall take adequate and proper precautions to assure that no alien water enters oil or gas strata, nor potential fresh water aquifers during such suspension period or periods. If alien water is found to be entering the production stratum or to be causing significant adverse environmental impact to fresh water aquifers during completion testing or after the well has been put on production, the condition shall be promptly remedied.

l. **Flaring of gas during drilling and notice to local emergency dispatch**. Any gas escaping from the well during drilling operations shall be, so far as practicable, conducted to a safe distance from the well site and burned. The operator shall notify the local emergency dispatch as provided by the local governmental designee of any such flaring. Such notice shall be given prior to the flaring if the flaring can be reasonably anticipated, and in all other cases as soon as possible but in no event more than two (2) hours after the flaring occurs.

m. **Protection of productive strata during deepening operations**. If a well is deepened for the purpose of producing oil and gas from a lower stratum, such deepening to and completion in the lower stratum shall be conducted in such a manner as to protect all upper productive strata.

n. **Requirement to evaluate disposal zones for hydrocarbon potential**. If a well is drilled as a disposal well then the disposal zone shall be evaluated for hydrocarbon potential. The proposed hydrocarbon evaluation method shall be submitted in writing and approved by the Director prior to implementation. The productivity results shall be submitted to the Director upon completion of the well.

o. **Requirement to log well**. For all new drilling operations, the operator shall be required to run a minimum of a resistivity log with gamma-ray or other petrophysical log(s) approved by the Director that adequately describe the stratigraphy of the wellbore. This log and all other logs run shall be submitted with the Well Completion or Recompletion Report and Log, Form 5. Open hole logs shall be run to adequately verify setting depth of surface casing and aquifer coverage. These requirements shall not apply to the unlogged open hole completion intervals, or to wells in which no open hole logs are run.

p. **Remedial cementing during recompletion.** The Director may apply a condition of approval for Application for Permit to Drill, Deepen, Re-enter, or Recomplete and Operate, Form 2, to require remedial cementing during recompletion operations consistent with the provisions for protecting aquifers and hydrocarbon bearing zones in this Rule 317.

317A. SPECIAL DRILLING RULES - D-J BASIN FOX HILLS PROTECTION AREA

The following special drilling rules shall apply to wells in the D-J Basin Fox Hills Protection Area:

a. **Surface Casing - Minimum Requirements for Well Control**. In all wells drilled within the D-J Basin Fox Hills Protection Area, surface casing shall be run to a minimum depth of five percent (5%) of the projected total depth to which the well is to be drilled, provided that in no event shall the surface casing be run to a depth less than two hundred (200) feet. The Director may, on a case-by-case basis, grant variances in this five percent (5%) requirement where the Director finds that the well is a development well in which pressures can be accurately predicted and finds that, based upon those predictions, the five percent (5%) requirement should be varied to achieve effective well control. In all cases, however, the actual depth at which the surface casing is set shall be calculated to position the casing seat to a depth within a competent formation (preferably shale) which will contain the maximum pressure to which the casing will be exposed during normal drilling operations.

b. **Surface Casing - Aquifer Protection**. For purposes of aquifer protection, surface casing must be set as follows in wells which are not exploratory wells:

(1) Surface casing shall be run to a depth at least fifty (50) feet below the Fox Hills transition zone in wells drilled within Townships 5 South through 5 North, Ranges 65 West through 70 West or within Townships 3 North through 5 North, Range 64 West.

(2) With respect to Townships 5 South through 5 North, Ranges 58 West through 63 West, Townships 5 South through 2 North, Range 64 West; and Township 6 South, Ranges 65 West through 70 West, in all wells located within one (1) mile of a permitted producing water well, surface casing shall be set to a depth sufficient to protect the deepest permitted producing water well within such one (1) mile area. Said depth shall be at least fifty (50) feet below the depth of the base of the aquifer from which said deepest water well is producing, or fifty (50) feet below the base of the Fox Hills Transition Zone if such deepest water well produces from the Fox Hills Aquifer.

Upon the request of the operator, the Director (or the Commission upon appeal) may grant a variance to the requirements of this subparagraph b. upon a showing to the Director, or the Commission upon appeal, that the variance does not violate the basic intent of said requirements. For such variance purpose, the basic intent of said requirements is stated to be to provide reasonable aquifer protection for the water well(s) which are permitted by the State of Colorado Division of Water Resources and are currently producing in the area potentially affected by the oil or gas well to be drilled.

c. **Exploratory Wells**. For purposes of the D-J Basin Fox Hills Protection Area only, the term exploratory well means any well:

(1) Which targets the classically demonstrated zones with limited geographic extent such as channel, bar, valley fill and levee type sandstones that were deposited prior to the x-bentonite time stratigraphic event; or

(2) Which can be demonstrated to be separated from a known producing horizon by a dry hole; or

(3) Which can be demonstrated to be targeted to a horizon which is geologically separate from the producing horizon in an offsetting producing well, or

(4) Which the Director, or the Commission upon appeal, may define as an exploratory well by variance, it being the basic intent of this definition that the requirements of subparagraph b. not operate to discourage the drilling of high risk wells.

318. LOCATION OF WELLS

All wells drilled for oil or gas to a common source of supply shall have the following setbacks:

a. **Wells deeper than 2,500 feet in depth**. A well to be drilled in excess of two thousand five hundred (2,500) feet in depth shall be located not less than six hundred (600) feet from any lease line, and shall be located not less than one thousand two hundred (1,200) feet from any other producible or drilling oil or gas well when drilling to the same common source of supply, unless authorized by order of the Commission upon hearing.

b. **Wells less than 2,500 feet in depth**. A well to be drilled to less than a depth of two thousand five hundred (2,500) feet below the surface shall be located not less than two hundred (200) feet from any lease line, and not less than three hundred (300) feet from any other producible oil or gas well, or drilling well, in said source of supply, except that only one producible oil or gas well in each such source of supply shall be allowed in each governmental quarter-quarter section unless an exception under Rule 318.c. is obtained.

c. **Exception locations.** The Director may grant an operator's request for a well location exception to the requirements of this rule or any order because of geologic, environmental, topographic or archaeologic conditions, irregular sections, a surface owner request, or for other good cause shown, provided that a waiver or consent signed by the lease owner toward whom the well location is proposed to be moved, agreeing that said well may be located at the point at which the operator proposes to drill the well and where correlative rights are protected. If the operator of the proposed well is also the operator of the drilling unit or unspaced offset lease toward which the well is proposed to be moved, waivers shall be obtained from the mineral interest owners under such lands. If waivers cannot be obtained from all parties and no party objects to the location, the operator may apply for a variance under Rule 502.b. If a party or parties object to a location and cannot reach an agreement, the operator may apply for a Commission hearing on the exception location.

d. **Exemptions to Rule 318**.

(1) This rule shall not apply to authorized secondary recovery projects.

(2) This rule shall apply to fracture or crevice production found in shale, except from fields previously exempted from this rule.

(3) In a unit operation, approved by federal or state authorities, the rules herein set forth shall not apply except that no well in excess of two thousand five hundred (2,500) feet in depth shall be located less than six hundred (600) feet from the exterior or interior (if there be one) boundary of the unit area and no well less than two thousand five hundred (2,500) feet in depth below the surface shall be located less than two hundred (200) feet from the exterior or interior (if there be one) boundary of the unit area unless otherwise authorized by the order of the Commission after proper notice to owners outside the unit area.

e. **Wells located near a mine**. No well drilled for oil or gas shall be located within two hundred (200) feet of a shaft or entrance to a coal mine not definitely abandoned or sealed, nor shall such well be located within one hundred (100) feet of any mine shaft house, mine boiler house, mine engine house, or mine fan; and the location of any proposed well shall insure that when drilled it will be at least fifteen (15) feet from any mine haulage or airway.

318A. GREATER WATTENBERG AREA SPECIAL WELL LOCATION RULE

a. The Greater Wattenberg Area ("GWA") is defined to include those lands from and including Townships 2 South to 7 North and Ranges 61 West to 69 West, 6^{th} P.M. In GWA, operators may utilize the following described drilling locations to drill or twin a well, deepen a well, or recomplete a well and to commingle any or all of the Cretaceous Age formations from the base of the Dakota to the surface ("GWA wells"):

(1) A square with sides four hundred (400) feet in length, the center of which is the center of any quarter/quarter section; and,

(2) A square with sides eight hundred (800) feet in length, the center of which is the center of any quarter section.

b. Any GWA well in existence prior to the effective date of this rule, which is not located as described above, may also be utilized for deepening to or recompletion in any Cretaceous Age formation, and for the commingling of production therefrom.

c. Where an existing well cannot be utilized for deepening or recompletion, for reasons including, but not limited to, differing ownership or wellbore limitations, any new, twinned well shall be located as close to such existing well as is practicable, consistent with sound engineering practice.

d. This rule does not alter the size or configuration of drilling units for GWA wells in existence prior to its effective date. Where deemed necessary an operator for purposes of allocating production, such operator may allocate production to an expanded drilling unit with respect to a particular Cretaceous Age formation consistent with the provisions of this rule.

e. This rule shall not serve to bar the granting of relief to owners who file an application alleging abuse of their correlative rights to the extent that such owners can demonstrate that their opportunity to produce the Cretaceous Age formations from the drilling locations herein authorized does not provide an equal opportunity to obtain their just and equitable share of oil and gas from such formations.

f. Subject to paragraph d. above, this rule supersedes all prior Commission drilling and spacing orders affecting the GWA wells. Well location exceptions to this rule shall be subject to the provisions of Rule 318.c.

319. ABANDONMENT

The requirements for abandoning a well shall be as follows:

a. **Plugging**

(1) A dry or abandoned well, seismic, core, or other exploratory hole, must be plugged in such a manner that oil, gas, water, or other substance shall be confined to the reservoir in which it originally occurred. Any cement plug shall be a minimum of fifty (50) feet in length and shall extend a minimum of fifty (50) feet above each zone to be protected. The material used in plugging, whether cement, mechanical plug, or some other equivalent method approved in writing by the Director, must be placed in the well in a manner to permanently prevent migration of oil, gas, water, or other substance from the formation or horizon in which it originally occurred. The preferred plugging cement slurry is that recommended by the American Petroleum Institute (API) Environmental Guidance Document: Well Abandonment and Inactive Well Practices for U.S. Exploration and Production Operations, i.e., a neat cement slurry mixed to API standards. However, pozzolan, gel and other approved extenders may be used if the operator can document, to the Director's satisfaction, that the slurry design will achieve a minimum compressive strength of three hundred (300) psi after twenty-four (24) hours and eight hundred (800) psi after seventy-two (72) hours measured at ninety-five (95) degrees fahrenheit and at eight hundred (800) psi.

(2) The operator shall have the option as to the method of placing cement in the hole by (a) dump bailer, (b) pumping a balanced cement plug through tubing or drill pipe, (c) pump and plug, or (d) equivalent method approved by the Director prior to plugging. Unless prior approval is given, all wellbores will have water, mud or other approved fluid between all plugs.

(3) No substance of any nature or description other than normally used in plugging operations shall be placed in any well at any time during plugging operations. All final reports of plugging and abandonment shall be submitted on a Well Abandonment Report, Form 6, and accompanied by a job log or cement verification report from the plugging contractor specifying the type of fluid used to fill the wellbore, type and slurry volume of API Class cement used, date of work, and depth the plugs were placed.

(4) In order to protect the fresh water strata, no surface casing shall be pulled from any well unless authorized by the Director.

(5) All abandoned wells shall have a plug or seal placed at the surface of the ground or the bottom of the cellar in the hole in such manner as not to interfere with soil cultivation or other surface use. The top of the pipe must be sealed with either a cement plug and a screw cap, or cement plug and a steel plate welded in place or by other approved method, or in the alternative be marked with a permanent monument which shall consist of a piece of pipe not less than four (4) inches in diameter and not less than ten (10) feet in length, of which four (4) feet shall be above the general ground level, the remainder to be embedded in cement or to be welded to the surface casing.

(6) The operator must obtain approval from the Director of the plugging method prior to plugging, and shall notify the Director of the estimated time and date the plugging operation of any well is to commence, and identify the depth and thickness of all known sources of ground water. For good cause shown, the Director may require that a cement plug be tagged if a cement retainer or bridge plug is not used. If requested by the operator, the Director shall furnish written follow-up documentation for a requirement to tag cement plugs.

(7) **Wells Used for Fresh Water**. When the well, seismic, core, or other exploratory hole to be plugged may safely be used as a fresh water well, and such utilization is desired by the landowner, the well need not be filled above the required sealing plug set below fresh water; provided that written authority for such use is secured from the landowner and, in such written authority, the landowner assumes the responsibility to plug the well upon its abandonment as a water well in accordance with these rules. Such written authority and assumption of responsibility shall be filed with the Commission, provided further that the landowner furnish a copy of the permit for a water well approved by the Division of Water Resources.

b. **Shut-in and Temporary Abandonment**.

(1) A well may be shut-in or temporarily abandoned when completed, upon approval of the Director, for a period not to exceed six (6) months provided the hole is cased or left in such a manner as to prevent migration of oil, gas, water or other substance from the formation or horizon in which it originally occurred. All shut-in or temporarily abandoned wells shall be closed to the atmosphere with a swedge and valve or packer, or other approved method. The well sign shall remain in place. If an operator requests shut-in or temporary

abandonment status in excess of six (6) months the operator shall state the reason for requesting such extension and state plans for future operation. A Sundry Notice, Form 4, or other form approved by the Director, shall be submitted annually stating the status of the well and plans for future operation. The Director shall submit copies of any Sundry Notice, Form 4, to the local governmental designees who so requests.

(2) The manner in which the well is to be maintained should be reported to the Commission, and bonding requirements, as provided for in Rule 304., kept in force until such time as the well is permanently abandoned.

(3) A well which has ceased production or injection or is incapable of production or injection shall be abandoned within six (6) months thereafter unless the time is extended by the Director upon application by the owner. The application shall indicate why the well is shut-in and future plans for utilization. In the event the well is covered by a blanket bond, the Director may require an individual plugging bond on the shut-in or temporarily abandoned well. Gas storage wells are to be considered active at all times unless physically plugged.

(4) In addition to the requirements of Rule 325., an injection well that is shut-in or temporarily abandoned shall have a mechanical integrity test performed within two (2) years after the shut-in date in order to be retained in shut-in or temporarily abandoned status.

(5) If an injection well which has been shut-in or temporarily abandoned is determined not to have mechanical integrity as a result of any test required by the Commission rules and regulations, it must, within six (6) months following such a test, be either repaired and pass a mechanical integrity test or be plugged and abandoned.

320. LIABILITY

The owner and operator of any well drilled for oil or gas production or injection purposes, or any seismic, core, or other exploratory holes, whether cased or uncased, shall be liable and responsible for the plugging thereof in accordance with the rules and regulations of the Commission regardless of whether the cost of such plugging and abandonment exceeds the amount of security as set forth in Rule 304.

321. DIRECTIONAL DRILLING

If an operator intends to drill a horizontal or deviated wellbore utilizing controlled directional drilling methods, other than whipstocking due to hole conditions, the plans shall accompany an application for Permit-to-Drill, Form 2. In addition to the information required on the plat in Rule 303.c., the plat shall also show the surface and bottom hole location. If the surface location is in a different section than the bottom hole location, a plat depicting each section is required. Additionally, the proposed directional survey including two (2) wellbore deviation plots, one depicting the plan view and one depicting the side view, shall accompany the application.

Within thirty (30) days of completion the operator shall submit a Drilling Completion Report, Form 5, according to Rule 308., with a copy of the directional survey coordinate listing and the wellbore deviation plots (plan and side views). The survey data shall be provided in a single analysis report with sufficient detail to determine the location of the wellbore from the base of the surface casing to the kick off point and from that point to total depth.

Any changes to an approved Application for Permit-to-Drill, Form 2, shall be submitted and approved on a Sundry Notice, Form 4, prior to implementation. Any request to change either the surface or bottom hole location shall be accompanied by a new proposed directional plan, an updated plat and updated wellbore deviation plots (plan and side view).

322. COMMINGLING

The commingling of production from multiple formations or wells is encouraged in order to maximize the efficient use of wellbores and to minimize the surface disturbance from oil and gas operations. Commingling may be conducted at the discretion of an operator, unless the Commission has issued an order or promulgated a rule excluding specific wells, geologic formations, geographic areas, or field from commingling in response to an application filed by a directly and adversely affected or aggrieved party or on the Commission's own motion.

This rule supercedes the procedural requirements to establish commingling and allocation contained in any Commission order as of the effective date of this rule, but does not supersede any allocation made under such order.

323. OPEN PIT STORAGE OF OIL OR HYDROCARBON SUBSTANCES

Storage of oil or any other produced liquid hydrocarbon substance in earthen pits or reservoirs is considered to constitute waste, except in emergencies where such substances cannot be otherwise contained. In such cases, these substances must be reclaimed and such storage eliminated as soon as practicable after the emergency is controlled, unless special permission to delay or continue is obtained from the Director.

324A. POLLUTION

a. The operator shall take precautions to prevent significant adverse environmental impacts to air, water, soil, or biological resources to the extent necessary to protect public health, safety and welfare, by using cost-effective and technically feasible measures to protect environmental quality and to prevent the unauthorized discharge or disposal of oil, gas, E&P waste, chemical substances, trash, discarded equipment or other oil field waste.

b. No operator, in the conduct of any oil or gas operation shall perform any act or practice which shall constitute a violation of water quality standards or classifications established by the Water Quality Control Commission for waters of the state, or any point of compliance established by the Director pursuant to Rule 324D. The Director may establish one (1) or more points of compliance for any event of pollution, which shall be complied with by all parties determined to be a responsible party for such pollution.

c. No owner, in the conduct of any oil or gas operation, shall perform any act or practice which shall constitute a violation of any comprehensive plan adopted by the Air Quality Control Commission for the prevention, control and abatement of pollution of the air of the state.

d. No injection shall be authorized pursuant to Rule 325. or Rule 401. unless the person applying for authorization to conduct the injection activities demonstrates that those activities will not result in the presence in an underground source of drinking water of any physical, chemical, biological or radiological substance or matter which may cause a violation of any primary drinking water regulation in effect as of July 12, 1982 and found at 40 C.F.R. Part 142, as amended, or may otherwise adversely affect the health of persons. An underground source of drinking water is an aquifer or its portion:

(1) A. Which supplies any public water system; or

B. Which contains a sufficient quantity of ground water to supply a public water system; and

i. Currently supplies drinking water for human consumption; or
ii. Contains fewer than ten thousand (10,000) milligrams per liter total dissolved solids; and

(2) Which is not an exempted aquifer.

e. No person shall accept water produced from oil and gas operations, or other oil field waste for disposal in a commercial disposal facility, without first obtaining a Certificate of Designation from the County in which such facility is located, in accord with the regulations pertaining to solid waste disposal sites and facilities as promulgated by the Colorado Department of Public Health and Environment.

324B. EXEMPT AQUIFERS

a. **Criteria for aquifer exemption.** An aquifer or a portion thereof may be designated by the Director or the Commission as an exempted aquifer, in connection with the filing of an application pursuant to Rule 325. or Rule 401. if it meets the following criteria:

(1) It does not currently serve as a source of drinking water; and either subparagraph (2) or (3) below apply:

(2) It cannot now and will not in the future serve as a source of drinking water because:

A. It is mineral, hydrocarbon or geothermal energy producing, or can be demonstrated by a person filing an application pursuant to Rule 324. or Rule 401. to contain minerals or hydrocarbons that considering their quantity and location are expected to be commercially producible; or

B. It is situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical; or

C. It is so contaminated that it would be economically or technologically impractical to render the water fit for human consumption;

(3) The total dissolved solids content of the ground water is more than three thousand (3,000) and less than ten thousand (10,000) milligrams per liter and it is not reasonably expected to supply a public water system.

b. **Aquifer exemption public notice.** If an aquifer exemption is required as part of an injection permit process, the injection well applicant shall apply for an aquifer exemption. This application shall contain data and information which show that applicable aquifer exemption criteria set forth in Rule 324B.a. are met. After evaluation of the application and prior to designating an aquifer or a portion thereof as an exempted aquifer, the Director shall publish a notice of proposed designation in a newspaper of general circulation serving the area where the aquifer is located. The notice shall identify such aquifer or portion thereof which the Director proposes to designate as exempted, and shall state that any person who can make a showing to the Director that the requested designation does not meet the critera set forth in Rule 324B.a.

c. **Evaluation of written requests for public hearing.** Written requests for a public hearing before the Commission shall be reviewed and evaluated by the Director in consultation with the applicant to determine if the criteria set forth in Rule 324B.a. have been met. If, within thirty (30) days after publication of the notice, the Commission receives a hearing request for which the Director determines the criteria set forth in Rule 324B.a. have not been met, the Commission shall hold such a hearing in accordance with the provisions of §34-60-108, C.R.S., 1973, as amended, and shall make a final determination regarding designation.

d. **Aquifer exemption designation**. If, within thirty (30) days after publication of the notice described in subparagraph b. above, the Commission does not receive a hearing request or receives a hearing request for which the Director determines the criteria set forth in Rule 324B.a. have been met, said aquifer or portion thereof shall be considered exempted thirty (30) days after publication of the notice.

324C. QUALITY ASSURANCE FOR CHEMICAL ANALYSIS

For the purpose of application for a permit for all wells authorized under Rule 325. and Rule 401., collection and analysis of water samples must comply with the Commission's approved quality assurance project plan.

324D. CRITERIA TO ESTABLISH POINTS OF COMPLIANCE

In determining a point of compliance, the Director shall take into consideration recommendations of the operator or any responsible party or parties, if applicable, including technical and economic feasibility, together with the following factors:

a. The classified use established by the Water Quality Control Commission, for any ground water or surface water which will be impacted by contamination. If not so classified, the Director shall consider the quality, quantity, potential economic use and accessibility of such water;

b. The geologic and hydrologic characteristics of the site, such as depth to ground water, ground water flow, direction and velocity, soil types, surface water impacts, and climate;

c. The toxicity, mobility, and persistence in the environment of contaminants released or discharged from the site;

d. Established wellhead protection areas;

e. The potential of the site as an aquifer recharge area; and

f. The distance to the nearest permitted domestic water well or public water supply well completed in the same aquifer affected by the event.

g. The distance to the nearest permitted livestock or irrigation water well completed in the same aquifer affected by the event.

325. UNDERGROUND DISPOSAL OF WATER

a. No person shall commence operations for the underground disposal of water, or any other fluids, into a Class II well, or any well regulated by the Commission, nor shall any person commence construction of such a well, without having first obtained written authorization for such operations from the Director. Persons wishing to obtain authorization to conduct underground disposal activities shall file with the Director an Underground Injection Formation Permit Application, Form 31 and an Injection Well Permit Application, Form 33. If the disposal well is to be drilled, this application shall be submitted concurrently with the Application for Permit-to-Drill, Form 2, along with a service and filing fee to be determined by the Commission. (See Appendix III)

b. **Withholding approval of underground disposal of water.** The Director may withhold the issuance of a permit and the granting of approval of any Underground Injection Formation Permit Application, Form 31 and any Injection Well Permit Application, Form 33 for any proposed disposal well when the Director has reasonable cause to believe that the proposed disposal well could result in a significant adverse impact on the environment or public health, safety and welfare. In the event such approval is not granted, the Director shall immediately advise the operator and bring the matter to the Commission at its next regularly scheduled hearing.

c. The application for a dedicated injection well shall include the following information:

(1) The name, description and depth of the formation into which water is to be injected, and all underground sources of drinking water which may be affected by the proposed operation. A water analysis of the injection formation (if the total dissolved solids of the injection formation is determined to be less than ten thousand (10,000) milligrams per liter, the aquifer must be exempted in accordance with Rule 324B.). The fracture pressure or fracture gradient of the injection formation.

(2) A base plat covering the area within one-quarter (1/4) mile of the proposed disposal well showing location of the proposed disposal well or wells and the location of all oil and gas wells, domestic and irrigation wells of public record and the identification of all oil and gas wells currently producing from the proposed injection zone within one-half (1/2) mile of the disposal zone. The names, addresses and holdings of all surface and mineral owners as defined in §34-60-103 (7), C.R.S., within one-quarter (1/4) mile of the proposed disposal well or wells, or all owners of record in the field if a field-wide system is proposed. These owners shall be specifically outlined and identified on the base plat. A list of all domestic an irrigation wells of public record, within one-quarter mile of the proposed disposal well or wells, including their location and depth. (This information may be obtained at the Colorado Division of Water Resources.) Remedial action shall be required for any well within one-quarter (1/4) mile of the proposed disposal well or wells, which the applicant may or may not operate and a plan for the performance of any such remedial work. A copy of all plans and specifications for the system and its appurtenances.

(3) A resistivity log, run from the bottom of the surface casing to total depth of the disposal well or wells or any well within one (1) mile together with a log from that well that can be correlated with the injection well. If the disposal well is to be drilled, a description of the typical stratigraphic level of the disposal formation in the disposal well or wells, and any other available logging or testing data, on the disposal well or wells.

(4) A full description of the casing in the disposal well or wells. This shall include any information available on any remedial cement work performed to any casing string. This shall also include a schematic drawing showing all casing strings with cement volumes and tops, existing or as proposed, plug back total depth, depth of any existing open or squeezed perforations, setting depths of any bridge plugs existing or proposed, planned perforations in the injection zone, tubing and packer size and setting depth. A diagram of the surface facility showing all pipelines and tanks associated with the system. A listing of all leases connected directly by pipelines to the system.

(5) A listing of all sources of water, by lease and well, to be injected shall be submitted on a Source of Produced Water for Disposal, Form 26.

(6) Any proposed stimulation program.

(7) The estimated minimum and maximum amount of water to be injected daily with anticipated injection pressures. Maximum injection pressure will be set by the Director upon approval.

(8) The names and addresses of those persons notified by the applicant, as required by subparagraph i of this rule.

d. The application for a simultaneous injection well shall include the following:

(1) The name, description and depth of the formation into which water is to be injected, and all underground sources of drinking water which may be affected by the proposed operation. A water analysis of the injection formation (if the total dissolved solids of the injection formation is determined to be less than ten thousand (10,000) milligrams per liter, the aquifer must be exempted in accordance with Rule 324B.); a water analysis from the producing formation; and the fracture pressure or fracture gradient of the injection formation.

(2) A base plat covering the area within one-quarter (1/4) mile of the proposed well showing the location of the proposed well or wells and the location of all oil and gas wells, domestic and irrigation wells of public record and the identification of all oil and gas wells currently producing from the proposed injection zone within one-half (1/2) mile of the disposal zone and the names, addresses and holdings of all mineral owners as defined in §34-60-103 (7), C.R.S., within one-quarter (1/4) mile of the proposed disposal well or wells, or all owners of record in the field if a field-wide system is proposed. These owners shall be specifically outlined and identified on the base plat. Remedial action shall be required for any well within one-quarter (1/4) mile of the proposed well or wells in which the injection zone is not adequately confined. The applicant shall include information regarding the need for remedial action on any well(s) penetrating the injection zone within one-quarter (1/4) mile of the proposed disposal well or wells, which the applicant may or may not operate and a plan for the performance of any such remedial work and a copy of all plans and specifications for the system and its appurtenances.

(3) A resistivity log, run from the bottom of the surface casing to total depth of the disposal zone or such log from a well within one (1) mile together with a log from that well that can be correlated with the simultaneous injection well. If the simultaneous injection well is to be drilled, a description of the typical stratigraphic level of the injection formation in the simultaneous injection well or wells, and any other available logging or testing data, on the simultaneous injection well or wells.

(4) A full description of the casing in the simultaneous injection well or wells. This shall include any information available on any remedial cement work performed to any casing string. This shall also include a schematic drawing showing all casing strings with cement volumes and tops, existing or as proposed, plug back total depth, depth of any existing open or squeezed perforations, setting depths of any bridge plugs existing or proposed, planned perforations in the injection zone, downhole pump setting depth and any tubing and or packer size and setting depth.

(5) Any proposed stimulation program.

(6) The estimated amount of water to be injected daily.

(7) Downhole pump specifications, together with a calculation of maximum discharge pressure created under proposed wellbore configuration. Downhole pump configurations shall be designed to inject below the injection zone fracture gradient.

(8) The names and addresses of those persons notified by the applicant, as required by subparagraph j. of this rule.

The following rules shall apply to both dedicated injection well and simultaneous injection well applications.

e. **Mechanical integrity testing requirement**. Prior to application approval, the proposed disposal well must satisfactorily pass a mechanical integrity test in accordance with Rule 326.

f. **Centralized and commercial disposal well requirements.** Prior to application approval, the appurtenant centralized and commercial disposal well operations shall comply with the requirements of Rules 704. and 908.

g. **Multiple well applications**. Application may be made to include the use of more than one (1) disposal well on the same lease, or on more than one (1) lease. Wherever feasible and applicable, the application shall contemplate a coordinated plan for the entire field.

h. The designated operator of a unitized or cooperative project shall execute the application.

i. Notice of the application for a dedicated injection well shall be given by the applicant by registered or certified mail or by personal delivery, to each surface owner and owner as defined in §34-60-103(7), C.R.S., within one-quarter (1/4) mile of the proposed well or wells and to owners and operators of oil and gas wells producing from the injection zone within one-half (1/2) mile of the disposal well or to owners of cornering and contiguous units where injection will occur into the producing zones, whichever is the greater distance.

j. Notice of the application for a simultaneous injection well shall be given by the applicant by registered or certified mail or by personal delivery, to each owner as defined in §34-60-103(7), C.R.S., within one-quarter (1/4) mile of the proposed well or wells and to owners and operators of oil and gas wells producing from the injection zone within one-half (1/2) mile of the disposal well or to owners of cornering and contiguous units where injection will occur into the producing zones, whichever is the greater distance.

k. A copy of the notice of application shall be included with the disposal application filed with the Commission, and the applicant shall certify that notice by registered or certified mail or by personal delivery, to each of the owners specified in subparagraphs i. and j., has been accomplished.

l. **Notice of application requirements**. The notice shall describe the proposed operation and shall state that any person who would be directly and adversely affected or aggrieved by the authorization of the underground disposal into the proposed injection zone may file, within fifteen (15) days of notification, a written request for a public hearing before the Commission, provided such request meets the protest requirements specified in subparagraph m. of this rule. The notice shall also state that additional information on the operation of the proposed disposal well may be obtained at the Commission office.

m. **Evaluation of written requests for public hearing**. Written requests for public hearing before the Commission by a person, notified in accordance with subparagraphs i. and j. of this rule, who may be directly and adversely affected or aggrieved by the authorization of the underground disposal into the proposed injection zone, shall be reviewed and evaluated by the Director in consultation with the applicant. Written protests shall specifically provide information on:

(1) Possible conflicts between the injection zone's proposed disposal use and present or future use as a source of drinking water or present or future use as a source of hydrocarbons, or

(2) Operations at the well site which may affect potential and current sources of drinking water.

n. **Dedicated injection well public notice**. The Director shall publish a notice of the proposed disposal permit for dedicated injection wells in a newspaper of general circulation serving the area where the well(s) is (are) located. The notice shall briefly describe the disposal application and include legal location, proposed injection zone, depth of injection and other relevant information. Comment period on the proposed disposal application shall end thirty (30) days after date of publication. If any data, information, or arguments submitted during the public comment period appear to raise substantial questions concerning potential impacts to the environment, public health, safety and welfare raised by the proposed disposal well permit the Director may request that the Commission hold a hearing.

o. **Injection application deadlines**. If all of the data or information necessary to approve the disposal application has not been received within six (6) months of the date of receipt, the application will be withdrawn from consideration. However, for good cause shown, a ninety (90) day extension may be granted, if requested prior to the date of expiration.

326. MECHANICAL INTEGRITY TESTING

For the purpose of this rule, a mechanical integrity test of a well is a test designed to determine if: there is a significant leak in the casing, tubing, or packer of the well, and there is significant fluid movement into an underground source of drinking water through vertical channels adjacent to the wellbore.

a. Injection Wells - A mechanical integrity test shall be performed on all injection wells.

(1) The mechanical integrity test shall include one (1) of the following tests to determine whether significant leaks are present in the casing, tubing, or packer;

A. A pressure test with liquid or gas at a pressure of not less than three hundred (300) psi or the minimum injection pressure, whichever is greater, and not more than the maximum injection pressure; or

B. The monitoring and reporting to the Director, on a monthly basis for sixty (60) consecutive months, of the average casing-tubing annulus pressure, following an initial pressure test; or

C. In lieu of A. and B. any equivalent test or combinations of tests approved by the Director.

(2) The mechanical integrity test shall include one (1) of the following tests to determine whether there are significant fluid movements in vertical channels adjacent to the well bore:

A. Cementing records which shall only be valid for injection wells in existence prior to July 1, 1986;

B. Tracer surveys;

C. Cement bond log or other acceptable cement evaluation log;

D. Temperature surveys; or

E. In lieu of A.-D., any other equivalent test or combination of tests approved by the Director.

(3) No person shall inject fluids into a new injection well unless a mechanical integrity test on the well has been performed and supporting documents including Mechanical Integrity Test, Form 14B, submitted and approved by the Director. Verbal approval may be granted for continuous injection following the test.

(4) Following the performance of the initial mechanical integrity test required by subparagraph (3), additional mechanical integrity tests shall be performed on each type of injection well as follows:

A. **Dedicated injection well.** As long as it is used for the injection of fluids, mechanical integrity tests shall be performed at the rate of not less than one (1) test every five (5) years. The first five (5) year period shall commence on the date the initial mechanical integrity test is performed.

B. **Simultaneous injection well.** No additional tests will be required after the initial mechanical integrity test.

(5) Following the performance of the initial mechanical integrity test required by subparagraph (3), additional mechanical integrity tests shall be performed on each well, as long as it is used for the injection of fluids, at the rate of not less than one (1) test every five (5) years. The first five (5) year period shall commence on the date the initial mechanical integrity test is performed.

b. **Shut-in Wells** - All shut-in wells shall pass a mechanical integrity test.

(1) A mechanical integrity test shall be performed on each shut-in well within two (2) years of the initial shut-in date. A mechanical integrity test shall be performed on each shut-in well on five (5) year intervals from the date the initial mechanical integrity test was performed. If, at any time, surface equipment is removed or the well becomes incapable of production, a mechanical integrity test must be performed within thirty (30) days. The mechanical integrity test for a shut-in well shall be:

A. Isolation of the wellbore with a bridge plug or similar approved isolating device set one hundred (100) feet or less above the highest perforations and a pressure test with liquid or gas at a pressure of not less than three hundred (300) psi surface pressure or any equivalent test or combination of tests approved by the Director.

B. Following the performance of the initial mechanical integrity test for shut-in wells, additional tests, other than the five (5) year interval test, may be required.

c. Not less than ten (10) days prior to the performance of any mechanical integrity test required by this rule, any person required to perform the test shall notify the Director, in writing, of the scheduled date on which the test will be performed.

d. All wells shall maintain mechanical integrity. All wells which lack mechanical integrity shall be repaired or plugged and abandoned within six (6) months of failing a mechanical integrity test or of a determination through any other means that the well lacks mechanical integrity, and the well site reclaimed in accordance with Rule 1004.a. All injection wells which fail a mechanical integrity test, or which are determined through any other means to lack mechanical integrity, shall be shut-in immediately.

327. LOSS OF WELL CONTROL

The operator shall take all reasonable precautions, in addition to fully complying with Rule 317. to prevent any oil, gas or water well from blowing uncontrolled and shall take immediate steps and exercise due diligence to bring under control any such well, and shall report such occurrence to the Director as soon as practicable, but no later than twenty four (24) hours following the incident. Within fifteen (15) days after all occurrences the operator shall submit a written report giving all details. The Director shall maintain these written reports in a central file.

328. MEASUREMENT OF OIL

The volume of production of oil shall be computed in terms of barrels of clean oil on the basis of properly calibrated meter measurements or tank measurements of oil-level differences, made and recorded to the nearest one-quarter (1/4) inch of one hundred percent (100%) capacity tables, subject to the following corrections:

a. **Correction for Impurities.** The percentage of impurities (water, sand and other foreign substances not constituting a natural component part of the oil) shall be determined to the satisfaction of the Director, and the observed gross volume of oil shall be corrected to exclude the entire volume of such impurities.

b. **Temperature Correction.** The observed volume of oil corrected for impurities shall be further corrected to the standard volume of sixty degrees fahrenheit (60°F). in accordance with A.S.T.M. D-1250 Table 7, or any revisions thereof and any supplements thereto or any close approximation thereof approved by the Director.

c. **Gravity Determination.** The gravity of oil at sixty degrees fahrenheit (60°F) shall be determined in accordance with A.S.T.M. D-1250 Table 5, or any revisions thereof and any supplements thereto or any close approximation thereof approved by the Director.

329. MEASUREMENT OF GAS

Production of gas of all kinds shall be measured by meter unless otherwise agreed to by the Director. For computing volume of gas to be reported to the Commission, the standard pressure base shall be fourteen point seventy-three (14.73) psia, regardless of atmospheric pressure at the point of measurement, and the standard temperature base shall be sixty degrees fahrenheit (60°F). All volumes of gas to be reported to the Commission shall be adjusted by computation to these standards, regardless of pressures and temperatures at which the gas was actually measured, unless otherwise authorized by the Director.

330. MEASUREMENT OF PRODUCED AND INJECTED WATER

a. The volume of produced water shall be computed and reported in terms of barrels on the basis of properly calibrated meter measurements or tank measurements of water-level differences, made and recorded to the nearest one-quarter (1/4) inch of one hundred percent (100%) capacity tables. If measurements are based on oil/water ratios, the oil/water ratio must be based on a production test performed during the last calendar year. Other equivalent methods for measurement of produced water may be approved by the Director.

b. The volume of water injected into a Class II dedicated injection well shall be computed and reported in terms of barrels on the basis of properly calibrated meter measurements or tank measurements of water-level differences, made and recorded to the nearest one-quarter (1/4) inch of one hundred percent (100%) capacity tables. If water is transported to an injection facility by means other than direct pipeline, measurement of water is required by a properly calibrated meter.

c. The volume of water injected and produced in simultaneous injection wells shall be computed and reported in terms of barrels on the basis of calculated pump volumes, on the basis of properly calibrated meter measurements, or on the basis of a produced gas to water ratio based on an annual production test.

331. VACUUM PUMPS ON WELLS

The installation of vacuum pumps or other devices for the purpose of imposing a vacuum at the wellhead or on any oil or gas bearing reservoir may be approved by the Director upon application therefore, except as herein provided. The application shall be accompanied by an exhibit showing the location of all wells on adjacent premises and all offset wells on adjacent lands, and shall set forth all material facts involved and the manner and method of installation proposed. Notice of the application shall be given by the applicant by registered or certified mail, or by delivering a copy of the application to each producer within one-half (1/2) mile of the installation.

In the event no producer within one-half (1/2) mile of the installation or the Commission itself files written objection or complaint to the application within fifteen (15) days of the date of application, then the application shall be approved, but if any producer within one-half (1/2) mile of said installation or the Commission itself files written objection within fifteen (15) days of the date of application, then a hearing shall be held as soon as practicable.

332. USE OF GAS FOR ARTIFICIAL GAS LIFTING

Gas may be used for artificial gas lifting of oil where all such gas returned to the surface with the oil is used without waste. Where the returned gas is not to be so used, the use of gas for artificial gas lifting of oil is prohibited unless otherwise specifically ordered and authorized by the Commission upon hearing.

333. SEISMIC OPERATIONS

a. **COGCC Form 20, Notice of Intent to Conduct Seismic Operations**. Seismic operations require an approved Form 20 which shall be submitted to the Director prior to commencement of shothole drilling or recording operations. An informational copy of the Form 20 shall be filed by the operator with the local governmental designee at or before the time of filing with the Director. Any change of plans or line locations may be implemented without Director approval provided that after such change is performed, the Director shall receive written notice of the change within five (5) days.

A map shall be included with the notice. This map shall be at a scale of at least 1:48,000 showing sections, townships and ranges and providing the location of the proposed seismic lines, including source and receiver line locations.

The Notice of Intent to Conduct Seismic Operations, Form 20, shall be in effect for six (6) months from the date of approval. An extension of time may be granted upon written request submitted prior to the expiration date.

b. **Surface owner consultation.** Prior to the commencement of any seismic operations, a good faith effort shall be made to consult with all surface owners of the lands included in the seismic project area.

c. **Exploration requiring the drilling of shotholes**:

(1) **Explosive storage.** All explosives shall be legally and safely stored and accounted for in magazines when not in use in accordance with relevant regulations of the Alcohol, Tobacco and Firearms Division of the Federal Department of the Treasury.

(2) **Blasting safety setbacks.** Blasting shall be kept a safe distance from occupied buildings, water wells or springs, unless by special written permission of the surface owner or lessee, according to the following minimum setback distances:

CHARGES IN LBS. GREATER THAN	CHARGES IN LBS. UP TO AND INCLUDING	MINIMUM SETBACK DISTANCE IN FEET
0	2	200
2	5	300
5	6	360
6	7	420
7	8	480
8	9	540
9	10	600
10	11	649
11	12	696
12	13	741
13	14	784
14	15	825
15	16	864
16	17	901
17	18	936
18	19	969
19	20	1000
20		1320

(3) Prior to any shothole drilling, the operator shall contact the Utility Notification Center of Colorado at 1-800-922-1987.

(4) **Drilling and plugging.** The following guidelines shall be used to plug shotholes unless the operator can demonstrate that another method will provide adequate protection to ground water quality and movement and long-term land stability:

A. Any slurry, drilling fluids, or cuttings which are deposited on the surface around the seismic hole shall be raked or otherwise spread out to at least within one (1) inch of the surface, such that the growth of the natural grasses or foliage shall not be impaired.

B. All shotholes shall be preplugged or anchored to prevent public access if not immediately shot. In the event the preplug does not hold, seismic holes shall be properly plugged and abandoned as soon as practical after the shot has been fired. However, a fired hole shall not be left unplugged for more than thirty (30) days without approval of the Director. In no event shall shotholes be left open, but shall be covered with a tin hat or other similar cover until they are properly plugged. The hats shall be imprinted with the seismic contractor's name or identification number or mark.

C. The hole shall be filled to a depth of approximately three (3) feet below ground level by returning the cuttings to the hole and tamping the returned cuttings to ensure the hole is not bridged. A non-metallic perma-plug either imprinted or tagged with the operator name or the identification number or mark described in the notice of intent shall be set at a depth of three (3) feet, and the remaining hole shall be filled and tamped to the surface with cuttings and native soil. A sufficient mound of native soil shall be left over the hole to allow for settling.

D. When non-artesian water is encountered while drilling seismic shotholes, the holes shall be filled from the bottom up with a high grade coarse ground bentonite to ten (10) feet above the static water level or to a depth of three (3) feet from the surface; the remaining hole shall be filled and tamped to the surface with cuttings and native soil, unless the operator otherwise demonstrates that use of another suitable plugging material may be substituted for bentonite without harm to ground water resources.

E. If artesian flow (water rising above the depth at which encountered) is encountered in the drilling of any seismic hole, cement or high grade coarse ground bentonite shall be used to seal off the water flow with the selected material placed from the bottom of the hole to the surface or at least fifty (50) feet above the top of the water-bearing material, thereby preventing cross-flow between aquifers, erosion or contamination of fresh water supplies. Said holes shall be plugged immediately.

d. **COGCC Form 20A, Completion Report for Seismic Operations**. A Form 20A shall be submitted to the Director within sixty (60) days after completion of the project. The report shall include: maps (with a scale not less than 1:48,000) showing the location of all receiver lines, energy source lines and any shotholes. Shotholes encountering artesian flow shall be indicated on the map.

If the program included any shotholes, then the completion report shall be accompanied by the following:

(1) a certification by the party responsible for plugging the holes that all shotholes are plugged as prescribed by these rules and approved by the Director, and

(2) the latitude and longitude of each shothole location. Latitude and longitude values shall be referenced to the NAD 1927 and reported in decimal degrees to an accuracy of at least five (5) decimal places (e.g.; latitude 37.12345 N, longitude 104.45632 W), or reported in other form as approved by the Director. If GPS technology is utilized to determine the latitude and longitude, all GPS data shall meet the requirements set forth in Rule 303.c.(4)a. through d.

e. **Bonding Requirements.** The company submitting the Notice of Intent to Conduct Seismic Operations, Form 20, shall file financial assurance in accordance with Rule 705. prior to the commencement of operations. The bond shall remain in effect until a request is made by the company to release the bond for the following reasons:

(1) The shotholes have been properly plugged and abandoned, and source and receiver lines have been reclaimed in accordance with this Rule 333., and

(2) There are no outstanding complaints received from surface owners that have not been investigated by the Director and addressed as provided for in Rule 522.

f. **Reclamation requirements.** Upon completion of seismic operations the surface of the land shall be restored as nearly as practicable to its original condition at the commencement of seismic operations. Appropriate reclamation of disturbed areas will vary depending upon site specific conditions and may include compaction alleviation and revegetation. All flagging, stakes, cables, cement, mud sacks or other materials associated with seismic operations shall be removed.

334. PUBLIC HIGHWAYS AND ROADS

All persons subject to the Act and these rules and regulations while using public highways or roads shall be subject to the State Vehicles and Traffic Laws pursuant to Title 42, C.R.S. and the State Highway and Roads Laws, Title 43, C.R.S., pertaining to the use of public highways or roads within the state.

335. COGCC Form 15. PIT CONSTRUCTION REPORT/PERMIT

A Pit Construction Report/Permit, Form 15, shall be submitted for approval by the Director in accordance with Rule 903.

336. COGCC Form 18. COMPLAINT FORM

Any party who wishes to file a complaint regarding oil and gas operations is encouraged to submit a Form 18. The Director shall investigate any complaint and determine what, if any, action shall be taken in accordance with Rule 522.

337. COGCC Form 19. SPILL/RELEASE REPORT

All spills and releases of E&P waste exceeding five (5) barrels shall be reported on a Spill/Release Report, Form 19. Form 19 shall be filed with the Director pursuant to the reporting requirements in Rule 906.

338. COGCC Form 24. SOIL ANALYSIS REPORT

Soil Analysis Report, Form 24, shall be submitted where soil composition data is required, in accordance with Rule 910.

339. COGCC Form 25. WATER ANALYSIS REPORT

Water Analysis Report, Form 25, shall be submitted where water quality data is required, in accordance with Rule 910.

340. COGCC Form 27. SITE INVESTIGATION AND REMEDIATION WORKPLAN

Site Investigation and Remediation Workplan, Form 27, shall be submitted when required in accordance with Rule 909.

UNIT OPERATIONS, ENHANCED RECOVERY PROJECTS, AND STORAGE OF LIQUID HYDROCARBONS

401. AUTHORIZATION

a. No person shall perform any enhanced recovery operations, cycling or recycling operations including the extraction and separation of liquid hydrocarbons from natural gas in connection therewith, or operations for the storage of gaseous or liquid hydrocarbons, nor shall any person carry on any other method of unit or cooperative development or operation of a field or a part of either, without having first obtained written authorization from the Commission to perform the aforementioned activities or operations. No person shall commence construction of a well for use in either enhanced recovery operations or for storage of gaseous or liquid hydrocarbons without having first obtained written authorization from the Commission to do so. These provisions shall not apply to existing gas storage projects or to projects that have received approval of the Federal Energy Regulatory Commission; provided however, that a copy of such application and approval shall be submitted to the Commission and made a part of their records.

b. Persons wishing to obtain such authorization shall file an application for authorization with the Commission. The application may be filed by any one (1) or more of the parties involved, or by the operator of the project for which authorization is sought. The application shall include the following:

(1) A plat showing the area involved, together with the well or wells, including drilling wells, dry and abandoned wells located thereon, all properly designated. If the plan of operation involves injection of fluids for enhanced recovery operations, or storage of liquid hydrocarbons, such plat shall show the names of owners of record within one-quarter (1/4) mile of the injection well or wells indicating whether they are surface owners, mineral interest owners, or working interest owners. The application shall also include information regarding the need for remedial action on wells penetrating the injection zone within one-quarter (1/4) mile of each injection well and a plan for the performance of any such remedial work.

(2) A full description of the particular operation for which authorization is required.

(3) Copies of the unit or co-operative agreement and operating agreement, unless these agreements have already been provided to the Commission.

(4) Where injection of fluids for enhanced recovery operations or storage of liquid hydrocarbons is proposed, the application shall also contain:

A. The name, description, thickness and depth of the following formations: those from which wells are producing or having produced; those which will receive any fluids to be injected; those capable of limiting the movement of any fluids to be injected;

B. The name and the depth to the bottom of all underground sources of drinking water which may be affected by the proposed activity or operation;

C. A resistivity log, run from the bottom of the surface casing to total depth of the injection well or wells, or a resistivity log of any well within one (1) mile together with a log from that well that can be correlated with a similar log of the injection well. If the injection well is to be drilled, a description of the typical stratigraphic level of the injection formation and any other available logging or testing data;

D. A description of the casing of the injection well or wells or the proposed casing program, including a schematic drawing of the surface and subsurface construction details of the system and a full description of cement jobs already in place or proposed;

E. A statement specifying the type of fluid to be injected, chemical analysis of the fluid to be injected, the source of the fluid, the estimated amounts to be injected daily, the anticipated injection pressures, water analysis of receiving formation, any available data on the compatibility of the fluid with the receiving formations and known or calculated fracture gradient (maximum authorized surface injection pressure will be set by the Director);

F. A description of any proposed stimulation program;

G. The name and address of the operator or operators of the project and those persons notified by the applicant.

(5) This rule does not apply to gas storage projects in existence on August 18, 1986.

402. NOTICE AND DATE OF HEARING

Upon the filing of any application, the Commission shall issue notice thereof, as provided by the Act and these regulations. Said application shall be set for public hearing at such time as the Commission may fix.

403. ADDITIONAL NOTICE

If injection of fluids is proposed by said application, in addition to the notice required by the Act, a copy of such application shall be given in person or by first class mail to each owner of record of the reservoir involved within one-quarter (1/4) mile of the proposed intake well or wells. Such delivery, whether in person or by mail, shall take place on or before the date the application is filed. An affidavit shall be attached to the application showing the parties to whom the notice has been given and their addresses.

404. CASING AND CEMENTING OF INJECTION WELLS

Wells used for injection of fluids into the producing formation shall be cased with safe and adequate casing or tubing so as to prevent leakage, and shall be so set or cemented that damage will not be caused to oil, gas or fresh water resources. (Each injection well must satisfactorily pass a mechanical integrity test in accord with Rule 326. prior to injection.)

405. NOTICE OF COMMENCEMENT AND DISCONTINUANCE OF INJECTION OPERATIONS

The following provisions shall apply to all injection projects whether or not they are approved by the Commission:

a. Immediately upon the commencement of injection operations, the operator shall notify the Commission of the injection date.

b. Within ten (10) days after the discontinuance of injection operations the operator shall notify the Commission of the date of such discontinuance and the reasons therefore.

c. When any well in an approved enhanced recovery unit operation is converted to or from an injection status, notice shall be given on a Sundry Notice, Form 4, within thirty (30) days.

d. Before any intake well shall be plugged, notice shall be given to the Commission by the owner of said well, and the same procedure shall be followed in the plugging of such well as is provided for the plugging of oil and gas wells.

RULES OF PRACTICE AND PROCEDURE

501. APPLICABILITY OF RULES OF PRACTICE AND PROCEDURE

a. These rules shall be known and designated as "Rules of Practice and Procedure before the Oil and Gas Conservation Commission of the State of Colorado," and shall apply to all proceedings before the Commission. These rules shall be liberally construed to secure just, speedy, and inexpensive determination of all issues presented to the Commission.

b. Notwithstanding any provision of these rules, the Commission shall, upon its own motion or upon the motion of a party to a proceeding, act to prohibit or terminate any abuse of process by an applicant, protestant, intervenor, witness or party offering a statement pursuant to Rule 510. in a proceeding. Such action may include, but is not limited to, summary dismissal of an application, protest, intervention or other pleading; limitation or prohibition of harassing or abusive testimony; and finding a party in contempt. Grounds for such action include, but are not limited to, the use of the Commission's procedures for reasons of obstruction and delay; misrepresentation in pleadings or testimony; or, other inappropriate or outrageous conduct.

c. Any rule, regulation, or final order of the Commission shall be subject to judicial review in accordance with the provisions of the Administrative Procedure Act, §§24-4-101 to 108, C.R.S., and any other applicable provisions of law.

502. PROCEEDINGS NOT REQUIRING THE FILING OF AN APPLICATION

a. **Commission's own motion.** The Commission may, on its own motion, initiate proceedings upon any questions relating to conservation of oil and gas or the conduct of oil and gas operations in the State of Colorado, or to the administration of the Act, by notice of hearing or by issuance of an emergency order without notice of hearing. Such emergency order shall be effective upon issuance and shall remain effective for a period not to exceed fifteen (15) days. Notice of an emergency order shall be given as soon as possible after issuance.

b. **Variances.**

(1) Variances to any Commission rules, regulations, or orders may be granted in writing by the Director without a hearing upon written request by an operator to the Director, or by the Commission after hearing upon application. The operator or the applicant requesting the variance shall make a showing that it has complied with the specific requirements contained in these rules to secure a variance, if any, and that the requested variance will not violate the basic intent of the Oil and Gas Conservation Act.

(2) No variance to the rules and regulations applicable to the Underground Injection Control Program shall be granted by the Director without consultation with the U.S. Environmental Protection Agency, Region VIII, Waste Water Management Division Director.

(3) The Director shall report any variances granted at the monthly Commission hearing following the date on which such variance was granted.

503. ALL OTHER PROCEEDINGS COMMENCED BY FILING AN APPLICATION

a. All proceedings other than those initiated by the Commission or variance requests submitted for Director approval shall be commenced by filing with the Commission the original and nine (9) copies of a typewritten or printed petition which shall be titled "application." Whenever possible, the application shall also be submitted on compatible electronic media. The application shall set forth in reasonable detail the relief requested and the legal and factual grounds for such relief. The original of the application shall be executed by a person with authority to do so on behalf of the applicant and the contents thereof shall be verified by a party with sufficient knowledge to confirm the facts contained therein. Each application shall be accompanied by a docket fee established by the Commission (See Appendix III), except applications seeking an order finding violation or an emergency order.

b. Applications to the Commission may be filed by the following applicants:

(1) For purposes of applications for the creation of drilling units, applications for additional wells within existing drilling units, other applications for modifications to existing drilling unit orders, or applications for exceptions to Rule 318., only those owners within the proposed drilling unit, or within the existing drilling unit to be affected by the application, may be applicants.

(2) For purposes of applications for involuntary pooling orders made pursuant to §34-60-116, C.R.S., only those persons who own an interest in the mineral estate of the tracts to be pooled may be applicants.

(3) For purposes of applications for unitization made pursuant to §34-60-118, C.R.S., only those persons who own an interest in the mineral estate underlying the tract or tracts to be unitized may be applicants.

(4) For purposes of seeking an order finding violation, only the Director or a party who made a complaint under Rule 522. may be an applicant.

(5) For purposes of seeking a variance from the Commission, only the operator, mineral owner, surface owner or tenant of the lands which will be affected by such variance, other state agencies, any local government within whose jurisdiction the affected operation is located, or any person who may be directly and adversely affected or aggrieved if such variance is not granted, may be an applicant.

(6) For purposes of seeking a hearing on a permit-to-drill, Form 2, under Rules 303.d. and 303.k., the relevant local government shall be the applicant, and the hearing shall be conducted in similar fashion as is specified in Rule 508.j., k and l. with respect to a public issues hearing. It shall be the burden of the local government applicant to bring forward evidence sufficient for the commission to make the preliminary findings specified in subsection j of Rule 508. at the outset of such hearing.

(7) For purposes of seeking relief or a ruling from the Commission on any other matter not described in (1) through (6) above, only persons who can demonstrate that they are directly and adversely affected or aggrieved by the conduct of oil and gas operations or an order of the Commission and that their interest is entitled to legal protection under the act may be an applicant.

c. Applications subject to the requirements for local public forums under Rule 508.a. shall be accompanied by a proposed plan (the "Proposed Plan") to address protection of the environment, public health, safety, and welfare and a description of the current surface occupancy/use. The Proposed Plan shall include the rules and regulations of the Commission as they are applied to oil and gas operations in the application lands along with any procedures or conditions the applicant will voluntarily follow to address the protection of the environment, public health, safety, and welfare.

d. No later than seven (7) days after the application is filed, the applicant shall submit to the Commission a certificate of service demonstrating that the applicant served a copy of the application on all persons entitled to notice pursuant to these rules by mailing a copy thereof, first-class postage prepaid, to the last known mailing address of the person to be served, or by personal delivery. The applicant shall at the same time submit to the Commission a list of all persons entitled to notice pursuant to these rules on compatible electronic media. If the applicant is unable to submit an electronic media list of persons noticed the applicant shall submit a written list of persons noticed no later than seven (7) days after the application is filed.

e. The applicant shall enjoy a rebuttable presumption that it has properly served notice on persons entitled to notice of the proceedings by demonstrating through certification or testimony that notice was provided pursuant to Rules 507. and 508.

f. In order to continue to receive copies of the pleadings filed in a specific proceeding a party who receives notice of the application shall file with the Secretary a protest or intervention in accordance with these rules.

g. Subsequent to the initiation of a proceeding, all pleadings filed by any party shall be offered by filing with the Secretary the original and nine (9) copies bearing the cause number assigned to such proceeding. Each pleading shall include the certificate of the party filing the pleading that the pleading has been served on all persons who have filed a protest or intervention in accordance with these rules, by mailing a copy thereof, first-class postage prepaid, to the last known mailing address of the person to be served, or by personal delivery.

504. DOCKET NUMBER OF PROCEEDINGS

When a proceeding is initiated the Secretary of the Commission shall assign it a new docket number and enter on a separate page of a docket provided for such purpose, the proceeding with the date of the filing of the application, or the date of the entry of the Commission order, initiating such proceeding. All subsequent pleadings shall be assigned the same docket number and shall be noted with the date of filing upon the docket page or continued docket page, for such proceeding, as the case may be.

505. REQUIREMENT OF PUBLIC HEARING

Before the Commission adopts any rule, regulation, or enters any order, or amendment thereof, or grants any variance pursuant to Rule 502., the Commission shall hold a public hearing, scheduled in accordance with Rule 506., at such time and place as may be prescribed by the Commission. Any party shall be entitled to be heard as provided in these rules and regulations. The foregoing shall not apply to the issuance of an emergency order, notice of alleged violation, or cease and desist order.

506. HEARING DATE/CONTINUANCE

a. All applications shall be filed no later than fifty (50) days in advance of the hearing date for which the applicant proposes the matter be docketed provided the docket has not been filled by the Secretary. The Secretary shall have the discretion to accept applications later than fifty (50) days prior to the hearing date, subject to docket availability and the notice requirements of Rules 507. and 508. The Secretary shall grant the first request by an applicant for a continuance of any matter three (3) business days before the scheduled hearing, provided that a protest has not been filed. For contested matters the Secretary shall have the discretion to grant any motion for continuance stipulated to by the applicant and any protestants or intervenors. The Secretary shall notify the Commission of any continuances granted at the next regularly scheduled Commission meeting. The Commission may at any time direct the Secretary to discontinue granting continuances in any matter. In all other cases, requests for continuance shall be reviewed by the Commission before approval or denial. When a continuance request is heard by the Commission the moving party shall demonstrate good cause in order for the Commission to grant the continuance.

b. In all rulemaking proceedings, hearings shall be held in accordance with Rule 529.

c. The Commission may for good cause cancel or continue any hearing to another date by issuing written notice at any time prior to the close of the record, or by announcement at hearing. Good cause shall include, but shall not be limited to, the Commission's acknowledgment that it will not have sufficient time at any regularly scheduled meeting to hear any matter. Any continuance of a hearing shall not extend the filing deadline for the filing of protests or interventions in accordance with Rule 509., unless the application is amended, or as otherwise allowed by the Commission.

d. When a Commission hearing is scheduled for multiple days the Secretary may estimate the time and date that a given matter may be heard by the Commission. The Commission may change, at its discretion, the proposed hearing docket, including the time or date of any scheduled hearing. It shall be the responsibility of the participating party and its attorney to be present when the Commission hears the matter.

507. NOTICE FOR HEARING

a. **General notice provisions**

(1) When any proceeding has been initiated, the Commission shall cause notice of such proceeding to be given to all persons specified in the relevant sections of Rules 507.b. and 507.c. at least twenty (20) days in advance of any Commission hearing at which the matter will first be heard. Notice shall be provided in accordance with the requirements of §34-60-108(4), C.R.S.

(2) The applicant shall assume the cost for publication, and if the number of notices exceeds one hundred (100), responsibility for mailing the notices.

(3) The Secretary shall give notice to any person who has filed a request to be placed on the Commission hearing notice list, and paid the annual fee therefor. Notice by publication or notice provided pursuant to the hearing notice list shall not confer interested party status on any person.

b. **Notice for specific applications**

(1) **Applications affecting drilling units.** For purposes of applications for the creation of drilling units, applications for additional wells within existing drilling units or other applications for modifications of or exceptions to existing drilling unit orders (except for applications for well exception locations to existing orders which are addressed in subsection 4 of this rule) notice of the application shall be served on the owners within the proposed drilling unit or within the existing drilling unit to be affected by the applications.

(2) **Applications for involuntary pooling.** For purposes of applications for involuntary pooling orders made pursuant to §34-60-116, C.R.S., notice of the application shall be served on those persons who own any interest in the mineral estate of the tracts to be pooled, except owners of an overriding royalty interest.

(3) **Applications for unitization.** For purposes of applications for unitization made pursuant to §34-60-118, C.R.S., notice of the application shall be served on those persons who own any interest in the mineral estate underlying the tract or tracts to be unitized and the owners within one-half (1/2) mile of the tract or tracts to be unitized.

(4) **Applications changing certain well location setbacks.** For purposes of applications that change the permitted minimum setbacks for established drilling and spacing units, notice of the application shall be served on those owners of contiguous or cornering tracts who may be affected by such change.

(5) **Applications for well location exception.** For purposes of applications made for exceptions to Rule 318., exceptions to legal locations within drilling and spacing units, or for an exception location to an existing order, notice of the application shall be served on the owners of any contiguous or cornering tract toward which the well location is proposed to be moved, provided that when the applicant owns any interest covering such tract, the person who owns the mineral estate underlying the tract covered by such lease shall also be notified. If there is more than one owner within a single drilling unit and the owners have designated a party as the operator on their behalf, notice shall be presumed sufficient if served upon the designated operator of the affected formation.

(6) **Orders related to violations.** With respect to the resolution of a Notice of Alleged Violation (NOAV) through an Administrative Order by Consent (AOC), and to applications for an Order Finding Violation (OFV), notice shall be provided to the complainant and by publication in accordance with §34-60-108(4), C.R.S.

c. **Notice to local government.** For purposes of intervention pursuant to Rule 509. notice shall also be given to the local governmental designee of applications made under sections (1), (3) and (4) of this Rule at the same time that notice is provided to the Commission.

508. LOCAL PUBLIC FORUMS, HEARINGS ON APPLICATIONS FOR INCREASED WELL DENSITY AND PUBLIC ISSUES HEARINGS.

a. Applicability of rule. Applications that would result in more than one (1) well site or multi-well site per forty (40) acre nominal governmental quarter-quarter section or that request approval for additional wells that would result in more than one (1) well site or multi-well site per forty (40) acre nominal governmental quarter-quarter section, within existing drilling units, not previously authorized by Commission order (together an "application for increased well density") shall be subject to the provisions of this Rule 508.

b. **Local public forum.**

(1) The rules and regulations of the Oil and Gas Conservation Commission as they are applied to oil and gas operations are expected to adequately address impacts to the environment and public health, safety and welfare which may be raised by an application for increased well density.

(2) A local public forum may however be convened to consider potential issues related to the environment or public health, safety, and welfare that may be raised by an application for increased well density that may not be completely addressed by these rules or the Proposed Plan submitted with the application to address protection of the environment, public health, safety, and welfare as described in Rule 503.c.

A. A local public forum shall be convened on the Commission's own motion, or upon request from a local governmental designee or the applicant.

B. A local public forum may be convened at the Director's discretion, or upon receipt of a request for a local public forum from a citizen of the county(ies) in which the application area is situated, after the Director's consideration of the following factors:

(i) The size of the application area and the number and density of surface locations requested;

(ii) The population density of the application area;

(iii) The distribution of Indian, federal and fee lands within the application area;

(iv) The level of current or past public interest in increased well density in the vicinity of the application area;

(v) Whether the application is limited to the deepening or recompletion of existing wells, or directional drilling from existing surface locations, or;

(vi) Whether the application is limited to an exploratory unit formed for involuntary pooling purposes.

(3) The Director shall notify the local governmental designee of any application for increased well density no later than five (5) days after receipt of such application. If the local governmental designee elects to require a local public forum it shall notify the Director of its decision within five (5) days of receipt of notice of the application.

(4) The Director shall notify the applicant of any decision to convene a local public forum no later than ten (10) days after receipt of the application.

c. **Local public forums on federal and Indian lands.**

(1) If the surface and the minerals of the application area are comprised in their entirety of federal or Indian lands no local public forum shall be convened because potential impacts to the environment or public health, safety, and welfare on such lands are subject to federal or tribal requirements. All proceedings on any application for increased well density on federal or Indian lands shall be conducted to comply with the obligations contained in any intergovernmental or tribal memoranda of understanding governing the conduct of oil and gas operations on federal or Indian lands.

(2) If the application area is comprised in part of federal or Indian lands, the Director shall consult with the appropriate federal or Indian authorities before scheduling any public forum on the application. Insofar as the application includes federal or Indian lands, proceedings thereon shall be conducted in accordance with this rule and any obligations contained in any intergovernmental or tribal memoranda of understanding governing the conduct of oil and gas operations on federal or Indian lands.

(3) The Director shall notify the appropriate federal and Indian authorities of any local public forum to be convened to evaluate an application area that includes federal or Indian lands. Federal or Indian participation in the local public forum may include without limitation presentation of the most recent applicable resource management plan(s) and any environmental assessment(s) or environmental impact statement(s) that cover or include all or any portion of the application area.

d. **Notice of the local public forum.**

(1) Within five (5) days from the date the applicant receives notice from the Director that a local public forum shall be convened, the applicant shall submit to the Director a list of the surface owners within the application area. In determining the identity and address of a surface owner for the purpose of giving all notices under this rule the records of the assessor for the county in which the lands are situated may be relied upon.

(2) At least twenty (20) days before the date of the local public forum the Director shall mail to the listed surface owners notice thereof.

(3) Within ten (10) days of receipt of an application for increased well density the Director shall, by regular or electronic mail or by facsimile copy, provide to the local governmental designee(s) notice of the local public forum or notice that based on the factors in Rule 508.b.(2).B. above the Director will not conduct a local public forum.

(4) At least ten (10) days before the date of the local public forum the Director shall publish notice thereof in a newspaper of general circulation in the count(ies) where the application lands are located.

(5) The notice for the local public forum shall state that the forum is being conducted to consider any issues raised by the application that may affect the environment or public health, safety, and welfare that are not addressed by the rules or the Proposed Plan.

(6) Within five (5) days of receipt of an application for increased well density, the Director shall post a description of such application on the COGCC Internet web page.

e. **Timing and location of the local public forum.**

(1) As soon as practicable after publication of notice, but at least ten (10) days prior to the scheduled Commission hearing on the application, the Director shall conduct the local public forum at a location

reasonably proximate to the lands affected by the application. In the alternative, if the hearing is to be held at a location reasonably proximate to the lands affected by the application, the local public forum shall be replaced by the presentation of statements in accordance with Rule 510 during the hearing on the application.

(2) The Director shall immediately notify the applicant of the scheduled time and location of the local public forum.

(3) To the extent practicable, the local public forum shall be scheduled to accommodate the Director or the Director's designee, the participants and the applicant.

(4) If the application area is comprised of lands located in more than one jurisdiction the Director shall coordinate the local public forum to provide for a single forum at a reasonable location proximate to the lands affected by the application.

f. **Conduct of the local public forum.**

(1) A COGCC Hearing Officer shall preside over the local public forum. The COGCC Hearing Officer shall provide to the participants an explanation of the purpose of the local public forum and how the Commission may use the information obtained from the local public forum. The purpose of the local public forum is to address the sufficiency of the rules or the Proposed Plan with respect to protection of the environment or public health, safety, and welfare.

(2) The conduct of the local public forum shall be informal, and participants shall not be required to be sworn, represented by attorneys, or subjected to cross examination.

(3) Attendance or participation at the local public forum by a Commissioner shall not constitute a violation of Rule 515.

(4) The applicant shall participate in the local public forum and present information related to the application.

(5) The Director shall create a record of the local public forum by video-tape, audio-tape or by court reporter. Such record shall be made available to all Commissioners for review prior to the hearing on the application, and may be relied upon in making a decision to convene a public issues hearing.

g. The local public forum shall be conducted to allow elected officials, local government personnel and citizens to express concerns not completely addressed by the rules or the Proposed Plan or make statements regarding the potential impacts from increased well density that relate to the environment or public health, safety, and welfare. Issues raised in the local public forum may include the following:

(1) Impact to local infrastructure;

(2) Impact to the environment;

(3) Impact to wildlife;

(4) Impact to ground water resources;

(5) Potential reclamation impact; and

(6) Other impact to public health, safety and welfare.

The local public forum shall be limited to matters that are within the jurisdiction of the Commission.

h. **Report to the Commission.** At the conclusion of the local public forum the presiding officer shall prepare and submit to the Commission a report of the proceedings. A copy of the report shall be made available, no later than five (5) days prior to the hearing on the application, to the Commissioners, the applicant, any affected local government and the public and shall be posted to the COGCC Internet web page. The report on the local public forum presented to the Commission shall be included in the administrative record for the application taking into consideration the nature of the local public forum process.

i. **Conduct of the hearing on the application.**

(1) The hearing on the application shall be conducted in accordance with Rule 528.

(2) The Commission shall approve or deny the application based solely on the application's technical merits in accordance with §34-60-116, C.R.S.

(3) The presiding officer for any local public forum shall present to the Commission the report of the local public forum.

(4) At the conclusion of the hearing on the application the Commission shall consider and decide whether to convene a public issues hearing based on the local public forum or statements made under Rule 510., and any motions to intervene, and the Commission may:

A.Approve the application without condition;

B.Approve the application with conditions based on the technical testimony presented at the hearing on the application;

C. Approve the application, and with the applicant's consent, attach to the order on the application conditions the Commission determines are necessary to address issues related to the environment or public heath, safety or welfare;

D. Approve the application and stay its effective date to convene a public issues hearing in accordance with Rule 508.j.

E.Deny the Application.

(5) If the Commission orders a public issues hearing it shall set the public issues hearing for the next regularly scheduled Commission meeting, unless the applicant requests at a prehearing conference, and the Commission agrees, to convene the public issues hearing immediately following the hearing on the application.

(6) If the Commission orders a public issues hearing it shall set the public issues hearing for the next regularly scheduled Commission meeting.

j. **Public issues hearing**

Upon a request by an applicant, protestant, or intervener, or on the Commission's own motion, a public issues hearing shall be convened provided the Commission makes the following preliminary findings:

(1) That the public issues raised by the application reasonably relate to potential significant adverse impacts to the environment or public health, safety and welfare that are within the Commission's jurisdiction to remedy; and

(2) That the potential impacts were not adequately addressed by:

A. In the case of an application for increased well density, the application or the Proposed Plan; or

B. In the case of an application for permit-to-drill, by such permit.

(3) That the potential impacts are not adequately addressed by the rules and regulations of the Commission.

k. **Conduct of the public issues hearing:**

(1) The rules and regulations of the Commission shall apply to all participants in the public issues hearing.

(2) The public issues hearing shall be conducted, to the extent practicable, in accordance with Rule 528.

(3) After the public issues hearing the Commission may attach conditions to its order to protect the environment from significant adverse impacts or to protect public health safety and welfare as are warranted by the relevant testimony, and that are not otherwise addressed by these rules and regulations and the Proposed Plan. In addition, the Commission may without limitation:

A. Direct the applicant to amend its Proposed Plan for Commission review and approval for all or a portion of the application area to address specific issues related to the environment or public health, safety and welfare, including any identified impacts of increased well density within all or a portion of the application area, rather than on a single well basis.

B. Include in any order a provision to allow the Director discretion to attach specific conditions to individual well permits as the Commission determines are reasonable and necessary to protect the environment or public health, safety, and welfare.

(4) Any plan or conditions imposed by Commission order that would affect federal or Indian lands sall take into account conditions imposed by the federal or Indian authorities and any federal environmental analysis in order to facilitate regulatory consistency and minimize duplicative regulatory efforts.

(5) Any plan or conditions imposed shall take into account cost effectiveness and technical feasibility, and shall not be applied to prevent the drilling of new wells per se.

I. The Director and the commission shall use best efforts to comply with the provisions of this Rule 508., however, any deviation from this rule shall not give rise to a challenge to Commission action on the local public forum, the application for increased well density, or the public issues hearing.

509. PARTICIPATION IN ADJUDICATORY PROCEEDINGS

a. The applicant and persons that have filed with the Commission a timely and proper protest or intervention pursuant to this rule shall have the right to participate formally in any adjudicatory proceeding. In the case of a local government, intervention shall be granted by right and without fee solely to raise environmental or public health, safety, and welfare concerns.

(1) The protest or intervention shall be filed with the Secretary, and served on the applicant and its counsel at least ten (10) business days prior to the first hearing date on the matter.

(2) Description of affected interest:

A. A protest shall include information to demonstrate that the person is a protestant under these rules in order for the protest to be accepted by the Commission.

B. A local government intervening as a matter of right shall include in the intervention information describing the environmental or public health, safety and welfare concerns raised by the application. When an intervention is filed by any local government or person on an application subject to Rule 508.a., information on the following shall be included:

i. That the public issues raised by the application reasonably relate to potential significant adverse impacts to the environment or public health, safety and welfare that are within the Commission's jurisdiction to remedy; and

ii. That the potential impacts were not adequately addressed by the application or by the Proposed Plan; and

iii. That the potential impacts are not adequately addressed by the rules and regulations of the Commission.

C. A party desiring to intervene by permission of the Commission shall include in the intervention information to demonstrate why the intervention will serve the public interest, in which case granting the intervention shall be at the Commission's sole discretion. The Commission, at its discretion, may limit the scope of the permissive intervenor's participation at the hearing.

(3) The pleading shall include:

A. A general statement of the factual or legal basis for the protest or intervention,

B. The relief requested;

C. A description of the intended presentation including a list of proposed witnesses;

D. A time estimate to hear the protest or intervention; and

E. A certificate of service attesting that the pleading has been served, at least ten (10) business days prior to the first hearing date on the matter, on the applicant and any other party which has filed a protest or intervention in the proceeding. If the pleading is served by mail the party filing the pleading shall provide a facsimile copy of the pleading to the applicant and other persons who have filed a proper protest or intervention in the matter on or before the final date for protest or intervention. If for any reason the party filing the pleading is not able to furnish a copy of the pleading to the applicant and the other persons who have filed a proper protest or intervention on or before the final date for protest or intervention, the party filing the pleading shall so notify the Secretary, the applicant and the other parties to the proceeding.

b. The Secretary or the Director may require any additional information necessary pursuant to these rules to ensure the application, protest or intervention is complete on its face.

c. Any person shall have the right to participate in an adjudicatory proceeding by making a 510. statement in accordance with these rules.

d. All pleadings filed pursuant to this rule shall be submitted with an original and nine (9) copies, and shall be accompanied by a docket fee established by the Commission (see Appendix III). The docket fee shall be refunded if an intervention is denied. In cases of extreme hardship, the docket fee may be refunded at the discretion of the Commission.

e. **Participation at the hearing:**

(1) Adjudicatory hearings shall be conducted in accordance with Rule 528. and any applicable prehearing orders of the Commission, or its designated Hearing Officer.

(2) Testimony and cross-examination by a protestant or intervenor shall be limited to those issues that reasonably relate to the interests that the protestant or intervenor seeks to protect, and which may be adversely affected by an order of the Commission.

510. STATEMENTS AT HEARING

a. Any person may make an oral statement or submit a written statement at any hearing that relates to the proceeding before the Commission. The Commission, at its discretion, may limit the length of any oral statement or restrict repetitive statements. In an adjudicatory hearing, an oral statement shall not be accepted into the record unless:

(1) The statement is made under oath, and

(2) The parties to the hearing are allowed to cross-examine the maker of the statement.

b. The Commission, at its discretion, may accept a sworn written statement into the record with due regard to the fact the statement was not subject to cross-examination.

c. The parties to the hearing shall have the right to object to inclusion of any statement under this Rule 510. into the record. The Commission shall note the objection for the record. If the Commission accepts the basis for excluding the 510. statement from the record the substance of the statement shall not be considered by the Commission in making a decision on the matter at issue.

511. APPLICATION PROCEDURE

a. Upon the filing of an application, the Secretary shall set the matter for hearing and ensure that notice is given.

b. If the matter is uncontested, the applicant may request, and the Director may recommend approval on the basis of the merits of the verified application and the supporting exhibits. If the Director does not recommend approval of the application without hearing, the applicant may request an administrative hearing on the application. For purposes of this rule an uncontested matter shall mean any application that is not subject to a protest or an intervention objecting to the relief requested in the application.

c. If the application is contested, the Commission or the Director, at their discretion, may direct the parties to engage in a prehearing conference in accordance with Rule 527. A prehearing conference may result in a continuance of the hearing, or bifurcation of hearing issues as determined by the Director, Hearing Officer or Hearing Commissioner.

512. COMMISSION MEMBERS REQUIRED FOR HEARINGS AND/OR DECISIONS

Four (4) members of the Commission constitute a quorum for the transaction of business. Testimony may be taken and oath or affirmation administered by any member of the Commission.

513. RESERVED

514. JUDICIAL REVIEW

Any Commission order constitutes final agency action for the purpose of judicial review, except as may otherwise be specified under these rules. The statutory time period for filing a notice of appeal from any Commission decision shall commence on the date the order is mailed or served.

515. EX PARTE COMMUNICATIONS

a. The following provisions shall be applied in any adjudicatory proceeding before the Commission or a Hearing Officer.

(1) No person shall make or knowingly cause to be made to any member of the Commission or a Hearing Officer, an ex parte communication concerning the merits of a proceeding which has been noticed for hearing.

(2) No Commissioner or Hearing Officer shall make or knowingly cause to be made to any interested person an ex parte communication concerning the merits of a proceeding which has been noticed for hearing.

(3) A Commissioner or Hearing Officer who receives, or who makes or knowingly causes to be made, a communication prohibited by this rule shall place on the public record of a proceeding:

A. All such written communications and any responses thereto;

B. Memoranda stating the substance of any such oral communications and any responses thereto.

(4) Upon receipt of a communication knowingly made or knowingly caused to be made by a person in violation of this Rule, the Commission or a Hearing Officer may require the person to show cause why their claim or interest in the proceeding should not be dismissed, denied, or otherwise adversely affected on account of such violation.

b. Oral or written communication with individual Commission members is permissible in a rulemaking proceeding. If such information is relied upon in final decision making it shall be made part of the record by the Commission. After the rulemaking record is closed new information that is intended for the rulemaking record shall be presented to the Commission as a whole upon approval of a request to reopen the rulemaking record.

c. This rule shall not limit the right to challenge a decision of the Commission or a Hearing Officer on the grounds of bias or prejudice due to any ex parte communication.

516. STANDARDS OF CONDUCT

a. The purpose of this rule is to ensure that the Commission's decisions are free from personal bias and that its decision making processes are consistent with the concept of fundamental fairness. The provisions of this rule are in addition to the requirements for Commission members set forth in Title 24, Article 18, Section 108.5 of the Colorado Revised Statutes. This rule should be construed and applied to further the objectives of fair and impartial decision making. To achieve these standards Commissioners and Hearing Officers should:

(1) Discharge their responsibilities with high integrity.

(2) Respect and comply with the law. Their conduct, at all times, should promote public confidence in the integrity and impartiality of the Commission.

(3) Not lend the prestige of the office to advance their own private interests, or the private interests of others, nor should they convey, or permit others to convey, the impression that special influence can be brought to bear on them.

b. **Conflicts of interest.** A conflict of interest exists in circumstances where a Commissioner or Hearing Officer has a personal or financial interest that prejudices that Commissioner's or Hearing Officer's ability to participate objectively in an official act.

(1) A Commissioner or a Hearing Officer shall disclose the basis for a potential conflict of interest to the Commission and others in attendance at the hearing before any discussion begins or as soon thereafter as the conflict is perceived. A conflict of interest may also be raised by other Commissioners, the applicant, any protestant or intervenor, or any member of the public.

(2) In response to an assertion of a conflict of interest, a Commissioner may withdraw or the Director may designate an alternate Hearing Officer. If the Commissioner does not agree to withdraw, the other Commissioners, after discussion and comments from any member of the public, shall vote on whether a conflict of interest exists. Such vote shall be binding on the Commissioner disclosing the conflict.

(3) In determining whether there is a conflict of interest that warrants withdrawal the Commission members or Hearing Officer shall take the following into consideration:

A. Whether the official act will have a direct economic benefit on a business or other undertaking in which the Commissioner or Hearing Officer has a direct or substantial financial interest.

B. Whether the potential conflict will result in the Commissioner or Hearing Officer not being capable of judging a particular controversy fairly on the basis of its own circumstances.

C. Whether the potential conflict will result in the Commissioner or Hearing Officer having an unalterable closed mind on matters critical to the disposition of the proceeding.

c. **Discharge of duties.** In the performance of their official duties, the Commission shall apply the following standards:

(1) To be faithful to and constantly strive to improve their competence in regulatory principles, and to be unswayed by partisan interests, public clamor or fear of criticism.

(2) To maintain order and decorum in the proceedings before them.

(3) To be patient, dignified and courteous to litigants, witnesses, lawyers and others with whom the Commission deals in an official capacity, and to require similar conduct of attorneys, staff and others subject to their direction and control.

(4) To afford to every person who is legally interested in a proceeding, or their attorney, full right to be heard according to law.

(5) To diligently discharge their administrative responsibilities, maintain professional confidence in Commission administration and facilitate the performance of the administrative responsibilities of other staff officials.

517. REPRESENTATION AT ADMINISTRATIVE AND COMMISSION HEARINGS

a. Natural persons may appear on their own behalf and represent themselves at hearings before the Commission and persons allowed to make oral or written statements may do so without counsel. Pro se participants shall be subject to these rules and regulations.

b. Except as provided in a. and c. of this rule, representation at hearings before the Commission shall be by attorneys licensed to practice law in the State of Colorado, and provided that any attorney duly admitted to practice law in a court of record of any state or territory of the United States or in the District of Columbia, but not admitted to practice in Colorado, who appears at a hearing before the Commission may, upon motion, be admitted for the purpose of that hearing only, if that attorney has associated for purposes of that hearing with any attorney who:

(1) Is admitted to practice law in Colorado;

(2) Is a resident or maintains a law office within Colorado; and

(3) Is personally appearing with the applicant in the matter and in all proceedings connected with it.

The resident attorney shall continue in the case unless other resident counsel is submitted. Any notice, pleading, or other paper may be served upon the resident attorney with the same effect as if personally served on the non-resident attorney within this state. Resident counsel shall be present before the Commission unless otherwise ordered by the Commission.

c. The Commission has the discretion to allow representation by a corporate officer or director of a community organization, a closely held corporation, a citizens' group duly authorized under Colorado law, or if a limited liability corporation, the member/manager in the following circumstances:

(1) Where the agency is adopting a rule of future effect;

(2) Local public forums;

(3) When an individual is appearing on behalf of a closely held corporation as provided in §13-1-127, C.R.S.;

d. Unless a non-attorney is appearing pro se or pursuant to §13-1-127, C.R.S., or the Director is participating pursuant to Rule 528.c., a non-attorney shall not be permitted to examine or cross-examine witnesses, make objections or resist objections to the introduction of testimony, or make legal arguments.

e. At administrative hearings before the Director, attorneys shall not be required.

518. SUBPOENAS

The Commission may, through the Secretary, issue subpoenas requiring attendance of witnesses and the production of books, papers, and other instruments to the same extent and in the same manner and in accordance with the procedure provided in the Colorado Rules of Civil Procedure which authorize issuance of subpoenas by Clerks of District Courts. A party seeking a subpoena shall submit the form of the subpoena to the Secretary for execution. Upon execution, the party requesting the subpoena has the responsibility to serve the subpoena in accordance with the Rules of Civil Procedure. Upon receipt of an objection to any subpoena issued by the Commission, the Commission has the discretion to limit the scope of the subpoena to matters that are within the scope of the Commission's jurisdiction under the Act.

519. APPLICABILITY OF COLORADO COURT RULES AND ADMINISTRATIVE NOTICE.

a. The Commission adopts the rules of practice and procedure contained in the Colorado Rules of Civil Procedure insofar as the same may be applicable and not inconsistent with the rules herein set forth.

b. In general, the rules of evidence applicable before a trial court without a jury shall be applicable, providing that such rules may be relaxed, where, by so doing, the ends of justice will be better served.

(1) To promote uniformity in the admission of evidence, the Commission, to the extent practical, shall observe and conform to the Colorado rules of evidence applicable in civil non-jury cases in the district courts of Colorado.

(2) When necessary to ascertain facts affecting substantial rights of the parties to a proceeding, the Commission may receive and consider evidence not admissible under the rules of evidence, if the evidence

possesses probative value commonly accepted by reasonable and prudent persons in the conduct of their affairs.

(3) Informality in any proceeding or in the manner of taking testimony shall not invalidate any Commission order, decision, rule or regulation.

c. **Administrative notice.** The Commission may take administrative notice of:

(1) Constitutions and statutes of any state and of the United States;

(2) Rules, regulations, official reports, decisions, and orders of state and federal administrative agencies;

(3) Decisions and orders of federal and state courts;

(4) Reports and other documents in the files of the Commission;

(5) Matters of common knowledge and undisputed technical or scientific fact;

(6) Matters that may be judicially noticed by a Colorado district court in a civil non-jury case; and

(7) Matters within the expertise of the Commission.

520. TIME OF HEARINGS AND HEARING AGENDA

a. Regular hearings will be held before the Commission on such days as may be set by the Commission.

b. The Secretary shall place on the consent agenda those matters recommended by a Hearing Officer for approval, those matters in which an Administrative Order by Consent (AOC) has been negotiated, and those uncontested matters for which a decision has been requested based on the verified application.

(1) The consent agenda shall be voted on without deliberation and without the necessity of reading the individual items, except any Commissioner may request clarification from the Director for any matter on the consent agenda.

(2) Any Commissioner may remove a matter from the consent agenda prior to voting thereon.

(3) Any matter removed from the consent agenda shall be heard at the end of the remaining agenda, if practicable and agreeable to the applicant, or, if not, scheduled for hearing at the next regularly scheduled meeting of the Commission.

521. RESERVED

522. PROCEDURE TO BE FOLLOWED REGARDING ALLEGED VIOLATIONS

a. **Notice of Alleged Violation.**

(1) A complaint requesting that the Director issue a Notice of Alleged Violation (NOAV) may be made by the mineral owner, surface owner or tenant of the lands upon which the alleged violation took place, by other state agencies, by the local government within whose boundaries the lands are located upon which the alleged violation took place, or by any other person who may be directly and adversely affected or aggrieved as a result of the alleged violation.

(2) Oral complaints shall be confirmed in writing. Persons making a complaint are encouraged to submit a Complaint Form, Form 18.

(3) If the Director, on the Director's own initiative or based on a complaint, has reasonable cause to believe that a violation of the Act, or of any rule, regulation, or order of the Commission, or of any permit issued by the Director, has occurred, the Director shall cause the operator to voluntarily remedy the violation, or shall issue a NOAV to the operator. Reasonable cause requires, at least, physical evidence of the alleged violation, as verified by the Director.

(4) If the Director, after investigating a complaint made in accordance with this Rule 522.a.(1), decides not to issue a NOAV, the complainant may file an application to the Commission pursuant to Rule 503.b.(4), requesting the Commission enter an Order Finding Violation (OFV) in accordance with this rule.

(5) **NOAV process**

A. A NOAV issued by the Director shall be served on the operator's designated agent, or on the operator if no agent has been designated, by personal delivery or by certified mail, return receipt requested.

B. The NOAV shall not be placed on the Commission docket, except as part of an application filed pursuant to subparagraph c. of this rule.

C. The NOAV does not constitute final agency action for purposes of judicial appeal.

D. The NOAV shall identify the statute, rule, regulation, order, permit or permit condition subject to Commission jurisdiction allegedly violated and the facts alleged to constitute the violation. The NOAV may propose appropriate corrective action and an abatement schedule, if any, that the Director elects to require. The NOAV shall also describe the penalty, if any, which the Director may propose, to be recommended in accordance with Rule 523.

b. **Resolution of a Notice of Alleged Violation.**

(1) Informal procedures to resolve issues raised by a NOAV with the Director are encouraged. Such procedures may include, but are not limited to, meetings, phone conferences and the exchange of information. If, as a result of such procedures, the Director determines that no violation has occurred, the Director shall revoke the NOAV in writing and shall provide a copy of the written notification to the complainant, if any.

(2) NOAVs may be resolved by written agreement of the operator and the Director as to the appropriate corrective action and abatement schedule, a copy of which shall be provided by the Director to the complainant, if any. Such agreements do not require Commission approval and shall not be placed on the Commission docket, except at the request of the operator.

(3) NOAVs which are not resolved by written agreement for correction and abatement or which recommend the imposition of a penalty may be provisionally resolved by negotiation between the operator and the Director. If such negotiations result in a proposed agreement, an Administrative Order By Consent (AOC) containing such agreement shall be prepared and noticed for review and approval by the Commission. The Director may propose the terms for an AOC directly to the alleged violator. Upon Commission approval, the AOC shall become a final order, and the agreed penalty imposed. The AOC shall be placed on the consent agenda and Commission approval may be granted without hearing, unless a protest thereto is filed. Unless the operator so agrees, such AOC shall not constitute an admission of the alleged violation.

(4) The Director shall advise the complainant of any informal procedures used to facilitate resolution of the NOAV. A complainant may object to the proposed resolution by AOC. At the Director's discretion the AOC may be reviewed and modified based on the complainant's concerns, with the consent of the operator. If the complainant objects to the Director's final decision to revoke or settle the NOAV, the complainant shall have the right to file with the Commission an application for an Order Finding Violation (OFV). Such application shall be filed within forty-five (45) days of the Director's decision and shall be served on the Director and the operator.

c. **Order Finding Violation.**

(1) If the operator contests the NOAV, as to the existence of the violation, the appropriate corrective action and abatement schedule, or as to any proposed penalty, the Director shall make application to the Commission for an OFV and shall place the matter on the next available Commission docket, providing that at least twenty (20) days notice of such application is provided to the operator.

(2) If the Director decides not to issue a NOAV, the Commission may conduct a hearing to consider whether to issue an OFV upon twenty (20) days notice to the affected operator under the following circumstances:

A. On the Commission's own initiative if it believes that the Director has failed to enforce a provision of statute, rule, regulation, order, permit or permit condition subject to Commission jurisdiction.

B. On the application of a complainant pursuant to Rule 503.b.(4), provided that such complainant has first made a written request to the Director to issue an NOAV and the Director has determined in writing not to do so. An application by a complainant shall be filed within forty-five (45) days of the Director's written determination.

(3) Upon an operator's request a settlement conference shall be held with the Director no less than five (5) days before the hearing on an OFV. If an agreement is reached, an AOC containing such agreement shall be prepared and noticed for review and approval by the Commission, at its discretion. Upon such approval, the AOC shall become a final order, and the agreed penalty shall be imposed. Such approval may be granted without hearing, unless a hearing thereon is requested by a complainant. Unless the operator so agrees, such AOC shall not constitute an admission of the alleged violation.

(4) A hearing to consider whether to issue an OFV shall be a de novo proceeding, unless the parties stipulate as to the facts, or as to the appropriate corrective action and abatement schedule, in which case the hearing may be accordingly limited.

(5) The Director is always a necessary party to a hearing on an OFV. The operator against which an OFV is sought is always a necessary party but need not present a case. Any person, which is not the applicant for an OFV, but whose complaint initiated the enforcement proceeding, shall be granted intervenor status if so requested, pursuant to Rule 509., except that the filing fee shall be waived.

d. **Cease and Desist Orders.**

(1) The Commission or the Director may issue a cease and desist order whenever an operator fails to take corrective action required by final AOC or OFV.

(2) Whenever the Commission has evidence that a violation of any provision of the Act, any rule, permit, or order of the Commission has occurred under circumstances deemed to constitute an emergency situation, the Commission or the Director may issue a cease and desist order. If the order is entered by the Director it shall be immediately reported to the Commission for review and approval. Such order shall be considered a final order for purposes of judicial review.

(3) The order shall be served by personal delivery or by certified mail, return receipt requested, or by confirmed facsimile copy followed by a copy provided by certified mail, return receipt requested, to the operator's designated agent, or on the operator if no agent has been designated, for service of process and shall state the provision alleged to have been violated, the facts alleged to constitute the violation, the time by which the acts or practices cited are required to cease, and any corrective action the Commission or the Director elects to require of the operator. Any protest by an operator to a cease and desist order issued by the Director shall automatically stay the effective date of the order, in which case the order shall not be considered final for purposes of judicial review until such protest is heard.

(4) In the event an operator fails to comply with a cease and desist order, the Commission may request the attorney general to bring suit pursuant to §34-60-109, C.R.S.

523. PROCEDURE FOR ASSESSING FINES

a. **Fines.** An operator who violates any provision of the Act or any rule, permit, or order issued by the Commission shall be subject to a fine which shall be imposed only by order of the Commission, after hearing, or by an AOC approved by the Commission. All fines shall be calculated using the base fine amount for the particular violation as set forth in the fine schedule in subparagraph c. of this Rule 523., subject to the following:

(1) The Commission may in its discretion find that each day a violation exists constitutes a separate violation; however, no fine for any single violation shall exceed one thousand dollars ($1,000) per day.

(2) All fines shall be subject to adjustment based upon the factors listed in subparagraph d. of this Rule 523.

(3) For a violation which does not result in significant waste of oil and gas resources, damage to correlative rights, or a significant adverse impact on public health, safety or welfare, the maximum penalty for any single violation shall not exceed ten thousand dollars ($10,000) regardless of the number of days of such violation.

(4) Fines for violations for which no base fine is listed shall be determined by the Commission at its discretion subject to subparagraphs (1), (2), and (3) of this Rule 523.a.

b. **Voluntary disclosure.** Any operator who conducts a voluntary self-evaluation as defined in the 100 Series of the rules and makes a voluntary disclosure to the Director of a significant adverse impact on the environment or of a failure to obtain or comply with any necessary permits, shall enjoy a rebuttable presumption against the imposition of a fine for any violation relating to such impact or failure, under the following conditions:

(1) The disclosure is made promptly after the operator learns of the violation as a result of the voluntary self-evaluation;

(2) The operator making the disclosure cooperates with the Director regarding investigation of the issue identified in the disclosure; and

(3) The operator making the disclosure has achieved or commits to achieve compliance within a reasonable time and pursues compliance with due diligence.

The Commission shall deny the presumption against the imposition of fines only, if, after hearing, it finds that any of the preceding conditions have not been met, or that the use of this process was engaged in for fraudulent purposes.

c. Base fine schedule. The following table sets forth the base fine for violation of the rules listed.

RULE NUMBER	BASE FINE
205	$500
206	$500
207	$500
208	$500

910	$1000
911	$1000
912	$1000

d. **Adjustment.** The fine may be increased or decreased by application of the aggravating and mitigating factors set forth below.

Aggravating factors.

(1) The violation was intentional or reckless.

(2) The violation had a significant negative impact, or threat of significant negative impact on the environment or on public health, safety, or welfare.

(3) The violation resulted in significant waste of oil and gas resources.

(4) The violation had a significant negative impact on correlative rights of other parties.

(5) The violation resulted in or threatened to result in significant loss or damage to public or private property.

(6) The violation involved recalcitrance or recidivism upon the part of the violator.

(7) The violation involved intentional false reporting or recordkeeping.

(8) The violation resulted in economic benefit to the violator, including the economic benefit associated with noncompliance with the applicable rule, in which case the amount of such benefit may be taken into consideration.

Mitigating factors.

(1) The violator self-reported the violation.

(2) The violator demonstrated prompt, effective and prudent response to the violation, including assistance to any impacted parties.

(3) The violator cooperated with the Commission, or other agencies with respect to the violation.

(4) The cause(s) of the violation was outside of the violator's reasonable control and responsibility, or is customarily considered to be force majeure.

(5) The violator made a good faith effort to comply with applicable requirements prior to the Commission learning of the violation.

(6) The cost of correcting the violation reduced or eliminated any economic benefit to the operator.

(7) The operator has demonstrated a history of compliance with Commission rules, regulations and orders.

e. **Public projects.** In lieu of or in reduction of fine amounts, an AOC may provide for the initiation of or participation in operator projects which are beneficial to the environment or public health, safety and welfare, and the Commission encourages AOCs which so provide.

f. **Payment of fines.** An operator against whom the Commission enters an order to pay a fine must pay the amount due within thirty (30) days of the effective date of the order, unless the Commission grants a longer period or unless the operator files for judicial appeal, in which event payment of the penalty shall be stayed pending resolution of such appeal. An operator's obligations to comply with the provisions of a Commission order requiring compliance with the Act, a permit condition or these rules and regulations shall not be stayed pending resolution of an appeal unless the stay is ordered by the court.

524. DETERMINATION OF RESPONSIBLE PARTY

In all cases it shall be the burden of the Director to present sufficient evidence to the Commission to determine responsible party status.

a. A hearing may be initiated on the Commission's own motion, upon application, or at the request of the Director to decide responsible party status upon at least twenty (20) days notice to the potentially responsible parties.

b. Operators shall provide to the Director such information as the Director may reasonably require in making such determination.

c. The Commission shall make the determination under this section without regard to any contractual assignments of liability or other legal defenses between parties.

d. An operator shall enjoy a rebuttable presumption against mitigation liability under §34-60-124 (7), C.R.S., for ongoing significant adverse environmental impacts where the violation which led to such impacts was committed by a predecessor operator and where the operator has conducted an environmental investigation, with reasonable due diligence, of the environmental condition of the particular asset or activity and such investigation did not reveal such significant adverse environmental impacts. The failure to report any condition which is causing such impacts, upon subsequent knowledge by the operator, shall negate the rebuttable presumption against mitigation liability.

e. Where multiple persons are determined to be responsible parties, they shall share in the mitigation liability in proportion to their respective shares of production, respective periods of ownership or respective contributions to the problem, or any other factors as may serve the interests of fairness.

f. The determination of responsible party status and mitigation liability shall require a showing that the responsible party conducted operations that have resulted in or have threatened to cause a significant adverse environmental impact to any air, water, soil or biological resource based on the conduct of oil or gas operations in contravention of any then applicable historic provisions of the Act or rules, whether or not the Commission has entered an order finding violation.

525. PERMIT-RELATED PENALTIES

a. If the Commission determines, after a hearing, that an operator failed to perform any required corrective action/abatement or failed to comply with a cease and desist order issued by the Director or the Commission with regard to violation of a permit provision, the Commission may issue an order suspending, modifying or revoking the permit authorizing the operation. The order shall provide the condition(s) which must be met by the operator for reinstatement of the permit. An operator which is subject to an order that suspends, modifies or revokes a permit shall continue the affected operations only for the purpose of bringing them into compliance with the permit or modified permit and shall do so under the supervision of the Director. Once the condition for reinstatement has been met to the satisfaction of the Director and any fine not subject to judicial review or appeal has been paid, the Director shall inform the Commission, and the Commission, if in agreement, shall reinstate the permit.

b. Whenever the Commission or the Director has evidence that an operator is responsible for a pattern of violation of any provision of the Act, or of any rule, permit, or order of the Commission, the Commission or the Director shall issue a notice to such operator to appear for a hearing before the Commission. If the Commission finds, after such hearing, that a knowing and willful pattern of violation exists, it may issue an order which shall prohibit the issuance of any new permits to such operator. When such operator demonstrates to the satisfaction of the Commission that it has brought each of the violations into compliance and that any fine not subject to judicial review or appeal has been paid, such order denying new permits shall be vacated.

526. ADMINISTRATIVE HEARINGS IN UNCONTESTED MATTERS

a. As to applications where there has been no protest or intervention filed with the Commission in accordance with Rule 509., and where the Director has not recommended approval based on the content of the verified application and supporting exhibits, the application may be heard administratively prior to or on the date of the scheduled Commission hearing. The date and time of the administrative hearing shall be scheduled for the mutual convenience of the applicant and the Hearing Officer. The administrative hearing may be conducted prior to the protest or intervention date but no order shall be entered by the Commission until it has fully considered any timely and properly filed protest or intervention.

b. One or more duly appointed Hearing Officers may hear the application at the administrative hearing. Administrative hearings shall proceed informally in a meeting format. The applicant may present its case using exhibits and witnesses. All witnesses shall be sworn. At the conclusion of the administrative hearing, the Hearing Officer shall make a decision concerning approval or denial of the application and so inform the applicant. The Hearing Officer shall put such decision in a written report to the Commission containing findings of fact, conclusions of law, if any, and a recommended order. If the Hearing Officer recommends denial or qualified approval of the application, the applicant shall be entitled to a hearing de novo at the next scheduled hearing of the Commission.

c. The Commission may appoint Hearing Officers from the Commission staff for the purpose of hearing uncontested matters, presiding at local public forums or otherwise representing the Commission. The service of the Hearing Officers shall be at the Director's discretion.

527. PREHEARING PROCEDURES FOR CONTESTED ADJUDICATORY PROCEEDINGS BEFORE THE COMMISSION

a. The Commission encourages the use of prehearing conferences between parties to a contested matter in order to facilitate settlement, narrow the issues, identify any stipulated facts, resolve any other pertinent issues, and reduce the hearing time before the Commission. A prehearing conference shall be conducted at the direction of the Commission or the Director upon receipt of a protest or an intervention, or upon the request of the applicant or any person who has filed a protest or intervention. For matters in which a staff analysis has been prepared, the Director shall participate in the prehearing conference to advise the parties of the content of the preliminary staff analysis. The prehearing conference shall be conducted under the following general guidelines.

b. The Director, a Hearing Officer or Hearing Commissioner shall preside over any prehearing conference and rule on preliminary matters in any proceeding pending before the Commission.

c. The Secretary shall notify the applicant and any person who has filed a protest or intervention of the prehearing conference, and shall direct the attorneys for the parties, and pro se parties, to appear in order to expedite the hearing or settle issues, or both.

d. All parties shall be prepared to discuss all procedural and substantive issues, and shall be authorized to make binding commitments on all procedural matters.

e. Preparation should include advance study of all materials filed and materials obtained through discovery.

f. Failure of any person to attend the prehearing conference, after being notified of the date, time and place, shall be a waiver of any objection and shall be deemed to be a concurrence to any agreement reached, or to any order or ruling made at the prehearing conference.

g. A prehearing statement may be required of any party.

h. At any prehearing conference, the following matters may be considered:

(1) Offers of settlement or designation of issues;

(2) Simplification of and establishment of a list or summary of the issues;

(3) Bifurcation of issues for hearing purposes;

(4) Admissions as to, or stipulations of, facts not remaining in dispute or the authenticity of documents;

(5) Limitation of the number of fact and expert witnesses;

(6) Limitation on methods and extent of discovery, and a discovery schedule;

(7) Disposition of procedural motions; and

(8) Other matters raised by the parties, the Commission, or presiding officer.

i. At any prehearing conference, the following information may be required:

(1) An exchange and acceptance of service of exhibits proposed to be offered in evidence, and establishment of a list of exhibits to be offered;

(2) Establishment of a list of witnesses to be called and anticipated testimony times; and

(3) A timetable for the completion of discovery, if discovery is allowed.

j. The parties shall reduce to writing any agreement reached or orders issued at a prehearing conference which shall be filed with the presiding officer, who shall enter a decision approving or disapproving it, or recommend modification as a condition for approval. An agreement which is disapproved shall be privileged and inadmissible as evidence in any Commission proceeding.

j. It is the intent of this rule that a prehearing order shall be binding upon the participating parties.

k. Subsequent to the prehearing conference and prior to the hearing on a contested matter, the parties shall each prepare and submit to the Hearing Officer a recommended order for the Commission to consider for adoption at the time of hearing.

528. CONDUCT OF ADJUDICATORY HEARINGS.

a. **Contested applications.** Every party shall have the right to present its case by oral and/or documentary evidence. The following shall be the order of presentation unless otherwise established by the Commission at the hearing:

(1) Determination of whether any Commission members have a conflict of interest;

(2) Presentation of any prehearing order;

(3) Presentation of any motions and disposition of procedural matters;

(4) Presentation of the stipulation, if any;

(5) Opening statement by the applicant;

(6) Opening statements by the respondent (and intervener, if any);

(7) Presentation of the case-in-chief by the applicant;

(8) Presentations by respondent (and intervener, if any);

(9) Presentation of statements under Rule 510., if any;

(10) Presentation of staff analysis, if requested by the Commission.

(11) Rebuttal by the applicant;

(12) Rebuttal by the respondent (and intervenor, if any);

(13) Closing statement by the applicant;

(14) Closing statements by the respondent (and intervenor, if any).

(15) Rebuttal closing statement by the applicant.

(16) Upon motion and for good cause shown, the Commission may permit surrebuttal.

(17) Closing of the record.

b. **Uncontested applications not approved administratively.** For uncontested applications not approved administratively pursuant to Rule 526., the applicant may present evidence in support of its application to the Commission. The order of presentation shall be as follows, unless otherwise established by the Commission at the hearing:

(1) Determination of whether any Commission members have a conflict of interest;

(2) Presentation of staff analysis, if requested by the Commission. The Commission, at its discretion, or upon request of the Director may defer staff testimony until all of the evidence has been presented.

(3) Presentation of the case-in-chief by the applicant;

(4) Closing statement by the applicant.

(5) Closing of the record.

c. **Enforcement hearings.** In order to assure that all parties against whom a fine or penalty may be imposed are afforded due process of law, the Commission shall, at any hearing, permit the Director or the complainant pursuant to Rule 522.b.(4) to present evidence and argument and to conduct cross-examination required for a full disclosure of the facts. The enforcement matter shall be heard by the Commission de novo unless the operator waives its right to a de novo hearing prior to or at the Commission hearing. The order of presentation in a hearing for an enforcement matter shall be as follows, unless otherwise established by the Commission at the hearing:

(1) Determination of whether any Commission members have a conflict of interest;

(2) Opening statements by all parties;

(3) Presentation by the Director;

(4) Presentation by any complainant under Rule 522.b.(4).;

(5) Presentation by the operator;

(6) Rebuttal by the Director;

(7) Rebuttal by the respondent;

(8) Closing statements by the parties;

(9) Finding regarding existence of violation;

(10) If the Commission first determines by a preponderance of the evidence that a violation or violations exist, presentation by the Director of any recommended fine or permit-related penalty, and/or recommended corrective action/abatement to be taken by the operator;

(11) Response by any complainant under Rule 522.b.(4).;

(12) Presentation of statements under Rule 510., if any;

(13) Response by the operator;

(14) Rebuttal by the Director; and

(15) Closing statements by all parties;

(16) Closing of the record.

d. **Closing of record.** At the conclusion of closing statements, the record shall be closed to the presentation of any further evidence, testimony, or statements, except as such may occur in response to questions from the Commission.

e. **Witnesses.** Each witness shall take an oath or affirmation before testifying. After a witness has testified, the applicant, the protestant or participating intervenors and any Commissioner may cross-examine that witness in the order established by the chairperson of the Commission.

f. Where two or more protestants or intervenors have substantially similar interests and positions, the Commission may limit cross-examination or argument on motions and objections to fewer than all the intervenors. The Commission may also limit testimony to avoid undue delay, waste of time or needless presentation of cumulative evidence.

g. **Commission findings and order.** After due consideration of written and oral statements, the testimony, and the arguments presented at hearing, the Commission shall make its findings and order, based upon evidence in the record and, as appropriate, consistent with the Act and any rule, permit, or order made pursuant thereto.

529. PROCEDURES FOR RULEMAKING PROCEEDINGS

a. **Institution of rulemaking.** The Commission may institute rulemaking on its motion or in response to an application filed by any person.

b. **Applications for rulemaking.** Any person may petition the Commission to initiate rulemaking. All applications for rulemaking shall contain the following information:

(1) The name, address, and telephone number of the person requesting the rulemaking;

(2) A copy of the rule proposed in the application and a general statement of the reasons for the requested rule; and

(3) A proposed statement of the basis and purpose for the rule.

c. **Notice of proposed rulemaking.** All rulemaking hearings of the Commission shall be noticed by publication in the Colorado Register not less than twenty (20) days and not more than sixty (60) days prior to the hearing.

d. **Time for rulemaking.** The rulemaking hearing shall not be held until the expiration of six (6) months from the date of application unless the Commission, in its discretion, decides that an earlier hearing is appropriate.

e. **Development of proposed rules.** Prior to the notice of proposed rulemaking, the Commission or Director may use informal procedures to gather information, including, but not limited to, public forums, investigation by Commission staff, and formation of rulemaking teams. Commissioners may participate in such informal proceedings.

f. **Content of notice.** The notice shall state the time, date, place, and general subject matter of the hearing to be held. It may include a statement indicating whether an informal public meeting will be held, the time, date, place, and general purpose of the meeting, any special procedures the Commission deems appropriate for the particular rulemaking proceeding and a statement encouraging public participation. The notice shall state that the proposed regulations will be available upon request from the office of the Commission, the date of availability, and any fee. The notice shall include a short and plain statement which summarizes the intended action and states generally the basis and purpose of the rule.

g. **The rulemaking hearing.** The Commission shall hold a formal public hearing before promulgating any rules or regulations. At that hearing, the Commission shall afford any person an opportunity to submit data, views or arguments. The Commission may limit such testimony or presentation of evidence at its discretion and may prohibit repetitive, irrelevant or harassing testimony.

h. **Conduct of rulemaking hearings.**

(1) The Commission encourages any person to participate at rulemaking hearings. The times at which the public may participate will be determined at the discretion of the Commission. The Commission may, at its discretion, limit the amount of time a person may use to comment or make public statements. Oaths shall not be required for public participation.

(2) The Commission encourages witnesses to make plain, brief, and simple statements of their positions. It also encourages submittal of written statements prior to hearing, with only an oral summary of such a statement at the hearing.

(3) The order of presentation at a rulemaking hearing shall be as established by the Commission at the hearing.

(4) The Commission has the discretion to continue rulemaking hearings by announcement at the rulemaking hearing without republication of the proposed rule.

530. INVOLUNTARY POOLING PROCEEDINGS

a. An application for involuntary pooling pursuant to §34-60-116, C.R.S. may be filed at any time a nonconsenting owner within the drilling unit refuses to agree to bear his proportionate share of the costs and risks of drilling and operating the well. As used herein a nonconsenting owner shall mean an owner in the area to be pooled who, after at least thirty (30) days written notice of the following information does not elect in writing to consent to participate in the cost of the well concerning which the pooling order is sought:

(1) The location and objective depth of the well.

(2) The estimated drilling and completion cost of the well.

(3) The estimated spud date for the well or range of time within which spudding is to occur.

(4) An authority for expenditure prepared by the operator and containing the information required above, together with additional information deemed appropriate by the operator shall satisfy this obligation.

b. In determining whether a reasonable offer to lease has been tendered under §34-60-116(7)(d), C.R.S., the Commission shall consider the lease terms listed below for the drilling and spacing unit in the application and for all cornering and contiguous units that are under the proposed lease:

(1) Date of lease and primary term or offer with acreage in lease;

(2) Annual rental per acre;

(3) Bonus payment or evidence of its non-availability;

(4) Mineral interest royalty;

(5) Such other lease terms as may be relevant.

SAFETY REGULATIONS

601. INTRODUCTION

The rules and regulations in this section are promulgated to protect the health, safety and welfare of the general public during the drilling, completion and operation of oil and gas wells and producing facilities. They do not apply to parties or requirements regulated under the Federal Occupational Safety and Health Act of 1970 (See Rule 212.).

602. GENERAL

The training and action of employees, as well as proper location and operation of equipment is an important part of any safety program. While this section is general in nature, it is considered a basic part of the foundation of any safety program.

a. Employees shall be familiarized with these rules and regulations as provided herein as they relate to their function in their respective jobs. Each new employee should have their job outlined, explained and demonstrated.

b. Unsafe and potentially dangerous conditions as defined by these rules, should be reported immediately by employees to the supervisor in charge and shall be remedied as soon as practical. Any accident involving injury to wellsite personnel or to a member of the general public which requires hospitalization, or significant damage to equipment or the wellsite shall be reported to the Oil and Gas Conservation Commission as soon as practicable, but in no event later than twenty-four (24) hours after the accident.

Where unsafe or potentially dangerous conditions exist, the owner or operator shall respond as directed by an agency with demonstrated authority to do so (such as sheriff, fire district director, etc.).

c. Vehicles of persons not involved in drilling, production, servicing, or seismic operations shall be located a minimum distance of one hundred (100) feet from the wellbore, or a distance equal to the height of the derrick or mast, whichever is greater. Equivalent safety measures shall be taken where terrain, location or other conditions do not permit this minimum distance requirements.

d. Existing wells are exempt from the provisions of these regulations as they relate to the location of the well.

e. Existing producing facilities shall be exempt from the provisions of these regulations with respect to minimum distance requirements and setbacks unless they are found by the Director to be unsafe.

f. Self-contained sanitary facilities shall be provided during drilling operations and at any other similarly staffed oil and gas operations facility.

603. DRILLING AND WELL SERVICING OPERATIONS AND HIGH DENSITY AREA RULES

a. **Statewide setbacks**. Subparagraph (1) below shall apply to all areas of the state except as provided under subparagraphs b. and e. of this rule. Subparagraph (2) below shall apply to all areas of the state.

(1) At the time of initial drilling of the well, the wellhead shall be located a distance of one hundred fifty (150) feet or one and one-half (1-1/2) times the height of the derrick, whichever is greater, from any occupied building, public road, major above ground utility line or railroad.

(2) A well shall be a minimum distance of one hundred fifty (150) feet from a surface property line. An exception may be granted by the Director if it is not feasible for the operator to meet this minimum distance requirement and a waiver is obtained from the offset surface owner(s). An exception request letter stating the reasons for the exception shall be submitted to the Director and accompanied by a signed waiver(s) from the offset surface owner(s). Such waiver shall be written and filed in the county clerk and recorder's office and with the Director.

b. **High density area rules for building units**. A high density area shall be determined at the time the well is permitted on a well-by-well basis by calculating the number of occupied building units within the seventy-two (72) acre area defined by a one thousand (1000) foot radius from the wellhead or production facility. If thirty-six (36) or more actual or platted building units (as defined in the 100 Series rules) are within the one thousand (1000) foot radius or eighteen (18) or more building units are within any semi-circle of the one thousand (1000) foot radius (i.e., an average density of one (1) building unit per two (2) acres), it shall be deemed a high density area. If platted building units are used to determine the density, then fifty percent (50%) of said platted units shall have building units under construction or constructed.

c. **High density area rules for other facilities.** If an educational facility, assembly building, hospital, nursing home, board and care facility, or jail is located within one thousand (1000) feet of a wellhead or production facility, high density area rules shall apply.

d. **Designated outside activity area.** The Commission, upon application and hearing, shall determine the appropriate boundary and setbacks for a designated outside activity area as defined in the 100 Series rules. The minimum setback from the boundary of the designated outside activity area shall be three hundred fifty (350) feet.

e. The following rules shall apply in high density and designated outside activity areas:

(1) **Provisions for encroaching development**. If, by virtue of subsequent future surface development, an area becomes a high density area, subparagraphs (2), (3), (7) and (14) shall not apply to the operator.

(2) **Setbacks for wellheads**. At the time of initial drilling of the well, the wellhead location shall be not less than three hundred fifty (350) feet from any building unit, educational facility, assembly building, hospital, nursing home, board and care facility, or jail.

(3) **Setbacks for production equipment**. At the time of initial installation, production tanks and/or associated on-site production equipment shall be located not less than three hundred fifty (350) feet from any building unit, and, if requested by the local governmental designee, production tanks shall be located five hundred (500) feet from an educational facility, assembly building, hospital, nursing home, board and care facility, jail or designated outside activity area. However, such five hundred (500) foot setback shall be decreased to the maximum achievable setback if five hundred (500) feet would extend beyond the area on which the operator has a legal right to place or construct such facilities. Should the operator object to such five hundred (500) foot setback for any reason, a variance hearing shall be conducted at the next regularly scheduled meeting of the Commission, subject to the notice requirements of Rule 507.

(4) A. **Blowout preventer equipment ("BOPE") for high density area drilling operations**. Blowout prevention equipment for drilling operations shall consist of (at a minimum):

i. Rig with kelley double ram with blind ram and pipe ram;
annular preventer or a rotating head

ii. Rig without kelley double ram with blind ram and pipe ram

Mineral Management certification or Director approved training for blowout prevention shall be required for at least one (1) person at the wellsite during drilling operations.

B. **BOPE testing for high density area drilling operations**. Upon initial rig-up and at least once every thirty (30) days during drilling operations thereafter, pressure testing of the casing string and each component of the blowout prevention equipment including flange connections shall be performed to seventy percent (70%) of working pressure or seventy percent (70%) of the internal yield of casing, whichever is less. Pressure testing shall be conducted and the documented results shall be retained by the operator for inspection by the Director for a period of one (1) year. Activation of the pipe rams for function testing shall be conducted on a daily basis when practicable.

C. **Pit level indicators**. Pit level indicators shall be used.

D. **Drill stem tests**. Closed chamber drill stem tests shall be allowed in high density areas. All other drill stem tests shall require approval by the Director.

(5) A. **BOPE for well servicing operations**. Adequate blowout prevention equipment shall be used on all well servicing operations.

B. Backup stabbing valves shall be required on well servicing operations during reverse circulation. Valves shall be pressure tested before each well servicing operation using both low pressure air and high pressure fluid.

(6) **Location requirement exceptions and waivers**. Exceptions to the location requirements set out in subparagraphs (2) and (3) above shall be granted by the Director if the Director determines that Rule 318. has been complied with and that a copy of waivers from each person owning an occupied building or building permitted for construction within three hundred fifty (350) feet of the proposed location is submitted as part of

the Permit to Drill, Form 2, and that the proposed location complies with all other safety requirements of the rules and regulations.

(7) **Fencing requirements**. At the time of initial installation, if a wellsite falls within a high density area, all pumps, pits, wellheads and production facilities shall be adequately fenced to restrict access by unauthorized persons. For security purposes, all such facilities and equipment used in the operation of a completed well shall be surrounded by a fence six (6) feet in height, constructed in conformance with local written standards so long as the material is non-combustible and allows for adequate ventilation, and the gate(s) shall be locked.

(8) **Control of fire hazards**. Any material not in use that might constitute a fire hazard shall be removed a minimum of twenty-five (25) feet from the wellhead, tanks and separator. Any electrical equipment installations inside the bermed area shall comply with API RP 500 classifications and comply with the current national electrical code as adopted by the State of Colorado.

(9) **Loadlines**. In high density areas, all loadlines shall be bullplugged or capped.

(10) **Removal of surface trash**. All surface trash, debris, scrap or discarded material connected with the operations of the property shall be removed from the premises or disposed of in a legal manner.

(11) **Guy line anchors**. All guy line anchors left buried for future use shall be identified by a marker of bright color not less than four (4) feet in height and not greater than one (1) foot east of the guy line anchor.

(12) **Berm construction**. All newly installed or replaced berms in high density areas, in the absence of remote impounding, shall be constructed around crude oil and condensate storage tanks and shall enclose an area sufficient to contain one hundred fifty percent (150%) of the largest single tank. No more than two (2) crude oil and condensate storage tanks shall be located within a single berm. Berms shall be inspected at regular intervals and containment integrity maintained. Refer to American Petroleum Institute Recommended Practices - D16.

(13) **Tank specifications**. All newly installed or replaced crude oil and condensate storage tanks in high density areas shall be designed, constructed, and maintained in accordance with National Fire Protection Association's latest edition (NFPA 30). The operator shall maintain written records verifying proper design, construction, and maintenance, and shall make these records available for inspection by the Director.

(14) **Access roads**. If a wellsite falls within a high density area at the time of construction, all leasehold roads shall be constructed to accommodate local emergency vehicle access requirements, and shall be maintained in a reasonable condition.

(15) **Well site cleared**. Within ninety (90) days after a well is plugged and abandoned, the well site shall be cleared of all non-essential equipment, trash, and debris. For good cause shown, an extension of time may be granted by the Director.

(16) **Identification of plugged and abandoned wells in high density areas**. The operator shall identify the location of the wellbore with a permanent monument as specified in Rule 319.a.(5). The operator shall also inscribe or imbed the well number and date of plugging upon the permanent monument.

(17) **Development from existing well pads**. Where possible, operators shall provide for the development of multiple reservoirs by drilling on existing pads or by multiple completions or commingling in existing wellbores (see Rule 322.). If any operator asserts it is not possible to comply with, or requests relief from, this requirement, the matter shall be set for hearing by the Commission and relief granted as appropriate.

f. **Statewide rig floor safety valve requirements**. When drilling or well servicing operations are in progress on a well where there is any indication the well will flow hydrocarbons, either through prior records or present conditions, there shall be on the rig floor a safety valve with connections suitable for use with each size and type of tool joint or coupling being used on the job.

g. **Statewide static charge requirements**. Rig substructure, derrick, or mast shall be designed and operated to prevent accumulation of static charge.

h. **Statewide well servicing pressure check requirements**. Prior to initiating well servicing operations, the well shall be checked for pressure and steps taken to remove pressure or operate safely under pressure before commencing operations.

i. **Statewide well control equipment and other safety requirements**. Well control equipment and other safety requirements are:

(1) When there is any indication that a well will flow, either through prior records, present well conditions, or the planned well work, blowout prevention equipment shall be installed in accordance with Rule 317. or any special orders of the Commission.

(2) Blowout prevention equipment when required by Rule 317. shall be in accordance with API RP 53: Recommended Practices for Blowout Prevention Equipment Systems, or amendments thereto.

(3) While in service, blowout prevention equipment shall be inspected daily and a preventer operating test shall be performed on each round trip, but not more than once every twenty-four (24) hour period. Notation of operating tests shall be made on the daily report.

(4) All pipe fittings, valves and unions placed on or connected with blowout prevention equipment, well casing, casinghead, drill pipe, or tubing shall have a working pressure rating suitable for the maximum anticipated surface pressure and shall be in good working condition as per generally accepted industry standards.

(5) Blowout prevention equipment shall contain pipe rams that enable closure on the pipe being used. The choke line(s) and kill line(s) shall be anchored, tied or otherwise secured to prevent whipping resulting from pressure surges.

(6) Pressure testing of the casing string and each component of the blowout prevention equipment, if blowout prevention equipment is required, shall be conducted prior to drilling out any string of casing except conductor pipe. The minimum test pressure shall be five hundred (500) psi, and shall hold for fifteen (15) minutes without pressure loss in order for the casing string to be considered serviceable. Upon demand the operator shall provide to the commissioner the pressure test evidence. Drilling operations shall not proceed until blowout prevention equipment is tested and found to be serviceable.

(7) If the blind rams are closed for any purpose except operational testing, the valves on the choke lines or relief lines below the blind rams should be opened prior to opening the rams to bleed off any trapped pressure.

(8) All rig employees shall have adequate understanding of and be able to operate the blowout prevention equipment system. New employees shall be trained in the operations of blowout prevention equipment system as soon as practicable to do so.

(9) Drilling contractors shall place a sign or marker at the point of intersection of the public road and rig access road.

(10) The number of the public road to be used in accessing the rig along with all necessary emergency numbers shall be posted in a conspicuous place on the drilling rig.

j. **Statewide equipment, weeds, waste, and trash requirements**. All locations, including wells and surface production facilities, shall be kept free of the following: equipment, vehicles, and supplies not necessary for use on that lease; weeds; rubbish, and other waste material. The burning or burial of such material on the premises may be subject to other applicable laws. In addition, material may be burned or buried on the premises only with the prior written consent of the surface owner.

k. **Statewide equipment anchoring requirements**. All equipment at drilling and production sites in geological hazard and floodplain areas shall be anchored to the extent necessary to resist flotation, collapse, lateral movement or subsidence.

604. PRODUCTION FACILITIES

a. **Crude Oil Tanks**.

(1) Atmospheric tanks used for crude oil storage shall be built in accordance with the following standards as applicable:

A. Underwriters Laboratories, Inc., No. UL-142, "Standard for Steel Above Ground Tanks for Flammable and Combustible Liquids"

B. American Petroleum Institute Standard No. 650, "Welded Steel Tanks for Oil Storage"

C. American Petroleum Institute Standard No. 12B, "Bolted Tanks for Storage of Production Liquids"

D. American Petroleum Institute Standard No. 12D, "Field Welded Tanks for Storage of Production Liquids" or

E. American Petroleum Institute Standard No. 12F, "Shop Welded Tanks for Storage of Production Liquids".

(2) Tanks shall be located at least two (2) diameters or three hundred fifty (350) feet, whichever is smaller, from the boundary of the property on which it is built. Where the property line is a public way the tanks shall be two thirds (2/3) of the diameter from the nearest side of the public way or easement.

A. Tanks less than three thousand (3,000) barrels capacity shall be located at least three (3) feet apart.

B. Tanks three thousand (3,000) or more barrels capacity shall be located at least one-sixth (1/6) the sum of the diameters apart. When the diameter of one (1) tank is less than one-half (1/2) the diameter of the adjacent tank, the tanks shall be located at least one-half (1/2) the diameter of the smaller tank apart.

(3) At the time of installation, tanks shall be a minimum of two hundred (200) feet from residences, normally occupied buildings, or well defined normally occupied outside areas.

(4) Berms shall be constructed around tanks in the absence of remote impounding. Both methods shall enclose an area with sufficient volume to contain the entire contents of the largest tank in the enclosure. Berms shall be inspected at regular intervals and maintained in good condition. When a berm is provided around tanks no potential ignition sources shall be installed inside that area.

(5) Tanks shall be a minimum of seventy-five (75) feet from a fired vessel or heater-treater.

(6) Tanks shall be a minimum of fifty (50) feet from a separator, well test unit or other non-fired equipment.

(7) Tanks shall be a minimum of seventy-five (75) feet from a compressor with a rating of two hundred (200) horsepower, or more.

(8) Tanks shall be a minimum of seventy-five (75) feet from a wellhead.

(9) Gauge hatches on atmospheric tanks used for crude oil storage shall be closed at all times when not in use.

(10) Vent lines from individual tanks shall be joined and ultimate discharge shall be directed away from the loading racks and fired vessels in accord with API RP 12R-1.

(11) During hot oil treatments on tanks containing thirty-five (35) degree or higher API gravity oil, hot oil units shall be located a minimum of one hundred (100) feet from any tank being serviced.

b. **Fired Vessel, Heater-Treater**.

(1) Fired vessels (FV) including heater-treaters (HT) shall be minimum of fifty (50) feet from separators or well test units.

(2) FV-HT shall be a minimum of fifty (50) feet from a lease automatic custody transfer unit (LACT).

(3) FV-HT shall be a minimum of forty (40) feet from a pump.

(4) FV-HT shall be a minimum of seventy-five (75) feet from a well.

(5) At the time of installation, FV-HT shall be a minimum of two hundred (200) feet from residences occupied buildings, or well defined normally occupied outside areas.

(6) Vents on pressure safety devices shall terminate in a manner so as not to endanger the public or adjoining facilities. They shall be designed so as to be clear and free of debris and water at all times.

c. **Special Equipment**. Under unusual circumstances special equipment may be required to protect public safety. The Director shall determine if such equipment should be employed to protect public safety and if so, require the operator to employ same. If the operator or the affected party does not concur with the action taken, the Director shall bring the matter before the Commission at public hearing.

(1) All wells located within one hundred fifty (150) feet of a residence(s), normally occupied buildings, or well defined normally occupied outside area(s), shall be equipped with an automatic control valve that will shut the well in when a sudden change of pressure, either a rise or drop, occurs. Automatic control valves shall be designed so they fail safe.

(2) Pressure control valves required in subparagraph a. shall be activated by a secondary gas source supply, and shall be inspected at least every three (3) months to assure they are in good working order and the secondary gas supply has volume and pressure sufficient to activate the control valve.

(3) All pumps, pits, and producing facilities shall be adequately fenced to prevent access by unauthorized persons when the producing site or equipment is easily accessible to the public and poses a physical or health hazard.

(4) Sign(s) shall be posted at the boundary of the producing site where access exists, identifying the operator, lease name, location, and listing a phone number, including area code, where the operator may be reached at all times unless emergency numbers have been furnished to the county commission or it's designee.

d. **Mechanical Conditions**. All valves, pipes and fittings shall be securely fastened, inspected at regular intervals and maintained in good mechanical condition.

e. **Buried or partially buried tanks, vessels or structures.** Buried or partially buried tanks, vessels, or structures used for storage of E&P waste shall be properly designed, constructed and installed in a manner to contain materials safely. Such vessels shall be tested for leaks after installation and maintained, repaired or replaced to prevent spills or releases of E&P waste.

605. RESERVED

606A. FIRE PREVENTION AND PROTECTION

a. Gasoline-fueled engines shall be shut down during fueling operations if the fuel tank is an integral part of the engine.

b. Handling, connecting and transfer operations involving liquefied petroleum gas (LPG) shall conform to the requirements of the State Oil Inspector.

c. Flammable liquids storage areas within any building or shed shall:

(1) Be adequately vented to the outside air;

(2) Have two (2) unobstructed exits leading from the building in different directions if the building is in excess of five hundred (500) square feet.

(3) Be maintained with due regard to fire potential with respect to housekeeping and materials storage;

(4) Be identified as a hazard and appropriate warning signs posted;

d. Flammable liquids shall not be stored within fifty (50) feet of the wellbore, except for the fuel in the tanks of operating equipment or supply for injection pumps. Where terrain and location configuration do not permit maintaining this distance, equivalent safety measures should be taken.

e. Liquefied petroleum gas (LPG) tanks larger than two hundred fifty (250) gallons and used for heating purposes, shall be placed as far as practical from and parallel to the adjacent side of the rig or wellbore as terrain and location configuration permit. Installation shall be consistent with provisions of NFPA 58, "Standards for the Storage and Handling of Liquid Petroleum Gases".

f. Smoking shall be prohibited at or in the vicinity of operations which constitute a fire hazard and such locations shall be conspicuously posted with a sign, "No Smoking" or "Open Flame". Matches and all smoking equipment may not be carried into "No Smoking" areas.

g. No source of ignition shall be permitted in an area where smoking has been prohibited unless it is first determined to be safe to do so by the supervisor in charge or the designated representative.

h. Open fires, transformers, or other sources of ignition shall be permitted only in designated areas located at a safe distance from the wellhead or flammable liquid storage areas.

i. Only approved heaters for Class I Division 2 areas, as designated by API RB 500B, shall be permitted on or near the rig floor. The safety features of these heaters shall not be altered.

j. Combustible materials such as oily rags and waste shall be stored in covered metal containers.

k. Material used for cleaning shall have a flash point of not less than one hundred degrees fahrenheit (100°F). For limited special purposes, a lower flash point cleaner may be used when it is specifically required and should be handled with extreme care.

l. Firefighting equipment shall not be tampered with and shall not be removed for other than fire protection and firefighting purposes and services. A firefighting water system may be used for wash down and other utility purposes so long as its firefighting capability is not compromised. After use, water systems must be properly drained or properly protected from freezing.

m. An adequate amount of fire extinguishers and other firefighting equipment shall be suitably located, readily accessible, and plainly labeled as to their type and method of operation.

n. Fire protection equipment shall be periodically inspected and maintained in good operating condition at all times.

o. Firefighting equipment shall be readily available near all welding operations. When welding, cutting or other hot work is performed in locations where other than a minor fire might develop, a person shall be designated as a fire watch. The area surrounding the work shall be inspected at least one (1) hour after the hot work is completed.

p. Portable fire extinguishers shall be tagged showing the date of last inspection, maintenance or recharge. Inspection and maintenance procedures shall comply with the latest edition of the National Fire Protection Association's publication NFPA 10.

q. Personnel shall be familiarized with the location of fire control equipment such as drilling fluid guns, water hoses and fire extinguishers and trained in the use of such equipment. They shall also be familiar with the procedure for requesting emergency assistance as terrain and location configuration permit. Installation shall be consistent with provisions of NFPA 58, "Standards for the Storage and Handling of Liquefied Petroleum Gases".

606B. AIR AND GAS DRILLING

a. Drilling compressors (air or gas) shall be located at least one hundred twenty five (125) feet from the wellbore and in a direction away from the air or gas discharge line.

b. The air or gas discharge line shall be laid in as nearly as a straight line as possible from the wellbore and be a minimum of one hundred fifty (150) feet in length. The line shall be securely anchored.

c. A pilot flame shall be maintained at the end of the air or gas discharge line at all times when air, gas, mist drilling, or well testing is in progress.

d. All combustible material shall be kept at least one hundred (100) feet away from the air and gas discharge line and burn pit.

e. The air line from the compressors to the standpipe shall be of adequate strength to withstand at least the maximum discharge pressure of the compressors used, and shall be checked daily for any evidence of damage or weakness.

f. Smoking shall not be allowed within seventy-five (75) feet of the air and gas discharge line and burn pit.

g. All operations associated with the drilling, completion or production of a well shall be subject to the Colorado Air Quality Control Act, §25-7-101, C.R.S.

607. HYDROGEN SULFIDE GAS

a. When well servicing operations take place in zones known to contain at or above one hundred (100) ppm hydrogen sulfide gas, as measured in the gas stream, the operator shall file a hydrogen sulfide drilling operations plan (United States Department of the Interior, Bureau of Land Management, Onshore Order No. 6, November 23, 1990).

b. When proposing to drill a well in areas where hydrogen sulfide gas in excess of one hundred (100) ppm can reasonably be expected to be encountered, the operator shall submit as part of the Application for Permit to Drill, Form 2, a hydrogen sulfide drilling operations plan (United States Department of the Interior, Bureau of Land Management, Onshore Order No. 6, November 23, 1990).

c. Any gas analysis indicating the presence of hydrogen sulfide gas shall be reported to the Commission and the local governmental designee.

FINANCIAL ASSURANCE AND ENVIRONMENTAL RESPONSE FUND

701. SCOPE

The rules in this series pertain to the provision of financial assurance by operators to ensure the performance of certain obligations imposed by the Oil and Gas Conservation Act (the Act), §34-60-106 (3.5), (11), (12) and (17) C.R.S., as well as the use of the Environmental Response Fund (ERF), §34-60-124 C.R.S., as a mechanism to plug and abandon orphan wells, perform orphaned site reclamation, and remediation, and to conduct other authorized environmental activities.

702. GENERAL

Operators are required to provide financial assurance to the Commission to demonstrate that they are capable of fulfilling the obligations imposed by the Act, as described in this series. Except as otherwise specified herein, a surety bond, in a form and from a company acceptable to the Commission, is an approved method of providing financial assurance. Any other method of providing financial assurance identified in §34-60-106(B), C.R.S., shall be submitted to the Commission for approval, and shall be equivalent to the protection provided by a surety bond and may require detailed Commission review on an ongoing basis, including the use of third party consultants, the reasonable expense for which shall be charged to the operator proposing such alternative financial assurance.

a. When the Director has reasonable cause to believe that the Commission may become burdened with the costs of fulfilling the statutory obligations described herein because an operator has demonstrated a pattern of non-compliance with oil and gas regulations in this or other states, because special geologic, environmental, or operational circumstances exist which make the plugging and abandonment of particular wells more costly, or due to other special and unique circumstances, the Director may petition the Commission for an increase in any individual or blanket financial assurance required in this series.

b. The requirements of this series do not apply to situations where financial assurance has been provided to federal or Indian agencies for operations regulated solely by such agencies.

703. SURFACE OWNER PROTECTION

Operators shall provide financial assurance to the Commission, prior to commencing any operations with heavy equipment, to protect surface owners who are not parties to a lease, surface use or other relevant agreement with the operator from unreasonable crop loss or land damage caused by such operations. The determination that crop loss or land damage is unreasonable shall be made by the Commission after the affected surface owner has filed an application in accordance with the 500 Series rules. Financial assurance for the purpose of surface owner protection shall not be required for operations conducted on state lands when a bond has been filed with the State Board of Land Commissioners.

The financial assurance required by this section shall be in the amount of two thousand dollars ($2,000) per well for non-irrigated land, or five thousand dollars ($5,000) per well for irrigated land. In lieu of such individual amounts, operators may submit statewide, blanket financial assurance in the amount of twenty five thousand dollars ($25,000).

704. CENTRALIZED E&P WASTE MANAGEMENT FACILITIES

An operator which makes application for an offsite, centralized E&P waste management facility shall, upon approval and prior to commencing construction, provide to the Commission financial assurance in the amount of fifty thousand dollars ($50,000) to ensure the proper reclamation, closure and abandonment of such facility. This section does not apply to underground injection wells and multi-well pits covered under Rules 706. and 707.

705. SEISMIC OPERATIONS

Any operator submitting a Notice of Intent to Conduct Seismic Operations, Form 20, shall, prior to commencing such operations, provide financial assurance to the Commission in the amount of twenty five thousand dollars ($25,000) statewide blanket financial assurance to ensure the proper plugging and abandonment of any shot holes and any necessary surface reclamation.

706. SOIL PROTECTION AND PLUGGING AND ABANDONMENT

Prior to commencing the drilling of a well, an operator shall provide financial assurance to the Commission to ensure the protection of the soil and the proper plugging and abandonment of the well in accordance with the 300 Series of drilling regulations, the 900 Series of E&P waste management, the 1000 Series of reclamation regulations, and the 1100 Series of flowline regulations. The financial assurance required by this section shall be in the amount of five thousand dollars ($5,000) per well. In lieu of such individual amount, an operator may submit statewide blanket financial assurance in the amount of thirty thousand dollars ($30,000) for the drilling and operation of less than one hundred (100) wells, or one hundred thousand dollars ($100,000) for the drilling and operation of one hundred (100) or more wells.

707. INACTIVE WELLS

a. To the extent that an operator's inactive well count exceeds such operator's financial assurance amount divided by five thousand dollars ($5,000), such additional wells shall be considered "excess inactive wells". For each excess inactive well, an operator's required financial assurance amount under Rule 706. shall be increased by five thousand dollars ($5,000). This requirement shall be modified or waived if the Commission approves a plan submitted by the operator for reducing such additional financial assurance requirement, for returning wells to production in a timely manner, or for plugging and abandoning such wells on an acceptable schedule.

In determining whether such plan is acceptable, the Commission shall take into consideration such factors as: the number of excess inactive wells; the cost to plug and abandon such wells; the proportion of such wells to the total number of wells held by the operator; any business reason the operator may have for shutting-in or temporarily abandoning such wells; the extent to which such wells may cause or have caused a significant adverse environmental impact; the financial condition of the operator; the capability of the operator to manage such plan in an orderly fashion; and the availability of plugging and abandonment services. If an increase in financial assurance is ordered pursuant to this subsection, the operator may, at its option and in compliance with these 700 Series rules, submit new financial assurance or supplement its existing financial assurance.

b. Operators shall identify and list any shut-in or temporarily abandoned wells on their monthly production/injection report. In addition, when equipment is removed from a well so as to render it temporarily abandoned, operators shall file a Sundry Notice, Form 4, with the Commission within thirty (30) days describing such activity.

c. Any person, other than the operator, who causes equipment from a well to be removed so as to render it temporarily abandoned shall, prior to conducting such activity, file a notice of intent to remove equipment and receive the approval of the Director. The Director may condition such approval on concurrent plugging and abandonment of the well or on provision of the financial assurance required of operators in this series.

708. PUBLIC HEALTH, SAFETY AND WELFARE

All operators shall maintain general liability insurance coverage for property damage and bodily injury to third parties in the minimum amount of five hundred thousand dollars ($500,000) per occurrence. Operators with wells or production facilities located in "high density areas" as defined in Rule 603.b. shall maintain such coverage in the minimum amount of one million dollars ($1,000,000) per occurrence. Such policies shall include the Commission as a "certificate holder" so that the Commission may receive advance notice of cancellation.

709. FINANCIAL ASSURANCE

All financial assurance provided to the Commission pursuant to this Series shall remain in place until such time as the Director determines an operator has complied with the statutory obligations described herein, or until such time the Director determines a successor-in-interest has filed satisfactory replacement financial assurance, at which time the Director shall provide written approval for release of such financial assurance. Whenever an operator fails to fulfill any statutory obligation described herein, and the Commission undertakes to expend funds to remedy the situation, the Director shall make application to the Commission for an order calling or foreclosing the operator's financial assurance.

a. Operators and third party providers of financial assurance shall be served with a copy of such application pursuant to Rule 503. and shall be accorded an opportunity to be heard thereon. Any third party provider of financial assurance which subsequently fails to comply with a Commission order to make such financial assurance available shall be considered an unacceptable provider of any new financial assurance to operators in Colorado, until such time as it applies for and receives an order of reinstatement. This provision shall be stayed by the filing of a judicial appeal. In addition, the Commission may institute suit to recover such monies.

b. If an operator's financial assurance is called or foreclosed by the Commission, the called or foreclosed amount shall be deposited in the Environmental Response Fund to be expended by the Director for the purposes referenced in Rule 701., and an overhead recovery fee of ten percent (10%) of the funds expended by the Director as direct costs shall be charged against any excess of the financial assurance over such costs.

Any remainder of such financial assurance after such cost recovery shall be returned to its provider. In no circumstances will the liability of a third party provider of financial assurance exceed the face amount of such financial assurance.

c. If an operator's financial assurance is called or foreclosed by the Commission, such operator's Certificates of Clearance, Form 10, are forthwith suspended and no sales of gas or oil shall be allowed, except as may be allowed by the Commission order, until such time as the operator's financial assurance has been replaced or restored.

710. ENVIRONMENTAL RESPONSE FUND

It is the intent of the Commission that an Environmental Response Fund (ERF) "emergency reserve" of unobligated funds be maintained in the amount of one million dollars ($1,000,000), which may be used in accordance with the Act and Rule 701.

711. NATURAL GAS GATHERING, NATURAL GAS PROCESSING AND UNDERGROUND NATURAL GAS STORAGE FACILITIES

Operators of natural gas gathering, natural gas processing, or underground natural gas storage facilities shall be required to provide statewide blanket financial assurance to ensure compliance with the 900 Series rules in the amount of fifty thousand dollars ($50,000), or in an amount voluntarily agreed to with the Director, or in an amount to be determined by order of the Commission. Operators of small systems gathering or processing less than five (5) MMSCFD may provide individual financial assurance in the amount of five thousand dollars ($5,000).

AESTHETIC AND NOISE CONTROL REGULATIONS

801. INTRODUCTION

The rules and regulations in this section are promulgated to control aesthetics and noise impacts during the drilling, completion and operation of oil and gas wells and production facilities. Any Colorado county, home rule or statutory city, town, territorial charter city or city and county may, by application to the Commission, seek a determination that the rules and regulations in this section, or any individual rule or regulation, shall not apply to oil and gas activities occurring within the boundaries, or any part thereof, of any Colorado county, home rule or statutory city, town, territorial charter city or city and county, such determination to be based upon a showing by any Colorado county, home rule or statutory city, town, territorial charter city or city and county that, because of conditions existing therein, the enforcement of these rules and regulations is not necessary within the boundaries of any Colorado county, home rule or statutory city, town, territorial charter city or city and county for the protection of public health, safety and welfare.

802. NOISE ABATEMENT

a. Oil and gas operations, including gas facility operations, shall comply with the following maximum permissible noise levels for the predominant land use existing in the zone in which the operation occurs. Any operation involving pipeline or gas facility installation or maintenance, the use of a drilling rig, completion rig, workover rig, or stimulation is subject to the maximum permissible noise levels for industrial zones. In the hours between 7:00 a.m. and the next 7:00 p.m. the noise levels permitted below may be increased ten (10) db(A) for a period not to exceed fifteen (15) minutes in any one (1) hour period.

ZONE	7:00 am to next 7:00 pm	7:00 pm to next 7:00 am
Residential	55 db(A)	50 db(A)
Commercial	60 db(A)	55 db(A)
Light industrial	70 db(A)	65 db(A)
Industrial	80 db(A)	75 db(A)

The following provide guidance for the measurement of sound levels from oil and gas operations:

(1) If there are no occupied building units impacted, sound levels shall be measured at a distance of twenty-five (25) feet or more from the property line radiating the noise. Sound levels at occupied building units shall be measured as near as practicable to the exterior edge of the occupied building unit closest to the area radiating the noise.

(2) Sound level meters shall be equipped with wind screens, and readings taken when the wind velocity at the time and place of measurement is not more than five (5) miles per hour.

(3) Sound level measurements shall be taken four (4) feet above ground level.

(4) Sound levels shall be determined by averaging measurements made over a fifteen (15) minute sample duration.

(5) In all sound level measurements, the existing ambient noise level from all other sources in the encompassing environment at the time and place of such sound level measurement shall be considered to determine the contribution to the sound level by the oil and gas operation(s).

b. Exhaust from all engines, motors, coolers and other mechanized equipment shall be vented in a direction away from all occupied buildings to the extent practicable.

c. In high density areas all facilities within four hundred (400) feet of occupied buildings with engines or motors which are not electrically operated shall be equipped with quiet design mufflers or equivalent. All mufflers shall be properly installed and maintained in proper working order.

803. LIGHTING

To the extent practicable, site lighting shall be directed downward and internally so as to avoid glare on public roads and occupied buildings within seven hundred (700) feet.

804. VISUAL IMPACT MITIGATION

Production facilities constructed or substantially repainted after May 30, 1992 which are observable from any public highway shall be painted with uniform, non-contrasting, non-reflective color tones, (similar to the Munsell Soil Color Coding System) and with colors matched to but slightly darker than the surrounding landscape.

901. INTRODUCTION

a. **General.** The rules and regulations of this series establish the permitting, construction, operating and closure requirements for pits, methods of E&P waste management, procedures for spill/release response and reporting, and sampling and analysis for remediation activities. The 900 Series rules are applicable only to E&P waste, as defined in §34-60-103(4.5), C.R.S., or other solid waste where the Colorado Department Of Public Health And Environment ("CDPHE") has allowed remediation and oversight by the Commission.

b. **COGCC reporting forms.** The reporting required by the rules and regulations of this series shall be made on forms provided by the Director. Alternate forms may be used where equivalent information is supplied and the format has been approved by the Director.

c. **Additional requirements.** Whenever the Director has reasonable cause to believe that an operator, in the conduct of any oil or gas operation, is performing any act or practice which threatens to cause or causes a violation of Table 910-1 and with consideration of water quality standards or classifications established by the Water Quality Control Commission ("WQCC") for waters of the state, the Director may impose additional requirements, including but not limited to, sensitive area determination, sampling and analysis, remediation, monitoring, permitting and the establishment of points of compliance. Any action taken pursuant to this Rule shall comply with the provisions of Rules 324A. through D. and the 500 Series rules.

d. **Alternative compliance methods.** Operators may propose for prior approval by the Director alternative methods for determining the extent of contamination, sampling and analysis, or alternative cleanup goals using points of compliance or risk-based approaches.

e. **Sensitive area determination.** Operators shall make a sensitive area determination using the Sensitive Area Determination Decision Tree, Figure 901-1 to evaluate the potential for impact to ground water and submit data evaluated and analysis used in the determination to the Director for the following operations or remediation activities:

(1) Construction of drilling pits designed for use with fluids containing hydrocarbon concentrations exceeding 20,000 parts per million ("ppm") total petroleum hydrocarbon ("TPH") or chloride concentrations at total well depth exceeding 15,000 ppm.

(2) Construction of production and special purpose pits;

(3) Construction of centralized E&P waste management facilities;

(4) Management and remediation of spills/releases exceeding twenty (20) barrels net loss of E&P waste; or

(5) When the operator or Director has data that indicate an impact or threat of impact to ground water.

f. Sensitive area operations. **Operations in sensitive areas shall incorporate adequate measures and controls to prevent significant adverse environmental impacts and ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC standards and classifications. Unlined production and special purpose pits in sensitive areas are generally not approved.**

902. PITS - GENERAL AND SPECIAL RULES

a. Pits used for exploration and production of oil and gas shall be constructed and operated to protect the waters of the state from significant adverse environmental impacts from E&P waste, except as permitted by applicable laws and regulations.

b. Topsoil and subsoil removed in the construction of the pit shall be segregated and stockpiled in a manner described in Rule 1002. and used for reclamation of the site.

c. Pits shall be constructed and operated to provide for a minimum of two (2) feet of freeboard between the top of the pit wall and the fluid level of the pit.

d. Any accumulation of oil in a pit shall be removed within twenty-four (24) hours of discovery. This requirement is not applicable to properly permitted and properly fenced or netted skim pits.

e. Where necessary to protect public health, safety and welfare or to prevent significant adverse environmental impacts resulting from access to a pit by wildlife, migratory birds, domestic animals, or members of the general public, operators shall install appropriate netting or fencing.

f. **Multi-well pits.** Production and special purpose pits used for treatment or disposal of E&P waste generated from more than one well may be permitted in accordance with Rule 903. as a multi-well pit, subject to Director approval.

g. Unlined drilling pits shall not be constructed on fill material.

h. Produced water shall be treated in accordance with Rule 907. before being placed in a production pit.

903. PIT PERMITTING/REPORTING REQUIREMENTS

a. Drilling pits, production pits, and special purpose pits shall be permitted or reported as follows:

(1) Pit Construction Report/Permit, Form 15, shall be submitted for prior Director approval for the following:

A. Drilling pits designed for use with fluids containing hydrocarbon concentrations exceeding 20,000 ppm TPH or chloride concentrations at total well depth exceeding 15,000 ppm in sensitive areas or 50,000 ppm outside sensitive areas.

B. Production pits and unlined special purpose pits in sensitive areas.

C. Unlined production pits and special purpose pits outside sensitive areas, excluding those pits permitted in accordance with Rule 903.a.(2).B.

(2) Pit Construction Report/Permit, Form 15, shall be submitted within thirty (30) days after construction for the following:

A. Lined production pits outside sensitive areas.

B. Unlined production pits outside sensitive areas receiving produced water at an average daily rate of five (5) or less barrels per day calculated on a monthly basis for each month of operation.

C. Lined special purpose pits.

D. Flare pits where there is no risk of condensate accumulation.

(3) Pit Construction Report/Permit, Form 15, shall not be required for drilling pits using water-based bentonitic drilling fluids with concentrations of TPH and chloride below those referenced in Rule 903.a.(1).A.

b. The Pit Construction Report/Permit, Form 15, shall be completed in accordance with the instructions in Appendix I. Failure to complete the form in full may result in delay of approval or return of form.

c. The Director shall endeavor to review any properly completed Pit Construction Report/Permit, Form 15, within thirty (30) days after receipt. In order to allow adequate time for pit permit approval, operators should submit required Form 15 pit construction permit requests for approval with an Application for Permit to Drill, Form 2. The Director may condition permit approval upon compliance with additional terms, provisions or requirements necessary to protect the waters of the state, public health, or the environment.

904. PIT LINING REQUIREMENTS AND SPECIFICATIONS

a. Pit lining requirements. The following pits shall be lined:

(1) Drilling pits designed for use with fluids containing hydrocarbon concentrations exceeding 20,000 ppm TPH or chloride concentrations at total well depth exceeding 15,000 ppm in sensitive areas or 50,000 ppm outside sensitive areas.

(2) Production pits in sensitive areas.

(3) Special purpose pits, except emergency pits constructed during initial response to spills/releases, or flare pits where there is no risk of condensate accumulation.

(4) Skim pits.

b. The following specifications shall apply to pits that are required to be lined:

(1) Materials used in lining pits shall be impervious, weather resistant and resistant to deterioration when in contact with hydrocarbons, aqueous acids, alkali, fungi or other substances in the produced water.

(2) Soil liners shall have a minimum thickness of six (6) inches after compaction, shall cover the entire bottom and interior sides of the pit, and shall be constructed so that the hydraulic conductivity of the liner shall not exceed 1.0×10^{-6} cm/sec. Bentonite liners shall be constructed to provide equivalent protection. Operators shall perform post-construction tests either in a laboratory or in the field. All test results shall be filed with the Director.

(3) Synthetic or fabricated liners shall have a minimum thickness of twelve (12) mils and shall be resistant to deterioration by ultraviolet light, weathering, chemicals, punctures and tearing, and designed for the life of the well. The foundation for the liner shall be constructed to prevent punctures from soils or other materials beneath the liner. The synthetic or fabricated liner shall cover the bottom and interior sides of the pit with the edges secured with at least a twelve (12) inch deep anchor trench around the pit perimeter.

(4) In Sensitive Areas, the Director may require a leak detection system for the pit or other equivalent protective measures, including but not limited to, increased record-keeping requirements, monitoring systems and underlying gravel fill sumps and lateral systems. In making such determination, the Director shall consider the surface and subsurface geology, the use and quality of potentially-affected ground water, the quality of the produced water, and the hydraulic conductivity of the surrounding soils and the type of liner.

905. CLOSURE OF PITS, AND BURIED OR PARTIALLY BURIED PRODUCED WATER VESSELS.

a. Unlined production and special purpose pits, except emergency pits constructed during initial response to spills/releases, shall be closed in accordance with an approved Site Investigation and Remediation Workplan, Form 27. The workplan shall be submitted for prior Director approval and shall include a description of the proposed investigation and remediation activities in accordance with Rule 909.

b. Lined pits and buried or partially buried produced water vessels:

(1) Operators shall ensure that soils and ground water meet the allowable concentrations of Table 910-1.

(2) **Pit evacuation.** Prior to backfilling and site reclamation, E&P waste shall be treated or disposed in accordance with Rule 907.

(3) Liners shall be disposed as follows:

A. **Synthetic liner disposal.** On irrigated crop land, liner material shall be removed and disposed in accordance with applicable solid waste rules. On non-irrigated crop land and on non-crop land, liner material may be left in place with surface owner approval.

B. **Constructed soil liners.** Constructed soil liner material may be removed for treatment or disposal, or, where left in place, the material shall be ripped and mixed with native soils in a manner to alleviate compaction and prevent an impermeable barrier to infiltration and ground water flow.

c. **Discovery of a spill/release during closure**. When a spill/release is discovered during closure operations operators shall report the spill/release on the Spill/Release Report, Form 19, in accordance with Rule 906. Leaking pits and buried or partially buried produced water vessels shall be closed and remediated in accordance with Rules 909. and 910.

d. **Emergency pits**. Emergency pits constructed during initial response to contain and mitigate spills/releases shall not be subject to lining requirements. These pits shall be closed and remediated in accordance with Rule 906.

e. **Unlined drilling pits.** Unlined drilling pits shall be closed and reclaimed in accordance with the 1000 Series rules.

906. SPILLS AND RELEASES

a. **General.** Spills/releases of E&P waste, including produced fluids shall be controlled and contained immediately upon discovery. Impacts resulting from spills/releases shall be investigated and cleaned up as soon as practicable.

The Director may require additional activities to prevent or mitigate threatened or actual significant adverse environmental impacts on any air, water, soil or biological resource, or to the extent necessary to ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC ground water standards and classifications.

b. **Reporting.**

(1) Spills/releases of E&P waste or produced fluid exceeding five (5) barrels, including those contained within unlined berms, shall be reported on COGCC Spill/Release Report Form, 19. Such report shall include information relating to initial mitigation, site investigation and remediation, and shall be submitted to the Director within ten (10) days of discovery of the spill/release.

(2) In addition, spills/releases which exceed twenty (20) barrels of an E&P waste shall be verbally reported to the Director within twenty-four (24) hours of discovery.

(3) In addition, spill/releases of any size which impact or threaten to impact any waters of the state, residence or occupied structure, livestock or public byway, shall be verbally reported to the Director as soon as practicable after discovery.

c. **Surface owner notification and consultation.** The operator shall make good faith efforts to notify and consult with the surface owner prior to commencing operations to remediate E&P waste from a spill/release in an area not being utilized for oil and gas operations.

d. **Remediation of spills/releases**.

(1) **Remediation workplan.** When threatened or actual significant adverse environmental impacts on any air, water, soil or biological resource from a spill/release exists or when necessary to ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC ground water standards and classifications, the Director may require operators to submit a Site Investigation and Remediation Workplan, Form 27.

(2) **Remediation requirements.** Spills/releases shall be remediated to meet the allowable concentrations in Table 910-1. Spills/releases exceeding twenty (20) barrels net loss of E&P waste shall be remediated in accordance with Rules 909. and 910.

e. **Spill/release prevention.**

(1) **Secondary containment.** Secondary containment shall be constructed or installed around tanks containing crude oil, condensate or produced water with greater than 10,000 milligrams per liter (mg/l) total dissolved solids (TDS). Operators are also subject to crude oil tank and containment requirements under Rules 603. and 604. This requirement shall not apply to water tanks with a capacity of one hundred (100) barrels or less.

(2) **Spill/release evaluation.** Operators shall determine the cause of a spill/release, and to the extent practicable, shall implement measures to prevent spills/releases due to similar causes in the future. For reportable spills, operators shall submit this information to the Director on the Spill/Release Report, Form 19 within ten (10) days after discovery of the spill/release.

907. MANAGEMENT OF E&P WASTE

a. **General requirements.**

(1) **Operator obligations.** Operators shall ensure that E&P waste is properly stored, handled, transported, treated, recycled or disposed to prevent threatened or actual significant adverse environmental impacts to air, water, soil or biological resources or to the extent necessary to ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC ground water standards and classifications.

(2) E&P waste management activities shall be conducted, and facilities constructed and operated, to protect the waters of the state from significant adverse environmental impacts from E&P waste, except as permitted by applicable laws and regulations.

(3) **Reuse and recycling.** To encourage and promote waste minimization, operators may propose plans for managing E&P waste through beneficial use, reuse and recycling by submitting a written management plan to the Director for approval. Such plans shall describe the proposed use of the waste, method of waste treatment, product quality assurance, and shall include a copy of any certification or authorization that may be required by other laws.

b. **Waste transportation.**

(1) E&P waste, when transported off-site within Colorado for treatment or disposal, shall be transported to facilities authorized by the Director or waste disposal facilities approved to receive E&P waste by the CDPHE.

(2) **Waste generator requirements.** Generators of E&P waste shall maintain, for not less than three (3) years, copies of each invoice, bill or ticket and such other records as necessary to document the following information from a transporter or disposal site, describing the disposal of E&P waste from each location:

A. The date of the transport;

B. The identity of the waste generator;

C. The identity of the waste transporter;

D. The location of the waste pickup site;

E. The type and volume of waste; and

F. The name and location of the treatment or disposal site.

Such records shall be made available for inspection by the Director during normal business hours and copies thereof shall be furnished to the Director upon request.

c. **Produced water.**

(1) **Treatment of produced water.** Produced water shall be treated prior to placement in a production pit to prevent crude oil and condensate from entering the pit.

(2) **Produced water disposal.** Produced water may be disposed as follows:

A. Injection into a Class II well, permitted in accordance with Rule 325.;

B. Evaporation/percolation in a properly permitted lined or unlined pit;

C. Disposal at permitted commercial facilities; or

D. Disposal by roadspreading on lease roads outside sensitive areas for produced waters with less than 5,000 mg/l TDS when authorized by the surface owner. Roadspreading shall not result in pooling or runoff of produced waters and the adjacent soils shall meet the allowable concentrations in Table 910-1.

E. Discharging into state waters, in accordance with the Water Quality Control Act and the rules and regulations promulgated thereunder. Produced water discharged pursuant to this subsection (2)E. may be put to beneficial use in accordance with applicable state statutes and regulations governing the use and administration of water.

(3) **Produced water reuse and recycling.** Produced water may be reused for enhanced recovery, drilling, and other uses in a manner consistent with existing water rights and in consideration of water quality standards and classifications established by the WQCC for waters of the state, or any point of compliance established by the Director pursuant to Rule 324D.

(4) **Mitigation.** Water produced during operation of an oil or gas well may be used to provide an alternate domestic water supply to surface owners within the oil or gas field, in accordance with all applicable laws, including, but not limited to, obtaining the necessary approvals from the WQCD for constructing a new "waterworks," as defined by section 25-1-107(1)(X)(II)(A), C.R.S. Any produced water not so used shall be disposed of in accordance with subsection (2) or (3). Provision of produced water for domestic use within the meaning of this subsection (4) shall not constitute an admission by the operator that the well is dewatering or

impacting any existing water well. The water produced shall be to the benefit of the surface owner within the oil and gas field and may not be sold for profit or traded.

d. **Drilling fluids.**

(1) **Drilling pit fluid recycling.** Drilling pit contents may be recycled to another drilling pit consistent with Rule 903.

(2) **Drilling fluids treatment and disposal.** Drilling fluids may be treated or disposed as follows:

A. Injection into a Class II well permitted in accordance with Rule 325.;

B. Disposal at a commercial solid waste disposal facility; or

C. Land treatment or land application at a centralized E&P waste management facility permitted in accordance with Rule 908.

(3) **Additional authorized disposal of water-based bentonitic drilling fluids.** Water-based bentonitic drilling fluids may be disposed as follows:

A. Drying and burial in drilling pits on non-crop land; or

B. Land application as follows:

i. **Applicability.** Acceptable methods of land application include, but are not limited to, production facility construction and maintenance, lease and farm road maintenance, or lining of stock ponds and irrigation ditches.

ii. **Land application requirements**. The average thickness of water-based bentonitic drilling fluid waste applied shall be no more than three (3) inches prior to incorporation. The waste shall be applied to prevent ponding or erosion and shall be incorporated as a beneficial amendment into the native soils as soon as practicable. The resulting concentrations shall not exceed those in Table 910-1.

iii. **Surface owner approval.** Operators shall obtain written authorization from the surface owner prior to land application of water-based bentonitic drilling fluids.

iv. **Operator obligations**. Operators with control and authority over the wells from which the water-based bentonitic drilling fluid wastes are obtained retain responsibility for the land application operation, and shall diligently cooperate with the Director in responding to complaints regarding land application of water-based bentonitic drilling fluids.

v. **Approval.** Prior Director approval is not required for reuse of water-based bentonitic drilling fluids for land application as a soil amendment or lining material.

e. **Oily waste.** Oily waste includes those materials containing crude oil, condensate or other hydrocarbon-containing E&P waste, such as soil, frac sand, drilling fluids, workover fluids, pit sludge, tank bottoms, pipeline pigging wastes, and natural gas gathering, processing and storage wastes.

(1) Oily waste may be treated or disposed as follows:

A. Disposal at a commercial solid waste disposal facility;

B. Land treatment onsite or with prior written surface owner approval, offsite land treatment; or

C. Land treatment at a centralized E&P waste management facility permitted in accordance with Rule 908.

(2) Land treatment requirements:

A. Free oil shall be removed from the oily waste prior to land treatment.

B. Oily waste shall be spread evenly to prevent pooling, ponding or runoff.

C. Contamination of ground water or surface water shall be prevented.

D. Biodegradation shall be enhanced by disking, tilling, aerating, addition of nutrients, microbes, water or other amendments, as appropriate.

E. Land-treated oily waste incorporated in place shall not exceed the allowable concentrations in Table 910-1.

F. When a threatened or significant adverse environmental impact from onsite land treatment exists, the Director may require operators to submit a Site Investigation And Remediation Workplan, Form 27. Treatment shall thereafter be completed in accordance with the workplan and Rules 909. and 910.

G. When land treatment occurs in an area not being utilized for oil and gas operations, operators shall obtain prior written surface owner approval.

908. CENTRALIZED E&P WASTE MANAGEMENT FACILITIES

a. **Applicability.** Operators may establish non-commercial, centralized E&P waste management facilities for the treatment, disposal, recycling or beneficial reuse of E&P waste. This rule applies only to non-commercial facilities, which means the operator does not represent itself as providing E&P waste management services to third parties, except as part of a unitized area or joint operating agreement or in response to an emergency. Centralized facilities may include components such as land treatment or land application sites, pits and recycling equipment.

b. **Permit requirements.** An application for permit including the following information shall be submitted to the Director for prior approval along with a filing and service fee established by the Commission (Appendix III):

(1) The name, address, phone and fax number of the operator, and a designated contact person.

(2) The name, address and phone number of the surface owner of the site, if not the operator, and the written authorization of such surface owner.

(3) The legal description of the site.

(4) A general topographic, geologic and hydrologic description of the site, including immediately adjacent land uses, a topographic map of a scale no less than 1:24,000 showing the location, and the average annual precipitation and evaporation rates at the site.

(5) Centralized facility siting requirements.

A. A site plan showing drainage patterns and any diversion or containment structures, and facilities such as roads, fencing, tanks, pits, buildings, and other construction details.

B. Scaled drawings of entire sections containing the proposed facility. The field measured distances from the nearer north or south and nearer east or west section lines shall be measured at ninety (90) degrees from said section lines to facility boundaries and referenced on the drawing. A survey shall be provided including a complete description of established monuments or collateral evidence found and all aliquot corners.

C. Appropriate measures to limit access to the centralized facility by wildlife, domestic animals, and members of the general public shall be implemented.

D. Centralized facilities shall have a fire lane of at least ten (10) feet in width around the active treatment areas and within the perimeter fence. In addition, a buffer zone of at least ten (10) feet shall be maintained within the perimeter fire lane.

E. Surface water diversion structures, including, but not limited to, berms and ditches, shall be constructed to accommodate a one hundred (100) year, twenty four (24) hour event.

(6) **Waste profile.** For each type of waste, the amounts to be received and managed by the facility shall be estimated on a monthly average basis. For each waste type to be treated, a characteristic waste profile shall be completed.

(7) F**acility design and engineering.** Facility design and engineering data, including plans and elevations, design basis, calculations, and process description.

(8) **Operating plan.** An operating plan, including, but not limited to, a detailed description of the method of treatment, loading rates, application of nutrients and soil amendments, dust and moisture control, sampling, inspection and maintenance, emergency response, record-keeping, site security, hours of operation, and final disposition of waste. Where treated waste will be beneficially reused, a description of reuse and method of product quality assurance shall be included.

(9) **Ground water monitoring.**

A. The Director may require ground water monitoring for the purpose of preventing and mitigating threatened or actual significant adverse environmental impact or to ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC standards and classifications by establishing points of compliance.

B. Where monitoring is required, the direction of flow, ground water gradient and quality of water shall be established by the installation of a minimum of three (3) monitor wells, including an up-gradient well and two (2) down-gradient wells that will serve as points of compliance, or other methods authorized by the Director.

c. **Permit approval**. The Director shall endeavor to approve or deny the properly completed permit within thirty (30) days after receipt and may condition permit approval as necessary to prevent any threatened or actual significant adverse environmental impact on air, water, soil or biological resources or to the extent necessary to ensure compliance with the allowable concentrations and levels in Table 910-1, with consideration to WQCC ground water standards and classifications.

d. **Financial assurance.** The operator of a land treatment facility shall submit for the Director's approval such financial assurance as required by Rule 704.

e. **Facility modifications.** Throughout the life of the facility the operator shall submit proposed modifications to the facility design, operating plan, permit data, or permit conditions to the Director for prior approval.

f. **Annual permit review.** To ensure compliance with permit conditions and the 900 Series rules, the facility permit shall be subject to an annual review by the Director.

g. **Closure.** A preliminary plan for closure shall be submitted with the centralized facility permit. A Site Investigation and Remediation Workplan, Form 27 shall be submitted sixty (60) days prior to closure for approval by the Director. The workplan shall describe the final closure plan.

h. Operators may be subject to local requirements for zoning and construction of facilities and shall provide copies of notifications to local governments or other agencies to the Director.

909. SITE INVESTIGATION, REMEDIATION AND CLOSURE

a. **Applicability.** This section applies to the closure and remediation of pits other than drilling pits constructed pursuant to Rule 903.a.(3).; investigation, reporting and remediation of spills/releases; permitted waste management facilities including treatment facilities; plugged and abandoned wellsites; sites impacted by E&P waste management practices; or other sites as designated by the Director.

b. **General site investigation and remediation requirements.**

(1) **Sensitive Area Determination.** Operators shall complete a sensitive area determination in accordance with Rule 901.e.

(2) **Sampling and analyses.** Samples and analysis of soil and ground water shall be conducted in accordance with Rule 910. to determine the horizontal and vertical extent of any contamination in excess of the allowable concentrations in Table 910-1.

(3) **Management of E&P waste.** E&P waste shall be managed in accordance with Rule 907.

(4) **Pit evacuation**. Prior to backfilling and site reclamation, E&P waste shall be treated or disposed in accordance with Rule 907. and the 1000 Series rules.

(5) **Remediation.** Remediation shall be performed in a manner to mitigate, remove or reduce contamination that exceeds the allowable concentrations in Table 910-1 in order to ensure protection of public health, safety and welfare, and to prevent and mitigate significant adverse environmental impacts. Soil that does not meet allowable concentrations in Table 910-1 shall be remediated. Ground water that does not meet allowable concentrations in Table 910-1 shall be remediated in accordance with a Site Investigation and Remediation Workplan, Form 27.

(6) **Reclamation.** Remediation sites shall be reclaimed in accordance with the 1000 Series rules for reclamation.

c. **Site Investigation And Remediation Workplan, Form 27.** Operators shall prepare and submit for prior Director approval a Site Investigation and Remediation Workplan, Form 27 for the following operations and remediation activities:

(1) Unlined pit closure when required by Rule 905.

(2) Remediation of spills/releases in accordance with Rule 906.

(3) Land treatment of oily waste in accordance with Rule 907.e.(2).F.

(4) Closure of centralized E&P waste management facilities in accordance with Rule 908.g.

(5) Remediation of impacted ground water in accordance with Rule 910.b.(4).

d. **Multiple sites.** Remediation of multiple sites may be submitted on a single workplan with prior Director approval.

e. **Closure.**

(1) Remediation and reclamation shall be complete upon compliance with the allowable concentrations in Table 910-1, or upon compliance with an approved workplan.

(2) **Notification of completion.** Within thirty (30) days after conclusion of site remediation and reclamation activities operators shall provide the following notification of completion:

A. Operators conducting remediation operations in accordance with Rule 909.b. shall submit to the Director a Site Investigation and Remediation Workplan, Form 27, containing information sufficient to demonstrate compliance with these rules.

B. Operators conducting remediation under an approved workplan shall submit to the Director, by adding or attaching to the original workplan, information sufficient to demonstrate compliance with the workplan.

f. **Release of financial assurance.** Financial assurance required by Rule 706. may be held by the Director until the required remediation of ground water impacts is completed in accordance with the approved workplan, or until cleanup goals are met.

910. ALLOWABLE CONCENTRATIONS AND SAMPLING FOR SOIL AND GROUND WATER

a. **Soil and ground water allowable concentrations.** The allowable concentrations for soil and ground water are in Table 910-1. Ground water standards and analytical methods are derived from the ground water standards and classifications established by WQCC.

b. **Sampling and analysis.**

(1) **Existing workplans.** Sampling and analysis for sites subject to an approved workplan shall be conducted in accordance with the workplan and the sampling and analysis requirements described in this rule.

(2) **Methods for sampling and analysis.** Sampling and analysis for site investigation or confirmation of successful remediation shall be conducted to determine the nature and extent of impact and confirm compliance with appropriate allowable concentrations.

A. **Field analysis.** Field measurements and field tests shall be conducted using appropriate equipment, calibrated and operated according to manufacturer specifications, by personnel trained and familiar with the equipment.

B. **Sample collection.** Samples shall be collected, preserved, documented, and shipped using standard environmental sampling procedures in a manner to ensure accurate representation of site conditions.

C. **Laboratory analytical methods.** Laboratories shall analyze samples using standard methods (such as EPA SW-846 or API RP-45) appropriate for detecting the target analyte. The method selected shall have detection limits less than or equal to the allowable concentrations in Table 910-1.

D. **Background sampling.** Samples of comparable, nearby, non-impacted, native soil, ground water or other medium may be required by the Director for establishing background conditions.

(3) **Soil sampling and analysis.**

A. **Applicability.** If soil contamination is suspected or known to exist as a result of spills/releases or E&P waste management, representative samples of soil shall be collected and analyzed in accordance with this rule.

B. **Sample collection.** Samples shall be collected from areas most likely to have been impacted, and the horizontal and vertical extent of contamination shall be determined. The number and location of samples shall be appropriate to the impact.

C. **Sample analysis.** Soil samples shall be analyzed for contaminants listed in Table 910-1 as appropriate to assess the impact or confirm remediation.

D. **Reporting.** Soil Analysis Report, Form 24 shall be used when the Director requires results of soil analyses.

E. **Soil impacted by produced water.** For impacts to soil due to produced water, samples from comparable, nearby non-impacted, native soil shall be collected and analyzed for purposes of establishing background soil conditions including pH and electrical conductivity (EC). Where EC of the impacted soil exceeds the allowable level in Table 910-1, the sodium adsorption ratio (SAR) shall also be determined.

F. **Soil impacted by hydrocarbons.** For impacts to soil due to hydrocarbons, samples shall be analyzed for TPH.

(4) **Ground water sampling and analysis.**

A. **Applicability.** Operators shall collect and analyze representative samples of ground water in accordance with these rules under the following circumstances:

i. Where ground water contamination is suspected or known to exceed the allowable concentrations in Table 910-1;

ii. Where impacted soils are in contact with ground water; or

iii. Where impacts to soils extend down to the high water table.

B. **Sample collection.** Samples shall be collected from areas most likely to have been impacted, downgradient or in the middle of excavated areas. The number and location of samples shall be appropriate to determine the horizontal and vertical extent of the impact. If the concentrations in Table 910-1 are exceeded, the direction of flow and a ground water gradient shall be established, unless the extent of the contamination and migration can otherwise be adequately determined.

C. **Sample analysis.** Ground water samples shall be analyzed for benzene, toluene, ethylbenzene, xylene, and API RP-45 constituents, or other parameters appropriate for evaluating the impact.

D. **Reporting.** Water Analysis Report, Form 25 shall be used when the Director requires results of water analyses.

E. **Impacted ground water.** Where ground water contaminants exceed the allowable concentrations listed in Table 910-1, operators shall notify the Director, and submit to the Director for prior approval a Site Investigation and Remediation Workplan, Form 27, for the investigation, remediation, or monitoring of ground water to meet the required allowable concentrations.

911. PIT, BURIED OR PARTIALLY BURIED PRODUCED WATER VESSEL, BLOWDOWN PIT, AND BASIC SEDIMENT/TANK BOTTOM PIT MANAGEMENT REQUIREMENTS PRIOR TO DECEMBER 30, 1997.

a. **Applicability.** This rule applies to the management, operation, closure and remediation of drilling, production and special purpose pits, buried or partially buried produced water vessels, blowdown pits, and basic sediment/tank bottom pits put into service prior to December 30, 1997 and unlined skim pits put into service prior to July 1, 1995. For pits constructed after December 30, 1997 and skim pits constructed after July 1, 1995, operators shall comply with the requirements contained in Rules 901. through 910.

b. **Inventory.** Operators were required to submit to the Director no later than December 31, 1995, an inventory identifying production pits, buried or partially buried produced water vessels, blowdown pits, and basic sediment/tank bottom pits that existed on June 30, 1995. The inventory required operators to provide the facility name, a description of the location, type, capacity and use of pit/vessel, whether netted or fenced, lined or unlined, and where available, water quality data. Operators who have failed to submit the required inventory are in continuing violation of this rule.

c. **Sensitive area determination.**

(1) For unlined production and special purpose pits constructed prior to July 1, 1995 and not closed by December 30, 1997, operators were required to determine whether the pit was located within a sensitive area in accordance with the Sensitive Area Determination Decision Tree, Figure 901-1, (now Rule 901.e.), and submit data evaluated and analysis used in the determination to the Director on a Sundry Notice, Form 4.

(2) For steel, fiberglass, concrete, or other similar produced water vessels that were buried or partially buried and located in sensitive areas prior to December 30, 1997, operators were required to test such vessels for integrity, unless a monitoring or leak detection system was put in place.

d. The following permitting/reporting requirements applied to pits constructed prior to December 30, 1997:

(1) A Sundry Notice, Form 4, including the name, address, and phone number of the primary contact person operating the production pit for the operator, the facility name, a description of the location, type, capacity and use of pit, engineering design, installation features and water quality data, if available, was required for the following:

A. Lined production pits and lined special purpose pits constructed after July 1, 1995.

B. Unlined production pits constructed prior to July 1, 1995 which are lined in accordance with Rule 905. by December 30, 1997.

(2) An Application For Permit For Unlined Pit, Form 15 was required for the following:

A. Unlined production pits and special purpose pits in sensitive areas constructed prior to July 1, 1995, and not closed by December 30, 1997.

B. Unlined production pits outside sensitive areas constructed after July 1, 1995 and not closed by December 30, 1997.

(3) An Application For Permit For Unlined Pit, Form 15 and a variance under Rule 904.e.(1). (repealed, now Rule 502.b.) was required for unlined production pits and unlined special purpose pits in sensitive areas constructed after July 1, 1995.

(4) A Sundry Notice, Form 4 was required for unlined production pits outside sensitive areas receiving produced water at an average daily rate of five (5) or less barrels per day calculated on a monthly basis for each month of operation constructed prior to December 30, 1997.

e. The Director may have established points of compliance for unlined production pits and special purpose pits and for lined production pits in sensitive areas constructed after July 1, 1995.

f. **Closure requirements.**

(1) Operators of production or special purpose pits existing on July 1, 1995 which were closed before December 30, 1997, were required to submit a Sundry Notice, Form 4, within thirty (30) days of December 30, 1997. The Sundry Notice, Form 4 shall include a copy of the existing pit permit, if a permit was obtained and a description of the closure process.

(2) Pits closed prior to December 30, 1997 were required to be reclaimed in accordance with the 1000 Series rules. Pits closed after December 30, 1997 shall be closed in accordance with the 900 Series rules and reclaimed in accordance with the 1000 Series rules.

(3) Operators of steel, fiberglass, concrete or other similar produced water vessels buried or partially buried and located in sensitive areas were required to repair or replace vessels and tanks found to be leaking. Operators shall repair or replace vessels and tanks found to be leaking. Operators shall submit to the Director a Sundry Notice, Form 4, describing the integrity testing results and action taken within thirty (30) days of December 30, 1997.

(4) Closure of pits and steel, fiberglass, concrete or other similar produced water vessels, and associated remediation operations conducted prior to December 30, 1997 are not subject to Rules 905., 906., 907., 909. and 910.

912. VENTING OR FLARING NATURAL GAS

a. The unnecessary or excessive venting or flaring of natural gas produced from a well is prohibited.

b. Except for gas flared or vented during an upset condition, well maintenance, well stimulation flowback, purging operations, or a productivity test, gas from a well shall be flared or vented only after notice has been given and approval obtained from the Director on a Sundry Notice, Form 4, stating the estimated volume and content of the gas. The notice shall indicate whether the gas contains more than one (1) ppm of hydrogen sulfide. If necessary to protect the public health, safety or welfare, the Director may require the flaring of gas.

c. Gas flared, vented or used on the lease shall be estimated based on a gas-oil ratio test or other equivalent test approved by the Director, and reported on Operator's Monthly Production Report, Form 7.

d. Prior to flaring of any gas, operators shall construct a special purpose pit in compliance with Rule 903.

e. Operators shall notify the local emergency dispatch or the local governmental designee of any natural gas flaring. Notice shall be given prior to flaring when flaring can be reasonably anticipated, or as soon as possible but in no event more than two (2) hours after the flaring occurs.

Table 910-1
ALLOWABLE CONCENTRATIONS AND LEVELS

Contaminant of concern	Allowable concentrations
Organics in Soil: EPA Method 8015 (modified)	
TPH-Non-Sensitive Area	10,000 mg/kg
TPH-Sensitive Area	1,000 mg/kg
Organics in Ground Water: EPA Method 8020 [1]	
Benzene	5 µg/l [1]
Toluene	1,000 µg/l [1]
Ethylbenzene	680 µg/l [1]
Xylene	10,000 µg/l [1]
Inorganics in Soils[4]	
Electrical Conductivity (EC)	<4 mmhos/cm or 2x background
Sodium Adsorption Ratio (SAR)	<12
pH	6-9
Inorganics in Ground Water	
Total Dissolved Solids (TDS)	<1.25 x background [1]
Chlorides	<1.25 x background [1]
Sulfates	<1.25 x background [1]
Total Metals in Soils: EPA Method 3050[4]	
Arsenic	41 mg/kg [2]
Barium (LDNR True Total Barium)	180,000 mg/kg [2]
Boron (Hot Water Soluble)	2 mg/l [2]
Cadmium	26 mg/kg [2]
Chromium	1,500 mg/kg [2]
Copper	750 mg/kg [2]
Lead	300 mg/kg [2]
Mercury	17 mg/kg [2]
Molybdenum	[3]
Nickel	210 mg/kg [2]
Selenium	[3]
Silver	100 mg/kg [2]
Zinc	1,400 mg/kg [2]

1 Concentrations taken from CDPHE-WQCC
2 Concentrations taken from API Metals Guidance: Maximum Soil Concentrations
3 Concentrations are dependent on site-specific conditions
4 Consideration shall be given to background levels in native soils

Figure 901-1
SENSITIVE AREA DETERMINATION
Decision Tree

***BOX 1*:** Is discharge water or waste:
>1.25 x background ppm TDS
>250 ppm Chloride or
1.25 x background
>250 ppm Sulfate or
1.25 x background
> 5 ppb Benzene
> 1000 ppb Toluene
> 680 ppb Ethylbenzene
> 10,000 ppb Xylene

NO → OUTSIDE SENSITIVE AREAS
YES ↓

***BOX 2*:** Is the site underlain by an unconfined aquifer or recharge zone?

NO → OUTSIDE SENSITIVE AREAS
YES ↓

***BOX 3*:** is the hydraulic conductivity of the underlying soils and geologic material less than or equal to 10^{-6} cm/sec?

YES → OUTSIDE SENSITIVE AREAS
NO ↓

***BOX 4*:** Is the site within an area classified for domestic use by WQCC, or a local (water supply) wellhead protection area (WHPA)?

YES → INSIDE SENSITIVE AREAS
NO ↓

***BOX 5*:** Is the location within 1/8 mi. of a domestic water well, or 1/4 mi. of a public water supply well, using the same aquifer?

YES → INSIDE SENSITIVE AREAS
NO ↓

***BOX 6*:** Is the depth to the average high ground water table <20', from the deeper of the ground surface, pit bottom or from the point of spill/release? (**see footnote*)

NO → OUTSIDE SENSITIVE AREAS
YES → INSIDE SENSITIVE AREAS

OUTSIDE SENSITIVE AREAS

-New E&P waste management facilities shall be allowed outside Sensitive Areas. Points of Compliance shall be established as appropriate.

-Where complaints are made, Points of Compliance may be established for existing facilities.

INSIDE SENSITIVE AREAS

-E&P waste management facilities shall not be allowed unless the operator demonstrates no potential for significant adverse environmental impact.

-Facilities which are permitted may have Points of Compliance established.

** Additional requirements may be imposed by the Director in accordance with Rule 901.c.*

RECLAMATION REGULATIONS

1001. INTRODUCTION

a. **General.** The rules and regulations of this series establish the proper reclamation of the land and soil affected by oil and gas operations and ensure the protection of the topsoil of said land during such operations. The surface of the land shall be restored as nearly as practicable to its condition at the commencement of drilling operations.

b. **Additional requirements.** Notwithstanding the provisions of the 1000 Series rules, when the Director has reasonable cause to believe that a proposed oil and gas operation could result in a significant adverse environmental impact on any air, water, soil, or biological resource, the Director shall conduct an onsite inspection and may request an emergency meeting of the Commission to address the issue.

c. **Surface owner waiver of 1000 Series rules.** The Commission shall not require compliance with Rules 1002., 1003., 1004.a., b., or c.(1), (2), or (3), if the operator can demonstrate to the Director's or the Commission's satisfaction that compliance with such rules is not necessary to protect the public health, safety and welfare, including prevention of significant adverse environmental impacts, and that the operator has entered into an agreement with the surface owner regarding topsoil protection and reclamation of the land. Absent bad faith conduct by the operator, penalties may only be imposed for non-compliance with a Commission order issued after a determination that, notwithstanding such agreement, compliance is necessary to protect public health, safety and welfare. Prior to final reclamation approval as to a specific well, the operator shall either comply with the rules or obtain a variance under Rule 502.b. This rule shall not have the effect of relieving an operator from compliance with the 900 Series rules.

1002. SITE PREPARATION

a. Effective June 1, 1996:

(1) **Fencing of drill sites and access roads on crop lands.** During drilling operations on crop lands, when requested by the surface owner, the operator shall delineate each drillsite and access road on crop lands constructed after such date by berms, single strand fence or other equivalent method in order to discourage unnecessary surface disturbance.

(2) **Fencing of reserve pit when livestock is present.** During drilling operations where livestock is in the immediate area and is not fenced out by existing fences, the operator, at the request of the surface owner, will install a fence around the reserve pit.

(3) **Fencing of well sites.** Subsequent to drilling operations, where livestock is in the immediate area and is not fenced out by existing fences, the operator, at the request of the surface owner, will install a fence around the wellhead, pit and production equipment to prevent livestock entry.

b. **Soil removal and segregation.**

(1) **Soil removal and segregation on crop land.** As to all excavation operations undertaken after June 1, 1996 on crop land, the operator shall separate and store the various A, B, and C soil horizons separately from one another and mark or document stockpile locations to facilitate subsequent reclamation. When separating soil horizons, the operator shall segregate horizons based upon noted changes in physical characteristics such as color, texture, density or consistency. On crop land below the C horizon, the soil horizons shall also be segregated based on the above noted physical characteristics. Segregation will be performed to the extent practicable to a depth of six (6) feet or bedrock, whichever is shallower.

(2) **Soil removal and segregation on non crop land.** As to all excavation operations undertaken after July 1, 1997 on non crop land, the operator shall separate and store the A soil horizon or the top six (6) inches, whichever is deeper, and mark or document stockpile locations to facilitate subsequent reclamation. When separating the A soil horizon, the operator shall segregate the horizon based upon noted changes in physical characteristics such as color, texture, density or consistency.

(3) **Horizons too rocky or too thin.** When the soil horizons are too rocky or too thin for the operator to practicably segregate, then the topsoil shall be segregated to the extent possible and stored. Too rocky shall mean that the soil horizon consists of greater than thirty five percent (35%) by volume rock fragments larger than ten (10) inches in diameter. Too thin shall mean soil horizons that are less than six (6) inches in thickness. The operator shall segregate remaining soils on crop land to the extent practicable to a depth of three (3) feet below the ground surface or bedrock, whichever is shallower, based upon noted changes in

physical characteristics such as color, texture, density or consistency and such soils shall be stockpiled to avoid loss and mixing with other soils.

c. **Protection of soils.** All stockpiled soils shall be protected from degradation due to contamination, compaction and, to the extent practicable, from wind and water erosion during drilling and production operations.

d. **Drill pad location.** The drilling location shall be designed and constructed to provide a safe working area while reasonably minimizing the total surface area disturbed. Consistent with applicable spacing orders and well location orders and regulations, in locating drill pads, steep slopes shall be avoided when reasonably possible. The drill pad site shall be located on the most level location obtainable that will accommodate the intended use. Deep vertical cuts and steep long fill slopes shall be constructed to the least percent slope practical.

e. **Surface disturbance minimization.** In order to reasonably minimize land disturbances and facilitate future reclamation, well sites, production facilities and access roads shall be located, constructed and maintained so as to reasonably control dust, minimize erosion, alteration of natural features and removal of surface materials.

f. **Access roads.** Existing roads shall be used to the greatest extent practicable to avoid erosion and minimize the land area devoted to oil and gas operations. Where feasible and practicable, operators are encouraged to share access roads in developing a field. Where feasible and practicable, roads shall be routed to complement other land usage. To the greatest extent practicable, all vehicles used by the operator, contractors, and other parties associated with the well shall not travel outside of the original access road boundary. Repeated or flagrant instance(s) of failure to restrict lease access to lease roads which result in unreasonable land damage or crop losses shall be subject to a penalty under Rule 523.

1003. INTERIM RECLAMATION

a. General. Debris and waste materials other than de minimis amounts, including, but not limited to, concrete, sack bentonite and other drilling mud additives, sand, plastic, pipe and cable, as well as equipment associated with the drilling, re-entry or completion operations shall be removed. All E&P waste shall be handled according to the 900 Series rules. All pits, cellars, rat holes, and other bore holes unnecessary for further lease operations, excluding the drilling pit, will be backfilled as soon as possible after the drilling rig is released to conform with surrounding terrain. On crop land, if requested by the surface owner, temporary guy line anchors shall be removed as soon as reasonably possible after the completion rig is released. When permanent guy line anchors are installed, it shall not be mandatory to remove them. When permanent guy line anchors are installed on cropland, care shall be taken to minimize disruption of cultivation, irrigation, or harvesting operations. If requested by the surface owner or its representative, the anchors shall be specifically marked, in addition to the marking required below, so as to facilitate farming operations. All guy line anchors left buried for future use shall be identified by a marker of bright color not less than four (4) feet in height and not greater than one (1) foot east of the guy line anchor. Material may be burned or buried on the premises only with the prior written consent of the surface owner, and with prior written notice to the surface tenant. Such burning or burial may be prohibited by other applicable law.

b. **Interim reclamation of areas no longer in use.** All disturbed areas affected by drilling or subsequent operations, except areas reasonably needed for production operations, shall be reclaimed as early and as nearly as practicable to their original condition and shall be maintained to control dust and minimize erosion. As to crop lands, if subsidence occurs in such areas additional topsoil shall be added to the depression and the land shall be re-leveled as close to its original contour as practicable. Interim reclamation shall occur no later than three (3) months on crop land or twelve (12) months on non-crop land after such operations unless the Director extends the time period because of conditions outside the control of the operator.

c. **Compaction alleviation.** All areas compacted by drilling and subsequent oil and gas operations which are no longer needed following completion of such operations shall be cross-ripped. On crop land, such compaction alleviation operations shall be undertaken when the soil moisture at the time of ripping is below thirty-five percent (35%) of field capacity. Ripping shall be undertaken to a depth of eighteen (18) inches unless and to the extent bed rock is encountered at a shallower depth.

d. **Drilling pit closure.** As part of interim reclamation, drilling pits shall be closed in the following manner:

(1) Drilling pit closure on crop land. On crop land water-based bentonitic drilling fluids, except *de minimis* amounts, shall be removed from the drilling pit and disposed of in accordance with the 900 Series rules. Drilling pit reclamation, including the disposal of drilling fluids and cuttings, shall be performed in a manner so as to not result in the formation of an impermeable barrier. Any cuttings removed from the pit for drying shall be returned to the pit prior to backfilling, and no more than *de minimis* amounts may be incorporated into the

surface materials. After the drilling pit is sufficiently dry, the pit shall be backfilled. The backfilling of the drilling pit shall be done to return the soils to their original relative positions.

(2) **Drilling pit closure on non-crop land.** All drilling fluids shall be disposed of in accordance with the 900 Series rules. After the drilling pit is sufficiently dry, the pit shall be backfilled. Materials removed from the pit for drying shall be returned to the pit prior to the backfilling. No more than de minimis amounts may be incorporated into the surface materials. The backfilling of the drilling pit will be done to return the soils to their original relative positions so that the muds and associated solids will be confined to the pit and not squeezed out and incorporated in the surface materials.

(3) **Minimum cover.** On crop lands, a minimum of three (3) feet of backfill cover shall be applied over any remaining drilling pit contents. As to both crop lands and non-crop lands, during the two (2) year period following drilling pit closure, if subsidence occurs over the closed drilling pit location additional topsoil shall be added to the depression and the land shall be re-leveled as close to its original contour as practicable.

e. **Restoration and revegetation.** When a well is completed for production, all disturbed areas no longer needed will be restored and revegetated as soon as practicable.

(1) **Revegetation of crop lands.** All segregated soil horizons removed from crop lands shall be replaced to their original relative positions and contour, and shall be tilled adequately to re-establish a proper seedbed. The area shall be treated if necessary and practicable to prevent invasion of undesirable species and noxious weeds, and to control erosion. Any perennial forage crops that were present before disturbance shall be re-established.

(2) **Revegetation of non-crop lands.** All segregated soil horizons removed from non-crop lands shall be replaced to their original relative positions and contour as near as practicable to achieve erosion control and long-term stability, and shall be tilled adequately in order to establish a proper seedbed. The disturbed area then shall be reseeded in the first favorable season. Reseeding with species consistent with the adjacent plant community is encouraged. In the absence of an agreement between the operator and the affected surface owner as to what seed mix should be used, the operator shall consult with a representative of the local soil conservation district to determine the proper seed mix to use in revegetating the disturbed area. In an area where an operator has drilled or plans to drill multiple wells, in the absence of an agreement between the operator and the affected surface owner, the operator may rely upon previous advice given by the local soil conservation district in determining the proper seed mixes to be used in revegetating each type of terrain upon which operations are to be conducted.

f. **Weed control.** During drilling, production, and reclamation operations, all disturbed areas shall be kept reasonably free of noxious weeds and undesirable species as practicable.

1004. FINAL RECLAMATION OF WELL SITES AND ASSOCIATED PRODUCTION FACILITIES

a. Well sites and associated production facilities. Upon the plugging and abandonment of a well, all pits, mouse and rat holes and cellars shall be backfilled. All debris, abandoned gathering line risers and flowline risers, and surface equipment shall be removed within three (3) months of plugging a well. All access roads to plugged and abandoned wells and associated production facilities shall be closed, graded and recontoured. Culverts and any other obstructions that were part of the access road(s) shall be removed. Well locations, access roads and associated facilities shall be reclaimed. As applicable, compaction alleviation, restoration, and revegetation of well sites, associated production facilities, and access roads shall be performed to the same standards as established for interim reclamation under Rule 1003. Material may be burned or buried on the premises only with the prior written consent of the surface owner, and with prior written notice to the surface tenant. Such burning or burial shall be subject to applicable state and local law. All such reclamation work shall be completed within three (3) months on crop land and twelve (12) months on non-crop land after plugging a well or final closure of associated production facilities. The Director may grant an extension where unusual circumstances are encountered, but every reasonable effort shall be made to complete reclamation before the next local growing season.

b. **Production and special purpose pit closure.** The operator shall comply with the 900 Series rules for the removal or treatment of E&P waste remaining in a production or special purpose pit before the pit may be closed for final reclamation. After any remaining E&P waste is removed or treated, all such pits must be backfilled to return the soils to their original relative positions. As to both crop lands and non-crop lands, if subsidence occurs over closed pit locations, additional topsoil shall be added to the depression and the land shall be re-leveled as close to its original contour as practicable.

c. **Final reclamation threshold for release of financial assurance.** Successful reclamation of the well site and access road will be considered completed when:

(1) On crop land, reclamation has been performed as per Rules 1003. and 1004., and observation by the Director over two growing seasons has indicated no significant unrestored subsidence.

(2) On non-crop land, reclamation has been performed as per Rules 1003. and 1004., and the total cover of live perennial vegetation, excluding noxious weeds, provides sufficient soils erosion control as determined by the Director through a visual appraisal. The Director shall consider the total cover of live perennial vegetation of adjacent or nearby undisturbed land, not including overstory or tree canopy cover, having similar soils, slope and aspect of the reclaimed area.

(3) Disturbances resulting from flow line installations shall be deemed adequately reclaimed when the disturbed area is reasonably capable of supporting the pre-disturbance land use.

(4) A Sundry Notice, Form 4, has been submitted by the operator which describes the final reclamation procedures and any mitigation measures associated with final reclamation performed by the operator, and

(5) A final reclamation inspection has been completed by the Director, there are no outstanding compliance issues relating to Commission rules, regulations, orders, permit conditions or the act, and the Director has notified the operator that final reclamation has been approved.

1101. INSTALLATION AND RECLAMATION

a. **Material**.

(1) After June 1, 1996, materials for pipe and components shall be:

A. Able to maintain the structural integrity of the flowline under temperature, pressure, and other conditions that may be anticipated;

B. Compatible with the material to be transported.

C. A tracer line or location device will be placed adjacent to or in the trench of all buried nonmetallic flowlines to facilitate the location of such pipelines.

b. **Design**. Each component of a flowline shall be designed to prevent failure from corrosion and be able to withstand anticipated operating pressures and other loadings without impairment of its serviceability. The pipe shall have sufficient wall thickness or be installed with adequate protection to withstand anticipated external pressures and loads that will be imposed on the pipe after installation.

c. **Cover**.

(1) All installed flowlines shall have cover sufficient to protect them from damage. On crop land, all flowlines installed after June 1, 1996 shall have a minimum cover of three (3) feet.

(2) Where an underground structure, geologic, economic or other uncontrollable condition prevents flowlines from being installed with minimum cover, or when there is an agreement between the surface owner and the operator, the line may be installed with less than minimum cover or above ground.

d. **Excavation, backfill and reclamation**.

(1) When flowlines cross crop lands, unless waived by the surface owner, the operator shall segregate topsoil while trenching, and trenches shall be backfilled so that the soils will be returned to their original relative positions and contour. This requirement to segregate and backfill topsoil shall not apply to trenches which are twelve (12) inches or less in width. Reasonable efforts shall be made to run flowlines parallel to crop irrigation rows on flood irrigated land.

(2) On crop lands and non-crop lands, flowline trenches will be maintained in order to correct subsidence and reasonably minimize erosion. Interim and final reclamation, including revegetation, shall be performed in accordance with the applicable 1000 Series rules.

e. **Pressure testing**.

(1) Before operating a segment of flowline installed after June 1, 1996, it must be tested to maximum anticipated operating pressure. In conducting tests, each operator shall ensure that reasonable precautions are taken to protect its employees and the general public. The testing may be conducted using well head pressure sources and well bore fluids, including natural gas. Such pressure tests shall be repeated once each calendar year to maximum anticipated operating pressure, and operators shall maintain records of such testing for Commission inspection for at least three (3) years.

(2) Flowline segments operating at less than fifteen (15) psig are excepted from pressure testing requirements.

1102. OPERATIONS, MAINTENANCE, AND REPAIR

a. **Maintenance**.

(1) Each operator shall take reasonable precautions to prevent failures, leakage and corrosion of flowlines.

(2) Whenever an operator discovers any condition that could adversely affect the safe and proper operation of its flowline, it shall correct it within a reasonable time. However, if the condition is of such a nature that it presents an immediate hazard to persons or property, the operator shall not operate the affected part of the system until it has corrected the unsafe condition.

b. **Flowline repair**.

(1) Each operator shall, in repairing its flowlines, ensure that the repairs are made in a safe manner and are made so as to prevent injury to persons and damage to property.

(2) No operator shall use any pipe, valve, or fitting in repairing flowline facilities unless the components meet the installation requirements of this section.

c. **Flowline marking**.

(1) In designated high density areas, and where crossing public rights-of-way or utility easement, a marker shall be installed and maintained to identify the location of flowlines installed after June 1, 1996.

(2) The following must be written legibly on a background of sharply contrasting color on each line marker:

"Warning", "Caution" or "Danger" followed by the words "gas (or name of natural gas or petroleum transported) pipeline" in letters at least one (1) inch high with one-quarter (1/4) inch stroke and the name of the operator and the telephone number where the operator can be reached at all times.

d. **One Call participation**. As to flowlines, and any other pipeline over which the Commission has jurisdiction, installed after June 1, 1996, each operator shall participate in Colorado's One Call notification system, the requirements of which are established by §9-1.5-101., C.R.S. et seq.

1103. ABANDONMENT

Each flowline abandoned in place must be disconnected from all sources and supplies of natural gas and petroleum, purged of liquid hydrocarbons, depleted to atmospheric pressure, and cut off three (3) feet below ground surface, or the depth of the flowline, whichever is less and sealed at the ends. This requirement shall also apply to compressor or gas plant feeder pipelines upon decommissioning or closure of a portion or all of a compressor station or gas plant.

Appendix C – New Mexico Regulatory Summary (General)

TABLE OF RULES

403	Natural Gas from Gas Wells to be Measured	19.15.6.403
404	Natural Gas Utilization	19.15.6.404
405	Storage Gas	19.15.6.405
406	Carbon Dioxide	19.15.6.406
407	Disconnection of Gas Wells	19.15.6.407
408	Hardship Gas Well	19.15.6.408
409	Application for Hardship Gas Well Classification	19.15.6.409
410	Processing of Application for Hardship Gas Wells	19.15.6.410
411	Emergency Hardship Gas Well Classification	19.15.6.411
412	Limits on Hardship Gas Well Classification	19.15.6.412
413	Reserved	19.15.6.413
414	Gas Sales by Less Than One Hundred Percent of the Owners in a Well	19.15.6.414

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 1 GENERAL PROVISIONS AND DEFINITIONS
TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 1 GENERAL PROVISIONS AND DEFINITIONS

19.15.1.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505
[2-1-96; 19.15.1.1 NMAC - Rn, 19 NMAC 15.A.1, 5-15-01]

19.15.1.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.1.2 NMAC - Rn, 19 NMAC 15.A.2, 5-15-01]

19.15.1.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.1.3 NMAC - Rn, 19 NMAC 15.A.3, 5-15-01]

19.15.1.4 DURATION: Permanent
[2-1-96; 19.15.1.4 NMAC - Rn, 19 NMAC 15.A.4, 5-15-01]

19.15.1.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.1.5 NMAC - Rn, 19 NMAC 15.A.5, 5-15-01]

19.15.1.6 OBJECTIVE: To set forth general provisions and definitions pertaining to the authority of the oil Conservation division and the oil conservation commission pursuant to the Oil and Gas Act, NMSA 1978, Sections 70-2-1 through 70-2-38.
[2-1-96; 19.15.1.6 NMAC - Rn, 19 NMAC 15.A.6, 5-15-01]

19.15.1.7 DEFINITIONS:
A. Definitions beginning with the letter “A”.
(1) Abate or abatement shall mean the investigation, containment, removal or other mitigation of water pollution.
(2) Abatement plan shall mean a description of any operational, monitoring, contingency and closure requirements and conditions for the prevention, investigation and abatement of water pollution.
(3) Adjoining spacing units are those existing or prospective spacing units in the same pool(s) that are touching at a point or line the spacing unit that is the subject of the application.
(4) Adjusted allowable shall mean the allowable production a well or proration unit receives after all adjustments are made.
(5) Allocated pool is one in which the total oil or natural gas production is restricted and allocated to various wells therein in accordance with proration schedules.
(6) Allowable production shall mean that number of barrels of oil or standard cubic feet of natural gas authorized by the division to be produced from an allocated pool.
(7) Aquifer shall mean a geological formation, group of formations, or a part of a formation that is capable of yielding a significant amount of water to a well or spring.
B. Definitions beginning with the letter “B”.
(1) Back allowable shall mean the authorization for production of any shortage or underproduction

resulting from pipeline proration.

(2) Background shall mean, for purposes of ground-water abatement plans only, the amount of ground-water contaminants naturally occurring from undisturbed geologic sources or water contaminants occurring from a source other than the responsible person's facility. This definition shall not prevent the director from requiring abatement of commingled plumes of pollution, shall not prevent responsible persons from seeking contribution or other legal or equitable relief from other persons, and shall not preclude the director from exercising enforcement authority under any applicable statute, regulation or common law.

(3) Barrel shall mean 42 United States gallons measured at 60 degrees fahrenheit and atmospheric pressure at the sea level.

(4) Barrel of oil shall mean 42 United States gallons of oil, after deductions for the full amount of basic sediment, water and other impurities present, ascertained by centrifugal or other recognized and customary test.

(5) Below-grade tank shall mean a vessel, excluding sumps and pressurized pipeline drip traps, where any portion of the sidewalls of the tank is below the surface of the ground and not visible.

(6) Berm shall mean an embankment or ridge constructed for the purpose of preventing the movement of liquids, sludge, solids, or other materials.

(7) Bottom hole or subsurface pressure shall mean the gauge pressure in pounds per square inch under conditions existing at or near the producing horizon.

(8) Bradenhead gas well shall mean any well producing gas through wellhead connections from a gas reservoir which has been successfully cased off from an underlying oil or gas reservoir.

C. Definitions beginning with the letter “C”.

(1) Carbon dioxide gas shall mean noncombustible gas composed chiefly of carbon dioxide occurring naturally in underground rocks.

(2) Casinghead gas shall mean any gas or vapor or both gas and vapor indigenous to and produced from a pool classified as an oil pool by the division. This also includes gas-cap gas produced from such an oil pool.

(3) Commission shall mean the oil conservation commission.

(4) Common purchaser for natural gas shall mean any person now or hereafter engaged in purchasing from one or more producers gas produced from gas wells within each common source of supply from which it purchases.

(5) Common purchaser for oil shall mean every person now engaged or hereafter engaging in the business of purchasing oil to be transported through pipelines.

(6) Common source of supply. See pool.

(7) Condensate shall mean the liquid recovered at the surface that results from condensation due to reduced pressure or temperature of petroleum hydrocarbons existing in a gaseous phase in the reservoir.

(8) Contiguous shall mean acreage joined by more than one common point, that is, the common boundary must be at least one side of a governmental quarter-quarter section.

(9) Conventional completion shall mean a well completion in which the production string of casing has an outside diameter in excess of 2.875 inches.

(10) Correlative rights shall mean the opportunity afforded, as far as it is practicable to do so, to the owner of each property in a pool to produce without waste his just and equitable share of the oil or gas, or both, in the pool, being an amount, so far as can be practically determined, and so far as can be practicably obtained without waste, substantially in the proportion that the quantity of recoverable oil or gas, or both, under such property bears to the total recoverable oil or gas, or both, in the pool, and for such purpose to use his just and equitable share of the reservoir energy.

(11) Cubic feet of gas or standard cubic foot of gas, for the purpose of these rules, shall mean that volume of gas contained in one cubic foot of space and computed at a base pressure of 10 ounces per square inch above the average barometric pressure of 14.4 pounds per square inch (15.025 psia), at a standard base temperature of 60 degrees fahrenheit.

D. Definitions beginning with the letter “D”.

(1) Deep pool shall mean a common source of supply which is situated 5000 feet or more below the surface.

(2) Depth bracket allowable shall mean the basic oil allowable assigned to a pool and based on its depth, unit size, or special pool rules, which, when multiplied by the market demand percentage factor in effect, will determine the top unit allowable for the pool.

(3) Director shall mean the director of the oil conservation division of the New Mexico energy, minerals and natural resources department.

(4) Division shall mean the oil conservation division of the New Mexico energy, minerals and natural resources department.

E. Definitions beginning with the letter "E".

(1) Exempted aquifer shall mean an aquifer that does not currently serve as a source of drinking water, and which cannot now and will not in the foreseeable future serve as a source of drinking water because: is hydrocarbon producing;

(a) it is hydrocarbon producing;

(b) it is situated at a depth or location which makes the recovery of water for drinking water purposes economically or technologically impractical; or,

(c) it is so contaminated that it would be economically or technologically impractical to render that water fit for human consumption.

(2) Existing spacing unit is a spacing unit containing a producing well.

F. Definitions beginning with the letter "F".

(1) Facility shall mean any structure, installation, operation, storage tank, transmission line, access road, motor vehicle, rolling stock, or activity of any kind, whether stationary or mobile.

(2) Field means the general area which is underlaid or appears to be underlaid by at least one pool; and field also includes the underground reservoir or reservoirs containing such crude petroleum oil or natural gas, or both. The words field and pool mean the same thing when only one underground reservoir is involved; however, field unlike pool may relate to two or more pools.

(3) Fresh water (to be protected) includes the water in lakes and playas, the surface waters of all streams regardless of the quality of the water within any given reach, and all underground waters containing 10,000 milligrams per liter (mg/1) or less of total dissolved solids (TDS) except for which, after notice and hearing, it is found there is no present or reasonably foreseeable beneficial use which would be impaired by contamination of such waters. The water in lakes and playas shall be protected from contamination even though it may contain more than 10,000 mg/1 of TDS unless it can be shown that hydrologically connected fresh ground water will not be adversely affected.

G. Definitions beginning with the letter "G".

(1) Gas lift shall mean any method of lifting liquid to the surface by injecting gas into a well from which oil production is obtained.

(2) Gas-oil ratio shall mean the ratio of the casinghead gas produced in standard cubic feet to the number of barrels of oil concurrently produced during any stated period.

(3) Gas-oil ratio adjustment shall mean the reduction in allowable of a high gas oil ratio unit to conform with the production permitted by the limiting gas-oil ratio for the particular pool during a particular proration period.

(4) Gas transportation facility shall mean a pipeline in operation serving gas wells for the transportation of natural gas, or some other device or equipment in like operation whereby natural gas produced from gas wells connected therewith can be transported or used for consumption.

(5) Gas well shall mean a well producing gas or natural gas from a gas pool, or a well with a gas-oil ratio in excess of 100,000 cubic feet of gas per barrel of oil producing from an oil pool.

(6) Ground water shall mean interstitial water which occurs in saturated earth material and which is capable of entering a well in sufficient amounts to be utilized as a water supply.

H. Definitions beginning with the letter "H".

(1) Hazard to public health exists when water which is used or is reasonably expected to be used in the future as a human drinking water supply exceeds at the time and place of such use, one or more of the numerical standards of Subsection A of 20.6.2.3103 NMAC, or the naturally occurring concentrations, whichever is higher, or if any toxic pollutant as defined at Subsection VV of 20.6.2.7 NMAC affecting human health is present in the water. In determining whether a release would cause a hazard to public health to exist, the director shall investigate and consider the purification and dilution reasonably expected to occur from the time and place of release to the time and place of withdrawal for use as human drinking water.

(2) High gas-oil ratio proration unit shall mean a unit with at least one producing oil well with a gas-oil ratio in excess of the limiting gas-oil ratio for the pool in which the unit is located.

I. Definitions beginning with the letter "I".

(1) Illegal gas shall mean natural gas produced from a gas well in excess of the allowable determined by the division.

(2) Illegal oil shall mean crude petroleum oil produced in excess of the allowable as fixed by the division.

(3) Illegal product shall mean any product of illegal gas or illegal oil.

(4) Inactive well shall be a well which is not being utilized for beneficial purposes such as production, injection or monitoring and which is not being drilled, completed, repaired or worked over.

(5) Injection or input well shall mean any well used for the injection of air, gas, water, or other fluids into any underground stratum.

J. Reserved.

K. Reserved.

L. Definitions beginning with the letter "L".

(1) Limiting gas-oil ratio shall mean the gas-oil ratio assigned by the division to a particular oil pool to limit the volumes of casinghead gas which may be produced from the various oil producing units within that particular pool.

(2) Load oil is any oil or liquid hydrocarbon which has been used in remedial operation in any oil or gas well.

(3) Log or well log shall mean a systematic detailed and correct record of formations encountered in the drilling of a well.

M. Definitions beginning with the letter "M".

(1) Marginal unit shall mean a proration unit which is incapable of producing top unit allowable for the pool in which it is located.

(2) Market demand percentage factor shall mean that percentage factor of 100 percent or less as determined by the division at an oil allowable hearing, which, when multiplied by the depth bracket allowable applicable to each pool, will determine the top unit allowable for that pool.

(3) Mineral estate is the most complete ownership of oil and gas recognized in law and includes all the mineral interests and all the royalty interests.

(4) Mineral interest owners are owners of an interest in the executive rights, which are the rights to explore and develop, including oil and gas lessees (i.e., "working interest owners") and mineral interest owners who have not signed an oil and gas lease.

(5) Minimum allowable shall mean the minimum amount of production from an oil or gas well which may be advisable from time to time to the end that production will repay reasonable lifting cost and thus prevent premature abandonment and resulting waste.

(6) Multiple completion (combination) shall mean a multiple completion in which two or more common sources of supply are produced through a combination of two or more conventional diameter casing strings cemented in a common well-bore, or a combination of small diameter and conventional diameter casing strings cemented in a common well-bore, the conventional diameter strings of which might or might not be a multiple completion (conventional).

(7) Multiple completion (conventional) shall mean a completion in which two or more common sources of supply are produced through one or more strings of tubing installed within a single casing string, with the production from each common source of supply completely segregated by means of packers.

(8) Multiple completion (tubingless) shall mean completion in which two or more common sources of supply are produced through an equal number of casing strings cemented in a common well-bore, each such string of casing having an outside diameter of 2.875 inches or less, with the production from each common source of supply completely segregated by use of cement.

N. Definitions beginning with the letter "N".

(1) Natural gas or gas shall mean any combustible vapor composed chiefly of hydrocarbons occurring naturally in a pool classified by the division as a gas pool.

(2) Non-aqueous phase liquid shall mean an interstitial body of liquid oil, petroleum product, petrochemical, or organic solvent, including an emulsion containing such material.

(3) Non-marginal unit shall mean a proration unit which is capable of producing top unit allowable for the pool in which it is located, and to which has been assigned a top unit allowable.

O. Definitions beginning with the letter "O".

(1) Official gas-oil ratio test shall mean the periodic gas-oil ratio test made by order of the division by such method and means and in such manner as prescribed by the division.

(2) Oil, crude oil, or crude petroleum oil shall mean any petroleum hydrocarbon produced from a well in the liquid phase and which existed in a liquid phase in the reservoir.

(3) Oil field wastes shall mean those wastes produced in conjunction with the exploration, production, refining, processing and transportation of crude oil and/or natural gas and commonly collected at field storage, processing, disposal, or service facilities, and waste collected at gas processing plants, refineries and other processing or transportation facilities.

(4) Oil well shall mean any well capable of producing oil and which is not a gas well as defined herein.

(5) Operator shall mean any person who, duly authorized, is in charge of the development of a lease or the operation of a producing property, or who is in charge of the operation or management of a facility.

(6) Overage or overproduction shall mean the amount of oil or the amount of natural gas produced during a proration period in excess of the amount authorized on the proration schedule.

(7) Owner means the person who has the right to drill into and to produce from any pool, and to appropriate the production either for himself or for himself and another.

P. Definitions beginning with the letter "P".

(1) Penalized unit shall mean a proration unit to which, because of an excessive gas-oil ratio, an allowable has been assigned which is less than top unit allowable for the pool in which it is located and also less than the ability of the well(s) on the unit to produce.

(2) Person shall mean an individual or any other entity including partnerships, corporation, associations, responsible business or association agents or officers, the state or a political subdivision of the state or any agency, department or instrumentality of the United States and any of its officers, agents or employees.

(3) Pit shall mean any surface or sub-surface impoundment, man-made or natural depression, or diked area on the surface. Excluded from this definition are berms constructed around tanks or other facilities solely for the purpose of safety and secondary containment.

(4) Playa lake shall mean a level or nearly level area that occupies the lowest part of a completely closed basin and that is covered with water at irregular intervals, forming a temporary lake.

(5) Pool means any underground reservoir containing a common accumulation of crude petroleum oil or natural gas or both. Each zone of a general structure, which zone is completely separated from any other zone in the structure, is covered by the word "pool" as used herein. "Pool" is synonymous with "common source of supply" and with "common reservoir."

(6) Potential shall mean the properly determined capacity of a well to produce oil, or gas, or both, under conditions prescribed by the division.

(7) Pressure maintenance shall mean the injection of gas or other fluid into a reservoir, either to maintain the existing pressure in such reservoir or to retard the natural decline in the reservoir pressure.

(8) Produced water shall mean those waters produced in conjunction with the production of crude oil and/or natural gas and commonly collected at field storage, processing, or disposal facilities including but not limited to: lease tanks, commingled tank batteries, burn pits, LACT units, and community or lease salt water disposal systems and which may be collected at gas processing plants, pipeline drips and other processing or transportation facilities.

(9) Producer shall mean the owner of a well or wells capable of producing oil or natural gas or both in paying quantities.

(10) Product means any commodity or thing made or manufactured from crude petroleum oil or natural gas, and all derivatives of crude petroleum oil or natural gas, including refined crude oil, crude tops, topped crude, processed crude petroleum, residue from crude petroleum, cracking stock, uncracked fuel oil, treated crude oil, fuel oil, residuum, gas oil, naphtha, distillate, gasoline, kerosene, benzene, wash oil, lubricating oil, and blends or mixtures of crude petroleum oil or natural gas or any derivative thereof.

(11) Proration day shall consist of 24 consecutive hours which shall begin at 7 a.m. and end at 7 a.m. on the following day. The language in this paragraph is different than that which was filed 02-28-97 (effective

(12) Proration month shall mean the calendar month which shall begin at 7 a.m. on the first day of such month and end at 7 a.m. on the first day of the next succeeding month.

(13) Proration period shall mean for oil the proration month and for gas the twelve-month period which shall begin at 7 a.m. on January 1 of each year and end at 7 a.m. on January 1 of the succeeding year or other period designated by general or special order of the division.

(14) Proration schedule shall mean the order of the division authorizing the production, purchase, and transportation of oil, casinghead gas, and natural gas from the various units of oil or of natural gas in allocated pools.

(15) Proration unit is the area in a pool that can be effectively and efficiently drained by one well as determined by the division or commission (See NMSA 1978 Section 70-2-17.B) as well as the area assigned to an individual well for the purposes of allocating allowable production pursuant to a prorationing order for the pool. A proration unit will be the same size and shape as a spacing unit. All proration units are spacing units but not all spacing units are proration units.

(16) Prospective spacing unit is a hypothetical spacing unit that does not yet have a producing well.

Q. Reserved.

R. Definitions beginning with the letter “R”.

(1) Recomplete shall mean the subsequent completion of a well in a different pool from the pool in which it was originally completed.

(2) Regulated naturally occurring radioactive material (regulated NORM) shall mean naturally occurring radioactive material (NORM) contained in any oil-field soils, equipment, sludges or any other materials related to oil-field operations or processes exceeding the radiation levels specified in 20.3.14.1403 NMAC.

(3) Release shall mean all breaks, leaks, spills, releases, fires or blowouts involving crude oil, produced water, condensate, drilling fluids, completion fluids or other chemical or contaminant or mixture thereof, including oil field wastes and natural gases to the environment.

(4) Remediation plan shall mean a written description of a program to address unauthorized releases. The plan may include appropriate information, including assessment data, health risk demonstrations, and corrective action(s). The plan may also include an alternative proposing no action beyond the submittal of a spill report.

(5) Responsible person shall mean the owner or operator who must complete division approved corrective action for pollution from releases.

(6) Royalty interest owners are owners of an interest in the non-executive rights including lessors, royalty interest owners and overriding royalty interest owners. Royalty interests are non-cost bearing.

S. Definitions beginning with the letter “S”.

(1) Secondary recovery shall mean a method of recovering quantities of oil or gas from a reservoir which quantities would not be recoverable by ordinary primary depletion methods.

(2) Shallow pool shall mean a pool which has a depth range from 0 to 5000 feet.

(3) Shortage or underproduction shall mean the amount of oil or the amount of natural gas during a proration period by which a given proration unit failed to produce an amount equal to that authorized in the proration schedule.

(4) Shut-in shall be the status of a production well or an injection well which is temporarily closed down, whether by closing a valve or disconnection or other physical means.

(5) Shut-in pressure shall mean the gauge pressure noted at the wellhead when the well is completely shut in, not to be confused with bottom hole pressure.

(6) Significant modification of an abatement plan shall mean a change in the abatement technology used excluding design and operational parameters, or relocation of 25% or more of the compliance sampling stations, for any single medium, as designated pursuant to Subsection E, Paragraph (4), Subparagraph (b), Subsubparagraph (iv) of Section 19.15.5.19 NMAC.

(7) Spacing unit is the area allocated to a well under a well spacing order or rule. Under the Oil & Gas Act, NMSA 1978, Section 70-2-12.B(10), the commission has the power to fix spacing units without first creating proration units. See *Rutter & Wilbanks Corp. v. Oil Conservation Comm'n*, 87 NM 286 (1975). This is the area designated on division form C-102.

(8) Subsurface water shall mean ground water and water in the vadose zone that may become ground water or surface water in the reasonably foreseeable future or may be utilized by vegetation.

T. Definitions beginning with the letter "T".

(1) Tank bottoms shall mean that accumulation of hydrocarbon material and other substances which settles naturally below crude oil in tanks and receptacles that are used in handling and storing of crude oil, and which accumulation contains in excess of two (2%) percent of basic sediment and water; provided, however, that with respect to lease production and for lease storage tanks, a tank bottom shall be limited to that volume of the tank in which it is contained that lies below the bottom of the pipeline outlet thereto.

(2) Temporary abandonment shall be the status of a well which is inactive and has been approved for temporary abandonment in accordance with the provisions of these rules.

(3) Top unit allowable for gas shall mean the maximum number of cubic feet of natural gas, for the proration period, allocated to a gas producing unit in an allocated gas pool.

(4) Top unit allowable for oil shall mean the maximum number of barrels for oil daily for each calendar month allocated on a proration unit basis in a pool to non-marginal units. The top unit allowable for a pool shall be determined by multiplying the applicable depth bracket allowable by the market demand percentage factor in effect.

(5) Treating plant shall mean any plant constructed for the purpose of wholly or partially or being used wholly or partially for reclaiming, treating, processing, or in any manner making tank bottoms or any other waste oil marketable.

(6) Tubingless completion shall mean a well completion in which the production string of casing has an outside diameter of 2.875 inches or less.

U. Definitions beginning with the letter "U".

(1) Underground source of drinking water shall mean an aquifer which supplies water for human consumption or which contains ground water having a total dissolved solids concentration of 10,000 mg/1 or less and which is not an exempted aquifer.

(2) Unit of proration for gas shall consist of such multiples of 40 acres as may be prescribed by special pool rules issued by the division.

(3) Unit of proration for oil shall consist of one 40-acre tract or such multiples of 40-acre tracts as may be prescribed by special pool rules issued by the division.

(4) Unorthodox well location shall mean a location which does not conform to the spacing requirements established by the rules and regulations of the division.

V. Definitions beginning with the letter "V". Vadose zone shall mean unsaturated earth material below the land surface and above ground water, or in between bodies of ground water.

W. Definitions beginning with the letter "W".

(1) Waste, in addition to its ordinary meaning, shall include:

(a) underground waste as those words are generally understood in the oil and gas business, and in any event to embrace the inefficient, excessive, or improper use or dissipation of the reservoir energy, including gas energy and water drive, of any pool, and the locating, spacing, drilling, equipping, operating, or producing, of any well or wells in a manner to reduce or tend to reduce the total quantity of crude petroleum oil or natural gas ultimately recovered from any pool, and the use of inefficient underground storage of natural gas;

(b) surface waste as those words are generally understood in the oil and gas business, and in any event to embrace the unnecessary or excessive surface loss or destruction without beneficial use, however caused, of natural gas of any type or in any form, or crude petroleum oil, or any product thereof, but including the loss or destruction, without beneficial use, resulting from evaporation, seepage, leakage, or fire, especially such loss or destruction incident to or resulting from the manner of spacing, equipping, operating or producing a well or wells, or incident to or resulting from the use of inefficient storage or from the production of crude petroleum oil or natural gas, in excess of the reasonable market demand;

(c) the production of crude petroleum oil in this state in excess of the reasonable market demand for such crude petroleum oil; such excess production causes or results in waste which is prohibited by the Oil and Gas Act; the words "reasonable market demand" as used herein with respect to crude petroleum oil, shall be construed to mean the demand for such crude petroleum oil, for reasonable current requirements for current consumption and use within or outside of the state, together with the demand of such amounts as are reasonably necessary for building up or maintaining reasonable storage reserves of crude petroleum oil or the products thereof, or both such crude petroleum oil and products;

(d) the non-ratable purchase or taking of crude petroleum oil in this state; such non-ratable taking and purchasing causes or results in waste, as defined in Subparagraphs (a), (b), and (c) of this definition and causes waste by violating Section 70-2-16 of the Oil and Gas Act;

(e) the production in this state of natural gas from any gas well or wells, or from any gas pool, in excess of the reasonable market demand from such source for natural gas of the type produced or in excess of the capacity of gas transportation facilities for such type of natural gas; the words "reasonable market demand," as used herein with respect to natural gas, shall be construed to mean the demand for natural gas for reasonable current requirements, for current consumption and for use within or outside the state, together with the demand for such amounts as are necessary for building up or maintaining reasonable storage reserves of natural gas or products thereof, or both such natural gas and products.

(2) Water shall mean all water including water situated wholly or partly within or bordering upon the state, whether surface or subsurface, public or private, except private waters that do not combine with other surface or subsurface water.

(3) Water contaminant shall mean any substance that could alter if released or spilled the physical, chemical, biological or radiological qualities of water. "Water contaminant" does not mean source, special nuclear or by-product material as defined by the Atomic Energy Act of 1954.

(4) Watercourse shall mean any lake bed, or gully, draw, stream bed, wash, arroyo, or natural or human-made channel through which water flows or has flowed.

(5) Water pollution shall mean introducing or permitting the introduction into water, either directly or indirectly, of one or more water contaminants in such quantity and of such duration as may with reasonable probability injure human health, animal or plant life or property, or to unreasonably interfere with the public welfare or the use of property.

(6) Well blowout shall mean a loss of control over and subsequent eruption of any drilling or workover well or the rupture of the casing, casinghead, or wellhead or any oil or gas well or injection or disposal well, whether active or inactive, accompanied by the sudden emission of fluids, gaseous or liquids, from the well.

(7) Wellhead protection area shall mean the area within 200 horizontal feet of any private, domestic fresh water well or spring used by less than five households for domestic or stock watering purposes or within1000 horizontal feet of any other fresh water well or spring. Wellhead protection areas shall not include areas around water wells drilled after an existing oil or natural gas waste storage, treatment, or disposal site was established.

(8) Wetlands shall mean those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions in New Mexico. Constructed wetlands used for wastewater treatment purposes are not included in this definition.

(9) Working interest owners are the owners of the operating interest under an oil and gas lease who have the exclusive right to exploit the oil & gas minerals. Working interests are cost bearing.

[1-5-50…2-1-96; A, 7-15-96; Rn, 19 NMAC 15.A.7.1 through 7.84, 3-15-97; A, 7-15-99; 19.15.1.7 NMAC - Rn, 19 NMAC 15.A.7, 5-15-001; A, 3/31/04]

19.15.1.8-10 [RESERVED]

19.15.1.11 SCOPE OF RULES:

A. The following rules of statewide application have been adopted by the commission to conserve the natural resources of the state of New Mexico, to prevent waste, to protect correlative rights, to protect public health and the environment and to otherwise implement the Oil and Gas Act, NMSA 1978, Section 70-2-1 through 70-2-38.

B. Orders, including special pool orders (formerly referred to as "special pool rules and regulations"), of the division or the commission may be issued when required and shall prevail against rules if in conflict with them.

[1-1-50...2-1-96; A, 7-15-99; 19.15.1.11 NMAC - Rn, 19 NMAC 15.A.11, 5-15-01]

19.15.1.12 ENFORCEMENT OF STATUTES AND RULES:
The division is charged with the duty and obligation of enforcing all rules and statutes of the state of New Mexico relating to the conservation of oil and gas including the protection of public health and the environment. However, it shall be the responsibility of all the owners or operators to obtain information pertaining to the regulation of oil and gas before operations begin.

[1-1-50...2-1-96; A, 7-15-99; 19.15.1.12 NMAC - Rn, 19 NMAC 15.A.12, 5-15-01]

19.15.1.13 GENERAL OPERATIONS/WASTE PROHIBITED:

A. The production or handling of crude petroleum oil or natural gas of any type or in any form, or the handling of products thereof, in such a manner or under such conditions or in such amount as to constitute or result in waste is hereby prohibited.

B. All operators, contractors, drillers, carriers, gas distributors, service companies, pipe pulling and salvaging contractors, treating plant operators or other persons shall at all times conduct their operations in or related to the drilling, equipping, operating, producing, plugging and abandonment of oil, gas, injection, disposal, and storage wells or other facilities in a manner that will prevent waste of oil and gas, the contamination of fresh waters and shall not wastefully utilize oil or gas, or allow either to leak or escape from a natural reservoir, or from wells, tanks, containers, pipe or other storage, conduit or operating equipment.

[1-1-50...2-1-96; 19.15.1.13 NMAC - Rn, 19 NMAC 15.A.13, 5-15-01]

19.15.1.14 UNITED STATES GOVERNMENT LEASES:
Operator shall file or cause to be filed with the division copies of "application for permit to drill, deepen or plug back," (BLM form no. 3160-3), "sundry notices and reports on wells," (BLM form no. 3160-5), and "well completion or recompletion report and log," (BLM form no. 3160-4), as approved by the bureau of land management for wells on U.S. government land.

[1-1-50...2-1-96; 19.15.1.14 NMAC - Rn, 19 NMAC 15.A.14, 5-15-01]

19.15.1.15 CLASSIFYING AND DEFINING POOLS:
The division will determine whether a particular well or pool is a gas or oil well, or a gas or oil pool, as the case may be, and from time to time classify and reclassify wells and name pools accordingly, and will determine the limits of any pool or pools producing crude petroleum oil or natural gas and from time to time redetermine such limits.

[1-1-50...2-1-96; 19.15.1.15 NMAC - Rn, 19 NMAC 15.A.15, 5-15-01]

19.15.1.16 FORMS UPON REQUEST:
Forms for written notices, requests and reports required by the division will be furnished upon request.

[1-1-50...2-1-96; 19.15.1.16 NMAC - Rn, 19 NMAC 15.A.16, 5-15-01]

19.15.1.17 AUTHORITY TO COOPERATE WITH OTHER AGENCIES:
The division may from time to time enter into arrangements with state and federal governmental agencies, industry

committees and individuals, with respect to special projects, services and studies relating to conservation of oil and gas and the associated protection of fresh waters.
[1-1-50...2-1-96; 19.15.1.17 NMAC - Rn, 19 NMAC 15.A.17, 5-15-01]

19.15.1.18 [RESERVED.]
[9-23-85; 9-1-89...2-1-96; 19.15.1.18 NMAC - Rn, 19 NMAC 15.A.18, 5-15-01; Repealed, 5-28-04]

19.15.1.19 PREVENTION AND ABATEMENT OF WATER POLLUTION:

A. Purpose

(1) The purpose of this rule are to:

(a) Abate pollution of subsurface water so that all ground water of the state of New Mexico which has a background concentration of 10,000 mg/L or less TDS, is either remediated or protected for use as domestic, industrial and agricultural water supply, and to remediate or protect those segments of surface waters which are gaining because of subsurface-water inflow, for uses designated in the water quality standards for interstate and intrastate surface waters in New Mexico (20.6.4 NMAC); and

(b) Abate surface-water pollution so that all surface waters of the state of New Mexico are remediated or protected for designated or attainable uses as defined in the water quality standards for interstate and intrastate surface waters in New Mexico (20.6.4 NMAC).

(2) If the background concentration of any water contaminant exceeds the standard or requirement of Section 19.15.1.19 NMAC, Subsection B, Paragraphs (1), (2) or (3) pollution shall be abated by the responsible person to the background concentration.

(3) The standards and requirements set forth in of Section 19.15.1.19 NMAC, Subsection B, Paragraphs (1), (2) or (3) are not intended as maximum ranges and concentrations for use, and nothing herein contained shall be construed as limiting the use of waters containing higher ranges and concentrations.

B. Abatement standards and requirements

(1) The vadose zone shall be abated so that water contaminants in the vadose zone will not with reasonable probability contaminate ground water or surface water, in excess of the standards in Paragraphs (2) and (3) below, through leaching, percolation, or other transport mechanisms, or as the water table elevation fluctuates.

(2) Ground-water pollution at any place of withdrawal for present or reasonably foreseeable future use, where the TDS concentration is 10,000 mg/L or less, shall be abated to conform to the following standards:

(a) Toxic pollutant(s) as defined in 20.6.2.7 NMAC shall not be present; and

(b) The standards of 20.6.2.3103 NMAC shall be met.

(3) Surface-water pollution shall be abated to conform to the water quality standards for interstate and intrastate surface waters in New Mexico 20.6.4 NMAC.

(4) Subsurface-water and surface-water abatement shall not be considered complete until eight (8) consecutive quarterly samples, or an alternate lesser number of samples approved by the director, from all compliance sampling stations approved by the director meet the abatement standards of Paragraphs (1), (2) and (3) above. Abatement of water contaminants measured in solid-matrix samples of the vadose zone shall be considered complete after one-time sampling from compliance stations approved by the director.

(5) Technical infeasibility

(a) If any responsible person is unable to fully meet the abatement standards set forth in Paragraphs (1) and (2) above using commercially accepted abatement technology pursuant to an approved abatement plan, he may propose that abatement standards compliance is technically infeasible. Technical infeasibility proposals involving the use of experimental abatement technology shall be considered at the discretion of the director. Technical infeasibility may be demonstrated by a statistically valid extrapolation of the decrease in concentration(s) of any water contaminant(s) over the remainder of a twenty (20) year period, such that projected future reductions during that time would be less than 20% of the concentration(s) at the time technical infeasibility is proposed. A statistically valid decrease cannot be demonstrated by fewer than eight (8) consecutive quarters. The technical infeasibility proposal shall include a substitute abatement standard(s) for those contaminants that is/are technically feasible. Abatement standards for all other water contaminants not demonstrated to be technically infeasible shall be met.

(b) In no event shall a proposed technical infeasibility demonstration be approved by the director for any water contaminant if its concentration is greater than 200% of the abatement standard for the contaminant.

(c) If the director cannot approve any or all portions of a proposed technical infeasibility demonstration because the water contaminant concentration(s) is/are greater than 300% of the abatement standard(s) for each contaminant, the responsible person may further pursue the issue of technical infeasibility by filing a petition with the division seeking approval of alternate abatement standard(s) pursuant to Paragraph (6) below.

(6) Alternative abatement standards

(a) At any time during or after the submission of a stage 2 abatement plan, the responsible person may file a petition seeking approval of alternative abatement standard(s) for the standards set forth in Paragraphs (1) and (2) above. The division may approve alternative abatement standard(s) if the petitioner demonstrates that:

(i) either: compliance with the abatement standard(s) is/are not feasible, by the maximum use of technology within the economic capability of the responsible person; or there is no reasonable relationship between the economic and social costs and benefits (including attainment of the standard(s) set forth in Subsection B of Section 19.15.1.19 NMAC to be obtained, and

(ii) the proposed alternative abatement standard(s) is/are technically achievable and cost-benefit justifiable; and

(iii) compliance with the proposed alternative abatement standard(s) will not create a present or future hazard to public health or undue damage to property.

(b) The petition shall be in writing, filed with the division environmental bureau chief. The petition may include a transport, fate and risk assessment in accordance with accepted methods, and other information as the petitioner deems necessary to support the petition. The petition shall:

(i) state the petitioner's name and address;

(ii) state the date of the petition;

(iii) describe the facility or activity for which the alternate abatement standard(s) is sought;

(iv) state the address or description of the property upon which the facility is located;

(v) describe the water body or watercourse affected by the release;

(iv) identify the abatement standard from which petitioner wishes to vary;

(vii) state why the petitioner believes that compliance with the regulation will impose an unreasonable burden upon his activity;

(viii) identify the water contaminant(s) for which alternative standard(s) is/are proposed;

(ix) state the alternative standard(s) proposed;

(x) identify the three-dimensional body of water pollution for which approval is sought;

(xi) state the extent to which the abatement standard(s) set forth in Subsection B of 19.15.1.19 NMAC is/are now, and will in the future be, violated.

(c) The division environmental bureau chief shall review the petition and, within sixty (60) days after receiving the petition, shall submit a written recommendation to the director to approve, approve subject to conditions, or disapprove any or all of the proposed alternative abatement standard(s). The recommendation shall include the reasons for the division environmental bureau chief's recommendation. The division environmental bureau chief shall submit a copy of the recommendation to the petitioner by certified mail.

(d) If the division environmental bureau chief recommends approval, or approval subject to conditions, of any or all of the proposed alternative abatement standard(s), the division shall hold a public hearing on those standards. If the division environmental bureau chief recommends disapproval of any or all of the proposed alternative abatement standard(s), the petitioner may submit a request to the director, within fifteen (15) days after receipt of the recommendation, for a public hearing on those standards. If a timely request for hearing is not submitted, the recommended disapproval shall become a final decision of the director and shall not be subject to review.

(e) If the director grants a public hearing, the hearing shall be conducted in accordance with division hearing procedures.

(f) Based on the record of the public hearing, the division shall approve, approve subject to condition, or disapprove any or all of the proposed alternative abatement standard(s). The division shall notify the petitioner by certified mail of its decision and the reasons therefore.

(7) Modification of abatement standards. If applicable abatement standards are modified after abatement measures are approved, the abatement standards are modified after abatement measures are approved, the abatement standards that are in effect at the time that abatement measures are approved shall be the abatement standards for the duration of the abatement action, unless the director determines that compliance with those standards may with reasonable probability create a present or future hazard to public health or the environment. In any appeal of the director's determination that additional actions are necessary, the director shall have the burden of proof.

C. Abatement plan required

(1) Unless otherwise provided by Section 19.15.1.19 NMAC all responsible persons who are abating, or who are required to abate, water pollution in excess of the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC shall do so pursuant to an abatement plan approved by the director. When an abatement plan has been approved, all actions leading to and including abatement shall be consistent with the terms and conditions of the abatement plan.

(2) In the event of a transfer of the ownership, control or possession of a facility for which an abatement plan is required or approved, where the transferor is a responsible person, the transferee also shall be considered a responsible person for the duration of the abatement plan, and may jointly share the responsibility to conduct the actions required by Section 19.15.1.19 NMAC with other responsible persons. The transferor shall notify the transferee in writing, at least thirty (30) days prior to the transfer, that abatement plan has been required or approved for the facility, and shall deliver or send by certified mail to the director a copy of such notification together with a certificate or other proof that such notification has in fact been received by the transferee. The transferor and transferee may agree to a designated responsible person who shall assume the responsibility to conduct the actions required by Section 19.15.1.19 NMAC. The responsible persons shall notify the director in writing if a designated responsible person is agreed upon. If the director determines that the designated responsible person has failed to conduct the actions required by Section 19.15.1.19 NMAC, the director shall notify all responsible persons of this failure in writing and allow them thirty (30) days, or longer for good cause shown, to conduct the required actions before setting a show cause hearing requiring those responsible persons to appear and show cause why they should not be ordered to comply, a penalty should not be assessed, a civil action should not be commenced in district court or any other appropriate action should not be taken by the division.

(3) If the source of the water pollution to be abated is a facility that operated under a discharge plan, the director may require the responsible person(s) to submit a financial assurance plan which covers the estimated costs to conduct the actions required by the abatement plan. Such a financial assurance plan shall be consistent with any financial assurance requirements adopted by the division.

D. Exemptions from abatement plan requirement

(1) Except a provided in Paragraph (2) below, Subsections C and E do not apply to a person who is abating water pollution:

(a) from an underground storage tank, under the authority of the underground storage tank regulations (Title 20, Chapter 5) adopted by the New Mexico environmental improvement board, or in accordance with the New Mexico Ground Water Protection Act;

(b) under the authority of the U.S. environmental protection agency pursuant to either the Federal Comprehensive Environmental Response, Compensation and Liability Act, and amendments, or the Resource Conservation and Recovery Act;

(c) pursuant to the hazardous waste management regulations (20.4.1 NMAC) adopted by the New Mexico environmental improvement board;

(d) under the authority of the U.S. nuclear regulatory commission or the U.S. department of energy pursuant to the Atomic Energy Act;

(e) under the authority of a ground-water discharge plan approved by the director, provided that such abatement is consistent with the requirements and provisions of Section 19.15.1.19 NMAC, Subsections A, B and E, Paragraphs (3) and (4), and Subsections F and K.

(f) under the authority of a letter of understanding, settlement agreement or administrative order on consent or other agreement signed by the director or his designee prior to **(insert effective date of rule),** 1997, provided that abatement is being performed in full compliance with the terms of the letter of understanding, settlement agreement or administrative order or other agreement on consent; and

(g) on an emergency basis, or while abatement plan approval is pending, or in a manner that will likely result in compliance with the standards and requirements set forth in Subsection B within one year after notice is required to be given pursuant to Subsection B of 19.15.3.116 NMAC provided that the division does not object to the abatement action.

(2) If the director determines that abatement of water pollution subject to Section 19.15.1.19 NMAC, Subsection D, Paragraph (1) will not met the standards of Section 19.15.1.19 NMAC, Subsection B, Paragraphs (2) and (3) or that additional action is necessary to protect health, welfare, environment or property, the director may notify a responsible person, by certified mail, to submit an abatement plan pursuant to Section 19.15.1.19 NMAC, Subsections C and E, Paragraph (1). The notification shall state the reasons for the director's determination. In any appeal of the director's determination under this Paragraph, the director shall have the burden of proof.

E. Abatement plan proposal

(1) Except as provided for in Subsection D of 19.15.1.19 NMAC a responsible person shall, within sixty (60) days of receipt of written notice from the director that an abatement plan is required, submit an abatement plan proposal to the director for approval. Stage 1 and stage 2 abatement plan proposals may be submitted together. For good cause shown, the director may allow for a total of one hundred and twenty (120) days to prepare and submit the abatement plan proposal.

(2) Voluntary abatement

(a) any person wishing to abate water pollution in excess of the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC may submit a stage 1 abatement plan proposal to the director for approval. Following approval by the director of a final site investigation report prepared pursuant to stage 1 of an abatement plan, any person may submit a stage 2 abatement plan proposal to the director for approval.

(b) Following approval of a stage 1 or stage 2 abatement plan proposal under E(2)(a) above, the person submitting the approved plan shall be a responsible person under Section 19.15.1.19 NMAC for the purpose of performing the approved stage 1 or stage 2 abatement plan. Nothing in Section 19.15.1.19 NMAC shall preclude the director from applying Subsection D of 19.15.3.116 NMAC to a responsible person if applicable.

(3) Stage 1 abatement plan. The purpose of stage 1 of the abatement plan shall be to design and conduct a site investigation that will adequately define site conditions, and provide the data necessary to select and design an effective abatement option. Stage 1 of the abatement plan may include, but not necessarily be limited to, the following information depending on the media affected, and as needed to select and implement an expeditious abatement option:

(a) Descriptions of the site, including a site map, and of site history including the nature of the release that caused the water pollution, and a summary of previous investigations;

(b) Site investigation work plan to define:

(i) site geology and hydrogeology, the vertical and horizontal extent and magnitude of vadose-zone and ground-water contamination, subsurface hydraulic conductivity, transmissivity, storativity, and rate and direction of contaminant migration, inventory of water wells inside and within one (1) mile from the perimeter of the three-dimensional body where the standards set forth in Subsection B, Paragraph (2) are exceeded, and location and number of such wells actually or potentially affected by the pollution; and

(ii) surface-water hydrology, seasonal stream flow characteristics, groundwater/surface-water relationships, the vertical and horizontal extent and magnitude of contamination and impacts to surface water and stream sediments. The magnitude of contamination and impacts on surface water may be, in part, defined by conducting a biological assessment of fish, benthic macro invertebrates and other wildlife populations. Seasonal ariations should be accounted for when conducting these assessments.

(c) Monitoring program, including sampling stations and frequencies, for the duration of the abatement plan that may be modified, after approval by the director, as additional sampling stations are created;

(d) Quality assurance plan, consistent with the sampling and analytical techniques listed in Subsection B of 20.6.2.3107 NMAC and with 20.6.4.13 NMAC of the water quality standards for interstate and intrastate surface waters in New Mexico 20.6.4 NMAC, for all work to be conducted pursuant to the abatement plan;

(e) A schedule for all stage 1 abatement plan activities, including the submission of summary quarterly progress reports, and the submission, for approval by the director, of a detailed final site investigation report; and

(f) Any additional information that may be required to design and perform an adequate site investigation.

(4) Stage 2 abatement plan

(a) Any responsible person shall submit a stage 2 abatement plan proposal to the director for approval within sixty (60) days, or up to one hundred and twenty (120) days for good cause shown, after approval by the director of the final site investigation report prepared pursuant to stage 1 of the abatement plan. A stage 1 and 2 abatement plan proposal may be submitted together. The purpose of stage 2 of the abatement plan shall be to select and design, if necessary, an abatement option that, when implemented, will result in attainment of the abatement standards and requirements set forth in Section 19.15.1.19 NMAC, Subsection B including post-closure maintenance activities.

(b) Stage 2 of the abatement plan should include, at a minimum, the following information:

(i) brief description of the current situation at the site;

(ii) development and assessment of abatement options;

(iii) description, justification and design, if necessary, of preferred abatement option;

(iv) modification, if necessary, of the monitoring program approved pursuant to stage 1 of the abatement plan, including the designation of pre- and post-abatement-completion sampling stations and sampling frequencies to be used to demonstrate compliance with the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC;

(v) site maintenance activities, if needed, proposed to be performed after termination of abatement activities;

(vi) a schedule for the duration of abatement activities, including the submission of summary quarterly progress reports;

(vii) a public notification proposal designed to satisfy the requirements of Section 19.15.1.19 NMAC, Subsection G, Paragraphs (2) and (3);

(viii) any additional information that may be reasonably required to select, describe, justify and design an effective abatement option.

F. Other requirements

(1) Any responsible person shall allow any authorized representative of the director, upon presentation of proper credentials and with reasonable prior notice, to:

(a) enter the facility at reasonable times;

(b) inspect and copy records required by an abatement plan;

(c) inspect any treatment works, monitoring and analytical equipment;

(d) sample any wastes, ground water, surface water, stream sediment, plants, animals, or vadose-zone material including vadose-zone vapor;

(e) use monitoring systems and wells under such responsible person's control in order to collect samples of any media listed in Subparagraph (d) above; and

(f) gain access to off-site property not owned or controlled by such responsible person, but accessible to such responsible person through a third-party access agreement, provided that it is allowed by the agreement.

(2) Any responsible person shall provide the director, or a representative of the director, with at least four (4) working days advance notice of any sampling to be performed pursuant to an abatement plan, or any well plugging, abandonment or destruction at any facility where an abatement plan has been required.

(3) Any responsible person wishing to plug, abandon or destroy a monitoring or water supply well within the perimeter of the 3-dimensional body where the standards set forth in Section 19.15.1.19 NMAC, Subsection B, Paragraph (2) of are exceeded, at any facility where an abatement plan has been required, shall propose such action by certified mail to the director for approval, unless such approval is required from the state engineer. The proposed action shall be designed to prevent water pollution that could result from water contaminants migrating through the well or borehole. The proposed action shall not take place without written approval from the director, unless written approval or disapproval is not received by the responsible person within thirty (30) days of the date of receipt of the proposal.

G. Public notice and participation

(1) Prior to public notice, the applicant shall give written notice, as approved by the division, of stage 1 and stage 2 abatement plans to the following persons:

(a) surface owners of record within one (1) mile of the perimeter of the geographic area where the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC are exceeded;

(b) the county commission where the geographic area where the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC are exceeded is located;

(c) the appropriate city official(s) if the geographic area where the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC are exceeded is located or is partially located within city limits or within one (1) mile of the city limits;

(d) those persons, as identified by the director, who have requested notification, who shall be notified by mail;

(e) the New Mexico trustee for natural resources, and any other local, state or federal governmental agency affected, as identified by the director, which shall be notified by certified mail;

(f) the appropriate governor or president of any indian tribe, pueblo or nation if the geographic area where the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC are exceeded is located or is partially located within tribal boundaries oar within one (1) mile of the tribal boundaries, who shall be notified by certified mail;

(g) the distance requirements for notice may be extended by the director is the director determines the proposed abatement plan has the potential to adversely impact public health or the environment at a distance greater than one (1) mile. The director may require additional notice as needed. A copy and proof of such notice will be furnished to the division.

(2) Within fifteen days after the division determines that a stage 1 abatement plan or a stage 2 abatement plan is administratively complete, the responsible person will issue public notice in a form approved by the division in a newspaper of general circulation in the county in which the release occurred, and in a newspaper of general circulation in the state. For the purposes of this paragraph, an administratively complete stage 1 abatement plan is a document that satisfies the requirements of Section 19.15.1.19 NMAC, Subsection E, Paragraph E (3) and an administratively complete stage 2 abatement plan is a document that satisfies the requirements of Section 19.15.1.19 NMAC, Subsection E, Paragraph (4), Subparagraph (b). The public notice shall include, as approved in advance by the director:

(a) name and address of the responsible person;

(b) location of the proposed abatement;

(c) brief description of the source extent, and estimated volume of release, whether the release occurred into the vadose zone, ground water or surface water; and a description of the proposed stage 1 or stage 2 abatement plan;

(d) brief description of the procedures followed by the director in making a final determination;

(e) statement that a copy of the abatement plan can be viewed by the public at the division's main office or at the division's district office for the area in which the release occurred, and a statement describing how the abatement plan can be accessed by the public electronically from a division-maintained site if such access is available;

(f) statement that the following comments and requests will be accepted for consideration if received by the director within thirty (30) days after the date of publication of the public notice:

(i) written comments on the abatement plan; and

(ii) for a stage 2 abatement plan, written requests for a public hearing that include reasons why a hearing should be held.

(g) address and phone number at which interested persons may obtain further information.

(3) Any person seeking to comment on a stage 1 abatement plan, or to comment or request a public hearing on a stage 2 abatement plan, must file written comments or hearing requests with the division within thirty (30) days of the date of public notice, or within thirty (30) days of receipt by the director of a proposed significant modification of a stage 2 abatement plan. Requests for a public hearing must set forth the reasons why a hearing should be held. A public hearing shall be held if the director determines that there is significant public interest or that the request has technical merit.

(4) The division will distribute notice of the filing of an abatement plan with the next division and commission hearing docket following receipt of the plan.

H. Director approval or notice of deficiency of submittals

(1) The director shall, within sixty (60) days of receiving an administratively complete stage 1 abatement plan a site investigation report, a technical infeasibility demonstration, or an abatement completion report, approve the document, or notify the responsible person of the document's deficiency, based upon the information available.

(2) If no public hearing is held pursuant to Section 19.15.1.19 NMAC, Subsection G, Paragraph (3) then the director shall, within ninety (90) days of receiving a stage 2 abatement plan proposal, approve the plan, or notify the responsible person of the plan's deficiency, based upon the information available.

(3) If a public hearing is held pursuant to Section 19.15.1.19 NMAC, Subsection G, Paragraph (3) then the director shall, within sixty (60) days of receipt of all required information, approve stage 2 of the abatement plan proposal, or notify the responsible person of the plan's deficiency, based upon the information contained in the plan and information submitted at the hearing.

(4) If the director notifies a responsible person of any deficiencies in a site investigation report, or in a stage 1 or stage 2 abatement plan proposal, the responsible person shall submit a modified document to cure the deficiencies specified by the director within thirty (30) days of receipt of the notice of deficiency. The responsible person shall be in violation of Section 19.15.1.19 NMAC if he fails to submit a modified document within the required time, or if the modified document does not make a good faith effort to cure the deficiencies specified by the director.

(5) Provided that the other requirements of Section 19.15.1.19 NMAC are met and provided further that stage 2 of the abatement plan, if implemented, will result in the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC being met within a schedule that is reasonable given the particular circumstances of the site, the director shall approve the plan.

I. Investigation and abatement - Any responsible person who receives approval for stage 1 and/or stage 2 of an abatement plan shall conduct all investigation, abatement, monitoring and reporting activity in full compliance with Section 19.15.1.19 NMAC and according to the terms and schedules contained in the approved abatement plans.

J. Abatement plan modification

(1) Any approved abatement plan may be modified, at the written request of the responsible person, in accordance with Section 19.15.1.19 NMAC, and with written approval of the director.

(2) If data submitted pursuant to any monitoring requirements specified in the approved abatement plan or other information available to the director indicates that the abatement action is ineffective, or is creating unreasonable injury to or interference with health, welfare, environment or property, the director may require a responsible person to modify an abatement plan within the shortest reasonable time so as to effectively abate water pollution which exceeds the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC, and to abate and prevent unreasonable injury to or interference with health, welfare, environment or property.

K. Completion and termination

(1) Abatement shall be considered complete when the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC are met. At that time, the responsible person shall submit an abatement completion report, documenting compliance with the standards and requirements set forth in Subsection B of Section

19.15.1.19 NMAC, to the director for approval. The abatement completion report also shall propose any changes to long-term monitoring and site maintenance activities, if needed, to be performed after termination of the abatement plan.

(2) Provided that the other requirements of Section 19.15.1.19 NMAC are met and provided further that the standards and requirements set forth in Subsection B of Section 19.15.1.19 NMAC have been met, the director shall approve the abatement completion report. When the director approves the abatement completion report, he shall also notify the responsible person in writing that the abatement plan is terminated.

L. Dispute resolution - In the event of any technical dispute regarding the requirements of Section 19.15.3.116 NMAC, Subsections B, D, E, J, or K (above), including notices of deficiency, the responsible person may notify the director by certified mail that a dispute has arisen, and desires to invoke the dispute resolution provisions of this Paragraph, provided that such notification must be made within thirty (30) days after receipt by the responsible person of the decision of the director that causes the dispute. Upon such notification, all deadlines affected by the technical dispute shall be extended for a thirty (30) day negotiation period, or for a maximum of sixty (60) days if approved by the director for good cause shown. During this negotiation period, the director or his/her designee and the responsible person shall meet at least once. Such meeting(s) may be facilitated by a mutually agreed upon third party, but the third party shall assume no power or authority granted or delegated to the director by the Oil and Gas Act or by the division or commission. If the dispute remains unresolved after the negotiation period, the decision of director shall be final.

M. Appeals from director's and division's decisions

(1) If the director determines that (i) an abatement plan is required pursuant to Subsection D of 19.15.3.116 NMAC, (ii) approves or provides notice of deficiency of a proposed abatement plan, technical infeasibility demonstration or abatement completion report, or (iii) modifies or terminates an approved abatement plan, he shall provide written notice of such action by certified mail to the responsible person and any person who participated in the action.

(2) Any person who participated in the action before the director and who is adversely affected by the action listed in Paragraph (1) above may file a petition requesting a hearing before a division examiner.

(3) The petition shall be made in writing to the division and shall be filed with the division within thirty (30) days after receiving notice of the director's action. The petition shall specify the portions of the action to which the petitioner objects, certify that a copy of the petition has been mailed or hand-delivered to the director, and to the applicant or permittee if the petitioner is not the applicant or permittee, and attach a copy of the action for which review is sought. Unless a timely petition for hearing is made, the director's action is final.

(4) The hearing before the division shall be conducted in the same manner as other division hearings.

(5) The cost of the court reporter for the hearing shall be paid by the petitioner.

(6) Any party adversely affected by any order by the division pursuant to any hearing held by an Examiner, shall have a right to have such matter heard ***de novo*** before the commission.

(7) The appeal provisions do not relieve the owner, operator or responsible person of their obligations to comply with any federal or state laws or regulations.

[3-15-97; 6-30-97; 19.15.1.19 NMAC - Rn, 19 NMAC 15.A.19, 5-15-01; A, 3-15-02]

19.15.1.20 MEETINGS BY TELECONFERENCE:

Pursuant to Section 10-15-1 NMSA 1978, commission members may participate in commission meetings and hearings by means of a conference telephone or other similar communications equipment when it is otherwise difficult or impossible for members to attend the meeting or hearing in person. Each member participating by conference telephone or other similar communications equipment must be identified when speaking. All participants must be able to hear each other at the same time. Members of the public hearing attending the meetings or hearing must be able to hear commission members who speak during the meeting or hearing.

[12-31-96; 19.15.1.20 NMAC - Rn, 19 NMAC 15.A.20, 5-15-01]

19.15.1.21 SPECIAL PROVISIONS FOR SELECTED AREAS OF SIERRA AND OTERO COUNTIES:

A. The selected areas comprise:

(1) all of Sierra county except the area west of Range 8West NMPM and north of Township 18 South, NMPM; and

(2) all of Otero county except the area included in the following townships and ranges:

(a) township 11 south, range 9 1/2 east and range 10 east NMPM;

(b) township 12 south, range 10 east and ranges 13 east through 16 east, NMPM;

(c) township 13 south, ranges 11 east through 16 east, NMPM;

(d) township 14 south, ranges 11 east through 16 east, NMPM;

(e) township 15 south, ranges 11 east through 16 east, NMPM;

(f) township 16 south, ranges 11 east through 15 east, NMPM;

(g) township 17 south, range 11 east (surveyed) and ranges 12 east through 15 east, NMPM;

(h) township 18 south, ranges 11 east through 15 East, NMPM;

(i) township 20 1/2 south, range 20 east, NMPM;

(j) township 21 south, range 19 east and range 20 east, NMPM; and

(k) township 22 south, range 20 east, NMPM; and also excepting also the unsurveyed area bounded as follows:

(i) beginning at the most northerly northeast corner of Otero county, said point lying in the west line of range 13 east (surveyed);

(ii) thence west along the north boundary line of Otero county to the point of intersection of such line with the east line of range 10 east NMPM (surveyed);

(iii) thence south along the east line of range 10 east NMPM (surveyed) to the southeast corner of township 11 south, range 10 east NMPM (surveyed);

(iv) thence west along the south line of township 11 south, range 10 east NMPM (surveyed) to the more southerly northeast corner of township 12 south, range 10 east NMPM (surveyed);

(v) thence south along the east line of range 10 east NMPM (surveyed) to the inward corner of township 13 south, range 10 east NMPM (surveyed) (said inward corner formed by the east line running south from the more northerly northeast corner and the north line running west from the more southerly northeast corner of said township and range);

(vi) thence east along the north line of township 13 south NMPM (surveyed) to the southwest corner of township 12 south, range 13 east, NMPM (surveyed);

(vii) thence north along the west line of range 13 east, NMPM (surveyed) to the point of beginning.

B. The division shall not issue permits under 19.15.2.50 NMAC or 19.15.9.711 NMAC for pits located in the selected areas.

C. Produced water injection wells located in the selected areas are subject to the following requirements in addition to those set out in 19.15.9.701 NMAC through 19.15.9.710 NMAC.

(1) Permits shall be issued under 19.15.9.701 NMAC only after notice and hearing.

(2) The radius of the area of review shall be the greater of:

(a) one-half mile; or

(b) one and one-third times the radius of the zone of endangering influence, as calculated under environmental protection agency regulation 40 CFR Part 146.6(a) or by any other method acceptable to the division; but in no case shall the radius of the area of review exceed one and one-third miles.

(3) Operators shall demonstrate the vertical extent of any fresh water aquifer(s) prior to using a new or existing well for injection.

(4) All fresh water aquifers shall be isolated throughout their vertical extent with at least two cemented casing strings. In addition,

(a) existing wells converted to injection shall have continuous, adequate cement from casing shoe to surface on the smallest diameter casing, and

(b) wells drilled for the purpose of injection shall have cement circulated continuously to surface on all casing strings, except the smallest diameter casing shall have cement to at least 100 feet above the casing shoe of the next larger diameter casing.

(5) Operators shall run cement bond logs acceptable to the division after each casing string is cemented, and file the logs with the appropriate district office of the division. For existing wells the casing and cementing program shall comply with 19.15.9.702 NMAC.

(6) Produced water transportation lines shall be constructed of corrosion-resistant materials acceptable to the division, and shall be pressure tested to one and one-half times the maximum operating pressure prior to operation, and annually thereafter.

(7) All tanks shall be placed on impermeable pads and surrounded by lined berms or other impermeable secondary containment device having a capacity at least equal to one and one-third times the capacity of the largest tank, or, if the tanks are interconnected, of all interconnected tanks.

(8) Operators shall record injection pressures and volumes daily or in a manner acceptable to the division, and make the record available to the division upon request.

(9) Operators shall perform a mechanical integrity tests as described in Paragraph 2, Subsection A of 19.15.9.704 NMAC annually, shall advise the appropriate district office of the division of the date and time each such test is to be commenced in order that the test may be witnessed, and shall file the pressure chart with the appropriate district office of the division.

[19.15.1.21 NMAC - N, 08-13-04]

19.15.1.22-29 [RESERVED]

19.15.1.30 ENHANCED OIL RECOVERY PROJECT TAX INCENTIVE:

A. General - Applications for qualification of enhanced oil recovery projects or expansions of existing enhanced oil recovery projects for the recovered oil tax rate pursuant to the New Mexico "Enhanced Oil Recovery Act" (Sections 7-29A-1 through 7-29A-5 NMSA 1978) will be accepted by the division after March 6, 1992.

B. Applicability - These rules apply to:

(1) enhanced oil recovery (EOR) projects;

(2) expansions of existing EOR projects;

(3) the expanded use of enhanced oil recovery technology in existing EOR projects; and

(4) the change from a secondary recovery project to a tertiary recovery project.

C. Definitions

(1) Crude oil means oil and other liquid hydrocarbons removed from natural gas at or near the wellhead.

(2) Enhanced oil recovery (EOR) project means the use or the expanded use of any process for the displacement of crude oil from an oil well or division-designated pool other than a primary recovery process, including but not limited to the use of a pressure maintenance process, a waterflooding process, an immiscible, miscible, chemical, thermal or biological process or any other related process.

(3) Expansion or expanded use means a significant change or modification as determined by the Division in (a) the technology or process used for the displacement of crude oil from an oil well or division-designated pool; or (b) the expansion, extension or increase in size of the geologic area or adjacent geologic area that could reasonably be determined to represent a new or unique area of activity.

(4) Operator means the person responsible for the actual physical operation of an enhanced recovery project.

(5) Positive production response means that the rate of oil production from the wells or pools affected by an enhanced recovery project is greater than the rate that would have occurred without the project.

(6) Project area means a pool or a portion of a pool that is directly affected by EOR operations.

(7) Primary recovery means the displacement of crude oil from an oil well or division-designated pool into the well bore by means of the natural pressure of the oil well or pool, including but not limited to artificial lift.

(8) Recovered oil tax rate means the tax rate set forth in Section 7-29-4 NMSA 1978, on crude oil produced from an enhanced recovery project.

(9) Secondary recovery project means an enhanced oil recovery project that: (a) occurs subsequent to the completion of primary recovery and is not a tertiary recovery project; (b) involves the application, in accordance with sound engineering principles of carbon dioxide miscible fluid displacement, pressure maintenance, waterflooding or any other secondary recovery method accepted and approved by the division that can reasonably be expected to result in an increase, determined in light of all facts and circumstances, in the amount of crude oil that may ultimately be recovered; and (c) encompasses a pool or portion of a pool the boundaries of which can be adequately defined and controlled.

(10) Termination means the discontinuance of an enhanced recovery project by the operator.

(11) Tertiary recovery project means an enhanced recovery project that: (a) occurs subsequent to the completion of a secondary recovery project; (b) involves the application, in accordance with sound engineering principles, of carbon dioxide miscible fluid displacement, pressure maintenance, water flooding or any other tertiary recovery method accepted and approved by the division that can reasonably be expected to result in an increase, determined in light of all facts and circumstances, in the amount of crude oil that may ultimately be recovered; and (c) encompasses a pool or portion of a pool the boundaries of which can be adequately defined and controlled.

D. Procedure

(1) The division’s general rules of procedure shall apply unless altered or amended by these rules.

(2) To be eligible for the tax rate the operator must apply for and receive division approval. No project or expansion approved by the division prior to March 6, 1992 shall qualify.

(3) All applications shall be filed in triplicate with the division’s Santa Fe office. One copy of the application and all attachments shall also be filed with the appropriate division district office.

(4) All applications shall be executed and certified by the operator or its authorized representative having knowledge of the facts therein and shall contain:

(a) operator’s name and address;

(b) description of the project area including:

(i) a plat outlining the project area;

(ii) description of the project area by section, township and range; total acres; and

(iii) name of the subject pool and formation;

(c) status of operations in the project area:

(i) if unitized, the name of the unit and the date and number of the division order approving the unit plan of operation;

(ii) if an application for approval of a unit plan has been made, the date the application was filed with the Division; and

(iii) if not unitized, identify each lease in the project area by lessor, lessee and legal description;

(d) method of recovery to be used:

(i) identify fluids to be injected;

(ii) if the division has approved the project, provide the date and number of the division order; and

(iii) if the project has not been approved by the division, provide the date the application for approval was filed with the division on form C-108;

(e) description of the project:

(i) a list of producing wells;

(ii) a list of injection wells;

(iii) capital costs of additional facilities;

(iv) total project cost;

(v) estimated total value of the additional production that will be recovered as a result of the project;

(vi) anticipated date for commencement of injection;

(vii) the type of fluid to be injected and the anticipated volumes; and if application is made for an expansion of an existing project, explain what changes in technology will be used or what additional geographic area will be added to the project area; and

(f) production data: provide graphs, charts and other supporting data to show the production history and production forecast of oil, gas, casinghead gas and water from the project area.

E. Approval and certification

(1) Project approval: An EOR project will be approved and the project area designated for the recovered oil tax rate when the operator proves that:

(a) the application of the proposed enhanced recovery techniques to the reservoir should result in an increase in the amount of crude oil that may be ultimately recovered;

(b) the project area has been so depleted that it is prudent to apply enhanced recovery techniques to maximize the ultimate recovery of crude oil; and

(c) the application is economically and technically reasonable and has not been prematurely filed.

(2) Positive production response certification:

(a) for the recovered oil tax rate to apply to oil produced from an approved qualified EOR project, the operator must demonstrate a positive production response to the division. Applications for certification of a positive production response shall be filed with the division's Santa Fe office and shall include:

(i) a copy of the division's approval of the enhanced recovery project or expansion;

(ii) a plat of the affected area showing all injection and producing wells with completion dates; and

(iii) production graphs and supporting data demonstrating a positive production response and showing the volumes of water or other substances that have been injected on the lease or unit since initiation of the enhanced recovery project;

(b) the division director shall have authority to administratively approve an application and certify a positive production response or, at the director's discretion or at the request of the applicant, may set the application for hearing; and

(c) the division shall certify that a positive production response occurred and notify the secretary of taxation and revenue. This certification and notice shall set forth the date the certification was made and the date the positive production response occurred provided however:

(i) for a secondary recovery project, the application for certification of a positive production response must occur not later than five (5) years from the date the division issued the certification of approval for the enhanced oil recovery project or expansion; and

(ii) for a tertiary recovery project, the application for certification of a positive production response must occur not later than seven (7) years from the date the division issues the certification of approval for the enhanced recovery project or expansion.

F. Reporting requirements

(1) The operator of an approved EOR project shall report annually on the status of the project and confirm that the project is still a viable EOR project as approved. The report will be for the year ending May 31 and shall be filed with the division's Santa Fe office. The report shall contain:

(a) the date and number of the division's certification order for the project;

(b) production graphs showing oil, gas and water production;

(c) a graph showing the volumes of fluid injected and the average injection pressures; and

(d) any additional data the director deems necessary for continued approval;

(2) the director may set for hearing the continued approval of any EOR project.

G. Termination - When active operation of an approved enhanced recovery project or expansion is terminated, the operator shall notify the division and the secretary of taxation and revenue in writing not later than the thirtieth (30) day after the termination of the enhanced recovery project or expansion.

[6-15-9; 19.15.1.30 NMAC - Rn, 19 NMAC 15.A.30, 5-15-01]

19.15.1.31 PRODUCTION RESTORATION PROJECT TAX INCENTIVE:

A. General - Applications for qualification of production restoration projects for the production restoration incentive tax exemption pursuant to the "Natural Gas and Crude Oil Production Incentive Act" (Sections 7-29B-1 through 7-29B-6 NMSA 1978) shall be accepted by the division after November 9, 1995.

B. Applicability - These rules apply to any natural gas or oil well division records show had thirty (30) days or less production in any period of twenty-four consecutive months beginning on or after January 1, 1993 upon which the operator commenced operations to restore production after June 16, 1995.

C. Definitions

(1) Operator means the person responsible for the actual physical operation of a natural gas or oil well;

(2) Production restoration incentive tax exemption means the severance tax exemption for natural gas and/or oil produced from an approved production restoration project found in Section 7-29-4 NMSA 1978.

(3) Production restoration project means returning to production any natural gas or oil well, including but not limited to any injection well which has previously produced, which had no more than (30) days of production in any period of twenty-four consecutive months beginning on or after January 1, 1993 as approved and certified by the division;

(4) Well means a wellbore with single or multiple completions, including all horizons and producing formations from the surface to total depth.

D. Procedure

(1) The division's general rules of procedure shall apply unless altered or amended by these rules.

(2) To be eligible for the exemption, the operator must apply for and receive division approval. No production restoration project commenced prior to June 16, 1995 shall qualify.

(3) An application must be filed with the division within twelve (12) months of the production restoration.

(4) Applications shall be filed by the operator on behalf of all interest owners in the project.

(5) Applications shall be filed in triplicate with the division at its appropriate district office on division form C-139 and shall contain:

(a) operator's name and address; and

(b) description of the production restoration project including:

(i) name and footage location of the well;

(ii) name of the pool from which the well previously produced;

(iii) a description of the process used, or to be used, by the operator for returning the well to production;

(iv) identification of the division records which show that the well had thirty (30) days or less production in any period of twenty-four consecutive months beginning on or after January 1, 1993;

(v) date the project was commenced and date the well was returned to production; and

(vi) a statement under oath by the operator or its authorized representative having knowledge of the facts contained in the application that: the application is complete and correct; production from the well has been reported to the division and division records establish the well had thirty (30) days or less production in any period of twenty-four consecutive months beginning on or after January 1, 1993.

E. Approval, certification, notification and hearing

(1) Project approval and certification

(a) A project shall be approved and a certification of approval issued to the operator designating the natural gas or oil well as a production restoration project when the operator proves that:

(i) after June 16, 1995, the operator has commenced any process to return the well to production; and

(ii) division records show the well had thirty (30) days or less of production in any period of twenty-four consecutive months beginning on or after January 1, 1993.

(b) The exemption will apply beginning the first day of the month following the date the well was returned to production as certified by the division.

(2) Notification to the secretary of taxation and revenue - The division shall notify the secretary of taxation and revenue of the approval. This notice shall identify the natural gas or oil well as a production restoration project and certify the date production was restored.

(3) Hearing - The division shall consider applications without a hearing. If the division district office

denies an application, the division upon the applicant's request shall set the application for hearing. Any application not acted upon by the division district office within thirty (30) days from the date it is filed shall be deemed denied.
[Rn, 19 NMAC 15.I.712.A through E, 6-15-99; A, 6-15-99; 19.15.1.31 NMAC - Rn, 19 NMAC 15.A.31, 5-15-01]

19.15.1.32 WELL WORKOVER PROJECT TAX INCENTIVE:

A. General - Applications for qualification of well workover projects for the well workover incentive tax rate pursuant to the "Natural Gas and Crude Oil Production Incentive Act" (Sections 7-29B-1 through 7-29B-6 NMSA 1978) shall be accepted by the division after November 9, 1995.

B. Applicability - These rules apply to any natural gas or oil well upon which the operator has commenced a workover after June 16, 1995 that is intended to increase production from the well.

C. Definitions

(1) Routine maintenance means repair or like-for-like replacement of downhole equipment or any other procedure performed by an operator to maintain the well's current production;

(2) Well means a wellbore with single or multiple completions, including all horizons and producing formations from the surface to total depth.

(3) Well workover incentive tax rate means the tax rate imposed by Section 7-29-4 NMSA 1978 on natural gas and/or oil produced from a well workover project;

(4) Well workover project means any procedure undertaken by the operator of a natural gas or oil well that is intended to increase production from the well and that has been approved and certified by the division;

(5) Workover means any procedure undertaken by the operator of the well intended to increase production but is not routine maintenance and includes, but is not limited to:

(a) re-entry into the well to drill deeper, to sidetrack to a different location, to recomplete for production or to restore production from a zone which has been temporarily abandoned;

(b) recompletion by re-perforation of a zone from which natural gas or oil has been produced or by perforation of a different zone;

(c) repair or replacement of faulty or damaged casing or related downhole equipment;

(d) fracturing, acidizing or installing compression equipment; and

(e) squeezing, cementing or installing equipment necessary for removal of excessive water, brine or condensate from the well bore in order to establish, continue or increase production from the well.

D. Procedure

(1) The division's general rules of procedure shall apply unless altered or amended by these rules.

(2) To be eligible for the incentive tax rate, the operator must apply for and receive division approval. No well workover project commenced by the operator prior to June 16, 1995 shall qualify.

(3) Applications must be filed with the division within twelve (12) months of completion of the workover.

(4) An application shall be filed by the operator on behalf of all interest owners in the project.

(5) The data utilized in the application shall be retained by the operator in its files during the period of time the well qualifies for and receives the well workover incentive tax rate and for such time thereafter as the department requires.

(6) Applications shall be filed in triplicate with the division at its appropriate district office on division form C-140 and shall contain:

(a) operator's name and address; and

(b) description of well workover project including:

(i) name and footage location of the well;

(ii) name of the pool from which the well previously produced;

(iii) the dates workover procedures commenced and were completed;

(iv) a description of the procedures undertaken by operator of the well intended to increase production;

(v) evidence of a positive production increase over the production rate of the well prior to the workover. The operator must submit a production curve or data tabulation made up of at least twelve months' production prior to the workover and at least three months' production following the workover that reflects a positive production increase;

(vi) other documentation the applicant determines may be applicable to this filing, such as division forms or division orders; and

(vii) a statement under oath by the operator or its authorized representative having knowledge of the facts contained in the application that he/she has made or caused to be made a diligent search of all production records which are reasonably available and contain information relevant to the production history of the well.

E. Approval, certification, notification and hearing

(1) Project approval and certification

(a) A workover shall be approved and a certification of approval issued to the operator designating the natural gas or oil well as a well workover project when the operator proves that:

(i) approved workover procedures have been undertaken on the well which are intended to increase production; and

(ii) the production curve or data tabulation from production data reflects a positive production increase from the workover.

(b) The incentive tax rate will apply beginning the first day of the month following the date the workover was completed as certified by the division.

(2) Notification to the secretary of taxation and revenue - The division shall notify the secretary of taxation and revenue of the approval by identifying the natural gas or oil well as a well workover project and certifying the date the project was completed.

(3) Hearings and requests for additional information

(a) The division shall consider applications without a hearing. If the division district office denies an application, the division upon the applicant's request shall set the application for hearing. Any application not acted upon by the division district office within thirty (30) days from the date it is filed is deemed denied.

(b) The division may request additional information from the operator to support an application. When additional information is requested, the 30-day approval period shall begin to run on the date the requested data is provided.

F. Certifications prior to July 1, 1999 - Well workover projects certified prior to July 1, 1999 shall be deemed to be approved and certified in accordance with the provisions of the 1999 act and natural gas or oil produced from those projects shall be eligible for the well workover incentive tax rate effective beginning July 1, 1999.

[6-15-99, Rn, 19. NMAC 15.I.713.A through E, 7-1-99; A, 7-1-99; 19.15.1.32 NMAC - Rn, 19 NMAC 15.A.32, 5-15-01]

19.15.1.33 STRIPPER WELL TAX INCENTIVE:

A. General - Qualification of stripper well properties for the stripper well incentive tax rates in Sections 7-29-4 and 7-31-4 NMSA 1978, requires certification by the division. The division shall certify stripper well properties for calendar year 1998 no later than June 30, 1999 and no later than June 1 of each succeeding year for the preceding calendar year.

B. Applicability - These rules apply to any property that the division certifies as a stripper well property after June 30, 1999.

C. Definitions

(1) Average daily production means the number derived by dividing the total volume of crude oil or natural gas production from the stripper well property reported to the division during a calendar year by the sum of the number of days each eligible well within the property produced or injected during that calendar year;

(2) Eligible well means a crude oil or natural gas well that produces, or an injection well that injects and is integral to production, for any period of time during the preceding calendar year.

(3) Stripper well property means a crude oil or natural gas producing property that is assigned a single production unit number (PUN) by the taxation and revenue department and:

(a) (if a crude oil producing property) produced a daily average of less than ten barrels of oil per eligible well per day for the preceding calendar year;

(b) (if a natural gas producing property) produced a daily average of less than sixty thousand cubic feet of natural gas per eligible well per day during the preceding calendar year; or

(c) (if a property with wells that produce both crude oil and natural gas) produced a daily average of less than ten barrels of oil per eligible well per day for the preceding calendar year, as determined by converting the volume of natural gas produced by the well to barrels of oil by using a ratio of six thousand cubic feet to one barrel of oil; and

(4) Stripper well incentive tax rates means the tax rates set for stripper well properties by Sections 7-29-4 and 7-31-4 NMSA 1978.

D. Certification, notification and hearing

(1) The division shall determine which wells qualify as stripper well properties.

(2) Upon certification of properties as stripper well properties, the division shall notify the operator and the secretary of taxation and revenue of that certification.

(3) The operator shall notify all the interest owners of the certification of the property as a stripper well property.

(4) An operator may make a written request that the division reevaluate a property for stripper well status.

(5) If the division denies stripper well certification to a property, the division upon the operator's request shall set the matter for hearing.

[6-15-99; 19.15.1.33 NMAC - Rn, 19 NMAC 15.A.33, 5-15-01]

19.15.1.34 NEW WELL TAX INCENTIVE:

A. Applicability - These rules apply to any new natural gas or oil well for which drilling commenced after January 1, 1999 and before July 1, 2000.

B. Definitions - New well means a crude oil or natural gas producing well for which drilling commenced after January 1, 1999 and before July 1, 2000, or a horizontal crude oil or natural gas well that was recompleted from a vertical well by drilling operations that commenced after January 1, 1999 and before July 1, 2000, that has been approved and certified as such by the division.

C. Procedure

(1) The division's general rules of procedure shall apply unless altered or amended by these rules.

(2) The operator must apply for and be granted division approval of the "new well". A new well shall qualify if the division certifies that:

(a) the operator applying for the tax credit commenced drilling the new well after January 1, 1999 and before July 1, 2000;

(b) the new well was completed as a producer; and

(c) the application is for one of the first six hundred new wells commenced after January 1, 1999 and before July 1, 2000.

(3) An application must be filed with the division: (a) within sixty (60) days of completion of the well as a producer, or (b) by Oct 1, 1999 for a well commenced after January 1, 1999 and before July 1, 1999.

(4) All applications shall be filed in triplicate with the division's Santa Fe office on form C-142 and shall contain:

(a) operator's name and address;

(b) description of the well:

(i) name and footage location;

(ii) date and time spudded; and

(iii) completion date and production test results;

(c) copies of division form C-103 or federal form 3160-5 showing spud date and time and form C-105 or federal form 3160-4 showing the well was completed as a producer;

(d) a list of all working interest owners in the well along with their percentage interests; and

(e) a statement under oath by the operator or its authorized representative having knowledge of the facts contained in the application that the application is complete and correct.

D. Certification, notification and hearing

(1) Upon approval of the application, the division shall certify that approval by sending a copy of the approved application to the operator and the secretary of taxation and revenue.

(2) The division shall consider applications without a hearing. The division may request additional information from an operator to support the application. If the division denies an application, the division upon the applicant's request shall set the application for hearing.

(3) The operator shall notify all working interest owners of the approval and certification of the well as a new well.

[6-15-99, A, 10-29-99; 19.15.1.34 NMAC - Rn, 19 NMAC 15.A.34, 5-15-01]

19.15.1.35 COMPULSORY POOLING. CHARGE FOR RISK

A. General rule - Compulsory pooling orders entered by the division pursuant to NMSA 1978 Section 70-2-17, as amended, may provide for the recovery, out of the share of production allocable to the working interest of any party that elects not to pay its proportionate share of well costs in advance, in addition to reasonable well costs and costs of supervision and management, of a charge for risk associated with the drilling, completion, or working over and recompletion of each unit well for which provision is made in the order. Unless otherwise ordered pursuant to Subsection B of 19.15.1.35 NMAC, the charge for risk shall be 200% of well costs.

(1) "Well costs" shall mean all reasonable costs of drilling, reworking, diverting, deepening, plugging back and testing the well; completing the well in any formation pooled by the order; and equipping the well for production. If, however, any well was previously completed in another formation or bottom-hole location, or was previously abandoned without completion, well costs as to such well shall mean only the reasonable costs of re-entering, reworking, diverting, deepening, plugging back or testing the well; completion in the pooled formation or formations and; if necessary, reequipping the well for production, unless the division determines that allowance of all or some portion of historical costs of drilling is just and reasonable due to particular circumstances. If a well is completed in two or more formations having diverse ownership or a different risk charge percentage, the order shall provide for allocation of well costs between the formations. As to any interest owner who elects not to pay its share of well costs associated with a specific well in advance, as provided in the applicable order, "well costs" shall include costs of any subsequent operation undertaken to secure or enhance production from any formation pooled by the order prior to the time that the entire amount of such non-consenting owner's share of well costs and applicable risk charge have been recovered from such non-consenting owner's share of production from such well. Such costs shall include expenses for reworking, diverting, deepening, plugging back, testing, completion or recompletion and equipping for production, but not ordinary operating expenses.

(2) Well costs shall also include reasonable costs of drilling, testing, completing, and equipping a substitute well if, in the drilling of a well pursuant to a compulsory pooling order, the operator loses the hole or encounters mechanical difficulties rendering it impracticable to drill to the objective depth, and the substitute well is located within 330 feet of the original well and drilling thereof is commenced within ten (10) days of the abandonment of the original well.

(3) An applicant for compulsory pooling shall not be required to present technical evidence justifying the risk charge provided in Subsection A of 19.15.1.35 NMAC.

B. Exceptions - Any person responding to a compulsory pooling application who seeks a different risk charge than that provided in Subsection A shall so state in a timely pre-hearing statement filed with the division and served on the applicant in accordance with Subsection B of 19.15.14.1208 NMAC, and shall have the burden to prove the justification for the risk charge sought by relevant geologic or technical evidence. The hearing officer shall have discretion to allow a responding party who has not filed a pre-hearing statement, but who appears in person or by attorney at the hearing, to offer evidence in support of a different risk charge than that provided in Subsection A of 19.15.1.35, but in such cases a continuance of the hearing shall be allowed, if requested, to enable the applicant to present rebuttal evidence.

TITLE 19 NATURAL RESOURCES and WILDLIFE
CHAPTER 15 OIL AND GAS
PART 2 GENERAL OPERATING PRACTICES, WASTES ARISING FROM EXPLORATION AND PRODUCTION

19.15.2.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 1220 S. St. Francis Drive, Santa Fe, New Mexico 87505, (505) 476-3440.
[19.15.2.1 NMAC - N, 2/13/04]

19.15.3.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[19.15.2.2 NMAC - N, 02/13/04]

19.15.3.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[19.15.2.3 NMAC - N, 02/13/04]

19.15.2.4 DURATION: Permanent.
[19.15.2.4 NMAC - N, 02/13/04]

19.15.2.5 EFFECTIVE DATE: February 13, 2004, unless a later date is cited at the end of a section.
[19.15.2.5 NMAC - N, 02/13/04]

19.15.2.6 OBJECTIVE: To regulate the drilling of oil and gas wells within the state of New Mexico to enable the oil conservation division to fulfill its statutory mandates under the Oil and Gas Act.
[19.15.2.6 NMAC - N, 02/13/04]

19.15.2.7 DEFINITIONS:
A. Alluvium shall mean detrital material that has been transported by water or other erosional forces and deposited at points along the flood plain of a watercourse. It typically is composed of sands, silts, and gravels, exhibits high porosity and permeability and generally carries fresh water.
B. Sump shall mean any impermeable single wall vessel with a capacity less than 500 gallons, where any portion of the sidewalls of the reservoir is below the surface of the ground and not visible which vessel remains predominantly empty, serves as a drain or receptacle for spilled or leaked liquids on an intermittent basis, and is not used to store, treat, dispose of, or evaporate products or wastes.
[19.15.2.7 NMAC - N, 02/13/04]

19.15.2.8 through 19.15.2.49 [RESERVED]

19.15.2.50 PITS AND BELOW-GRADE TANKS:
A. Permit required. Discharge into, or construction of, any pit or below-grade tank is prohibited absent possession of a permit issued by the division, unless otherwise herein provided or unless the division grants an exemption pursuant to Subsection G of 19.15.2.50 NMAC. Facilities permitted by the division pursuant to Section 711 of 19.15.9 NMAC or water quality control commission regulations are exempt from Section 50 of 19.15.2 NMAC.
B. Application.
(1) Where filed; application form.
(a) Downstream facilities. An operator shall apply to the division's environmental bureau for a permit to construct or use a pit or below-grade tank at a downstream facility such as a refinery, gas plant, compressor station, brine facility, service company, or surface waste management facility that is not permitted pursuant to Section 711 of 19.15.9 NMAC or water quality control commission regulations. The operator shall use a form C-144, application to discharge into a pit or below-grade tank. The operator may submit the form separately or as an attachment to an application for a discharge permit, best management practices permit, surface waste management facility permit, or other permit.
(b) Drilling or production. An operator shall apply to the appropriate district office for a permit for use of a pit or below-grade tank in drilling, production, or operations not otherwise identified in Subparagraph (a), Paragraph (1),

Subsection B of 19.15.2.50 NMAC. The operator shall apply for the permit on the application for permit to drill or on the sundry notices and reports on wells, or electronically as otherwise provided in this chapter. Approval of such form constitutes a permit for all pits and below-grade tanks annotated on the form. A separate Corm C-144 is not required.

(2) General permit; individual permit. An operator may apply for a permit to use an individual pit or below-grade tank, or may apply for a general permit applicable to a class of like facilities.

(3) When filed.

(a) New pits or new below-grade tanks. After April 15, 2004, operators shall obtain a permit before constructing a pit or below-grade tank.

(b) Existing pits or new below-grade tanks. For each pit or below-grade tank in existence on April 15, 2004 that has not received an exemption after hearing as allowed by OCC Order R-3221 through R-3221D inclusive, the operator shall submit a notice not later than April 15, 2004 indicating either that use of the pit or below-grade tank will continue or that such pit or below grade tank will be closed. If use of a pit or below-grade tank is to be discontinued, discharge into the pit or use of the below-grade tank shall cease not later than June 30, 2005. If use of a pit or below-grade tank will continue, the operator shall file a permit application not later than September 30, 2004. If an operator files a timely, administratively complete application for continued use, use of the pit or below-grade tank may continue until the division acts upon the permit application.

C. Design, construction, and operational standards.

(1) In general. Pits, sumps and below-grade tanks shall be designed, constructed and operated so as to contain liquids and solids to prevent contamination of fresh water and protect public health and the environment.

(2) Special requirements for pits.

(a) Location. No pit shall be located in any watercourse, lakebed, sinkhole, or playa lake. Pits adjacent to any such watercourse or depression shall be located safely above the ordinary high-water mark of such watercourse or depression. No pit shall be located in any wetland. The division may require additional protective measures for pits located in groundwater sensitive areas or wellhead protection areas.

(b) Liners.

(i) Drilling pits, workover pits. Each drilling pit or workover pit shall contain, at a minimum, a single liner appropriate for conditions at the site. The liner shall be designed, constructed, and maintained so as to prevent the contamination of fresh water, and protect public health and the environment. Pits used to vent or flare gas during drilling or workover operations that are designed to allow liquids to drain to a separate pit do not require a liner.

(ii) Disposal or storage pits. Each disposal pit (including, but not limited to, any separator pit, tank drain pit, evaporation pit, blowdown pit used in production activities, pipeline drip pit, or production pit) and each storage pit (including any brine pit, salt water pit, fluid storage pit for an LPG system, or production pit) shall contain, at a minimum, a primary and a secondary liner appropriate to the conditions at the site. Liners shall be designed, constructed, and maintained so as to prevent the contamination of fresh water, and protect public health and the environment.

(iii) Alternative liner media. The division may approve liners that are not constructed in accordance with division guidelines only if the operator demonstrates to the division's satisfaction that the alternative liner protects fresh water, public health, and the environment as effectively as those prescribed in division guidelines.

(c) Leak detection. A leak detection system shall be installed between the primary and secondary liner in each disposal or storage pit. The leak detection system shall be designed, installed, and operated so as to prevent the contamination of fresh water, and protect public health and the environment. The operator shall notify the division at least twenty-four hours prior to installation of the primary liner so a division representative may inspect the leak detection system before it is covered.

(d) Drilling and workover pits. Each drilling or workover pit shall be of an adequate size to assure that a supply of fluid is available and sufficient to confine oil, natural gas, or water within its native strata. Hydrocarbon-based drilling fluids shall be contained in tanks made of steel or other division-approved material.

(e) Disposal or storage pits. No measurable or visible layer of oil may be allowed to accumulate or remain anywhere on the surface of any pit. Spray evaporation systems shall be operated such that all spray-borne suspended or dissolved solids remain within the perimeter of the pond's lined portion.

(f) Fencing and netting. All pits shall be fenced or enclosed to prevent access by livestock, and fences shall be maintained in good repair. Active drilling or workover pits may have a portion of the pit unfenced to facilitate operations. In issuing a permit, the division may impose additional fencing requirements for protection of wildlife in particular areas. All tanks exceeding 16 feet in diameter, exposed pits, and ponds shall be screened, netted, covered, or otherwise rendered non-hazardous to migratory birds. Drilling and workover pits are exempt from the netting requirement. Immediately after cessation of these operations such pits shall have any visible or measurable layer of oil removed from the surface. Upon written application, the division may grant an exception to screening, netting, or covering requirements upon a showing that an alternative method will adequately protect migratory birds or that the tank or pit is not hazardous to migratory birds.

(g) Unlined pits.

(i) General prohibition. After June 30, 2005 use of, or discharge into, any unlined pit that has not been previously permitted pursuant to Section 711of 19.15.9 NMAC or water quality control commission regulations is prohibited, except as otherwise provided in Section 50 of 19.15.2 NMAC. After April 15, 2004, construction of unlined pits is prohibited unless otherwise provided in Section 50 of 19.15.2 NMAC.

(ii) Unlined pits exempted by previous order. An operator of an unlined pit existing on April 15, 2004 for which a previous exemption was received after hearing as allowed pursuant to commission Orders No. R-3221 through R-3221D inclusive, shall not be required to reapply for an exemption pursuant to Subparagraph (g), Paragraph (2), Subsection C of 19.15.2.50 NMAC provided the operator notifies the division, no later than April 15, 2004, of the existence of each unlined pit it believes is exempted by order, the location of the pit, and the nature and amount of any discharge into the pit. Such order shall constitute a permit for the purpose of Subparagraph (g), Paragraph (2), Subsection C of 19.15.2.50 NMAC. The division may terminate any such permit in accordance with Paragraph (2), Subsection C of 19.15.2.50 NMAC. Any pit constructed after April 15,2004 shall comply with the permitting, lining and other requirements of Section 50 of 19.15.2 NMAC, notwithstanding any previous order to the contrary.

(iii) Unlined pits shall be allowed in the following areas provided that the operator has submitted, and the division has approved, an application for permit as provided in Section 50 of 19.15.2 NMAC, and provided that the pit site is not located in fresh water-bearing alluvium or in a wellhead protection area:

TOWNSHIP 19 SOUTH, RANGE 30 EAST, NMPM Sections 8 through 36;
TOWNSHIP 20 SOUTH, RANGE 30 EAST, NMPM Sections 1 through 36;
TOWNSHIP 20 SOUTH, RANGE 31 EAST, NMPM Sections 1 through 36;
TOWNSHIP 20 SOUTH, RANGE 32 EAST, NMPM Sections 4 through 9, Sections 16 through 21; and Sections 28 through 33;
TOWNSHIP 21 SOUTH, RANGE 29 EAST, NMPM Sections 1 through 36;
TOWNSHIP 21 SOUTH, RANGE 30 EAST, NMPM Sections 1 through 36;
TOWNSHIP 21 SOUTH, RANGE 31 EAST, NMPM Sections 1 through 36;
TOWNSHIP 22 SOUTH, RANGE 29 EAST, NMPM Sections 1 through 36;
TOWNSHIP 22 SOUTH, RANGE 30 EAST, NMPM Sections 1 through 36;
TOWNSHIP 23 SOUTH, RANGE 29 EAST, NMPM Sections 1 through 3, Sections 10 through 15, Sections 22 through 27, and Sections 34 through 36;
TOWNSHIP 23 SOUTH, RANGE 30 EAST, NMPM Sections 1 through 19; and that area within San Juan, Rio Arriba, Sandoval, and McKinley Counties that is outside the valleys of the San Juan, Animas, Rio Grande, and La Plata Rivers, which are bounded by the topographic lines on either side of the rivers that are 100 vertical feet above the river channels, measured perpendicularly to the river channels, andis outside those areas that lie within 50 vertical feet, measured perpendicularly to the drainage channel, of all perennial and ephemeral creeks, canyons, washes, arroyos, and draws, and is outside the areas between the above-named rivers and the Highland Park Ditch, Hillside Thomas Ditch, Cunningham Ditch, Farmers Ditch, Halford Independent Ditch, Citizens Ditch, or Hammond Ditch, provided that no protectable ground water is present or if present, will not be adversely affected; or any area where the discharge into the pit meets New Mexico Water Quality Control Commission ground water standards.

(3) Special requirements for below-grade tanks. All below-grade tanks constructed after April 15, 2004 shall be constructed with secondary containment and leak detection. The operator of any below-grade tank constructed prior to April 15, 2004 shall test its integrity annually and shall promptly repair or replace any below-grade tank that does not demonstrate integrity. Any such below-grade tank shall be equipped with leak detection at the time of any major repair.

(4) Sumps. Operators shall test the integrity of all sumps annually, and shall promptly repair or replace any sump that does not demonstrate integrity. Sumps that can be removed from their emplacements may be tested by visual inspection. Other sumps shall be tested by appropriate mechanical means.

D. Emergency actions.

(1) Permit not required. In an emergency an operator may construct a pit without a permit to contain fluids, solids, or wastes if an immediate danger to fresh water, public health, or the environment exists.

(2) Construction standards. A pit constructed in an emergency shall be constructed, to the extent possible given the emergency, in a manner that is consistent with the requirements of Section 50 of 19.15.2 NMAC and that prevents the contamination of fresh water, and protects public health and the environment.

(3) Notice. The operator shall notify the appropriate district office as soon as possible (if possible before construction begins) of the need for construction of such a pit.

(4) Use and duration. The pit may be used only for the duration of the emergency. If the emergency lasts more than forty-eight (48) hours, the operator must seek approval from the division for continued use of the pit. All fluids, solids or wastes must be removed within 24 hours after cessation of use unless the division extends that time period.

(5) "Emergency pits." Subsection D, of 19.15.2.50 NMAC shall not be construed to allow construction or use of so-called "emergency pits," which are pits constructed as a precautionary matter to contain a spill in the event of a release. Construction or use of any such pit shall require a permit issued pursuant to Section 50 of 19.15.2 NMAC unless the pit is described in a spill prevention, control and countermeasure (SPCC) plan required by the United States environmental protection agency, all fluids are removed from the pit within 24 hours, and the operator has filed a notice of the location of the pit with the division.

E. Drilling fluids and drill cuttings. Drilling fluids and drill cuttings shall either be recycled or be disposed of as approved by the division and in a manner to prevent the contamination of fresh water and protect public health and the environment. The operator shall describe the proposed disposal method in the application for permit to drill or the sundry notices and reports on wells.

F. Closure and restoration.

(1) Closure. Except as otherwise specified in Section 50 of 19.15.2 NMAC, a pit or below-grade tank shall be properly closed within six months after cessation of use. As a condition of a permit, the division may require the operator to file a detailed closure plan before closure may commence. The division for good cause shown may grant a six-month extension of time to accomplish closure. Upon completion of closure a closure report (form C- 144), or sundry notices and reports on wells shall be submitted to the division. Where the pit's contents will likely migrate and cause ground water or surface water to exceed water quality control commission standards, the pit's contents and the liner shall be removed and disposed of in a manner approved by the division.

(2) Surface restoration. Within one year of the completion of closure of a pit, the operator shall contour the surface where the pit was located to prevent erosion and ponding of rainwater.

G. Exemptions; additional conditions.

(1) The division may attach additional conditions to any permit upon a finding that such conditions are necessary to prevent the contamination of fresh water, or to protect public health or the environment.

(2) The division may grant an exemption from any requirement if the operator demonstrates that the granting of such exemption will not endanger fresh water, public health or the environment. The division may revoke any such exemption after notice to the operator of the pit and opportunity for a hearing if the division determines that such action is necessary to prevent the contamination of fresh water, or to protect public health or the environment.

(3) Exemptions may be granted administratively without hearing provided that the operator gives notice to the surface owner of record where the pit is to be located and to such other persons as the division may direct and (a) written waivers are obtained from all persons to whom notice is required, or (b) no objection is received by the division within 30 days of the time notice is given. If any objection is received and the director determines that the objection has technical merit or that there is significant public interest the director shall set the application for hearing. The director, however, may set any application for hearing.

[19.15.2.50 NMAC - N, 02/13/04]

HISTORY OF 19.15.2 NMAC:

Pre-NMAC History: The material in this part was derived from that previously filed with the state records center and archives:
OCC 67-10, Commission Order No. R-3221, Case No. 3551, filed 5/2/67.
OCC 67-10, Amendment No. 1, Commission Order No. R-3221-A, Case No. 3644, filed 8/31/67.
OCC 67-10, Amendment No. 2, Commission Order No. R-3221-B, Case No. 3806, filed 7/31/68.
OCC 67-10, Amendment No. 2, Commission Order No. R-3221-B-1, Case No. 3806, filed 8/20/68.
Order No. R-7940-C, Special Rules and Regulations for the Disposal of Oil and Natural Gas Wastes in the Vulnerable Area in San Juan, McKinley, Rio Arriba and Sandoval Counties, New Mexico, filed 2/10/93.

History of Repealed Material:
OCC 67-10, Commission Order No. R-3221, Case No. 3551 (filed 5/2/67), repealed 02/13/04.
Order No. R-7940-C, Special Rules and Regulations for the Disposal of Oil and Natural Gas Wastes in the Vulnerable Area in San Juan, McKinley, Rio Arriba and Sandoval Counties, New Mexico (filed 2/10/93), repealed 02/13/04.

Other History:
OCC 67-10, Commission Order No. R-3221, Case No. 3551 (filed 5/2/67) and Order No. R-7940-C, Special Rules and Regulations for the Disposal of Oil and Natural Gas Wastes in the Vulnerable Area in San Juan, McKinley, Rio Arriba and Sandoval Counties, New Mexico, (filed 2/10/93) replaced by 19.15.2 NMAC, General Operating Practices, Wastes Arising from Exploration and Production, effective 02/13/04.

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 3 DRILLING

19.15.3.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2-1-96; 19.15.3.1 NMAC - Rn, 19 NMAC 15.C.1, 11-15-01]

19.15.3.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.3.2 NMAC - Rn, 19 NMAC 15.C.2, 11-15-01]

19.15.3.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.3.3 NMAC - Rn, 19 NMAC 15.C.3, 11-15-01]

19.15.3.4 DURATION: Permanent.
[2-1-96; 19.15.3.4 NMAC - Rn, 19 NMAC 15.C.4, 11-15-01]

19.15.3.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.3.5 NMAC - Rn, 19 NMAC 15.C.5, 11-15-01]

19.15.3.6 OBJECTIVE: To regulate the drilling of oil and gas wells within the State of New Mexico to enable the Oil Conservation Division to fulfill its statutory mandates under the Oil & Gas Act.
[2-1-96; 19.15.3.6 NMAC - Rn, 19 NMAC 15.C.6, 11-15-01]

19.15.3.7 DEFINITIONS: [Reserved].

19.15.3.8-100 [RESERVED].

19.15.3.101 PLUGGING BOND:

A. Any person, firm, corporation, or association who has drilled or acquired, is drilling, or proposes to drill or acquire any oil, gas, or service well on privately owned or state owned lands within this state shall furnish to the division, and obtain approval thereof, a surety bond running to the State of New Mexico, in a form prescribed by the division, and conditioned that the well be plugged and abandoned in compliance with the rules and regulations of the division. Such bond may be a one-well plugging bond or a blanket plugging bond. All bonds shall be executed by a responsible surety company authorized to do business in the State of New Mexico.

B. Blanket plugging bonds shall be in the amount of fifty thousand dollars ($50,000) conditioned as above provided, covering all oil, gas, or service wells drilled, acquired or operated in this state by the principal on the bond.

C. One-well plugging bonds shall be in the amounts stated below in accordance with the depth and location of the well:

(1) Chaves, Eddy, Lea, McKinley, Rio Arriba, Roosevelt, Sandoval, and San Juan Counties, New Mexico:

Projected Depth of Proposed Well or Actual Depth of Existing Well	Amount of Bond
Less than 5,000 feet	$ 5,000
5,000 feet to 10,000 feet	$ 7,500

More than 10,000 feet	$ 10,000

(2) All other Counties in the State:

Projected Depth of Proposed Well or Actual Depth of Existing Well	Amount of Bond
Less than 5,000 feet	$ 7,500
5,000 feet to 10,000 feet	$ 10,000
More than 10,000 feet	$ 12,500

D. Revised plans for an actively drilling well may be approved by the appropriate District Office of the division for drilling as much as 500 feet deeper than the normal maximum depth allowed on the well's bond. Any well to be drilled more than 500 feet deeper than the normal depth bracket must be covered by a new bond in the amount prescribed for the deeper depth bracket.

E. The bond requirement for any intentionally deviated well shall be determined by the well's measured depth, and not its true vertical depth.

F. A cash bond may be accepted by the division pursuant to the conditions set forth hereinafter. Cash representing the full amount of the bond shall be deposited by the operator in an account in a federally-insured financial institution located within the State of New Mexico, such account to be held in trust for the division. Both one well and blanket cash bonds shall be in the amount specified for surety bonds. A document, approved by the division, evidencing the terms and conditions of the cash bond shall be executed by an authorized representative of the operator and the depository institution and filed with the division prior to the effective date of the bond. No cash bond will be authorized by the Director and no wells may be drilled or acquired under a blanket cash bond unless the operator/applicant is in good standing with the division. If the financial status or reliability of the applicant is unknown to the Director he may require the filing of a financial statement or such other information as may be necessary to evaluate the ability of the applicant/operator to fulfill the conditions of the bond.

G. From time to time any accrued interest over and above the face amount of the bond may be paid to the operator. Upon satisfactory plugging by the operator of any well(s) covered by a cash bond, the Director shall issue an order authorizing the release of said bond.

H. Any bond required by Section 101 of 19.15.3 NMAC is a plugging bond, not a drilling bond, and shall endure until any well drilled or acquired under such bond has been plugged and abandoned and such plugging and abandonment has been approved by the division, or has been covered by another bond approved by the division.

I. Transfer of a property does not of itself release a bond. In the event of transfer of ownership of a well, the appropriate form, C-103 or C-104, properly executed, shall be filed with the District Office of the division in accordance with Rule 1103 or Rule 1104 by the new owner of the well. The District Office may approve the transfer providing that a new one-well bond covering the well or a blanket bond in the name of the new owner has been approved by the Santa Fe office of the division.

J. Upon approval of the bond and the Form C-103 or C-104, the transferror is released of plugging responsibility for the well, and upon request, the original bond will be released. No blanket bond will be released, however, until all wells covered by the bond have been plugged and abandoned or transferred in accordance with the provisions of Section 101 of 19.15.3 NMAC.

K. All bonds shall be filed with the Santa Fe office of the division, and approval of such bonds, as well as releases thereof, obtained from said office.

L. All bonds required by these rules shall be conditioned for well plugging and location cleanup only, and not to secure payment for damages to livestock, range, water, crops, tangible improvements, nor any other purpose.

M. Upon failure of the operator to properly plug and abandon the well(s) covered by a bond, the division shall give notice to the operator and surety, if applicable, and hold a hearing as to whether the well(s) should be plugged in accordance with a division-approved plugging program. If, at the hearing, it is determined that the operator has failed to plug the well as provided for in the bond conditions and division rules, the Division director shall issue an order directing the well(s) to be plugged in a time certain. Such an order may also direct the forfeiture of the bond upon the failure or refusal of the operator, surety, or other responsible party to properly plug the well(s). If the proceeds of the bond(s) are not sufficient to cover all of the costs incurred by the division in plugging the

well(s) covered by the bond, the division shall take such legal action as is necessary to recover such additional costs. Any monies recovered through bond forfeiture or legal actions shall be placed in the Oil & Gas Reclamation Fund.
[1-1-50, 6-17-77, 6-5-86, 2-1-96; 19.15.3.101 NMAC - Rn, 19 NMAC 15.C.101, 11-15-01]

19.15.3.102 NOTICE OF INTENTION TO DRILL:

A. Prior to the commencement of operations, notice shall be delivered to the division of intention to drill any well for oil or gas or for injection purposes and approval obtained on Form C-101. A copy of the approved Form C-101 must be kept at the well site during drilling operations.

B. No permit shall be approved for the drilling of any well within the corporate limits of any city, town, or village of this state unless notice of intention to drill such well has been given to the duly constituted governing body of such city, town or village or its duly authorized agent. Evidence of such notification shall accompany the application for a permit to drill (Form C-101).

C. When filing a permit to drill in any quarter-quarter section containing an existing well or wells, the applicant shall concurrently file a plat or other acceptable document locating and identifying such well(s) and a statement that the operator(s) of such well(s) have been furnished a copy of the permit.
[1-1-50, 5-22-73…2-1-96; 19.15.3.102 NMAC - Rn, 19 NMAC 15.C.102, 11-15-01]

19.15.3.103 SIGN ON WELLS:

A. All wells and related facilities regulated by the division shall be identified by a sign, which sign shall remain in place until the well is plugged and abandoned and the related facilities are closed.

B. For drilling wells, the sign shall be posted on the derrick or not more than 20 feet from the well. C. The sign shall be of durable construction and the lettering shall be legible and large enough to be read under normal conditions at a distance of 50 feet.

D. The wells on each lease or property shall be numbered in non-repetitive, logical and distinctive sequence.

E. An operator will have 90 days from the effective date of an operator name change to change the operator name on the well sign unless an extension of time, for good cause shown along with a schedule for making the changes, is granted.

F. Each sign shall show the:

(1) number of well;

(2) name of property;

(3) name of operator;

(4) location by footage, quarter-quarter section, township and range (or Unit Letter can be substituted for the quarter-quarter section); and

(5) API number.

[1-1-50, 2-1-96, 6-30-97, 3-31-00; 19.15.3.103 NMAC - Rn, 19 NMAC 15.C.103, 11-15-01; A, 01-31-03]

19.15.3.104 WELL SPACING AND LOCATION:

A. Classification Of Wells: Wildcat And Development Wells

(1) Wildcat Well

(a) In San Juan, Rio Arriba, Sandoval, and McKinley Counties a wildcat well is any well to be drilled the spacing unit of which is a distance of two miles or more from:

(i) the outer boundary of any defined pool that has produced oil or gas from the formation to which the well is projected to be drilled; and

(ii) any well that has produced oil or gas from the formation to which the proposed well is projected to be drilled.

(b) In all counties except San Juan, Rio Arriba, Sandoval, and McKinley, a wildcat well is any well to be drilled the spacing unit of which is a distance of one mile or more from:

(i) the outer boundary of any defined pool that has produced oil or gas from the formation to which the well is projected to be drilled; and

(ii) any well that has produced oil or gas from the formation to which the proposed well is projected.

(2) Development Well

(a) Any well that is not a wildcat well shall be classified as a development well for the nearest pool that has produced oil or gas from the formation to which the well is projected to be drilled. Such development well shall be spaced, drilled, operated, and produced in accordance with the rules in effect for that pool, provided the well is completed in that pool.

(b) Any well classified as a development well for a pool but completed in a producing formation not included in the vertical limits of that pool shall be operated and produced in accordance with the rules in effect for the nearest pool that is producing from that formation within the two miles in San Juan, Rio Arriba, Sandoval, and McKinley Counties or within one mile everywhere else. If there is no designated pool for that producing formation within the two miles in San Juan, Rio Arriba, Sandoval, and McKinley Counties or within one mile everywhere else, the well shall be re-classified as a wildcat well.

B. Oil Well Acreage And Well Location Requirements

(1) Any wildcat well that is projected to be drilled as an oil well to a formation and in an area that in the opinion of the division may reasonably be presumed to be productive of oil rather than gas and each development well for a defined oil pool, unless otherwise provided in special pool orders, shall be located on a spacing unit consisting of approximately 40 contiguous surface acres substantially in the form of a square which is a legal subdivision of the U.S. Public Land Surveys, which is a governmental quarter-quarter section or lot, and shall be located no closer than 330 feet to any boundary of such unit. Only those 40-acre spacing units committed to active secondary recovery projects shall be permitted more than four wells.

(2) If a well drilled as an oil well is completed as a gas well but does not conform to the applicable gas well location rules, the operator must apply for administrative approval for a non-standard location before the well can produce. The Director may set any such application for hearing.

C. Gas Wells Acreage And Well Location Requirements. Any wildcat well that is projected to be drilled as a gas well to a formation and in an area that in the opinion of the division may reasonably be presumed to be productive of gas rather than oil and each development well for a defined gas pool, unless otherwise provided in special pool orders, shall be spaced and located as follows:

(1) 640-Acre Spacing applies to any deep gas well in Rio Arriba, San Juan, Sandoval or McKinley County that is projected to be drilled to a gas producing formation older than the Dakota formation or is a development well within a gas pool created and defined by the division after June 1, 1997 in a formation older than the Dakota formation, which formation or pool is located within the surface outcrop of the Pictured Cliffs formation (i.e., the San Juan Basin). Such well shall be located on a spacing unit consisting of 640 contiguous surface acres, more or less, substantially in the form of a square which is a section and legal subdivision of the U.S. Public Land Surveys and shall be located no closer than: 1200 feet to any outer boundary of the spacing unit, 130 feet to any quarter section line, and 10 feet to any quarter-quarter section line or subdivision inner boundary.

(2) 320-Acre Spacing applies to any deep gas well in Lea, Chaves, Eddy or Roosevelt County, defined as a well that is projected to be drilled to a gas producing formation or is within a defined gas pool in the Wolfcamp or an older formation. Such well shall be located on a spacing unit consisting of 320 surface contiguous acres, more or less, comprising any two contiguous quarter sections of a single section that is a legal subdivision of the U.S. Public Land Surveys provided that:

(a) the initial well on a 320-acre unit is located no closer than 660 feet to the outer boundary of the quarter section on which the well is located and no closer than 10 feet to any quarter-quarter section line or subdivision inner boundary;

(b) only one infill well on a 320-acre unit shall be allowed provided that the well is located in the quarter section of the 320-acre unit not containing the initial well and is no closer than 660 feet to the outer boundary of the quarter section and no closer than 10 feet to any quarter-quarter section line or subdivision inner boundary; and

(c) the division-designated operator for the infill well is the same operator currently designated by the division for the initial well.

(3) 160-Acre Spacing applies to any other gas well not covered above. Such well shall be located in a spacing unit consisting of 160 surface contiguous acres, more or less, substantially in the form of a square which is a quarter section and a legal subdivision of the U.S. Public Land Surveys and shall be located no closer than 660 feet to any outer boundary of such unit and no closer than 10 feet to any quarter-quarter section or subdivision inner boundary.

D. Acreage Assignment

(1) Well Tests and Classification. It is the responsibility of the operator of any wildcat or development gas well to which more than 40 acres has been dedicated to conduct a potential test within 30 days following completion of the well and to file the test with the division within 10 days following completion of the test. (See Rule 401)

(a) The date of completion for a gas well is the date of the conclusion of active completion work on the well.

(b) If the division determines that a well should not be classified as a gas well, the division will reduce the acreage dedicated to the well to the standard acreage for an oil well.

Failure of the operator to file the test within the specified time will also subject the well to such acreage reduction.

(2) Non-Standard Spacing Units. Any well that does not have the required amount of acreage dedicated to it for the pool or formation in which it is completed may not be produced until a standard spacing unit for the well has been formed and dedicated or until a non-standard spacing unit has been approved.

(a) Division District Offices have the authority to approve non-standard spacing units without notice when the unorthodox size or shape is necessitated by a variation in the legal subdivision of the U. S. Public Land Surveys and/or consists of an entire governmental section and the non-standard spacing unit is not less than 70% or more than 130% of a standard spacing unit. The operator must obtain division approval of division Form C-102 showing the proposed non-standard spacing unit and the acreage contained therein.

(b) The Director may grant administrative approval to non-standard spacing units after notice and opportunity for hearing when an application has been filed and the unorthodox size or shape is necessitated by a variation in the legal subdivision of the U.S. Public Land Surveys or the following facts exist:

(i) the non-standard spacing unit consists of: (A) a single quarter-quarter section or lot or (B) quarter-quarter sections or lots joined by a common side; and

(ii) the non-standard spacing unit lies wholly within: a single quarter section if the well is completed in a pool or formation for which 40, 80, or 160 acres is the standard spacing unit size; a single half section if the well is completed in a pool or formation for which 320 acres is the standard spacing unit size; or a single section if the well is completed in a pool or formation for which 640 acres is the standard spacing unit size.

(c) Applications for administrative approval of non-standard spacing units pursuant to Subsection D, Paragraph (2), Subparagraph (b) of 19.15.3.104 NMAC shall be submitted to the division's Santa Fe Office and accompanied by: (i) a plat showing the spacing unit and an applicable standard spacing unit for that pool or formation, the proposed well dedications and all adjoining spacing units; (ii) a list of affected persons as defined in Rule 1207.A(2); and (iii) a statement discussing the reasons for the formation of the non-standard spacing unit.

(d) The applicant shall submit a statement attesting that the applicant, on or before the date the application was submitted to the division, sent notification to the affected persons by submitting a copy of the application, including a copy of the plat described in Subparagraph (c) above, by certified mail, return receipt requested, advising them that if they have an objection it must be filed in writing within 20 days from the date the division receives the application. The Director may approve the application upon receipt of waivers from all the notified persons or if no person has filed an objection within the 20-day period.

(e) The Director may set for hearing any application for administrative approval.

(3) Number of Wells Per Spacing Unit. Exceptions to the provisions of statewide rules or special pool orders concerning the number of wells allowed per spacing unit may be permitted by the Director only after notice and opportunity for hearing. Notice shall be given to those affected persons defined in Rule 1207.A.(2).

E. Forms - Form C-102 "Well Location and Acreage Dedication Plat" for any well shall designate the exact legal subdivision dedicated to the well. Form C-101 "Application for Permit to Drill, Deepen, or Plug Back" will not be approved without an acreage designation on Form C-102.

F. Unorthodox Locations

(1) Well locations for producing wells and/or injection wells that are unorthodox based on the requirements of Subsection B above and are necessary for an efficient production and injection pattern within a secondary recovery, tertiary recovery, or pressure maintenance project are hereby authorized, provided that the unorthodox location within the project is no closer than the required minimum distance to the outer boundary of the lease or unitized area, and no closer than 10 feet to any quarter-quarter section line or subdivision inner boundary. These locations shall only require such prior approvals as are necessary for an unorthodox location.

(2) The Director may grant an exception to the well location requirements of Subsections B and C above or special pool orders after notice and opportunity for hearing when the exception is necessary to prevent waste or protect correlative rights.

(3) Applications for administrative approval pursuant to Subsection F, Paragraph (2) above shall be submitted to the division's Santa Fe Office accompanied by (a) a plat showing the spacing unit, the proposed unorthodox well location and the adjoining spacing units and wells; (b) a list of affected persons as defined in Rule 1207.A(2); and (c) information evidencing the need for the exception. Notice shall be given as required in Rule 1207.A(2).

(4) The applicant shall submit a statement attesting that applicant, on or before the date that the application was submitted to the division, sent notification to the affected persons by submitting a copy of the application, including a copy of the plat described in Subsection F, Paragraph (3) above, by certified mail, return receipt requested, advising them that if they have an objection it must be filed in writing within 20 days from the date the division receives the application. The Director may approve the unorthodox location upon receipt of waivers from all the affected persons or if no affected person has filed an objection within the 20-day period.

(5) The Director may set for hearing any application for administrative approval of an unorthodox location.

(6) Whenever an unorthodox location is approved, the division may order any action necessary to offset any advantage of the unorthodox location.

G. Effect On Allowables

(1) If the drilling tract is within a prorated/allocated oil pool or is subsequently placed within such pool and the drilling tract consists of less than 39½ acres or more than 40½ acres, the top unit allowable for the well shall be increased or decreased in the proportion that the number of acres in the drilling tract bears to 40.

(2) If the drilling tract is within a prorated/allocated gas pool or is subsequently placed within such pool and the drilling tract consists of less than 158 acres or more than 162 acres in 160-acre pools, or less than 316 acres or more than 324 acres in 320-acre pools, or less than 632 acres or more than 648 acres in 640-acre pools, the top allowable for the well shall be decreased or increased in the proportion that the number of acres in the drilling tract bears to a standard spacing unit for the pool.

(3) In computing acreage under Paragraphs (1) and (2) above, less than ½ acre shall not be counted but ½ acre or more shall count as one acre.

(4) The provisions of Paragraphs (1) and (2) above shall apply only to wells completed after January 1, 1950.

H. Division-Initiated Exceptions - In order to prevent waste, the division may, after hearing, set different spacing requirements and require different acreage for drilling tracts in any defined oil or gas pool.

I. Pooling Or Communitization Of Small Oil Lots

(1) The division may approve the pooling or communitization of fractional oil lots of 20.49 acres or less with a contiguous oil spacing unit when the ownership is common and the tracts are part of the same lease with the same royalty interests if the following requirements are satisfied:

(a) Applications for administrative approval shall be submitted to the division's Santa Fe Office and accompanied by: (i) a plat showing the dimensions and acreage involved, the ownership of such acreage, the location of all existing and proposed wells and all adjoining spacing units; (ii) a list of affected persons as defined in Rule 1207.A(2); and (iii) a statement discussing the reasons for the pooling or communitization.

(b) The applicant shall submit a statement attesting that the applicant, on or before the date the application was submitted to the division, sent notification to the affected persons by submitting a copy of the application, including a copy of the plat described in (a) above, by certified mail, return receipt requested, advising them that if they have an objection it must be filed in writing within 20 days from the date the division receives the application. The Director may approve the application upon receipt of waivers from all the notified persons or if no person has filed an objection within the 20-day period.

(c) The Director may set for hearing any application for administrative approval.

(2) The division may consider the common ownership and common lease requirements met if the applicant furnishes with the application a copy of an executed pooling agreement communitizing the tracts involved.
[1-1-50…2-1-96; A, 6-30-97; A, 8-31-99; 19.15.3.104 NMAC - Rn, 19 NMAC 15.C.104, 11-15-01]

19.15.3.105 [RESERVED].
[1-1-50, 9-1-89…2-1-96; 19.15.3.105 NMAC - Rn, 19 NMAC 15.C.105, 11-15-01; Repealed, 5-28-04]

19.15.3.106 SEALING OFF STRATA:

A. During the drilling of any oil well, injection well or any other service well, all oil, gas, and water strata above the producing and/or injection horizon shall be sealed or separated in order to prevent their contents from passing into other strata.

B. All fresh waters and waters of present or probable value for domestic, commercial, or stock purposes shall be confined to their respective strata and shall be adequately protected by methods approved by the division. Special precautions by methods satisfactory to the division shall be taken in drilling and abandoning wells to guard against any loss of artesian water from the strata in which it occurs, and the contamination of artesian water by objectionable water, oil, or gas.

C. All water shall be shut off and excluded from the various oil- and gas-bearing strata which are penetrated. Water shut-offs shall ordinarily be made by cementing casing.
[1-1-50, 3-1-91…2-1-96; 19.15.3.106 NMAC - Rn, 19 NMAC 15.C.106, 11-15-01]

19.15.3.107 CASING AND TUBING REQUIREMENTS:

A. Any well drilled for oil or natural gas shall be equipped with such surface and intermediate casing strings and cement as may be necessary to effectively seal off and isolate all water-, oil-, and gas-bearing strata and other strata encountered in the well down to the casing point. In addition thereto, any well completed for the production of oil or natural gas shall be equipped with a string of properly cemented production casing at sufficient depth to ensure protection of oil- and gas-bearing strata encountered in the well, including the one(s) to be produced.

B. Sufficient cement shall be used on surface casing to fill the annular space behind the casing to the top of the hole, provided however, that authorized field personnel of the division may, at their discretion, allow exceptions to the foregoing requirement when known conditions in a given area render compliance impracticable.

C. All cementing shall be by pump and plug method unless some other method is expressly authorized by the division.

D. All cementing shall be with conventional-type hard-setting cements to which such additives (lighteners, densifiers, extenders, accelerators, retarders, etc.) have been added to suit conditions in the well.

E. Authorized field personnel of the division may, when conditions warrant, allow exceptions to the above paragraph and permit the use of oil-base casing packing material in lieu of hard-setting cements on intermediate and production casing strings; provided however, that when such materials are used on the intermediate casing string, conventional-type hard-setting cements shall be placed throughout all oil- and gas-bearing zones and throughout at least the lowermost 300 feet of the intermediate casing string. When such materials are used on the production casing string, conventional-type hard-setting cements shall be placed throughout all oil- and gas-bearing zones and shall extend upward a minimum of 500 feet above the uppermost perforation or, in the case of an open-hole completion, 500 feet above the production casing shoe.

F. All casing strings shall be tested and proved satisfactory as provided in Subsection I. below.

G. After cementing, but before commencing tests required in Subsection I. below, all casing strings shall stand cemented in accordance with Option 1 <u>or</u> 2 below. Regardless of which option is taken, the casing shall remain stationary and under pressure for at least eight hours after the cement has been placed. Casing shall be "under pressure" if some acceptable means of holding pressure is used or if one or more float valves are employed to hold the cement in place.

(1) Option 1 Allow all casing strings to stand cemented a minimum of eighteen (18) hours prior to commencing tests. Operators using this option shall report on Form C-103 the actual time the cement was in place before initiating tests.

(2) Option 2 (May be used in the counties of San Juan, Rio Arriba, McKinley, Sandoval, Lea, Eddy, Chaves, and Roosevelt only.) Allow all casing strings to stand cemented until the cement has reached a compressive strength of at least 500 pounds per square inch in the "zone of interest" before commencing tests, provided however, that no tests shall be commenced until the cement has been in place for at least eight (8) hours.

(a) The "zone of interest" for surface and intermediate casing strings shall be the bottom 20 percent of the casing string, but shall be no more than 1000 feet nor less than 300 feet of the bottom-part of the casing unless the casing is set at less than 300 feet. The "zone of interest" for production casing strings shall include the interval or intervals where immediate completion is contemplated.

(b) To determine that a minimum compressive strength of 500 pounds per square inch has been attained, operators shall use the typical performance data for the particular cement mix used in the well, at the minimum temperature indicated for the zone of interest by Figure 107-A, Temperature Gradient Curves. Typical performance data used shall be that data furnished by the cement manufacturer or by a competent materials testing agency, as determined in accordance with the latest edition of API Code RP 10 B "Recommended Practice for Testing Oil-Well Cements."

(See Temperature Gradient - Page 17A)

H. Operators using the compressive strength criterion (Option 2) shall report the following information on Form C-103:

(1) Volume of cement slurry (cubic feet) and brand name of cement and additives, percent additives used, and sequence of placement if more than one type cement slurry is used.

(2) Approximate temperature of cement slurry when mixed.

(3) Estimated minimum formation temperature in zone of interest.

(4) Estimate of cement strength at time of casing test.

(5) Actual time cement in place prior to starting test.

I. All casing strings except conductor pipe shall be tested after cementing and before commencing any other operations on the well. Form C-103 shall be filed for each casing string reporting the grade and weight of pipe used. In the case of combination strings utilizing pipe of varied grades or weights, the footage of each grade and weight used shall be reported. The results of the casing test, including actual pressure held on pipe and the pressure drop observed shall also be reported on the same Form C-103.

(1) Casing strings in wells drilled with rotary tools shall be pressure tested. Minimum casing test pressure shall be approximately one-third of the manufacturer's rated internal yield pressure except that the test pressure shall not be less than 600 pounds per square inch and need not be greater than 1500 pounds per square inch. In cases where combination strings are involved, the above test pressure shall apply to the lowest pressure rated casing used. Test pressures shall be applied for a period of 30 minutes. If a drop of more than 10 percent of the test pressure should occur, the casing shall be considered defective and corrective measures shall be applied.

(2) Casing strings in wells drilled with cable tools may be tested as outlined in Subsection I, Paragraph (1) above, or by bailing the well dry in which case the hole must remain satisfactorily dry for a period of at least one (1) hour before commencing any further operations on the well.

J. Well Tubing Requirements

(1) All flowing oil wells equipped with casing larger in size than 2 7/8-inch OD shall be tubed.

(2) All gas wells equipped with casing larger in size than 3 ½-inch OD shall be tubed.

(3) Tubing shall be set as near the bottom as practical and tubing perforations shall not be more than 250 feet above top of pay zone.

(4) The supervisor of the appropriate division district office, upon application, may grant exceptions to these requirements, provided waste will not be caused.

(5) The supervisor may request that an application be reviewed by the Director. The operator shall

submit information and give notice as requested by the Director. Unprotested applications may be approved after 20 days of receipt of the application and supporting information. If the application is protested, or the Director so decides, the application shall be set for hearing.

K. Repealed.

[1-1-50, 5-5-58, 6-26-59, 2-29-64, 2-1-96, 2-26-99; 19.15.3.107 NMAC - Rn, 19 NMAC 15.C.107, 11-15-01]

19.15.3.108 DEFECTIVE CASING OR CEMENTING:

If any well appears to have a defective casing program or faultily cemented or corroded casing which will permit or may create underground waste or contamination of fresh waters, the operator shall give written notice to the division within five (5) working days and proceed with diligence to use the appropriate method and means to eliminate such hazard. If such hazard of waste or contamination of fresh water cannot be eliminated, the well shall be properly plugged and abandoned.

[1-1-50...2-1-96; 19.15.3.108 NMAC - Rn, 19 NMAC 15.C.108, 11-15-01]

19.15.3.109 BLOWOUT PREVENTION: (See Section 114, Subsection B of 19.15.3 NMAC also)

A. Blowout preventers shall be installed and maintained in good working order on all drilling rigs operating in areas of known high pressures at or above the projected depth of the well and in all areas where pressures which will be encountered are unknown, and on all workover rigs working on wells in which high pressures are known to exist.

B. Blowout preventers shall be installed and maintained in good working order on all drilling rigs and workover rigs operating within the corporate limits of any city, town, or village, or within 1320 feet of habitation, school, or church, wherever located.

C. All operators, when filing Form C-101, Application for Permit to Drill, Deepen, or Plug Back, or Form C-103, Sundry Notices, for any operation requiring blowout prevention equipment in accordance with Subsections A and B above, shall submit a proposed blowout prevention program for the well. The program as submitted may be modified by the district supervisor if, in his judgement, such modification is necessary.

[10-22-74...2-1-96; 19.15.3.109 NMAC - Rn, 19 NMAC 15.C.109, 11-15-01]

19.15.3.110 PULLING OUTSIDE STRINGS OF CASING:

In pulling outside strings of casing from any oil or gas well, the space outside the casing left in the hole shall be kept and left full of mud-laden fluid or cement of adequate specific gravity to seal off all fresh and salt water strata and any strata bearing oil or gas not producing.

[1-1-50...2-1-96; 19.15.3.110 NMAC - Rn, 19 NMAC 15.C.110, 11-15-01]

19.15.3.111 DEVIATION TESTS AND DIRECTIONAL WELLS:

A. Definitions - the following definitions shall apply to Section 111 of 19.15.3 NMAC only:

(1) Azimuth - the deviation in the horizontal plane of a wellbore expressed in terms of compass degrees.

(2) Deviated Well - any wellbore which is intentionally deviated from vertical but not with an intentional azimuth. Any deviated well is subject to Section 111, Subsection B of 19.15.3 NMAC.

(3) Directional Well - a wellbore which is intentionally deviated from vertical with an intentional azimuth. Any directional well is subject to Section 111, Subsection C of 19.15.3 NMAC.

(4) Kick-off Point - the point at which the wellbore is intentionally deviated from vertical.

(5) Lateral - any portion of a wellbore past the point where the wellbore has been intentionally departed from the vertical.

(6) Penetration Point - the point where the wellbore penetrates the top of the pool from which it is intended to produce.

(7) Producing Area - the area that lies within a window formed by plotting the measured distance from the North, South, East and West boundaries of a project area, inside of which a vertical wellbore can be drilled and produced in conformity with the setback requirements from the outer boundary of a standard spacing unit for the

applicable pool(s).

(8) Producing Interval - that portion of the wellbore drilled inside the vertical limits of a pool, between its penetration point and its terminus.

(9) Project Area - an area designated on Form C-102 that is enclosed by the outer boundaries of a spacing unit, a combination of complete spacing units, or an approved secondary, secondary, tertiary or pressure maintenance project.

(10) Project Well - any well drilled, completed, produced or injected into as either a vertical well, deviated well or directional well.

(11) Spacing Unit - the acreage that is dedicated or a well in accordance with Rule 104. Included in this definition is a "unit of proration for oil or gas" as defined by the division and all non-standard such units previously approved by the division.

(12) Terminus - the farthest point attained along the wellbore.

(13) Unorthodox - any part of the producing interval which is located outside of the producing area.

(14) Vertical Well - a well that does not have an intentional departure or course deviation from the vertical.

(15) Wellbore - the interior surface of a cased or open hole through which drilling, production, or injection operations are conducted.

B. Deviated Wellbores

(1) Deviation Tests Required. Any vertical or deviated well which is drilled or deepened shall be tested at reasonably frequent intervals to determine the deviation from the vertical. Such tests shall be made at least once each 500 feet or at the first bit change succeeding 500 feet. A tabulation of all deviation tests run, sworn to and notarized, shall be filed with Form C-104, Request for Allowable and Authorization to Transport Oil and Natural Gas.

(2) Excessive Deviation. When the deviation averages more than five degrees in any 500-foot interval, the operator shall include the calculations of the maximum possible horizontal displacement of the hole. When the maximum possible horizontal displacement exceeds the distance to the nearest outer boundary line of the appropriate unit, the operator shall run a directional survey to establish the location of the producing interval(s).

(3) Unorthodox Locations. If the results of the directional survey indicate that the producing interval is more than 50 feet from the approved surface location and closer than the minimum setback requirements to the outer boundaries of the applicable unit, then the well shall be considered unorthodox. To obtain authority to produce such well, the operator shall file an application with the Division director, copy to the appropriate division district office, and shall otherwise follow the normal process outlined in Section 104, Subsection F, Paragraph (3) of 19.15.3 NMAC to obtain approval of the unorthodox location.

(4) Directional Survey Requirements. Upon request from the Division director, any vertical or deviated well shall be directionally surveyed. The appropriate division district office shall be notified of the approximate time any directional surveys are to be conducted. All directional surveys run on any well in any manner for any reason must be filed with the division upon completion of the well. The division shall not assign an allowable to the well until all such directional surveys have been filed.

C. Directional Wellbores

(1) Directional Drilling Within a Project Area. A permit to directionally drill a wellbore may be granted by the appropriate division district office if the producing interval is entirely within the producing area or at an unorthodox location previously approved by the division. Additionally, if the project area consists of a combination of drilling units and includes any State or Federal acreage, a copy of the OCD Form C-102 shall be sent to the State Land Office or the Bureau of Land Management.

(2) Unorthodox Wellbores. If all or part of the producing interval of any directional wellbore is projected to be outside of the producing area, the wellbore shall be considered unorthodox. To obtain approval for such wellbore, the applicant shall file a written application in duplicate with the Division director, copy to the appropriate division district office, and shall otherwise follow the normal process outlined in Section 104, Subsection F, Paragraph (3) of 19.15.3 NMAC.

(3) Allowables for Project Areas With Multiple Proration Units. The maximum allowable assigned to

the project area within a prorated pool shall be based upon the number of standard spacing units (or approved non-standard spacing units) that are developed or traversed by the producing interval of the directional wellbore or wellbores. Such maximum allowable shall be applicable to all production from the project area, including any vertical wellbores on standard spacing units inside the project area.

(4) Directional Surveys Required. A directional survey shall be required on each well drilled under the provisions of this section. The appropriate division district office shall be notified of the approximate time all directional surveys are to be conducted. All directional surveys run on any well in any manner for any reason must be filed with the division upon completion of the well. The division shall not assign an allowable to the well until all such directional surveys have been filed. If the directional survey indicates that any part of the producing interval is outside of the producing area, or, in the case of an approved unorthodox location, less than the approved setback requirements from the outer boundary of the applicable unit, then the operator shall file an application with the Division director, copy to the appropriate division district office, and shall otherwise follow the normal process outlined in Section 104, Subsection F, Paragraph (3) of 19.15.3 NMAC to obtain approval of the unorthodox location.

(5) Re-entry of Vertical or Deviated Wellbores for Directional Drilling Projects. These wellbores shall be considered orthodox provided the surface location is orthodox and the location of producing interval is within the tolerance allowed for deviated wellbores under Section 111, Subsection B, Paragraph (3) of 19.15.3 NMAC.

D. Additional Matters

(1) Directional surveys required under the provisions of Section 111 of 19.15.3 NMAC shall have shot points no more than 200 feet apart and shall be run by competent surveying companies that are approved by the Division director. Exceptions to the minimum shot point spacing will be allowed provided the accuracy of the survey is still within acceptable limits.

(2) The Division director, may, at his discretion, set any application for administrative approval whereby the operator shall submit appropriate information and give notice as requested by the Division director. Unprotested applications may be approved administratively within 20 days of receipt of the application and supporting information. If the application is protested, or the Division director decides that a public hearing is appropriate, the application may be set for public hearing.

(3) Permission to deviate or directionally drill any wellbore for any reason or in any manner not provided for in Section 111 of 19.15.3 NMAC shall be granted only after notice and opportunity for hearing.

[1-1-50; 8-28-62; 3-2-84; 7-26-95; 2-1-96; A, 7-31-97; 19.15.3.111 NMAC - Rn, 19 NMAC 15.C.111, 11-15-01]

19.15.3.112 [MULTIPLE COMPLETIONS; BRADENHEAD GAS WELLS]

A. Multiple Completions

(1) Filing. Operators intending to multiple complete must file Form C-101 and/or C-103 for approval before completing and C-104 after completing along with any information required by the form instructions.

(2) Operation and Testing

(a) Wells shall be completed and produced so that no commingling of hydrocarbons from separate pools occurs.

(b) The operator shall commence a segregation and/or packer leakage test within 20 days after the multiple completion. Segregation tests and/or packer leakage tests shall also be made any time the packer is disturbed. The operator shall also conduct any other tests and determinations required by the division. The appropriate district office shall be notified 48 hours in advance of tests so the district office may schedule personnel to witness the tests. Offset operators may witness such tests and shall advise the operator in writing if they desire to be notified of the tests. Test results shall be filed with the division within 20 days of test completion. In the event a segregation and/or packer leakage test indicates communication between separate pools, the operator shall immediately notify the division and commence corrective action on the well.

(c) Wells shall be equipped so that (i) reservoir pressure may be determined for each of the separate pools, and (ii) meters may be installed so that the gas and/or oil produced from each of the separate pools may be accurately measured.

(d) No multiple completion shall produce in a manner unnecessarily wasting reservoir energy.

(e) The division may require the proper plugging of any zone of a multiple-completed well if the plugging appears necessary to prevent waste, protect correlative rights or protect groundwater, public health or the environment.

B. Bradenhead Gas Wells

(1) The production of gas from a bradenhead gas well may be permitted only by order of the division upon hearing, except as noted by the provisions of Subsection C of 19.15.3.112 NMAC.

(2) The application for such hearings shall be submitted in triplicate and shall include an exhibit showing the location of all wells on applicant's lease and all offset wells on offset leases, together with a diagrammatic sketch showing the casing program, formation tops, estimated top of cement on each casing string run and any other pertinent data, including drill stem tests.

(3) The Division director shall have authority to grant an exception to the requirements of paragraph A. above without notice and hearing where application has been filed in due form, and when the lowermost producing zone involved in the completion is an oil or gas producing zone within the defined limits of an oil or gas pool and the producing zone to be produced through the bradenhead connection is a gas producing zone within the defined limits of a gas pool.

(4) Applicants shall furnish all operators who offset the lease upon which the subject well is located a copy of the application to the division, and applicant shall include with his application a written stipulation that all offset operators have been properly notified. The Division director shall wait at least 10 days before approving the production of gas from the bradenhead gas well, and shall approve such production only in the absence of objection from any offset operator. In the event an operator objects to the completion the Division director shall consider the matter only after proper notice and hearing.

(5) The division may waive the 10-day waiting period requirement if the applicant furnishes the division with the written consent to the production of gas from the bradenhead connection by all offset operators involved.

(6) Section 112-2 of 19.15.3 NMAC shall apply only to wells hereinafter completed as bradenhead gas wells.

(7) (1), (2), (3), (4) Repealed.

(8) (1); (1).(a); (1).(b); (2) Repealed.

(9) (1), (2) Repealed.

(10) (1).(a), (b), (c), (d), (e), (f), (g) Reserved.

[4-3-53; 7-3-58…2-1-82; 2-1-96; 19.15.3.112 NMAC - Rn, 19 NMAC 15.C.112-A and 112-B, 11-15-01]

19.15.3.113 SHOOTING AND CHEMICAL TREATMENT OF WELLS:
If injury results to the producing formation, injection interval, casing or casing seat from shooting, fracturing, or treating a well and which injury may create underground waste or contamination of fresh water, the operator shall give written notice to the division within five (5) working days and proceed with diligence to use the appropriate method and means for rectifying such damage. If shooting, fracturing, or chemical treating results in irreparable injury to the well the division may require the operator to properly plug and abandon the well.
[1-1-50...2-1-96; 19.15.3.113 NMAC - Rn, 19 NMAC 15.C.113, 11-15-01]

19.15.3.114 SAFETY REGULATIONS:

A. All oil wells shall be cleaned into a pit or tank, not less than 40 feet from the derrick floor and 150 feet from any fire hazard. All flowing oil wells must be produced through an oil and gas separator of ample capacity and in good working order. No boiler or portable electric lighting generator shall be placed or remain nearer than 150 feet to any producing well or oil tank. Any rubbish or debris that might constitute a fire hazard shall be removed to a distance of at least 150 feet from the vicinity of wells and tanks. All waste shall be burned or disposed of in such manner as to avoid creating a fire hazard.

B. When coming out of the hole with drill pipe, drilling fluid shall be circulated until equalized and subsequently drilling fluid level shall be maintained at a height sufficient to control subsurface pressures. During course of drilling blowout preventers shall be tested at least once each 24-hour period.

[1-1-50...2-1-96; 19.15.3.114 NMAC - Rn, 19 NMAC 15.C.114, 11-15-01]

19.15.3.115 WELL AND LEASE EQUIPMENT:

A. Christmas tree fittings or wellhead connections shall be installed and maintained in first class condition so that all necessary pressure tests may easily be made on flowing wells. On oil wells the Christmas tree fittings shall have a test pressure rating at least equivalent to the calculated or known pressure in the reservoir from which production is expected. On gas wells the Christmas tree fittings shall have a test pressure equivalent to at least 150 percent of the calculated or known pressure in the reservoir from which production is expected.

B. Valves shall be installed and maintained in good working order to permit pressures to be obtained on both casing and tubing. Each flowing well shall be equipped to control properly the flowing of each well, and in case of an oil well, shall be produced into an oil and gas separator of a type generally used in the industry.

[1-1-50...2-1-96; 19.15.3.115 NMAC - Rn, 19 NMAC 15.C.115, 11-15-01]

19.15.3.116 RELEASE NOTIFICATION AND CORRECTIVE ACTION:

A. Notification

(1) The division shall be notified of any unauthorized release occurring during the drilling, producing, storing, disposing, injecting, transporting, servicing or processing of crude oil, natural gases, produced water, condensate or oil field waste including Regulated NORM, or other oil field related chemicals, contaminants or mixture thereof, in the State of New Mexico in accordance with the requirements of Section 116 of 19.15.3 NMAC.

(2) The division shall be notified in accordance with Section 116 of 19.15.3 NMAC with respect to any release from any facility of oil or other water contaminant, in such quantity as may with reasonable probability be detrimental to water or cause an exceedance of the standards in Section 19, Subsection B, Paragraphs (1) and (2) or (3) of 19.15.1 NMAC.

B. Reporting Requirements. Notification of the above releases shall be made by the person operating or controlling either the release or the location of the release in accordance with the following requirements:

(1) A Major Release shall be reported by giving both immediate verbal notice and timely written notice pursuant to Subsection C, Paragraphs (1) and (2) of 19.15.3.116 NMAC. A Major Release is:

(a) an unauthorized release of a volume, excluding natural gases, in excess of 25 barrels;

(b) an unauthorized release of any volume which:

(i) results in a fire;

(ii) will reach a water course;

(iii) may with reasonable probability endanger public health; or

(iv) results in substantial damage to property or the environment;

(c) an unauthorized release of natural gases in excess of 500 mcf; or

(d) a release of any volume which may with reasonable probability be detrimental to water or cause an exceedance of the standards in Section 19, Subsection B, Paragraphs (1) and (2) or (3) of 19.15.1 NMAC.

(2) A Minor Release shall be reported by giving timely written notice pursuant to Subsection C, Paragraph (2) of 19.15.3.116 NMAC. A Minor Release is an unauthorized release of a volume, greater than 5 barrels but not more than 25 barrels; or greater than 50 mcf but less than 500 mcf of natural gases.

C. Contents Of Notification

(1) Immediate verbal notification required pursuant to Subsection B of 19.15.3.116 NMAC shall be reported within twenty-four (24) hours of discovery to the division district office for the area within which the

release takes place. In addition, immediate verbal notification pursuant to Subsection B, Paragraph (1), Subparagraph (d) of 19.15.3.116 NMAC shall be reported to the division's Environmental Bureau Chief. This notification shall provide the information required on division Form C-141.

(2) Timely written notification is required to be reported pursuant to Subsection B of 19.15.3.116 NMAC within fifteen (15) days to the division district office for the area within which the release takes place by completing and filing division Form C-141. In addition, timely written notification required pursuant to Subsection B, Paragraph (1), Subparagraph (d) of 19.15.3.116 NMAC shall also be reported to the division's Environmental Bureau Chief within fifteen (15) days after the release is discovered. The written notification shall verify the prior verbal notification and provide any appropriate additions or corrections to the information contained in the prior verbal notification.

D. Corrective Action. The responsible person must complete division approved corrective action for releases which endanger public health or the environment. Releases will be addressed in accordance with a remediation plan submitted to and approved by the division or with an abatement plan submitted in accordance with Section 19 of 19.15.1 NMAC.

[1-1-50…5-22-73…2-1-96; A, 3-15-97; 19.15.3.116 NMAC - Rn, 19 NMAC 15.C.116, 11-15-01]

19.15.3.117 WELL LOG, COMPLETION AND WORKOVER REPORTS:
Within 20 days after the completion of a well drilled for oil or gas, or the recompletion of a well into a different common source of supply, a completion report shall be filed with the division on Form C-105. For the purpose of Section 117 of 19.15.3 NMAC, any hole drilled or cored below fresh water or which penetrates oil- or gas-bearing formations or which is drilled by an "owner" as defined herein shall be presumed to be a well drilled for oil or gas.

[1-1-50...2-1-96; 19.15.3.117 NMAC - Rn, 19 NMAC 15.C.117, 11-15-01]

19.15.3.118 HYDROGEN SULFIDE GAS (HYDROGEN SULFIDE):

A. Applicability. This section applies to any person, operator or facility subject to the jurisdiction of the division, including, but not limited to, any person, operator or facility engaged in drilling, stimulating, injecting into, completing, working over or producing any oil, natural gas or carbon dioxide well or any person, operator or facility engaged in gathering, transporting, storing, processing or refining of crude oil, natural gas or carbon dioxide (referred to herein as "person, operator or facility" or "well, facility or operation"). This section shall not act to exempt or otherwise excuse surface waste management facilities permitted by the division pursuant to 19.15.9.711 NMAC from more stringent conditions on the handling of hydrogen sulfide required of such facilities by 19.15.9.711 NMAC or more stringent conditions in permits issued thereunder, nor shall such facilities be exempt or otherwise excused from the requirements set forth in this section by virtue of permitting under 19.15.9.711 NMAC.

B. Definitions (specific to this section).

(1) ANSI. The acronym "ANSI" means the American national standards institute.

(2) API. The acronym "API" means the American petroleum institute.

(3) Area of Exposure. The phrase "area of exposure" means the area within a circle constructed with a point of escape at its center and the radius of exposure as its radius.

(4) ASTM. The acronym "ASTM" means the American society for testing and materials.

(5) Dispersion Technique. A "dispersion technique" is a mathematical representation of the physical and chemical transportation characteristics, dilution characteristics and transformation characteristics of hydrogen sulfide gas in the atmosphere.

(6) Escape Rate. The "escape rate" is the maximum volume (Q) that is used to designate the possible rate of escape of a gaseous mixture containing hydrogen sulfide, as set forth herein.

(a) For existing gas facilities or operations, the escape rate shall be calculated using the maximum daily rate of the gaseous mixture produced or handled or the best estimate thereof. For an existing gas well, the escape rate shall be calculated using the current daily absolute open flow rate against atmospheric pressure or the best estimate of that rate.

(b) For new gas operations or facilities, the escape rate shall be calculated as the maximum anticipated flow rate through the system. For a new gas well, the escape rate shall be calculated using the maximum open-flow rate of offset wells in the pool or reservoir, or the pool or reservoir average of maximum open-flow rates.

(c) For existing oil wells, the escape rate shall be calculated by multiplying the producing gas/oil ratio by the maximum daily production rate or the best estimate thereof.

(d) For new oil wells, the escape rate shall be calculated by multiplying the producing gas/oil ratio by the maximum daily production rate of offset wells in the pool or reservoir, or the pool or reservoir average of the producing gas/oil ratio multiplied by the maximum daily production rate.

(e) For facilities or operations not mentioned, the escape rate shall be calculated using the actual flow of the gaseous mixture through the system or the best estimate thereof.

(7) GPA. The acronym "GPA" means the gas processors association.

(8) LEPC. The acronym "LEPC" means the local emergency planning committee established pursuant to the emergency planning and community right-to-know act, 42 U.S.C. Section 11001.

(9) NACE. The acronym "NACE" refers to the national association of corrosion engineers.

(10) PPM. The acronym "ppm" means "parts per million" by volume.

(11) Potentially Hazardous Volume means the volume of hydrogen sulfide gas of such concentration that:

(a) the 100-ppm radius of exposure includes any public area;

(b) the 500-ppm radius of exposure includes any public road; or

(c) the 100-ppm radius of exposure exceeds 3,000 feet.

(12) Public Area. A "public area" is any building or structure that is not associated with the well, facility or operation for which the radius of exposure is being calculated and that is used as a dwelling, office, place of business, church, school, hospital, or government building, or any portion of a park, city, town, village or designated school bus stop or other similar area where members of the public may reasonably be expected to be present.

(13) Public Road. A "public road" is any federal, state, municipal or county road or highway.

(14) Radius of Exposure. The radius of exposure is that radius constructed with the point of escape as its starting point and its length calculated using the following Pasquill-Gifford derived equation, or by such other method as may be approved by the division:

(a) For determining the 100-ppm radius of exposure: $X= [(1.589)(\text{hydrogen sulfide concentration})(Q)]^{(0.6258)}$, where "X" is the radius of exposure in feet, the "hydrogen sulfide concentration" is the decimal equivalent of the mole or volume fraction of hydrogen sulfide in the gaseous mixture, and "Q" is the escape rate expressed in cubic feet per day (corrected for standard conditions of 14.73 psia and 60 degrees F).

(b) For determining the 500-ppm radius of exposure: $X=[(0.4546)(\text{hydrogen sulfide concentration})(Q)]^{(0.6258)}$, where "X" is the radius of exposure in feet, the "hydrogen sulfide concentration" is the decimal equivalent of the mole or volume fraction of hydrogen sulfide in the gaseous mixture, and "Q" is the escape rate expressed in cubic feet per day (corrected for standard conditions of 14.73 psia and 60 degrees F).

(c) For a well being drilled, completed, recompleted, worked over or serviced in an area where insufficient data exists to calculate a radius of exposure but where hydrogen sulfide could reasonably be expected to be present in concentrations in excess of 100 ppm in the gaseous mixture, a 100-ppm radius of exposure equal to 3,000 feet shall be assumed.

C. Regulatory Threshold.

(1) Determination of Hydrogen Sulfide Concentration.

(a) Each person, operator or facility shall determine the hydrogen sulfide concentration in the gaseous mixture within each of its wells, facilities or operations either by testing (using a sample from each well, facility or operation), testing a representative sample, or using process knowledge in lieu of testing. If a representative sample or process knowledge is used, the concentration derived from the representative sample or process knowledge must be reasonably representative of the hydrogen sulfide concentration within the well, facility or operation.

(b) The tests used to make the determination referred to in the previous subparagraph shall be conducted in accordance with applicable ASTM or GPA standards or by another method approved by the division.

(c) If a test was conducted prior to the effective date of this section that otherwise meets the requirements of the previous subparagraphs, new testing shall not be required.

(d) If any change or alteration may materially increase the concentration of hydrogen sulfide in a well, facility or operation, a new determination shall be required in accordance with this section.

(2) Concentrations Determined to be Below 100 ppm. If the concentration of hydrogen sulfide in a given well, facility or operation is less than 100 ppm, no further actions shall be required pursuant to this section.

(3) Concentrations Determined to be Above 100 ppm.

(a) If the concentration of hydrogen sulfide in a given well, facility or operation is determined to be 100 ppm or greater, then the person, operator or facility must calculate the radius of exposure and comply with applicable requirements of this section.

(b) If calculation of the radius of exposure reveals that a potentially hazardous volume is present, the results of the determination of the hydrogen sulfide concentration and the calculation of the radius of exposure shall be provided to the division. For a well, facility or operation existing on the effective date of this section, the determination, calculation and submission required herein shall be accomplished within 180 days of the effective date of this section; for any well, facility or operation that commences operations after the effective date of this section, the determination, calculation and submission required herein shall be accomplished before operations begin.

(4) Recalculation. The person, operator or facility shall calculate the radius of exposure if the hydrogen sulfide concentration in a well, facility or operation increases to 100 ppm or greater. The person, operator or facility shall also recalculate the radius of exposure if the actual volume fraction of hydrogen sulfide increases by a factor of twenty-five percent in a well, facility or operation that previously had a hydrogen sulfide concentration of 100 ppm or greater. If calculation or recalculation of the radius of exposure reveals that a potentially hazardous volume is present, the results shall be provided to the division within sixty (60) days.

D. Hydrogen Sulfide Contingency Plan.

(1) When Required. If a well, facility or operation involves a potentially hazardous volume of hydrogen sulfide, a hydrogen sulfide contingency plan that will be used to alert and protect the public must be developed in accordance with the following paragraphs.

(2) Plan Contents.

(a) API Guidelines. The hydrogen sulfide contingency plan shall be developed with due consideration of paragraph 7.6 of the guidelines published by the API in its publication entitled “Recommended Practices for Oil and Gas Producing and Gas Processing Plant Operations Involving Hydrogen Sulfide," RP-55, most recent edition, or with due consideration to another standard approved by the division.

(b) Required Contents. The hydrogen sulfide contingency plan shall contain, but shall not be limited to, information on the following subjects, as appropriate to the well, facility or operation to which it applies:

(i) Emergency procedures. The hydrogen sulfide contingency plan shall contain information on emergency procedures to be followed in the event of a release and shall include, at a minimum, information concerning the responsibilities and duties of personnel during the emergency, an immediate action plan as described in the API document referenced in the previous subsubparagraph, and telephone numbers of emergency responders, public agencies, local government and other appropriate public authorities. The plan shall also include the locations of potentially affected public areas and public roads and shall describe proposed evacuation routes, locations of any road blocks and procedures for notifying the public, either through direct telephone notification using telephone number lists or by means of mass notification and reaction plans. The plan shall include information on the availability and location of necessary safety equipment and supplies.

(ii) Characteristics of hydrogen sulfide and sulfur dioxide. The hydrogen sulfide contingency plan shall include a discussion of the characteristics of hydrogen sulfide and sulfur dioxide.

(iii) Maps and drawings. The hydrogen sulfide contingency plan shall include maps and drawings that depict the area of exposure and public areas and public roads within the area of exposure.

(iv) Training and Drills. The hydrogen sulfide contingency plan shall provide for training and drills, including training in the responsibilities and duties of essential personnel and periodic on-site or classroom drills or exercises that simulate a release, and shall describe how the training, drills and attendance will be documented. The hydrogen sulfide contingency plan shall also provide for training of residents as appropriate on the proper protective measures to be taken in the event of a release, and shall provide for briefing of public officials on issues such as evacuation or shelter-in-place plans.

(v) Coordination with State Emergency Plans. The hydrogen sulfide contingency plan shall describe how emergency response actions under the plan will be coordinated with the division and with the New Mexico state police consistent with the New Mexico hazardous materials emergency response plan (HMER).

(vi) Activation Levels. The hydrogen sulfide contingency plan shall include the activation level and a description of events that could lead to a release of hydrogen sulfide sufficient to create a concentration in excess of the activation level.

(3) Plan Activation. The hydrogen sulfide contingency plan shall be activated when a release creates a concentration of hydrogen sulfide greater than the activation level set forth in the hydrogen sulfide contingency plan. At a minimum, the plan must be activated whenever a release may create a concentration of hydrogen sulfide of more than 100 ppm in any public area, 500 ppm at any public road or 100 ppm 3,000 feet from the site of release.

(4) Submission.

(a) Where Submitted. The hydrogen sulfide contingency plan shall be submitted to the division.

(b) When Submitted. A hydrogen sulfide contingency plan for a well, facility or operation existing on the effective date of this section shall be submitted within one year of the effective date of this section. A hydrogen sulfide contingency plan for a new well, facility or operation shall be submitted before operations commence. The hydrogen sulfide contingency plan for a drilling, completion, workover or well servicing operation must be on file with the division before operations commence and may be submitted separately or along with the application for permit to drill (APD) or may be on file from a previous submission. A hydrogen sulfide contingency plan shall also be submitted within 180 days after the person, operator or facility becomes aware or should have become aware that a public area or public road is established that creates a potentially hazardous volume where none previously existed.

(c) Electronic Submission. Any filer who operates more than one hundred wells or who operates a crude oil pump station, compressor station, refinery or gas plant must submit each hydrogen sulfide contingency plan in electronic format. The hydrogen sulfide contingency plan may be submitted through electronic mail, through an Internet filing or by delivering electronic media to the division, so long as the electronic submission is compatible with the division's systems.

(5) Failure to Submit Plan. Failure to submit a hydrogen sulfide contingency plan when required may result in denial of an application for permit to drill, cancellation of an allowable for the subject well or other enforcement action appropriate to the well, facility or operation.

(6) Review, Amendment. The person, operator or facility shall review the hydrogen sulfide contingency plan any time a subject addressed in the plan materially changes and make appropriate amendments. If the division determines that a hydrogen sulfide contingency plan is inadequate to protect public safety, the division may require the person, operator or facility to add provisions to the plan or amend the plan as necessary to protect public safety.

(7) Retention and Inspection. The hydrogen sulfide contingency plan shall be reasonably accessible in the event of a release, maintained on file at all times, and available for inspection by the division.

(8) Annual Inventory of Contingency Plans. On an annual basis, each person, operator or facility required to prepare one or more hydrogen sulfide contingency plans pursuant to this section shall file with the appropriate local emergency planning committee and the state emergency response commission an inventory of the wells, facilities and operations for which plans are on file with the division and the name, address and telephone number of a point of contact.

(9) Plans Required by Other Jurisdictions. A hydrogen sulfide contingency plan required by the Bureau of Land Management or other jurisdiction that meets the requirements of this subsection may be submitted to the division in satisfaction of this subsection.

E. Signage, Markers. For each well, facility or operation involving a concentration of hydrogen sulfide of 100 ppm or greater, signs and/or markers shall be installed and maintained. Each sign or marker shall conform with the current ANSI standard Z535.1-2002 (“Safety Color Code”), or some other standard approved by the division, shall be readily readable, and shall contain the words "poison gas" and other information sufficient to warn the public that a potential danger exists. Signs or markers shall be prominently posted at locations, including but not limited to entrance points and road crossings, sufficient to alert the public that a potential danger exists. Signs and/or markers that conform with this subsection shall be installed no later than one year from the effective date of this section.

F. Protection from Hydrogen Sulfide During Drilling, Completion, Workover, and Well Servicing Operations.

(1) API Standards. All drilling, completion, workover and well servicing operations involving a hydrogen sulfide concentration of 100 ppm or greater shall be conducted with due consideration to the guidelines published by the API entitled “Recommended Practice for Oil and Gas Well Servicing and Workover Operations Involving Hydrogen Sulfide," RP-68, and “Recommended Practices for Drilling and Well Servicing Operations Involving Wells Containing Hydrogen Sulfide,” RP-49, most recent editions, or some other standard approved by the division.

(2) Detection and Monitoring Equipment. Drilling, completion, workover and well servicing operations involving a hydrogen sulfide concentration of 100 ppm or greater shall include hydrogen sulfide detection and monitoring equipment as follows:

(a) Each drilling and completion site shall have an accurate and precise hydrogen sulfide detection and monitoring system that will automatically activate visible and audible alarms when the ambient air concentration of hydrogen sulfide reaches a predetermined value set by the operator, not to exceed 20 ppm. There shall be a sensing point located at the shale shaker, rig floor and bell nipple for a drilling site and the cellar, rig floor and circulating tanks or shale shaker for a completion site.

(b) For workover and well servicing operations, one operational sensing point shall be located as close to the well bore as practical. Additional sensing points may be necessary for large or long-term operations.

(c) Hydrogen sulfide detection and monitoring equipment must be provided and must be made operational during drilling when drilling is within 500 feet of a zone anticipated to contain hydrogen sulfide and continuously thereafter through all subsequent drilling.

(3) Wind Indicators. All drilling, completion, workover and well servicing operations involving a hydrogen sulfide concentration of 100 ppm or greater shall include wind indicators. Equipment to indicate wind direction shall be present and visible at all times. At least two devices to indicate wind direction shall be installed at separate elevations and visible from all principal working areas at all times. When a sustained concentration of hydrogen sulfide is detected in excess of 20 ppm at any detection point, red flags shall be displayed.

(4) Flare System. For drilling and completion operations in an area where it is reasonably expected that a potentially hazardous volume of hydrogen sulfide will be encountered, the person, operator or facility shall install a flare system to safely gather and burn hydrogen-sulfide-bearing gas. Flare outlets shall be located at least 150 feet from the well bore. Flare lines shall be as straight as practical. The flare system shall be equipped with a suitable and safe means of ignition. Where noncombustible gas is to be flared, the system shall provide supplemental fuel to maintain ignition.

(5) Well Control Equipment. When the 100 ppm radius of exposure includes a public area, the following well control equipment shall be required:

(a) Drilling. A remote-controlled well control system shall be installed and operational at all times beginning when drilling is within 500 feet of the formation believed to contain hydrogen sulfide and continuously thereafter during drilling. The well control system must include, at a minimum, a pressure and hydrogen-sulfide-rated well control choke and kill system including manifold and blowout preventer that meets or exceeds the specifications API-16C and API-RP 53 or other specifications approved by the division. Mud-gas separators shall be used. These systems shall be tested and maintained pursuant to the specifications referenced, according to the requirements of this part, or otherwise as approved by the division.

(b) Completion, Workover and Well Servicing. A remote controlled pressure and hydrogen-sulfide-rated well control system that meets or exceeds API specifications or other specifications approved by the division shall be installed and shall be operational at all times during completion, workover and servicing of a well.

(6) Mud Program. All drilling, completion, workover and well servicing operations involving a

hydrogen sulfide concentration of 100 ppm or greater shall use a hydrogen sulfide mud program capable of handling hydrogen sulfide conditions and well control, including de-gassing.

(7) Well Testing. Except with prior approval of the division, drill-stem testing of a zone that contains hydrogen sulfide in a concentration of 100 ppm or greater shall be conducted only during daylight hours and formation fluids shall not be permitted to flow to the surface.

(8) If Hydrogen Sulfide Encountered During Operations. If hydrogen sulfide was not anticipated at the time the division issued a permit to drill but is encountered during drilling in a concentration of 100 ppm or greater, the operator must satisfy the requirements of this section before continuing drilling operations. The operator shall notify the division of the event and the mitigating steps that have been or are being taken as soon as possible, but no later than 24 hours following discovery. The division may grant verbal approval to continue drilling operations pending preparation of any required hydrogen sulfide contingency plan.

G. Protection from Hydrogen Sulfide at Crude Oil Pump Stations, Producing Wells, Tank Batteries and Associated Production Facilities, Pipelines, Refineries, Gas Plants and Compressor Stations.

(1) API Standards. Operations at crude oil pump stations and producing wells, tank batteries and associated production facilities, refineries, gas plants and compressor stations involving a concentration of hydrogen sulfide of 100 ppm or greater shall be conducted with due consideration to the guidelines published by the API in its publication entitled “Recommended Practices for Oil and Gas Producing and Gas Processing Plant Operations Involving Hydrogen Sulfide," RP-55, latest edition or some other standard approved by the division.

(2) Security. Well sites and other unattended, fixed surface facilities involving a concentration of hydrogen sulfide of 100 ppm or greater shall be protected from public access by fencing with locking gates when the location is within 1/4 mile of a public area. A surface pipeline shall not be considered a fixed surface facility for purposes of this paragraph.

(3) Wind Direction Indicators. All crude oil pump stations, producing wells, tank batteries and associated production facilities, pipelines, refineries, gas plants and compressor stations involving a concentration of hydrogen sulfide of 100 ppm or greater shall have equipment to indicate wind direction. The wind direction equipment shall be installed and visible from all principal working areas at all times.

(4) Control Equipment. When the 100 ppm radius of exposure includes a public area, the following additional measures are required:

(a) Safety devices, such as automatic shut-down devices, shall be installed and maintained in good operating condition to prevent the escape of hydrogen sulfide. Alternatively, safety procedures shall be established to achieve the same purpose.

(b) Any well shall possess a secondary means of immediate well control through the use of an appropriate christmas tree or downhole completion equipment. Such equipment shall allow downhole accessibility (reentry) under pressure for permanent well control.

(5) Tanks or vessels. Each stair or ladder leading to the top of any tank or vessel containing 300 ppm or more of hydrogen sulfide in the gaseous mixture shall be chained or marked to restrict entry.

(6) Compliance Schedule. Each existing crude oil pump station, producing well, tank battery and associated production facility, pipeline, refinery, gas plant and compressor station not currently meeting the requirements of this subsection shall be brought into compliance within one year of the effective date of this section.

H. Personnel Protection and Training. All persons responsible for the implementation of any hydrogen sulfide contingency plan shall be provided training in hydrogen sulfide hazards, detection, personal protection and contingency procedures.

I. Standards for Equipment That May Be Exposed to Hydrogen Sulfide. Whenever a well, facility or operation involves a potentially hazardous volume of hydrogen sulfide, equipment shall be selected with consideration for both the hydrogen sulfide working environment and anticipated stresses and NACE Standard MR0175 (latest edition) or some other standard approved by the division shall be used for selection of metallic equipment or, if applicable, adequate protection by chemical inhibition or other methods that control or limit the corrosive effects of hydrogen sulfide shall be used.

J. Exemptions. Any person, operator or facility may petition the director or the director's designee for an exemption to any requirement of this section. Any such petition shall provide specific information as to the circumstances that warrant approval of the exemption requested and how the public safety will be protected. The director or the director's designee, after considering all relevant factors, may approve an exemption if the circumstances warrant and so long as the public safety will be protected.

K. Notification of the Division. The person, operator or facility shall notify the division upon a release of hydrogen sulfide requiring activation of the hydrogen sulfide contingency plan as soon as possible, but no more than four hours after plan activation, recognizing that a prompt response should supercede notification. The person, operator or facility shall submit a full report of the incident to the division on Form C-141 no later than fifteen (15) days following the release.

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 4 PLUGGING AND ABANDONMENT OF WELLS

19.15.4.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505 (505) 827-7131.
[2-1-96; 19.15.4.1 NMAC - Rn, 19 NMAC 15.D.1, 12-14-01]

19.15.4.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.4.2 NMAC - Rn, 19 NMAC 15.D.2, 12-14-01]

19.15.4.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.4.3 NMAC - Rn, 19 NMAC 15.D.3, 12-14-01]

19.15.4.4 DURATION: Permanent.
[2-1-96; 19.15.4.4 NMAC - Rn, 19 NMAC 15.D.4, 12-14-01]

19.15.4.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.4.5 NMAC - Rn, 19 NMAC 15.D.5, 12-14-01]

19.15.4.6 OBJECTIVE: To provide for the proper plugging and abandonment of wells to protect fresh water and public health and environment pursuant to the Oil and Gas Act.
[2-1-96; 19.15.4.6 NMAC - Rn, 19 NMAC 15.D.6, 12-14-01]

19.15.4.7 DEFINITIONS: [Reserved].

19.15.4.8-200 [RESERVED].

19.15.4.201 WELLS TO BE PROPERLY ABANDONED

A. The operator of any well drilled for oil, gas or injection; for seismic, core or other exploration, or for a service well, whether cased or uncased, shall be responsible for the plugging thereof.

B. A well shall be either properly plugged and abandoned or temporarily abandoned in accordance with these rules within ninety (90) days after:

(1) a sixty (60) day period following suspension of drilling operations, or
(2) a determination that a well is no longer usable for beneficial purposes, or
(3) a period of one (1) year in which a well has been continuously inactive.

[7-12-90…2-1-96; 19.15.4.201 NMAC - Rn, 19 NMAC 15.D.201, 12-14-01]

19.15.4.202 PLUGGING AND PERMANENT ABANDONMENT

A. Notice of Plugging

(1) Notice of intention to plug must be filed with the Division on Form C-103, Sundry Notices and Reports on Wells, by the operator prior to the commencement of plugging operations, which notice must provide all of the information required by Rule 1103 including operator and well identification and proposed procedures for plugging said well, and in addition the operator shall provide a well-bore diagram showing the proposed plugging procedure. Twenty-four hours notice shall be given prior to commencing any plugging operations. In the case of a newly drilled dry hole, the operator may obtain verbal approval from the appropriate District Supervisor or his representative of the method of plugging and time operations are to begin. Written notice in accordance with this rule shall be filed with the Division ten (10) days after such verbal approval has been given.

B. Plugging

(1) Before any well is abandoned, it shall be plugged in a manner which will permanently confine all oil, gas and water in the separate strata in which they are originally found. This may be accomplished by using mud-laden fluid, cement and plugs singly or in combination as approved by the Division on the notice of intention to plug.

(2) The operator shall mark the exact location of plugged and abandoned wells with a steel marker not less than four inches (4") in diameter set in cement and extending at least four feet (4') above mean ground level. The operator name, lease name and well number and location, including unit letter, section, township and range, shall be welded, stamped or otherwise permanently engraved into the metal of the marker. No permanent structures preventing access to the wellhead shall be built over a plugged and abandoned well without written approval of the OCD. No plugged and abandonment marker shall be removed without the written permission of the OCD.

(3) As soon as practical but no later than one year after the completion of plugging operations, the operator shall:

(a) fill all pits;

(b) level the location;

(c) remove deadmen and all other junk; and

(d) take such other measures as are necessary or required by the Division to restore the location to a safe and clean condition.

(4) Upon completion of plugging and clean up restoration operations as required, the operator shall contact the appropriate district office to arrange for an inspection of the well and location.

(5) Below-ground plugged and abandonment markers can be used only with written permission of the OCD when an above-ground marker would interfere with agricultural endeavors. The below-ground marker shall have a steel plate welded onto the surface or conductor pipe of the abandoned well and shall be at least 3 feet below the ground surface and of sufficient size so that all the information required by Section 103 of 19.15.3 NMAC can be stenciled into the steel or welded onto the surface of the steel plate. The OCD may require a re-survey of the well location.

C. Reports

(1) The operator shall file Form C-105, Well Completion or Recompletion Report and Log as provided in Rule 1105.

(2) Within thirty (30) days after completing all required restoration work, the operator shall file with the Division, in triplicate, a record of the work done on Form C-103 as provided in Rule 1103.

(3) The Division shall not approve the record of plugging or release any bonds until all necessary reports have been file and the location has been inspected and approved by the Division.

[1-1-50, 7-12-90…2-1-96; A, 3-31-00; 19.15.4.202 NMAC - Rn, 19 NMAC 15.D.202, 12-14-01]

19.15.4.203 TEMPORARY ABANDONMENT

A. Wells Which May Be Temporarily Abandoned

(1) The Division may permit any well which is required to be properly abandoned under these rules but which has potential for future beneficial use for enhanced recovery or injection, and any other well for which an operator requests temporary abandonment, to be temporarily abandoned for a period of up to five (5) years. Prior to the expiration of any approved temporary abandonment the operator shall return the well to beneficial use under a plan approved by the Division, permanently plug and abandon said well or apply for a new approval to temporarily abandon the well.

B. Request For Approval And Permit

(1) Any operator seeking approval for temporary abandonment shall submit on Form C-103, Sundry Notices and Reports on Wells, a notice of intent to temporarily abandon the well describing the proposed temporary abandonment procedure to be used. No work shall be commenced until approved by the Division and the operator shall give 24 hours notice to the appropriate District office of the Division before work actually begins.

(2) No temporary abandonment shall be approved unless evidence is furnished to show that the casing of such well is mechanically sound and in such condition as to prevent:

(a) damage to the producing zone;

(b) migration of hydrocarbons or water;

(c) the contamination of fresh water or other natural resources; and

(d) the leakage of any substance at the surface.

(3) If the well fails the mechanical integrity test required herein, the well shall be plugged and abandoned in accordance with these rules or the casing problem corrected and the casing retested within ninety (90) days.

(4) Upon successful completion of the work on the temporarily abandoned well, the operator will submit a request for Temporary Abandonment to the appropriate district office on Form C-103 together with such other information as is required by Rule 1103 E.(1).

(5) The Division may require the operator to post with the Division a one-well plugging bond for the well in an amount to be determined by the Division to be satisfactory to meet the particular requirements of the well.

(6) The Division shall specify the expiration date of the permit, which shall be not more than five (5) years from the date of approval.

C. Tests Required

(1) The following methods of demonstrating casing integrity may be approved for temporarily abandoning a well:

(a) a cast iron bridge plug will be set within one hundred (100) feet of uppermost perforations or production casing shoe and the casing loaded with inert fluid and pressure tested to 500 pounds per square inch with a pressure drop of not more than 10% for thirty (30) minutes; or

(b) a retrievable bridge plug or packer will be run to within one hundred (100) feet of uppermost perforations or production casing shoe and the well tested to 500 pounds per square inch for thirty minutes with a pressure drop of not greater than 10% for thirty (30) minutes; or

(c) for a gas well in southeast New Mexico completed above the San Andres formation, if the operator can demonstrate that the fluid level is below the base of the salt and that a Bradenhead test shows no casing leaks, the Division may exempt the well from the requirement for a bridge plug or packer; or

(d) a casing inspection log confirming the mechanical integrity of the production casing may be submitted.

(2) Any such test which is submitted must have been conducted within the previous twelve (12) months.

(3) The Division may approve other casing tests submitted on Form C-103 on an individual basis.

[7-12-90...7-12-90, 2-1-96; 19.15.4.203 NMAC - Rn, 19 NMAC 15.D.203, 12-14-01]

19.15.4.204 WELLS TO BE USED FOR FRESH WATER

A. When a well to be plugged may safely be used as a fresh water well and the landowner agrees to take over said well for such purpose, the well need not be plugged above the sealing plug set below the fresh water formation.

B. The operator must comply with all other requirements contained in Section 202 of 19.15.3 NMAC regarding plugging, including surface restoration and reporting requirements.

C. Upon completion of plugging operations, the operator must file with the Division a written agreement signed by the landowner whereby the landowner agrees to assume responsibility for such well. Upon the filing of this agreement and approval by the Division of well abandonment operations, the operator shall no longer be responsible for such well, and any bonds thereon may be released.

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 5 OIL PRODUCTION OPERATING PRACTICES

19.15.5.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department.
[2-1-96; 19.15.5.1 NMAC - Rn, 19 NMAC 15.E.1, 5-15-00]

19.15.5.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.5.2 NMAC - Rn, 19 NMAC 15.E.2, 5-15-00]

19.15.5.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.5.3 NMAC - Rn, 19 NMAC 15.E.3, 5-15-00]

19.15.5.4 DURATION: Permanent
[2-1-96; 19.15.5.4 NMAC - Rn, 19 NMAC 15.E.4, 5-15-00]

19.15.5.5 EFFECTIVE DATE: February 1, 1996, unless a later date is cited at the of a section.
[2-1-96; 19.15.5.5 NMAC - Rn, 19 NMAC 15.E.5, 5-15-00]

19.15.5.6 OBJECTIVE: To regulate the production of oil to enable the oil conservation division to fulfill its statutory mandates under the Oil and Gas Act.
[2-1-96; 19.15.5.6 NMAC - Rn, 19 NMAC 15.E.6, 5-15-00]

19.15.5.7 DEFINITIONS: [RESERVED]. See 19.15.1.7 NMAC.

19.15.5.8-300 [RESERVED]

19.15.5.301 GAS-OIL RATIO AND PRODUCTION TESTS:

A. Each operator shall take a gas-oil ratio test no sooner than 20 days nor later than 30 days following the completion or recompletion of each oil well, if:

(1) the well is a wildcat, or

(2) the well is located in a pool which is not exempt from the requirements of this rule. Wells completed within one mile of the outer boundary of a defined oil pool producing from the same formation shall be governed by the provisions of this rule which are applicable to the pool. The results of the test shall be reported to the division on form C-116 within 10 days following completion of the test. The gas-oil ratio thus reported shall become effective for proration purposes on the first day of the calendar month following the date they are reported.

(3) Each operator shall also take an annual gas-oil ratio test of each producing oil well, located within a pool not exempted from the requirements of this rule, during a period prescribed by the division. A gas-oil ratio survey schedule shall be established by the division setting forth the period in which gas-oil ratio tests are to be taken for each pool wherein a test is required. The gas-oil ratio test shall be such test designated by the division, made by such method and means, and in such manner as the division in its discretion may prescribe from time to time.

B. The results of gas-oil ratio tests taken during survey periods shall be filed with the division on form C-116 not later than the 10^{th} of the month following the close of the survey period for the pool in which the well is located. The gas-oil ratios thus reported shall become effective for proration purposes on the first day of the second month following the close of the survey period. Unless form C-116 is filed within the required time limit, no further allowable will be assigned the affected well until form C-116 is filed.

C. In the case of special tests taken between regular gas-oil ratio surveys, the gas-oil ratio shall become effective for proration purposes upon the date form C-116, reporting the results of such test, is received by the division. A special test does not exempt any well from the regular survey.

D. During gas-oil ratio test, no well shall be produced at a rate exceeding top unit allowable for the pool in which it is located by more than 25 percent.

E. The director shall have the authority to exempt such pools as he may deem proper from the gas-oil ratio test requirements of this rule. Such exemption shall be by executive order directed to all operators in the pool being exempted.

F. The director shall have the authority to require annual productivity tests of all oil wells in pools exempt from gas-oil ratio tests, during a period prescribed by the division. An oil well productivity survey schedule shall be established by the division setting forth the period in which productivity tests are to be taken for each pool wherein such tests are required.

G. The results of productivity tests taken during survey periods shall be filed with the division on form C-116 (with the word "Exempt" inserted in the column normally used for reporting gas production) not later than the 10^{th} of the month following the close of the survey period for the pool in which the well is located. Unless form C-116 is filed within the required time limit, no further allowable will be assigned the affected well until form C-116 is filed.

H. In the case of special productivity tests taken between regular test survey periods, which result in a change of allowable assigned to the well, the allowable change shall become effective upon the date the form C-116 is received by the proration department. A special test does not exempt any well from the regular survey.

I. During the productivity test, no well shall be produced at a rate exceeding top unit allowable for the pool in which it is located by more than 25 percent.

[1-1-50…2-1-96; 19.15.5.301 NMAC - Rn, 19 NMAC 15.E.301, 5-15-00]

19.15.5.302 SUBSURFACE PRESSURE TESTS:

The operator shall make a subsurface pressure test on the discovery well of any new pool hereafter discovered, and shall report the results thereof to the division within 30 days after the completion of such discovery well. On or before December 1 of each calendar year the division shall designate the months in which subsurface pressure tests shall be taken in designated pools. Included in the designated list shall be listed the required shut-in pressure time and datum of tests to be taken in each pool. In the event a newly discovered pool is not included in the division's list, the division shall issue a supplementary bottom hole pressure schedule. Tests as designated by the division shall only apply to flowing wells in each pool. This test shall be made by a person qualified by both training and experience to make such test, and with an approved subsurface pressure instrument which shall be calibrated against an approved dead-weight tester at intervals frequent enough to ensure its accuracy within one percent. Unless otherwise designated by the division all wells shall remain completely shut in for at least 24 hours prior to the test. In the event a definite datum is not established by the division the subsurface determination shall be obtained as close as possible to the mid-point of the productive sand of the reservoir. The report shall be on form C-124 and shall state the name of the pool, the pool datum (if established), the name of the operator and lease, the well number, the wellhead elevation above sea level, the date of the test, the total time the well was shut in prior to the test, the subsurface temperature in degrees fahrenheit at the test depth, the depth in feet at which the subsurface pressure test was made, the observed pressure in pounds per square inch gauge (corrected for calibration and temperature), the corrected pressure computed from applying to the observed pressure the appropriate correction for difference in test depth and reservoir datum plane and any other information as required by form C-124.

[1-1-50...2-1-96; 19.15.5.302 NMAC - Rn, 19 NMAC 15.E.302, 5-15-00]

19.15.5.303 SEGREGATION OF PRODUCTION FROM DIFFERENT POOLS OR LEASES:

A. In general

(1) Pool segregation required - Each pool shall be produced as a single common source of supply and wells therein shall be completed, cased, maintained, and operated so as to prevent communication within the wellbore with any other pool. Oil, gas, or oil or gas produced from each pool shall at all times be segregated, and the combination commingling of production, before marketing, with production from any other pool without division approval is prohibited.

(2) Lease segregation required - Oil, gas, or oil and gas shall not be transported from a lease until it has been accurately measured or determined by other methods acceptable to the division. The production from each lease shall at all times be segregated, and the combination or commingling of production, before marketing, with production from any other lease without division approval is prohibited.

(3) Exceptions. Exceptions to Paragraphs (1) and (2) of Subsection A of 19.15.5.303 NMAC may be permitted for surface commingling, downhole commingling and off-lease storage and/or measurement pursuant to Subsections B, C and D of 19.15.5.303 NMAC, respectively. Exceptions granted by previous orders of the division remain in effect in accordance with their terms and conditions.

B. Surface commingling - oil gas or oil and gas

(1) Introduction - To prevent waste, to promote conservation and to protect correlative rights, the division shall have the authority to grant exceptions to permit the surface commingling of oil, gas or oil and gas in common facilities from two or more pools, two or more leases or combinations of pools and leases provided that:

(a) the method used to allocate the production to the various leases or pools to be commingled is approved by the division;

(b) if federal, Indian or state lands are involved, the United States bureau of land management or the commissioner of public lands for the state of New Mexico (as applicable) has been notified of the proposed commingling; and

(c) all other applicable requirements set out in Subsection B of 19.15.5.303 NMAC are met.

(2) Definitions - For purposes of Section 303 of 19.15.5 NMAC only, the following definitions shall apply:

(a) Lease. "Lease" means a contiguous geographical area of identical ownership overlying a pool or portion of a pool. An area pooled, unitized or communitized, either by agreement or by division order, or a participating area shall constitute a lease. If there is any diversity of ownership between different pools, or between different zones or strata, then each such pool, zone or stratum having such diverse ownership shall be considered a separate lease.

(b) Diverse ownership. "Diverse Ownership" exists if leases or pools have any different working, royalty or overriding royalty interest owners or any different ownership percentages of the same working, royalty or overriding royalty interest owners.

(c) Identical ownership. "Identical Ownership" exists if leases or pools have all the same working, royalty and overriding royalty owners in exactly the same percentages.

(3) Specific requirements and provisions for commingling of leases, pools or leases and pools with identical ownership.

(a) Measurement and allocation methods.

(i) Well test method - If all wells or units to be commingled are marginal and are physically incapable of producing the top unit allowable for their respective pools, or if all affected pools are unprorated, commingling shall be permitted without separately measuring the production from each pool or lease. Instead, the production from each well and from each pool or lease may be determined from well tests conducted periodically, but no less than annually. The well test method shall not apply to wells or units that can produce an amount of oil equal to the top unit allowable for the pool but are restricted because of high gas-oil ratios. The operator of any such marginal commingling installation shall notify the division at any time any well or unit so commingled under this subsection becomes capable of producing the top unit allowable for its pool, at which time the division shall require separate measurement.

(ii) Metering method - Production from each pool or lease may be determined by separately metering before commingling.

(iii) Subtraction method - If production from all except one of the pools or leases to be commingled is separately measured, the production from the remaining pool or lease may be determined by the subtraction method as follows: For oil, the net production from the unmetered pool or lease shall be the difference between the net pipeline runs with the beginning and ending stock adjustments and the sum of the net production of all metered pools or leases. For gas, the net production from the unmetered pool or lease shall be the difference between the volume recorded at the sales meter and the sum of the volumes recorded at the individual pool or lease meters.

(iv) Top allowable producers - If any well or unit in a prorated pool to be commingled can physically be produced at top unit allowable rates (even if restricted because of high gas-oil ratios), commingling may be permitted only if the production from such unit is metered prior to commingling, or determined by the subtraction method.

(v) Alternative methods - Production from each pool or lease to be commingled may also be determined by any other method specifically approved by the division prior to commingling. The division shall determine what evidence is necessary to support any request to use an alternative method.

(b) Approval process. Prior to commingling, the applicant shall notify the division by filing form C-103 (sundry notices and reports on wells) in the Santa Fe office with the following information set forth therein or attached thereto:

(i) Identification of each of the leases, pools or leases and pools to be commingled;

(ii) The method of allocation to be used. If the well test method is proposed for production from a prorated pool, the notification to the division shall be accompanied by a tabulation of production showing that the average daily production of any affected proration unit over a 60-day period has been below the top unit allowable for the subject pool (or for any newly drilled well without a 60-day production history, a tabulation of the available production) or other evidence acceptable to the division to establish that the well or wells on such unit are not capable of producing the top unit allowable. If the proposed method of allocation is other than an approved method provided in this section, the operator shall submit evidence of the reliability of such method;

(iii) A certification by a licensed attorney or qualified petroleum landman that the ownership in all pools and leases to be commingled is identical as defined in this section; and

(iv) Evidence of notice to the state land office and/or the United States bureau of land management, if required. Commingling may be authorized without any notice or hearing and may be commenced upon approval of form C-103 by the division, subject to compliance with any conditions of such approval noted by the division; provided however that commingling involving any state, federal or tribal leases shall not be commenced unless or until approved by the state land office or the United States bureau of land management, as applicable.

(4) Specific requirements and provisions for commingling of leases, pools or leases and pools with diverse ownership.

(a) Measurement and allocation methods. Where there is diversity of ownership between two or more leases, two or more pools, or between different pools and leases, the surface commingling of production therefrom shall be permitted only if production from each of such pools or leases is accurately metered, or determined by other methods specifically approved by the division, prior to such commingling.

(b) Meter proving and calibration frequencies.

(i) Oil. Each meter used in oil production accounting shall be tested for accuracy as follows: monthly, if more than 100,000 barrels of oil per month are measured through the meter; quarterly, if between 10,000 and 100,000 barrels of oil per month are measured through the meter; and semi-annually, if less than 10,000 barrels of oil per month are measured through the meter.

(ii) Gas. For each gas sales and allocation meter, the accuracy of the metering equipment at the point of delivery or allocation shall be tested following the initial installation and following repair and retested: quarterly, if 100 thousand cubic feet of gas per day ("Mcfgpd") or more are measured through the meter; and semi-annually, if less than 100 Mcfgpd are measured through the meter.

(iii) Correction and adjustment. If a meter proving and calibration test reveals inaccuracy in the metering equipment of more than two percent (2%), the volume measured shall be corrected and the meter adjusted to zero error. The operator shall submit a corrected report adjusting the volume of oil or gas measured and showing all calculations made in correcting the volumes. The volumes shall be corrected back to the time the inaccuracy occurred, if known. If the time is unknown, the volumes shall be corrected for the last half of the period elapsed since the date of the last calibration. If a test reveals an inaccuracy of less than 2%, the meter shall be adjusted, but correction of prior production shall not be required.

(c) Low production gas wells. For gas wells producing less than 15 Mcfgpd, estimation of production is an acceptable alternative to individual well measurement provided that commingling of production from different pools or leases does not take place unless otherwise authorized pursuant to Section 303 of 19.15.5 NMAC.

(d) Approval process.

(i) In general. Where there is diversity of ownership, the division may grant an exception to the requirements of Subsection A of 19.15.5.303 NMAC to permit surface commingling of production from different leases, pools or leases and pools only after notice and an opportunity for hearing as provided in Subparagraph (d) of Paragraph (4) of Subsection B of 19.15.5.303 NMAC.

(ii) Application. An application for administrative approval shall be submitted to the division's Santa Fe office on form C-107-B and shall contain a list of all parties (hereinafter called "interest owners") owning any interest in any of the production to be commingled (including owners of royalty and overriding royalty interests whether or not they have a right or option to take their interests in kind) and a method of allocating production to ensure the protection of correlative rights.

(iii) Notice. Notice shall be given to all interest owners in accordance with Subsection A of 19.15.14.1207 NMAC. The applicant shall submit a statement attesting that applicant, on or before the date the application was submitted to the division, sent notification to each of the interest owners by submitting a copy of the application and all attachments thereto, by certified mail, return receipt requested, and advising them that any objection must be filed in writing with the Santa Fe office of the division within 20 days from the date the division received the application. The division may approve the application administratively, without hearing, upon receipt of written waivers from all interest owners, or if no such owner has filed an objection within the 20-day period. If any objection is received, the application shall be set for hearing. Notice of the hearing shall be given to the applicant, to any party who has filed an objection, and to such other parties as the division shall direct.

(iv) Hearing ordered by the division. The division may set for hearing any application for administrative approval of surface commingling, and, in such case, notice of such hearing shall be given in such manner as the division shall direct.

(v) Notice by publication. When an applicant has been unable to locate all interest owners after exercising reasonable diligence, notice shall be provided by publication, and proof of publication shall be submitted with the application. Such proof shall consist of a copy of the legal advertisement that was published in a newspaper of general circulation in the county or counties in which the commingled production is located. The contents of such advertisement shall include (a) the name, address, telephone number, and contact party for the applicant, (b) the location by section, township and range of the leases from which production will be commingled and the location of the commingling facility; (c) the source of all commingled production by pool name, and (d) a notation that interested parties must file objections or requests for hearing in writing with the oil conservation division's Santa Fe office, within 20 days after publication, or the division may approve the application.

(vi) Effect of protest. All protests and requests for hearing received by the division shall be included in the case file; provided however, the protest will not be considered by the division as evidence. If the protesting party does not appear at the hearing, the application may be granted without the division receiving additional evidence in support thereof.

(vii) Additions. A surface commingling order may authorize, prospectively, the inclusion therein of additional pools and/or leases within defined parameters set forth in the order, provided that (a) the notice to the interest owners has included a statement that authorization for subsequent additions is being sought and of the parameters for such additions proposed by the applicant, and (b) the division finds that subsequent additions within defined parameters will not, in reasonable probability, reduce the value of the commingled production or otherwise adversely affect the interest owners. A subsequent application to amend an order to add to the commingled production other leases, pools or leases and pools that are within the defined parameters shall require notice only to the owners of interests in the production to be added, unless the division otherwise directs.

(viii) State, federal or tribal lands. Notwithstanding the issuance of an exception under Subsection B of 19.15.5.303 NMAC, no commingling involving any state, federal or tribal leases shall be commenced unless or until approved by the state land office or the United States bureau of land management, as applicable.

C. Downhole commingling

(1) The director may grant an exception to Subsection A of 19.15.303 NMAC to permit the commingling of multiple producing pools in existing or proposed wellbores when the following conditions are met:

(a) the fluids from each pool are compatible and combining the fluids will not result in damage to any of the pools;

(b) the commingling will not jeopardize the efficiency of present or future secondary recovery operations in any of the pools to be commingled;

(c) the bottom perforation of the lower zone is within 150% of the depth of the top perforation in the upper zone and the lower zone is at or below normal pressure with normal pressure assumed to be 0.433 psi per foot of depth. If the pools to be commingled are not within this vertical interval, then evidence will be required to demonstrate that commingling will not result in shut-in or flowing wellbore pressures in excess of the fracture parting pressure of any commingled pool. The fracture parting pressure shall be assumed to be 0.65 psi per foot of depth unless the applicant submits other measured or calculated pressure data acceptable to the division;

(d) the commingling will not result in the permanent loss of reserves due to cross-flow in the wellbore;

(e) fluid-sensitive formations that may be subject to damage from water or other produced liquids shall be protected from contact with such liquids produced from other pools in the well;

(f) if any of the pools being commingled is prorated, or the well's production has been restricted by division order in any manner, the allocated production from each producing pool in the commingled wellbore shall not exceed the top oil or gas allowable rate for a well in that pool or rate restriction applicable to such well;

(g) the commingling will not reduce the value of the total remaining production; and

(h) correlative rights will not be violated.

(2) The director may rescind authority to commingle production in a wellbore and require the pools to be produced separately if, in the director’s opinion, waste or reservoir damage is resulting, correlative rights are being impaired or the efficiency of any secondary recovery project is being impaired, or any changes or conditions render the installation no longer eligible for downhole commingling.

(3) When the conditions set forth in Paragraph (1) of Subsection C of 19.15.5.303 NMAC are satisfied, the director may approve a request to downhole commingle production in one of the following ways:

(a) **Individual exceptions:** Applications to downhole commingle in wellbores located outside of an area subject to a downhole commingling order issued in a "reference case" and not within a pre-approved pool or area shall be filed on division form C-107-A with the division.

(i) The director may administratively approve a form C-107-A application in the absence of a valid objection filed within 20-days after receipt of the application by the division if, in the director's opinion, waste will not occur and correlative rights will not be impaired.

(ii) In those instances where the ownership or percentages between the pools to be commingled is not identical, applicant shall send a copy of form C-107-A to all interest owners in the spacing unit by certified mail (return receipt).

(iii) Applicant shall send copies of form C-107-A to the commissioner of public lands for the state of New Mexico for wells in spacing units containing state lands or the bureau of land management for wells in spacing units containing federal lands.

(iv) The director may set any administratively filed form C-107-A application for hearing.

(b) **Exceptions for wells located in pre-approved pools or areas**: Applications to downhole commingle in wellbores within pools or areas that have been established by the division as "pre-approved pools or areas" pursuant to Subparagraph (b) of Paragraph (4) of Subsection C of 19.15.5.303 NMAC shall be filed on form C-103 (sundry notice of intent) at the appropriate division district office. The supervisor of the appropriate division district office may approve the proposed downhole commingling following receipt of form C-103. In addition to the information required by form C-103, the applicant shall include:

(i) number of division order that established pre-approved pool or area;

(ii) names of pools to be commingled;

(iii) perforated intervals;

(iv) allocation method and supporting data;

(v) a statement that the commingling will not reduce the value of the total remaining production;

(vi) in those instances where the ownership or percentages between the pools to be commingled is not identical, a statement attesting that applicant sent notice to all interest owners in the spacing unit by certified mail (return receipt) of its intent to apply for downhole commingling and no objection was received within 20 days of sending this notice; and

(vii) a statement attesting that applicant sent a copy of the division form C-103 to the commissioner of public lands for the state of New Mexico for wells in spacing units containing state lands or the bureau of land management for wells in spacing units containing federal lands using sundry notice form 3160-5.

(c) Exceptions for wells located in areas subject to a downhole commingling order issued in a "reference case": Applications to downhole commingle in wellbores within an area subject to a division order that excepted any of the criteria required by Subsection C of 19.15.5.303 NMAC or division form C-107-A shall be filed with the supervisor of the appropriate division district office and, except for the place of filing, shall meet the requirements of the applicable order issued in that "reference case".

(4) Applications for establishing a "reference case" or for pre-approval of downhole commingling on an area-wide or pool-wide basis:

(a) Reference cases: If sufficient data exists for a lease, pool, formation, or geographical area to render it unnecessary to repeatedly provide such data on form C-107-A, an operator may except any of the various criteria required under Subsection C of 19.15.5.303 NMAC or set forth in form C-107-A by establishing a "reference case." The division, upon its own motion or application from an operator, may establish "reference cases" either administratively or by hearing. Upon division approval of such "reference cases" for specific criteria, subsequent form C-107-A applications to downhole commingle will be required only to cite the division order number that established such exceptions and shall not be required to submit data for those criteria. Cases involving exceptions to the specific criteria required by Subsection C of 19.15.5.303 NMAC or by division form C-107-A may be approved by the division after notice sent to all interest owners in the affected spacing units by certified mail (return receipt) and based on evidence that such approval would adequately satisfy the conditions of Paragraph (1) of Subsection C of 19.15.5.303 NMAC.

(b) Pre-approval of downhole commingling on a pool-wide or area-wide basis: If sufficient data exists for multiple formations or pools that have previously been commingled or are proposed to be commingled, the division, upon its own motion or application from an operator, may establish downhole commingling on a pool-wide or area-wide basis either administratively or by hearing:

(i) Applications for pre-approval shall include all of the data required by division form C-107-A, a list of the names and address of all operators in the pools, all previous orders authorizing downhole commingling for the pools or area, and a map showing the location of all wells in the pools or area and indicating those wells approved for downhole commingling.

(ii) Applications for pre-approval of downhole commingling on a pool-wide or area-wide basis may be approved by the director after notice sent to operators in the affected pools or area by certified mail (return receipt) and based on evidence that such approval would adequately satisfy the conditions of Subsection C of 19.15.5.303 NMAC.

(iii) Upon approval of certain pools or areas for downhole commingling, subsequent applications for approval to downhole commingle wells within those pools or areas may be obtained by filing a division sundry notice (form C-103) in accordance with the procedure set forth in Subparagraph (b) of Paragraph (3) of Subsection C of 19.15.5.303 NMAC.

(c) The division will maintain and continually update a list of pre-approved pools or areas as set forth in Paragraph (5) of Subsection C of 19.15.5.303 NMAC.

(5) Pre-approved pools and areas: Downhole commingling is hereby approved within the described pool combinations or geographical areas set forth in Exhibit "A," provided, however, that the operator shall file form C-103 (sundry notice of intent) with the appropriate division district office in accordance with the procedure set forth in Subparagraph (b) of Paragraph (3) of Subsection C of 19.15.5.303 NMAC.

Pre-approved pools or geographic areas for downhole commingling, permian basin

All Blinebry, Tubb, Drinkard, Blinebry-Tubb, Blinebry-Drinkard & Tubb-Drinkard pool combinations within the following described geographic area in Lea County:

Township 18 South, Ranges 37, 38 and 39 East;
Township 19 South, Ranges 36, 37, 38 and 39 East;
Township 20 South, Ranges 36, 37, 38 and 39 East;
Township 21 South, Ranges 36, 37 and 38 East;
Township 22 South, Ranges 36, 37 and 38 East;
Township 23 South, Ranges 36, 37 and 38 East;
Township 24 South, Ranges 36, 37 and 38 East;
Township 25 South, Ranges 36, 37 and 38 East;
Township 26 South, Ranges 36, 37 and 38 East;

D. Off-lease transportation or storage prior to measurement**.** The division may grant exceptions to the requirements of Subsection A of 19.15.5.303 NMAC, administratively, without hearing, to permit production from one lease to be transported prior to measurement to another lease for storage thereon when:

(1) an application for off-lease transportation or storage prior to measurement has been filed on division form C-107-B with the Santa Fe office of the division with one copy to the appropriate district office of the division;

(2) all such production is from the same common source of supply;

(3) commingling of production from different leases will not result;

(4) there will be no intercommunication of the handling, separating, treating or storage facilities designated to each lease;

(5) all parties owning working interests in any of the production to be transported off lease prior to measurement have been notified of the application in accordance with the provisions of 19.15.N.1207.A NMAC and have consented in writing ;

(6) in lieu of Paragraph (5), Subsection D of 19.15.5.303 NMAC, the applicant furnishes proof that said parties were notified by registered or certified mail of its intent to transport the production from one lease to another lease for storage prior to measurement, and after a period of twenty (20) days following receipt of the application, no party has filed objection to the application; and

(7) if state, federal or Indian lands are involved, the commissioner of public lands for the state of New Mexico or the United States bureau of land management (as applicable) has been notified. The division may set for hearing any application for approval of off-lease transportation or storage prior to measurement, in which event notice of hearing shall be given, pursuant to 19.15.N.1207.A NMAC, to all owners of working interests in any of the production to be transported off lease prior to measurement, and to such other owners as the division may direct.
[1-1-50…2-1-96; 19.15.5.303 NMAC - Rn, 19 NMAC 15.E.303 & A, 5-15-00; A, 3-31-03]

19.15.5.304 CONTROL OF MULTIPLE COMPLETED WELLS:
Multiple completed wells which have been authorized by the division shall at all times be operated, produced, and maintained in a manner to ensure the complete segregation of the various common sources of supply. The division may require such tests as it deems necessary to determine the effectiveness of segregation of the different common sources of supply.
[1-1-50...2-1-96; 19.15.5.304 NMAC - Rn, 19 NMAC 15.E.304, 5-15-00]

19.15.5.305 METERED CASINGHEAD GAS:
The owner of a lease shall not be required to measure the exact amount of casinghead gas produced and used by him for fuel purposes in the development and normal operation of the lease. All casinghead gas produced and sold or transported away from a lease, except small amounts of flare gas, shall be metered and reported in standard cubic feet monthly to the division. The amount of casinghead gas sold in small quantities for use in the field may be calculated upon a basis generally acceptable in the industry, or upon a basis approved by the division in lieu of meter measurements.
[1-1-50...2-1-96; 19.15.5.305 NMAC - Rn, 19 NMAC 15.E.305, 5-15-00]

19.15.5.306 CASINGHEAD GAS:

A. No casinghead gas produced from any well in this state shall be flared or vented after 60 days following completion of the well.

B. Any operator seeking an exception to the foregoing shall file an application therefor on division form C-129, application for exception to no-flare rule 306. Form C-129 shall be filed in triplicate with the appropriate district office of the division. The district supervisor may grant an exception when the same appears reasonably necessary to protect correlative rights, prevent waste, or prevent undue hardships on the applicant. The district supervisor shall either grant the exception within ten days after receipt of the application or refer it to the division director who will advertise the matter for public hearing if a hearing is desired by the applicant.

C. The flaring or venting by an operator of gas from any well in violation of this rule will result in suspension of the allowable assigned to the well.

D. No extraction plant processing gas in the state of New Mexico shall flare or vent such gas unless such flaring or venting is made necessary by mechanical difficulty of a very limited temporary nature or unless the gas flared or vented is of no commercial value.

E. In the event of a more prolonged mechanical difficulty or in the event of plant shut-downs or curtailment because of scheduled or non-scheduled maintenance or testing operations or other reasons, or in the event a plant is unable to accept, process, and market all of the casinghead gas produced by wells connected to its system, the plant operator shall notify the division as soon as possible of the full details of such shut-down or curtailment, following which the division shall take such action as is necessary to reduce the total flow of gas to such plant.

F. Pending connection of a well to a gas-gathering facility, or when a well has been excepted from the provisions of Paragraph A. of this rule, all gas produced and not utilized shall be burned, and the estimated volume reported on the monthly production report, form C-115.

G. The provisions of Paragraph A. of this rule shall not be applicable to wells completed prior to January 1, 1971, in pools which had no gas-gathering facilities on that date, provided however, said provisions shall be applicable to all wells in such a pool 60 days after the date of first casinghead gas connection in the pool.
[9-1-72...2-1-96; 19.15.5.306 NMAC - Rn, 19 NMAC 15.E.306, 5-15-00]

19.15.5.307 OPERATION AT BELOW ATMOSPHERIC PRESSURE:

A. A well operator may use vacuum pumps, gathering system compressors or other devices to operate a well or gathering system at below atmospheric pressure only if that operator has:

(1) executed a written agreement with the operator of the downstream gathering system or pipeline to which the well or gathering system so operated is immediately connected allowing operation of the well or gathering system at below atmospheric pressure; and

(**2)** filed a sundry notice in the appropriate district office of the division for each well operated at below atmospheric pressure or served by a gathering system operated at below atmospheric pressure, within ninety (90) days before beginning operation at below atmospheric pressure, notifying the division that the well or gathering system serving the well is being operated at below atmospheric pressure.

B. A gathering system operator may use vacuum pumps, gathering system compressors or other devices to operate a gathering system at below atmospheric pressure, or may accept gas originating from a well operated at below atmospheric pressure or that has been carried by any upstream gathering system operated at below atmospheric pressure, only if that operator has executed a written agreement with the operator of the downstream gathering system or pipeline to which the gathering system is immediately connected allowing delivery of gas from a well or gathering system that has been operated at below atmospheric pressure into the downstream gathering system or pipeline.

[1-1-50...2-1-96; 19.15.5.307 NMAC - Rn, 19 NMAC 15.E.307, 5-15-00; Repealed, 08/31/04; N, 08/31/04]

19.15.5.308 SALT OR SULPHUR WATER:

Operators shall report monthly on form C-115 the amount of water produced with the oil and gas from each well.

[1-1-50...2-1-96; 19.15.5.308 NMAC - Rn, 19 NMAC 15.E.308, 5-15-00]

19.15.5.309 AUTOMATIC CUSTODY TRANSFER EQUIPMENT:

A. Oil shall be received and measured in a facility of an approved design. Such facilities shall permit the testing of each well at reasonable intervals and may be comprised of manually gauged, closed stock tanks for which proper strapping tables have been prepared, or of automatic custody transfer (ACT) equipment. The use of such automatic custody transfer equipment shall be permitted only after compliance with the following: The operator shall file with the division form C-106, notice of intention to utilize automatic custody transfer equipment, and shall receive approval thereof prior to transferring oil through the ACT system. The carrier shall not accept delivery of oil through the ACT system until form C-106 has been approved.

B. Form C-106 shall be submitted in quadruplicate to the appropriate district office of the division and shall be accompanied (in quadruplicate) by the following:

(1) Plat of the lease showing thereon all wells which will be produced into the ACT system.

(2) Schematic diagram of the ACT equipment, showing thereon all major components such as surge tanks and their capacity, extra storage tanks and their capacity, transfer pumps, monitors, reroute valves, treaters, samplers, strainers, air and gas eliminators, back pressure valves, metering devices, (indicating type and capacity, i.e. whether automatic measuring tank, positive volume metering chamber, weir-type measuring vessel, or positive displacement meter). Schematic diagram shall also show means employed to prove accuracy of measuring device.

(3) Letter from transporter agreeing to utilization of ACT system as shown on schematic diagram.

C. Form C-106 will not be approved by the division unless the ACT system is to be installed and operated in compliance with the following:

(1) Provision must be made for accurate determination and recording of uncorrected volume and applicable temperature, or of temperature corrected volume. The overall accuracy of the system shall equal or surpass manual methods.

(2) Provision must be made for representative sampling of the oil transferred for determination of API gravity and BS&W content.

(3) Provision must be made if required by either the producer or the transporter of the oil to give adequate assurance that only merchantable oil is run by the ACT system.

(4) Provision must be made for set-stop counters to stop the flow of oil through the ACT system at or prior to the time the allowable has been run. All counters shall provide non-reset totalizers which shall be visible for inspection at all times.

(5) All necessary controls and equipment must be enclosed and sealed, or otherwise be so arranged as to provide assurance against, or evidence of, accidental or purposeful mismeasurement resulting from tampering.

(6) All components of the ACT system shall be properly sized to ensure operation within the range of their established ratings. All components of the system which require periodic calibration and/or inspection for proof of continued accuracy must be readily accessible. The frequency and methods of such calibration and/or inspection shall be set forth in Paragraph (12) of Subsection C of 19.15.5 NMAC.

(7) The control and recording system must include adequate fail-safe features which will provide assurance against mismeasurement in the event of power failure, or the failure of the ACT system's component parts.

(8) The ACT system and allied facilities shall include such fail-safe equipment as may be necessary, including high level switches in the surge tank or overflow storage tank which, in the event of power failure or malfunction of the ACT or other equipment, will shut down all artificially lifted wells connected to the ACT system and will shut in all flowing wells at the well-head or at the header manifold, in which latter case all flowlines shall be pressure-tested to at least 1 ½ times the maximum well-head shut-in pressure prior to initial use of the ACT system and each two years thereafter.

(9) As an alternative to the requirements of, Paragraph (8) of Subsection C of 19.15.5 NMAC the producer shall provide and shall at all times maintain a minimum of available storage capacity above the normal high working level of the surge tank to receive and hold the amount of oil which may be produced during maximum unattended time of lease operation.

(10) In all ACT systems employing automatic measuring tanks, weir-type measuring vessels, positive volume metering chambers, or any other volume measuring container, the container and allied components shall be properly calibrated prior to initial use and shall be operated, maintained, and inspected as necessary to ensure against incrustation, changes in clingage factors, valve leakage or other leakage, and improper action of floats, level detectors, etc.

(11) In all ACT systems employing positive displacement meters, the meter(s) and allied components shall be properly calibrated prior to initial use and shall be operated, maintained, and inspected as necessary to ensure against mismeasurement of oil.

(12) The measuring and recording devices of all ACT systems shall be checked for accuracy at least once each month unless exception to such determination has been obtained from the division director. API standard 1101, "measurement of petroleum liquid hydrocarbons by positive displacement meter," shall be used where applicable. Meters may be proved against master meters, portable prover tanks, or prover tanks permanently installed on the lease. If permanently installed prover tanks are used, the distance between the opening and closing levels and the provision for determining the opening and closing readings shall be sufficient to detect variations of 5/100 of one percent. Reports of determination shall be filed on the division form entitled "meter test report," or on another acceptable form and shall be submitted in duplicate to the appropriate district office of the division.

(13) To obtain exception to the requirement of Paragraph (12) of Subsection C of 19.15.5 NMAC that all measuring and recording devices be checked for accuracy once each month, either the producer or transporter may file such a request with the division director setting forth all facts pertinent to such exception. The application shall include a history of the average factors previously obtained, both tabulated and plotted on a graph of factors versus time, showing that the particular installation has experienced no erratic drift. The applicant shall also furnish evidence that the other interested party has agreed to such exception. The division director may then set the frequency for determination of the system's accuracy at the interval which he deems prudent.

D. Failure to operate an automatic custody transfer system in compliance with this rule shall subject the approval thereof to revocation by the division.

[5-1-61…2-1-96; 19.15.5.309 NMAC - Rn, 19 NMAC 15.E.309, 5-15-00, A, 3-31-03]

19.15.5.310 TANKS, OIL TANKS, FIRE WALLS, AND TANK IDENTIFICATION:

A. Oil shall not be stored or retained in earthen reservoirs, or in open receptacles. Dikes or fire walls shall not be required except such fire walls must be erected and kept around all permanent oil tanks, or battery of tanks that are within the corporate limits of any city, town or village, or where such tanks are closer than 150 feet to any producing oil or gas well or 500 feet to any highway or inhabited dwelling or closer than 1000 feet to any school or church, or where such tanks are so located as to be deemed an objectional hazard within the discretion of the division. Where fire walls are required, fire walls shall form a reservoir having a capacity one-third larger than the capacity of the enclosed tank or tanks.

B. After August 1, 1982, all oil tanks, tank batteries, automatic custody transfer systems, tanks used for salt water collection or disposal, and tanks used for sediment oil treatment or storage shall be identified by a sign posted on or not more than 50 feet from the tank, tank battery, or system. Such signs shall be of durable construction and the lettering thereon shall be kept in a legible condition and shall be large enough to be legible under normal conditions at a distance of 50 feet and shall identify the name of the operator, the name of the lease(s) being served by the tank(s) or system, if any, and the location of such tank(s) or system by unit letter, section, township, and range.

[1-1-50...2-1-96; 19.15.5.310 NMAC - Rn, 19 NMAC 15.E.310, 5-15-00]

19.15.5.311 SEDIMENT OIL, TANK CLEANING, AND TRANSPORTATION OF MISCELLANEOUS HYDROCARBONS:

A. "Sediment oil" is defined as tank bottoms and any other accumulations of liquid hydrocarbons on an oil and gas lease, which hydrocarbons are not merchantable through normal channels.

B. No tank shall be cleaned of sediment oil nor shall sediment oil be removed from any lease without prior approval of the appropriate division district office. Authorization for tank cleaning may be received by the operator of the lease or by the company contracted or otherwise authorized to perform the tank cleaning by obtaining approval on form C-117-A (tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit). No operator, contractor, or other party shall engage in the cleaning of any tank of sediment oil or the removal of sediment oil from any lease without an approved copy of form C-117-A at the site.

C. No sediment oil shall be destroyed unless and until the appropriate division district office has approved an application to destroy the same on form C-117-A (tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit). Unless the authorization to destroy sediment oil is utilized within ten (10) days after approval of the form C-117-A such authorization is automatically revoked. However, the district supervisor may approve one ten (10) day extension for good cause shown.

D. Any operator, contractor, or party, other than a treating plant operator, who cleans any tank of sediment oil and removes sediment oil from any lease shall file form C-117-B (monthly sediment oil disposal statement) setting out all information required thereon.

E. A representative sample of sediment oil from any source shall be tested in a manner designed to accurately estimate the percentage of good oil expected to be recovered therefrom. Such test shall be performed prior to transport and prior to commingling with sediment oil from other leases or sources and the results recorded on the appropriate form C-117-A. The division recommends the standard centrifugal tests prescribed by API Manual of Petroleum Measurement Standards, Chapter 10, Section 4. Other test procedures may be used if such procedures reliably predict the percentage of good oil to be recovered from sediment oil.

F. All sediment oil removed from storage shall be reported on form C-115 (operator's monthly report) together with the form C-117-A (tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit) permit number.

G. "Miscellaneous hydrocarbons" are defined as tank bottoms occurring at pipeline stations, crude oil storage terminals, or refineries, pipeline break oil, catchings collected in traps, drips, or scrubbers by operators of gasoline plants in such plants or in the gathering lines serving such plants, the catchings collected in private, community, or commercial salt water disposal systems, or any other liquid hydrocarbon which is not lease crude or condensate.

H. Except in case of emergency, no miscellaneous hydrocarbons shall be delivered to a treating plant or other facility until division approval is obtained on form C-117-A (tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit).

I. Whenever an emergency exists which requires delivery of miscellaneous hydrocarbons to a treating plant or other facilities prior to approval of form C-117-A, the transporter of such hydrocarbons shall notify the supervisor of the appropriate division district office of the nature and extent of such emergency on the first working day following the emergency and shall file form C-117-A within two working days following the emergency. For prolonged emergencies, the district supervisor may authorize the extended movement of miscellaneous hydrocarbons to a treating plant or other facilities during the period of the emergency and shall approve a form C-117-A filed subsequent to the conclusion of such emergency covering the entire volume of miscellaneous hydrocarbons transported.
[1-1-50…2-1-96; 19.15.5.311 NMAC - Rn, 19 NMAC 15.E.311, 5-15-00]

19.15.5.312 RESERVED: [Formerly "Treating Plants". Repealed 7-26-95]

19.15.5.313 EMULSION, BASIC SEDIMENTS, AND TANK BOTTOMS: Wells producing oil shall be operated in such a manner as will reduce as much as practicable the formation of emulsion and basic sediments. These substances and tank bottoms shall not be allowed to pollute fresh waters or cause surface damage.
[1-1-50...2-1-96; 19.15.5.313 NMAC - Rn, 19 NMAC 15.E.313, 5-15-00; A, 03/31/04]

19.15.5.314 GATHERING, TRANSPORTING AND SALE OF DRIP:

A. "Drip" is defined as any liquid hydrocarbon incidentally accumulating in a gas gathering or transportation system.

B. The waste of drip is hereby prohibited when it is economically feasible to salvage the same.

C. The movement and sale of drip is hereby authorized, provided the provisions of this Rule are complied with.

D. No drip shall be transported nor sold until the gas transporter has filed division form C-104 designating the drip transporter authorized to remove the drip from its gas gathering or transportation system.

E. Every person transporting drip within the state of New Mexico shall file division form C-112 each month, showing the amount, source, and disposition of all drip handled during the reporting period, and such other reports as may hereafter be required by the division.

F. Prior to commencement of operations, every person transporting drip directly from a gas gathering or transportation system shall file with the division plats drawn to scale, locating and identifying each drip trap which he is authorized to service.

G. Every person transporting drip directly from a gas gathering or transportation system shall keep a record of daily acquisitions from each drip trap which he is authorized to service, which records shall be made available at all reasonable times for inspection by the division or its authorized representatives.

H. Every gas transporter in the state of New Mexico shall, on or before the first day of November of each year, file with the division maps of its entire gas gathering and transportation systems within the state of New Mexico, locating and identifying thereon each drip trap in said systems, said maps to be accompanied by a report, on a form prescribed by the division, showing the disposition being made of the drip from each of said drip traps.

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 6 NATURAL GAS PRODUCTION OPERATING PRACTICE

19.15.6.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 South Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2-1-96; 19.15.6.1 NMAC - Rn, 19 NMAC 15.F.1, 12-14-01]

19.15.6.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.6.1 NMAC - Rn, 19 NMAC 15.F.2, 12-14-01]

19.15.6.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.6.3 NMAC - Rn, 19 NMAC 15.F.3, 12-14-01]

19.15.6.4 DURATION: Permanent.
[2-1-96; 19.15.6.4 NMAC - Rn, 19 NMAC 15.F.4, 12-14-01]

19.15.6.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.6.5 NMAC - Rn, 19 NMAC 15.F.5, 12-14-01]

19.15.6.6 OBJECTIVE: To regulate the production of natural gas to enable the Oil Conservation Division to fulfill its statutory mandates under the Oil and Gas Act.
[2-1-96; 19.15.6.6 NMAC - Rn, 19 NMAC 15.F.6, 12-14-01]

19.15.6.7 DEFINITIONS: [RESERVED].

19.15.6.8-400 [RESERVED].

19.15.6.401 METHOD OF DETERMINING NATURAL GAS WELL POTENTIAL:

A. All operators shall conduct tests to determine the daily open flow potential volumes of all natural gas wells from which gas is being used or marketed. Such tests shall be reported on forms prescribed by the division within 60 days after:

(1) the date of initial connection of the well to a gas transportation facility; and

(2) the date of reconnection following workover.

B. To establish comparable open flow capacity, wells shall be tested in accordance with the Oil Conservation Division "Manual for Back-Pressure Testing of Natural Gas Wells." In the event the division approves the alternate method for testing, all wells producing from a common source of supply shall be tested in a uniform and comparable manner.

C. All gas wells which are not connected to a gas gathering facility shall be tested within 30 days following the installation of a christmas tree. Tests shall be taken in accordance with the Rules of Procedure for Testing Unconnected Gas Well contained in the Oil Conservation Division "Manual for Back-Pressure Testing of Natural Gas Wells." Tests shall be reported on Form C-122 in compliance with Rule 1122 and shall be filed within 10 days following completion of the test.
[5-25-64...2-1-96; 19.15.6.401 NMAC - Rn, 19 NMAC 15.F.401, 12-14-01]

19.15.6.402 [RESERVED].

[7-15-63...2-1-96; 19.15.6.402 NMAC - Rn, 19 NMAC 15.F.402, 12-14-01; 19.15.6.402 NMAC - Repealed, 02-17-03]

19.15.6.403 NATURAL GAS FROM GAS WELLS TO BE MEASURED:

A. All natural gas produced shall be accounted for by metering or other method approved by the division and reported to the division by the transporter of the gas. Gas produced from a gas well and delivered to a gas transportation facility shall be reported by the owner or operator of the gas transportation facility. Gas produced from a gas well and required to be reported under this rule, which is not delivered to and reported by a gas transportation facility shall be reported by the operator of the well.

B. An operator may apply to the OCD District Supervisor, using Form C-136, for approval of one of the following procedures for measuring gas:

(1) In the event a well is not capable of producing more than 15 MCFD, a measurement method agreed upon by the operator and transporter whereby the parties establish by annual test the producing rate of said well under normal operating conditions and apply that rate to the period of time the well is in a producing status. If such well is capable of producing greater than 5 MCFD, a device shall be attached to the line which will determine the actual time period that the well is flowing.

(2) Any well which has a producing capacity of 100 MCFD or less and which is on a multi-well lease may be produced without being separately metered when the gas is measured using a lease meter at a Central Point Delivery (CPD). The ownership of the lease must be common throughout including working interest, royalty and overriding royalty ownership.

(3) If normal operating conditions change, either party may request a new well test, the cost of which will be borne by the party so requesting unless otherwise agreed upon.

C. Operators and transporters shall report the well volumes on Forms C-115 and C-111 based upon the approved method of measurement and, in the case of a CPD, upon the method of allocation of production to individual wells approved by the district supervisor.

[1-1-50, 12-23-91...2-1-96; 19.15.6.403 NMAC - Rn, 19 NMAC 15.F.403, 12-14-01]

19.15.6.404 NATURAL GAS UTILIZATION:

A. After the completion of a natural gas well, no gas from such well shall be:

(1) permitted to escape to the air;

(2) used expansively in engines or pumps and then vented, or

(3) used to gas-lift wells unless all gas produced is processed in a gasoline plant, used in the manufacture of carbon black, or beneficially used thereafter without waste.

B. Carbon black plants may utilize natural gas only in those instances in which all casinghead gas and residue gas produced in the vicinity of or which may reasonably be reached from the carbon black plant, is being used beneficially.

C. Any carbon black plant constructed after June 10, 1954, or any then existing carbon black plant which enlarges or expands its facilities for the manufacture of carbon black, may utilize natural gas in the manufacture of carbon black only after permission of the division is obtained upon due notice and hearing.

[1-1-50, 6-10-54...2-1-96; 19.15.6.404 NMAC - Rn, 19 NMAC 15.F.404, 12-14-01]

19.15.6.405 STORAGE GAS:

With the exception of the requirement to meter and report monthly the amount of gas injected and the amount of gas withdrawn from storage, in the absence of waste these rules and regulations shall not apply to gas being injected into or removed from storage. (See Rule 1131.)

[1-1-50...2-1-96; 19.15.6.405 NMAC - Rn, 19 NMAC 15.F.405, 12-14-01]

19.15.6.406 CARBON DIOXIDE:

The statewide regulations relating to gas and natural gas, gas wells, and gas reservoirs including, but not limited to, those provisions relating to well locations, acreage dedication requirements, casing and cementing requirements, and measuring and reporting of production shall also apply to carbon dioxide gas, carbon dioxide wells, and carbon dioxide reservoirs.

[1-1-50...2-1-96; 19.15.6.406 NMAC - Rn, 19 NMAC 15.F.406, 12-14-01]

19.15.6.407 DISCONNECTION OF GAS WELLS:

All gas wells which are disconnected from intrastate gas transportation facilities shall be reported to the division by the operator of the well or wells within 30 days of the date of disconnection. Such notice must be filed on Form C-130 in compliance with Rule 1130.

[8-23-77...2-1-96; 19.15.6.407 NMAC - Rn, 19 NMAC 15.F.407, 12-14-01]

19.15.6.408 HARDSHIP GAS WELL:

A. Hardship gas well is defined as a gas well wherein "underground waste" will occur if the well should be shut-in or curtailed below its minimum sustainable flow rate.

B. No well shall be classified as a hardship gas well except after notice and hearing or upon appropriate administrative action of the division.

C. Wells approved as hardship gas wells under Sections 409 and/or 410 of 19.15.6 NMAC shall be given priority access (over other gas wells) to the current available gas market to the extent that they might otherwise be restricted below the approved minimum flow rate.

[3-2-84...2-1-96; 19.15.6.408 NMAC - Rn, 19 NMAC 15.F.408, 12-14-01]

19.15.6.409 APPLICATION FOR HARDSHIP GAS WELL CLASSIFICATION:

A. Application for hardship gas well classification shall be made in the form prescribed by the division and shall include the following:

(1) a narrative description of the problem(s) which leads the applicant to believe that underground waste will occur if the well is shut-in or curtailed below its ability to produce;

(2) documentation that the applicant has made all reasonable and economic attempts to eliminate or correct the problem(s) or an explanation and justification as to why such attempts were not made;

(3) a wellbore sketch;

(4) historical data such as permanent loss of productivity after shut-in, frequency and actual costs of swabbing after shut-in or curtailment including length of swab time required, actual cost figures showing the inability to continue operations without special relief, or any other data which would show that shut-in or curtailment would cause underground waste;

(5) if failure to obtain a hardship gas well classification would result in premature abandonment of the well, a calculation of the reserves which would be lost thereby;

(6) the minimum sustainable producing rate as determined by a minimum flow or "log-off" test or documentation of well production history;

(7) a plat and/or map showing the proration unit dedicated to the well and the ownership of the offsetting acreage;

(8) the name of the authorized transporter (and purchaser if different) of gas; and

(9) any other data the applicant considers relevant.

B. Applications for hardship gas well classification shall be made in duplicate with the original copy being filed at Santa Fe and a copy being filed with the appropriate division district office.

C. In addition, the applicant will notify the transporter and purchaser of gas from the well and all offset operators of the application and the requested minimum producing rate and shall so certify to the division in his application.

[3-2-84...2-1-96; 19.15.6.409 NMAC - Rn, 19 NMAC 15.F.409, 12-14-01]

19.15.6.410 PROCESSING OF APPLICATIONS FOR HARDSHIP GAS WELLS:

A. The director of the division may administratively approve any application for hardship gas well classification or he may set such matter for notice and hearing.

B. Applications which are to be approved administratively shall be listed in the dockets of division or commission hearings which are issued from time to time.

(1) If no affected party has filed written objection to any such proposed administrative action within 20 days following the date of the hearing for which the docket is issued, the application may be approved. If any such party shall file an objection before or within such 20 day period, the application will be set for hearing unless withdrawn by the applicant.

(2) The director of the division, on his own or upon the request of an affected party, may require a minimum flow (log-off) test on the well for which the hardship classification is being sought. The applicant shall give notice to the division, the gas transporter and purchaser and the requesting affected party of any minimum flow test conducted following such a request, in order that such test may, at the option of the division or said parties, be witnessed. Notice of any minimum flow test conducted prior to submitting a hardship gas well application shall be given to the appropriate division district office, the gas transporter and purchaser, and offset operators in order that such test may, at the option of said parties, be witnessed.

[3-2-84...2-1-96; 19.15.6.410 NMAC - Rn, 19 NMAC 15.F.410, 12-14-01]

19.15.6.411 EMERGENCY HARDSHIP GAS WELL CLASSIFICATION:

A. The supervisor of the appropriate division district office may grant emergency approval of a hardship gas well classification upon receipt of a copy of the application form and attachments and a request by the applicant.

B. Approval of such emergency classification shall be made in writing to the director of the division, the applicant, and the purchaser. Emergency approval shall be given for 90 days and on a one time only basis.

[3-2-84...2-1-96; 19.15.6.411 NMAC - Rn, 19 NMAC 15.F.411, 12-14-01]

19.15.6.412 LIMITS ON HARDSHIP GAS WELL CLASSIFICATION:

A. No hardship gas well classification shall be retained for a period in excess of one year unless the applicant shall annually request an extension thereof and certify that the condition of the well has not substantially changed.

B. The division on its own motion may require that the applicant show cause why approval of the hardship gas well classification should not be rescinded in cases of suspected abuse, changed market conditions, or for any other reason.

C. Any well classified as a hardship gas well located in a prorated gas pool shall accumulate over or under production. No well which is classified as a hardship gas well shall be shut in for reason of over production.

D. Affected parties may petition the division for hearing for the purpose of offsetting any ratable take advantage which might be gained by the operator of a hardship gas well.
[3-2-84...2-1-96; 19.15.6.412 NMAC - Rn, 19 NMAC 15.F.412, 12-14-01]

19.15.6.413 [RESERVED].

19.15.6.414 GAS SALES BY LESS THAN ONE HUNDRED PERCENT OF THE OWNERS IN A WELL: When there are separate owners in a well and where any such owner's gas is not being sold with current production from such well, such owner may, if necessary to protect his correlative rights, petition the division for a hearing seeking appropriate relief.
[1-1-84...2-1-96; 19.15.6.414 NMAC - Rn, 19 NMAC 15.F.414, 12-14-01]

TITLE 19 NATURAL RESOURCES & WILDLIFE
CHAPTER 15 OIL AND GAS
PART 7 OIL PRORATION AND ALLOCATION

19.15.7.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2-1-96; 19.15.7.1 NMAC – Rn, 19 NMAC 15.G.1, 6-14-02]

19.15.7.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.7.2 NMAC – Rn, 19 NMAC 15.G.2, 6-14-02]

19.15.7.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.7.3 NMAC – Rn, 19 NMAC 15.G.3, 6-14-02]

19.15.7.4 DURATION: Permanent.
[2-1-96; 19.15.7.3 NMAC – Rn, 19 NMAC 15.G.4, 6-14-02]

19.15.7.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.7.5 NMAC – Rn, 19 NMAC 15.G.5, 6-14-02]

19.15.7.6 OBJECTIVE: To regulate oil proration and allocation to prevent waste and protect correlative rights pursuant to the Oil and Gas Act.
[2-1-96; 19.15.7.6 NMAC – Rn, 19 NMAC 15.G.6, 6-14-02]

19.15.7.7 DEFINITIONS: [RESERVED].

19.15.7.8-500 [RESERVED].

19.15.7.501 REGULATION OF OIL POOLS:

A. To prevent waste, the division shall prorate and distribute the allowable production among the producers in a pool upon a reasonable basis and recognizing correlative rights.

B. After notice and hearing, the division, in order to prevent waste and protect correlative rights, may promulgate special rules, regulations, or orders pertaining to any pool.
[1-1-50...2-1-96; 19.15.7.501 NMAC – Rn, 19 NMAC 15.G.501, 6-14-02]

19.15.7.502 RATE OF PRODUCING WELLS:

A. Daily Tolerance

(1) It is recognized that oil wells located on units capable of producing their allowables may overproduce one day and underproduce another. No unit capable of producing its allowable, except for the purpose of testing, in the process of completing or recompleting a well or for tests made for the purpose of obtaining scientific data, shall produce any day more than 125% of the daily top unit allowable for the pool in which the same is located. (Subject to the foregoing, any underproduction may be made up by production from the same unit within the same month, and in like manner any overproduction shall be adjusted or balanced by underproduction from the same unit, within the same proration period).

(2) It is also recognized that certain wells must, as a matter of practicality, be produced at daily rates in excess of 125% of the daily top unit allowable for the pool in which such wells are located. The division director is hereby given authority to grant exceptions to the provisions of Paragraph (1) of Subsection A of 19.15.7.502 NMAC, without formal hearing, where application is filed in due form setting out the reasons for such requested exception; applicants for such exceptions shall, at the time of filing, also furnish each operator in the pool in which the subject well is located, a copy of such application. Included in any application for exception or attached thereto, filed under authority hereof, shall be a formal written statement by the applicant that every operator in the pool in which the subject well is located has been served with a copy of such application. The division director shall wait at least ten (10) days after receipt before approving any such application, and shall approve the same only in absence of objection from any operator or interested party, or in his discretion. In the event the Director for any reason fails to

approve such application, the division after notice will hear and determine the matter.

B. Monthly Tolerance - No unit shall produce during any one proration period more than the allowable production of such unit for the proration period plus a tolerance of not to exceed five (5) days allowable production. This permissive tolerance of overproduction from a unit shall be subject to all other provisions of 19.15.7.502 NMAC and particularly to the provisions of Subsection D of 19.15.7.502 NMAC. This permissive tolerance of overproduction from a unit shall be adjusted or balanced by subsequent corresponding underproduction from the same unit. Overproduction within the permitted tolerance shall be considered as oil produced against the allowable production assigned to the unit for the proration period during which such overproduction is adjusted or balanced by underproduction.

C. Production in Excess of Monthly Allowable, Plus Tolerance

(1) Oil produced from any unit in excess of the assigned monthly allowable plus the permissive proration period tolerance shall be "illegal oil" as defined in the Oil and Gas Act, unless:

(a) such excess oil be produced as a result of mistake or error;

(b) mechanical failure beyond the immediate control of the operator; or,

(c) resulting from essential tests of the unit within the purview of Oil Conservation Rules.

(2) Whenever production from any unit for a proration period is in excess of the assigned allowable, plus the permitted tolerance authorized herein and the cause of such excess reasonably falls within Subparagraphs (a), (b), or (c) of Paragraph (1) of Subsection C of 19.15.7.502 NMAC, the producer or operator shall briefly set forth the cause of such excess production together with a proposed plan of adjustment thereof, upon all copies of the operator's monthly report (Form C-115) for the month in which such excess production occurs. Such excess production shall be considered as oil produced against the allowable assigned to the unit for the following proration period, and it may be transported from the lease tanks only as and when the unit accrues daily allowable to offset such excess production.

D. General

(1) The tolerance permitted on a daily or monthly basis as provided hereinabove shall not be construed to increase the allowable of a producing unit or to grant authority to any operator to market or to any transporter to transport any quantity of oil in excess of the unit's allowable.

(2) The possession of a quantity of oil in lease storage at the end of any proration period in excess of five days allowable plus any rerun allowable oil shall be construed as violation of this Rule, unless reported in the manner and within the time provided for filing Form C-115 provided by Subsection C of 19.15.7.502 NMAC above.

E. Storage Records - All producers and all transporters of oil are required to maintain adequate records showing unrun allowable oil in storage at the end of each proration period. Such storage oil shall be the amount of oil in tanks from which oil is measured and delivered to the transporter.

[8-28-53...2-1-96; 19.15.7.502 NMAC – Rn, 19 NMAC 15.G.502, 6-14-02]

19.15.7.503 AUTHORIZATION FOR PRODUCTION OF OIL:

A. Except as provided below, the daily top unit allowable for any oil pool shall be 100 percent of the depth bracket allowable for the pool determined pursuant to the provisions of 19.15.7.505 NMAC.

B. The division shall have the option, within five days prior to the end of the month, to make a determination as to the likelihood of the total producing capacity of all oil wells in the state being in excess of anticipated reasonable market demand for crude petroleum oil from this state. If the division determines that such capacity may be in excess of the anticipated reasonable market demand, and that a market demand factor of less than 100 percent may be necessary to prevent waste, it shall immediately institute proper proceedings for a hearing to be held before the 20th day of the following month to determine actual reasonable market demand up to a maximum of 6 months.

C. At said hearing the division shall consider all evidence of market demand for crude petroleum oil from this state, and if it is determined that the market demand percentage factor should be less than 100 percent, an order shall be issued establishing the market demand factor and setting a date for the next market demand hearing.

D. The market demand factor thus established shall be multiplied by the applicable depth bracket allowable for each well and each pool to determine its unit allowable. Any fraction of a barrel shall be regarded as a full barrel in determining top unit allowable. Upon initial establishment of a market demand factor, and from time to time thereafter, the division shall issue a proration schedule authorizing the production of oil from the various proration units in the various pools in the state. Any well completed or recompleted after the issuance of said schedule and for which Form C-104 has been approved, shall, by supplement to the schedule, be authorized a daily allowable equal to the top unit allowable in effect. The allowable for such well shall become effective at 7:00 a.m. on the date of the completion, provided Form C-104 is submitted and approved within ten days following date of completion; otherwise the allowable shall be effective on the date the C-104 is approved. (As provided in Rule 1104, "date of completion" is the date when new oil is delivered into the stock tanks.)

E. A non-marginal unit is defined as being a proration unit which is capable of producing top unit allowable for the pool in which it is located and to which has been assigned a top unit allowable. Any such non-marginal unit shall be permitted to produce said top unit allowable without waste and subject to the provisions of 19.15.5.301 NMAC, 19.15.7.502 NMAC and 19.15.7.506 NMAC and all other applicable rules.

F. A marginal unit is defined as being a proration unit which is incapable of producing top unit allowable for the pool in which it is located as evidenced by well test, production history, or other report or form filed by the operator with the division. Any such marginal unit shall be permitted to produce any amount of oil which it is capable of producing without waste up to top unit allowable for the pool, subject to the provisions of 19.15.5.301 NMAC, 19.15.7.502 NMAC and 19.15.7.506 NMAC, and all other applicable rules, provided that an allowable has been assigned to the unit to authorize such production.

G. A penalized non-marginal unit is defined as being a proration unit to which, because of an excessive gas-oil ratio, an allowable has been assigned which shall be determined in accordance with the procedure set forth in 19.15.7.506 NMAC. In calculating a penalized allowable, any fraction of a barrel shall be regarded as a full barrel.

H. A periodic tabulation of all supplements to the current proration schedule shall be made and distributed by the division.

I. The provisions of Subsection H of 19.15.3.104 NMAC shall be adhered to in fixing top unit allowables.

J. In the event it becomes necessary for any transporter of crude petroleum to resort to pipeline proration in New Mexico, such transporter shall, as soon as possible and not later than 24 hours after the effective date thereof, notify the division of its decision to so prorate; upon receipt of such notice from such transporter, the division may take such emergency action, as may be deemed proper, and/or upon its own motion, after notice, hold a hearing for the purpose of considering any action within its authority, to preserve and protect correlative rights.

K. In case of pipeline proration any operator affected thereby has the right to make application to the division for authorization to have any shortage or underproduction resulting therefrom included in subsequent proration schedules. Such applications shall be made upon a form hereby authorized to be prescribed by the division and filed therewith within thirty days after the close of the first proration period in which such pipeline proration shortage occurred, and such authorization shall be limited in any event to wells capable of producing the daily top unit allowable for such period.

L. In approving any such application the division shall determine the period of time during which such shortage shall be made up without injury to the well or pool, and shall include the same in the regularly approved proration schedules following the conclusion of pipeline proration.

[9-1-72...2-1-96; 19.15.7.503 NMAC – Rn, 19 NMAC 15.G.503, 6-14-02]

19.15.7.504 AUTHORIZATION FOR PRODUCTION OF OIL WHILE COMPLETING, RECOMPLETING, OR TESTING AN OIL WELL:

A. In the event an operator does not have sufficient lease storage to hold oil produced from a well during the process of its drilling, completing, recompleting, or testing, the operator of said well shall be permitted to produce and sell from said well an amount of oil as may be necessary to drill, complete, recomplete or test said well; provided however, that the operator of said well shall file with the division a written application stating the circumstances at said well and setting forth therein the estimated amount of oil to be produced during the aforementioned process of operations, and provided further that said application is approved by the division. Oil produced during the process of drilling, completion or recompletion, or testing a well shall be charged against the allowable production of said well.

B. No well shall be placed on the proration schedule until Form C-104 has been filed with and approved by the division.

[7-1-52...2-1-96; 19.15.7.504 NMAC – Rn, 19 NMAC 15.G.504, 6-14-02]

19.15.7.505 DEPTH BRACKET ALLOWABLES:

A. Subject to the market demand percentage factor determined pursuant to the provisions of 19.15.7.503 NMAC, the daily oil allowable for each oil pool in the state shall be equal to the appropriate depth bracket allowable below. The depth of the casing shoe or the top perforation in the casing, whichever is higher, in the first well completed in the pool shall determine the depth classification for the pool. Daily oil allowables for each of the several ranges of depth and spacing patterns shall be as follows:

POOL DEPTH RANGE	DEPTH BRACKET ALLOWABLE		
	40 Acres	80 Acres	160 Acres
0 to 4,999 feet	80 bbls.	160 bbls.	
5,000 to 5,999 "	107 "	187 "	347 bbls.
6,000 to 6,999 "	142 "	222 "	382 "
7,000 to 7,999 "	187 "	267 "	427 "
8,000 to 8,999 "	230 "	310 "	470 "

9,000 to 9,999 "	275 "	355 "	515 "
10,000 to 10,999 "	320 "	400 "	560 "
11,000 to 11,999 "	365 "	445 "	605 "
12,000 to 12,999 "	410 "	490 "	650 "
13,000 to 13,999 "	455 "	535 "	695 "
14,000 to 14,999 "	500 "	580 "	740 "
15,000 to 15,999 "	545 "	625 "	785 "
16,000 to 16,999 "	590 "	670 "	830 "
17,000 to	635 "	715 "	875 "

B. The 40-acre depth bracket allowables shall apply to all undesignated wells not governed by special pool rules and to all pools developed on the normal 40-acre statewide spacing unit.

C. The 80-acre and 160-acre depth bracket allowables shall apply to wells governed by applicable special pool rules promulgated by the division as an exception to the normal 40-acre statewide spacing unit.

D. The division may, where the same is deemed appropriate, assign to a given pool a special depth bracket allowable at variance to the depth bracket allowable normally assigned to a pool of similar depth and spacing. Such special allowable may be more or less than the regular depth bracket allowable and shall be assigned only after notice and hearing.

E. In assigning a lesser than regular depth bracket allowable, the division may consider, among other pertinent factors, reservoir damage, casinghead gas production and disposition, water production and disposition, transportation facilities, the prevention of surface or underground waste, and the protection of correlative rights.

F. Assignment of a greater than regular depth bracket allowable shall be made only after sufficient reservoir information is available to ensure that said allowable can be produced without damage to the reservoir and without causing surface or underground waste. The division shall also consider the availability of crude oil transportation and marketing facilities, casinghead gas transportation, processing, and marketing facilities, water disposal facilities, the protection of correlative rights, and other pertinent factors.

[9-1-72...2-1-96; 19.15.7.505 NMAC – Rn, 19 NMAC 15.G.505, 6-14-02]

19.15.7.506 GAS-OIL RATIO LIMITATION:

A. In allocated pools containing a well or wells producing from a reservoir which contains both oil and gas, each proration unit shall be permitted to produce only that volume of gas equivalent to the applicable limiting gas-oil ratio multiplied by the top unit oil allowable for the pool. In the event the division has not set a gas-oil ratio limit for a particular oil pool, the limiting gas-oil ratio shall be 2,000 cubic feet of gas for each barrel of oil produced. In allocated oil pools all producing wells, whether oil or casinghead gas, shall be placed on the oil proration schedule.

B. Unless heretofore or hereafter specifically exempted by order of the division issued after hearing, a gas-oil ratio limitation shall be placed on all allocated oil pools, and all proration units having a gas-oil ratio exceeding the limit for the pool shall be penalized in accordance with the following procedure:

(1) Any proration unit which, on the basis of the latest official gas-oil ratio test, has a gas-oil ratio in excess of the limiting gas-oil ratio and has the capacity to produce above the top casinghead gas volume calculated by Subsection A of 19.15.7.506 NMAC for the pool in which it is located shall be permitted to produce daily that number of barrels of oil which shall be determined by multiplying the current top unit allowable by a fraction, the numerator of which shall be the limiting gas-oil ratio for the pool and the denominator of which shall be the official test gas-oil ratio of the well, and the proration unit will be designated non-marginal.

(2) Any unit containing a well or wells producing from a reservoir which contains both oil and gas shall be permitted to produce only that volume of gas equivalent to the applicable limiting gas-oil ratio multiplied by the top unit allowable currently assigned to the pool.

(3) A marginal unit shall be permitted to produce the same volume of gas which it would be permitted to produce if it were a non-marginal unit.

C. All non-marginal proration units to which gas-oil ratio adjustments are applied shall be so indicated in the proration schedule with adjusted allowables stated.

D. In cases of new pools, the limit shall be 2,000 cubic feet per barrel until such time as changed by order of the division issued after a hearing. Upon petition and after notice and hearing according to law, the division will determine or redetermine the specific gas-oil ratio limit which is applicable to a particular allocated oil pool.

[1-1-50...2-1-96; 19.15.7.506 NMAC – Rn, 19 NMAC 15.G.506, 6-14-02]

19.15.7.507 UNITIZED AREAS:

After petition and notice and hearing, the division may grant approval for the combining of contiguous developed proration units

into a unitized area.
[1-1-50...2-1-96; 19.15.7.507 NMAC – Rn, 19 NMAC 15.G.507, 6-14-02]

19.15.7.508 RECOVERED LOAD OIL:

A. Recovered load oil may be run from the lease on which it is recovered, provided division approval is obtained by means of Form C-126. Form C-126 must be filed in QUADRUPLICATE with the appropriate district office of the division. Upon approval, one copy will be returned to the operator and one copy will be sent to the designated transporter as authority to transport the oil.

B. 19.15.7.508 NMAC applies only to oil which has been obtained from a source other than the lease on which it is used.

C. Recovered load oil as used herein is any oil or liquid hydrocarbon which has been used in any operation in an oil or gas well, and which has been recovered as a merchantable product.
[4-15-54...2-1-96; 19.15.7.508 NMAC – Rn, 19 NMAC 15.G.508, 6-14-02]

19.15.7.509 OIL DISCOVERY ALLOWABLE:

A. In addition to the normally assigned allowable, an oil discovery allowable may be assigned to a well completed as a bona fide discovery well in a new common source of supply. Said oil discovery allowable shall be in the amount of 5 barrels for each foot of depth of said well from the surface of the ground to the top of the perforations in the new pool or the depth of the casing shoe, whichever is higher. In counties where there is no other current oil production, and in any county when the discovery is the deepest oil production in the county, the oil discovery allowable shall be 10 barrels per foot of depth.

B. Date of discovery to determine the well which should properly receive the oil discovery allowable for any new pool shall be the date the well is completed and new oil is run into stock tanks, provided however, any operator drilling through and discovering a new oil pool in the course of drilling to a lower horizon may file an affidavit of such discovery within seven days after drill stem tests were made of said pool, accompanying said affidavit with all available pool data. If, prior to completion of said well, another operator claims discovery of a similar pool and there are reasonable grounds to believe the pools are one and the same, no discovery allowable will be assigned to either well until after the initial well for which the affidavit was filed has been completed. If at that time the operator of the initial well makes formal application for the discovery allowable in said pool, it will be determined after hearing which well shall receive the discovery allowable.

C. To obtain an oil discovery allowable, the owner of a discovery well shall file two copies of division Form C-109, Application for Discovery Allowable and Creation of a New Pool, with the appropriate district office of the division and one with the Santa Fe office. Each copy of said form shall be accompanied by the following:

(1) A map depicting all wells within a two-mile radius of the discovery well. All producing oil and gas wells and the formations from which they are producing or have produced are to be clearly shown as well as all dry holes and the depths to which they were drilled. Maps shall be on a scale one inch equals 1,000 feet and shall also indicate the names of all lessees of record in the depicted area.

(2) A complete electrical log of the subject well with the tops and bottoms of producing formations in the subject well and in nearby wells identified thereon.

(3) If application is based on horizontal separation, a sub-surface structural map of the producing formation(s) for which the discovery allowable is sought, showing seismic or geological interpretation of the subject structure and any troughs, faults, pinch-outs, etc., which separate the subject well from nearby wells producing from the same formation(s).

(4) A geological cross-section prepared from electrical logs of the subject well and nearby wells establishing horizontal as well as vertical separation from other wells depicted on the plat which are producing or have produced from the discovery formation(s).

(5) A summary of all available reservoir data including bottom hole pressure data, fluid levels, core analyses, reservoir liquid characteristics and any other pertinent data on the subject reservoir as well as other nearby reservoirs which may help establish whether the subject well is in fact a discovery.

D. If, in the opinion of the division staff, good cause exists to bring the pool on for hearing as a discovery, and no objection has been received from any other operator, the pool will be placed on the first available hearing docket for inclusion by the staff in its regular pool nomenclature case. If the staff is not in agreement with the applicant's contention that a new pool has been discovered, or if, within ten days after receiving a copy of the application another operator files with the division an objection to the creation of a new pool and the assignment of a discovery allowable, the applicant will be so notified, and he will be expected to present the evidence supporting his case. Or, if the applicant so desires, the application may be set for separate hearing on other than the nomenclature docket for presentation of evidence by the applicant.

E. Effective date of a well's discovery allowable will be 7:00 a.m. on the first day of the month next succeeding the month in which the division approves the discovery.

F. The total discovery allowable attributable to each zone in the well shall be produced over a two-year period commencing with the time of authorization. The well's daily allowable for each pool receiving the discovery allowable shall not exceed the daily top unit allowable for the pool plus the total pool discovery allowable divided by 730 days (731 days if a leap year is included).

G. A discovery well shall be permitted to produce only that volume of gas equivalent to the applicable limiting gas-oil ratio for the pool multiplied by the top unit allowable for the pool plus the daily oil discovery allowable. In addition to all other statewide rules not specifically excepted herein, the provisions of 19.15.7.502 NMAC relating to daily tolerance, monthly tolerance, and underproduction and overproduction, shall apply to oil discovery allowables as well as to regular allowables for discovery wells.

H. Nothing herein contained shall be construed as prohibiting the division from curtailing the discovery allowables of wells during times of depressed market demand, provided however, such discovery allowables shall be reinstated for production at the earliest possible date. Further, when it appears reservoir damage or waste might result from production of the oil discovery allowable within the normal two-year period, the division may, after notice and hearing, extend said period.

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 15 OIL AND GAS
PART 8 GAS PRORATION AND ALLOCATION

19.15.8.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2-1-96; 19.15.8.1 NMAC – Rn, 19 NMAC 15.H.1, 04-30-03]

19.15.8.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.8.2 NMAC - Rn, 19 NMAC 15.H.2, 04-30-03]

19.15.8.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.8.3 NMAC - Rn, 19 NMAC 15.H.3, 04-30-03]

19.15.8.4 DURATION: Permanent.
[2-1-96; 19.15.8.4 NMAC - Rn, 19 NMAC 15.H.4, 04-30-03]

19.15.8.5 EFFECTIVE DATE: February 1, 1996.
[2-1-96; 19.15.8.5 NMAC - Rn, 19 NMAC 15.H.5, 04-30-03]

19.15.8.6 OBJECTIVE: To regulate gas proration and allocation to prevent waste and protect correlative rights pursuant to the Oil and Gas Act.
[2-1-96; 19.15.6. NMAC - Rn, 19 NMAC 15.H.6, 04-30-03]

19.15.8.7 DEFINITIONS:

A. Acreage factor: A GPU's acreage factor shall be determined to the nearest hundredth of a unit by dividing the acreage assigned to the GPU by a number equal to the number of acres in a standard GPU for such pool. However, the acreage tolerance provided in Subparagraph (b), of Paragraph (2) of Subsection A, of 19.15.8.605 NMAC, shall apply.

B. Ad factor: An acreage times deliverability factor is calculated in pools in which acreage and deliverability are proration factors. The product obtained by multiplying the acreage factor by the calculated deliverability (expressed as MCF per day) for that GPU shall be known as the AD factor for that GPU. The AD Factor shall be computed to the nearest whole unit.

C. Allocation hearing: A hearing held by the division twice each year to determine pool allocations for the ensuing allocation period.

D. Allocation period: A six-month period beginning at 7:00 A.M. April 1 and October 1 of each year.

E. Balancing date: The date 7:00 A.M. April 1 of each year shall be known as the balancing date, and the twelve months following this date shall be known as the gas proration period.

F. Broker: A third party who negotiates contracts for purchase and resale.

G. Classification period: A three month period beginning at 7:00 A.M. April 1, July 1, October 1, and January 1 of each year.

H. Gas pool: Any pool which has been designated as a gas pool by the division after notice and hearing.

I. Gas proration unit (GPU): The acreage allocated to a well, or in the case of an infill well or wells to a group of wells, for purposes of spacing and proration. GPU's may be either of a standard or nonstandard size as provided in these rules. (GPU's means plural GPU).

J. Gas transporter: Any taker of gas, the party servicing the well meter, or the party responsible for measurement of gas sold from the well or beneficially used off-lease. This could be at the wellhead, at any other point on the lease, or at any other point authorized by the division where connection is made for gas transportation or utilization (other than is necessary for maintaining the producing ability of the well). The gas transporter can be the gatherer, transporter, producer, or a delegate of one of those parties. The gas transporter shall be identified on form C-104 and will be responsible for filing form C-111 as required under the provisions of 19.15.13.1111 NMAC.

K. Gas purchaser: The purchaser (where ownership of the gas is first exchanged by the producer to the purchaser for an agreed value) of the gas from a gas well or GPU.

L. Hardship gas well: A gas well wherein underground waste will occur if the well is shut-in or curtailed below its minimum sustainable flow rate. No well shall be classified as a hardship gas well except after notice and hearing or upon appropriate administrative action of the division.

M. Infill well: An additional producing well on a GPU which serves as a companion well to an existing well on the GPU.

N. Marginal GPU: A proration unit which is incapable of producing or has not produced the non-marginal allowable based on pool allocation factors. Marginal GPU's do not accrue over or underproduction.

O. Non-marginal GPU: A proration unit receiving an allowable based upon pool allocation factors. Non-marginal proration units accrue over or underproduction.

P. Overproduction: The volume of gas produced on a GPU in any month greater than the assigned non-marginal allowable (does not include gas used in maintaining the producing ability of the well(s) of the GPU). Overproduction accumulates month to month during the proration period.

Q. Prorated gas pool: A prorated gas pool is a gas pool in which, after notice and hearing, the production is allocated by the division according to these rules and any applicable special pool rules.

R. Proration period: The twelve-month period beginning April 1 of each year shall be the gas proration period.

S. Shadow allowable: The gas volume calculated for a marginal GPU that is equal to the allowable assigned to a non-marginal GPU in the same pool of the same A (acreage) or A and AD (acreage deliverability) factors as the marginal GPU.

T. Underproduction: The volume of assigned non-marginal allowable not produced on a GPU. Underproduction accumulates month to month during the proration period.

[5-30-98; 19.15.8.7 NMAC - Rn, 19 NMAC 15.H.7, 04-30-03]

19.15.8.8-600 [RESERVED]

19.15.8.601 ALLOCATION OF GAS PRODUCTION:

When the division determines that allocation of gas production in a designated gas pool is necessary to prevent waste, the division, after notice and hearing, shall consider the nominations of purchasers from that gas pool and other relevant data, and shall fix the allowable production of that pool, and shall allocate production among the gas wells in the pool delivering to a gas transportation facility upon a reasonable basis and recognizing correlative rights. The division shall include in the proration schedule of such pool any gas well which it finds is being unreasonably discriminated against through denial of access to a gas transportation facility which is reasonably capable of handling the type of gas produced by such well.

[1-1-50...2-1-96; 19.15.8.601 NMAC - Rn, 19 NMAC 15.H.601, 04-30-03]

19.15.8.602 PRORATION PERIOD:

The proration period shall be at least six months and the pool allowable and allocations thereof shall be made at least 30 days prior to each proration period.

[1-1-50...2-1-96; 19.15.8.602 NMAC - Rn, 19 NMAC 15.H.602, 04-30-03]

19.15.8.603 ADJUSTMENT OF ALLOWABLES:

When the actual market demand from any allocated gas pool during a proration period is more than or less than the allowable set by the division for the pool for the period, the division shall adjust the gas proration unit allowables for the pool for the next proration period so that each gas proration unit shall have a reasonable opportunity to produce its fair share of the gas production from the pool and so that correlative rights shall be protected.

[1-1-50...2-1-96; 19.15.8.603 NMAC - Rn, 19 NMAC 15.H.603, 04-30-03]

19.15.8.604 GAS PRORATION UNITS:

Before issuing a proration schedule for an allocated gas pool, the division after notice and hearing, shall fix the gas proration unit for that pool.

[1-1-50...2-1-96; 19.15.8.604 NMAC - Rn, 19 NMAC 15.H.604, 04-30-03]

19.15.8.605 GAS PRORATION RULES:

A. Well Acreage and Location Requirements

(1) Standard Gas Proration Unit Size and Well Spacing:

(a) Unless otherwise provided for in applicable special pool rules, gas wells in prorated gas pools shall be drilled according to the well spacing and acreage requirements contained in these rules provided that when wells are drilled in pools with 640 acre spacing, a government section shall comprise the proration unit.

(b) Any GPU drilled according to Subparagraph (a), of Paragraph (1) of Subsection A of 19.15.8.605 which contains acreage within the tolerances below shall be considered a standard GPU for calculating allowables:

Standard Proration Unit	Acreage Tolerance
160 acres	158-162 acres
320 acres	316-324 acres
640 acres	632-648 acres

(2) Non-Standard Gas Proration Units:

(a) The district supervisor of the appropriate district office of the division has the authority to approve a nonstandard GPU without notice and hearing when the unorthodox size and shape of the GPU is necessitated by a variation in the legal subdivision of the U.S. public land surveys and the nonstandard GPU is not less that 75% nor more than 125% of a standard GPU by accepting a form C-102 land plat showing the proposed nonstandard GPU with the number of acres contained therein, and shall assign an allowable to the nonstandard GPU based upon the acreage factor for that acreage.

(b) Non-standard proration units and unorthodox locations may be approved by the division according to applicable special pool rules or division rules.

B. Nominations

(1) Gas Purchasers Or Gas Transporters Shall Nominate: Each gas purchaser or each gas transporter as herein provided shall file with the division its nomination for the amount of gas which it in good faith desires to purchase and/or expects to transport during the ensuing allocation period from each gas pool regulated by this order. The purchaser may delegate the nomination responsibility to the transporter, operator, or broker by notifying the division's Santa Fe office. One copy of such nomination for each pool shall be submitted to the division's Santa Fe office on form C-121-A by the first day of the month during which the division will consider at its allocation hearing the nominations for the succeeding allocation period. The division shall consider at its allocation hearing the nominations received, actual production, and such other factors as may be deemed applicable in determining the amount of gas that may be produced without waste during the ensuing allocation period.

The division director may, at his discretion, suspend this rule whenever it appears that the nominations are of little or no value.

(2) Schedule: The division shall issue a gas proration schedule for each allocation period showing the monthly allowable for each GPU that may be produced during each month of the ensuing allocation period, the current classification of each GPU, and such other information as is necessary to show the allowable production status of each GPU on the schedule. The division may issue supplemental proration schedules during an allocation period as necessary to show changes in GPU classification, adjustments to allowables due to changes in market conditions, or to reflect any other changes as the division deems necessary.

(3) Proration of all Gas Wells Within a Pool: The division shall include in the proration schedule the gas wells in the gas pools regulated by this order delivering to a gas transporter, and shall include in the proration schedule any well which it finds is being unreasonably discriminated against through denial of access to a gas transportation facility, which is reasonably capable of handling the type of gas produced by such a well.

C. Allocation and Granting of Allowables

(1) Filing of Form C-102 and Form C-104 Required: No GPU shall be assigned an allowable before receipt of form C-102 (well location and acreage dedication plat) and the approval date of form C-104 (request for allowable and authorization to transport oil and natural gas).

(2) How Allowables are Calculated: The total allowable to be allocated to each gas pool regulated by this order for each allocation period shall be equal to the estimated market demand as determined by the division, plus any adjustments the director deems necessary to equate the total pool allowable to the estimated market demand. The director may make such adjustments as he deems necessary to compensate for overproduction, underproduction, and other circumstances which may necessitate such adjustment to equate pool allowable to the anticipated market demand. The estimated market demand for each pool shall be established from any information the director requires and can consist of nominations from purchasers, transporters or other parties having knowledge of market demand for gas from such pools, actual past production figures, seasonal trends, or any other factors deemed necessary to establish estimated market demand. The director shall not be bound to use all the information requested and can establish market demand by any method so approved. A monthly allowable shall be assigned to each GPU entitled to an allowable for the ensuing allocation period by allocating the pool allowable among all such GPU's in that pool according to the procedure set forth in the following paragraphs of this order. Should market conditions indicate a change is necessary, the director may adjust allowables up or down during the 6-month allocation period using a maximum of 10% as a guideline.

(3) Marginal GPU Allowable: The monthly allowable to be assigned to each marginal GPU shall be equal to its average monthly production from its latest classification period.

(4) Non-Marginal GPU Allowable: Non-marginal GPU allowables shall be determined in conformance with the applicable special pool rules.

(a) In pools where acreage is the only proration factor, the total non-marginal allowable shall be allocated to each GPU in the proportion that each GPU acreage factor bears to the total acreage factor for all non-marginal GPU's.

(b) In pools where acreage and deliverability are proration factors:

(i) A percentage as set forth in special pool rules, of the non-marginal allowable shall be allocated to each GPU in the proportion that each GPU's AD factor bears to the total AD factor for all non-marginal GPU's in the pool; and

(ii) The remaining non-marginal allowable shall be allocated to non-marginal GPU's among each GPU in the proportion that each GPU's acreage factor bears to the total acreage factor for all non-marginal GPU's in the pool.

(5) New Connects Assignment of Allowables: Allowables to newly completed gas wells shall commence, in pools where acreage is the only proration factor, on the date of first delivery of gas to a gas transporter as demonstrated by an affidavit furnished by the transporter to the appropriate division district office or the approval date of form C-102 and form C-104, whichever is later.

(6) Gas Charged Against GPU's Allowable: Except as provided in the Special Pool rules, the volume of produced gas sold or beneficially used other than lease fuel from each GPU shall be charged against the GPU's allowable; however, the gas used in maintaining the producing ability of the well shall not be charged against the allowable.

(7) Change in Acreage: If the acreage assigned to a GPU is changed, the operator shall notify the appropriate division district office in writing of such change by filing a revised plat (form C-102). The revised allowable, as determined by the division, assigned to the GPU shall be effective on the first day of the month following receipt of the notification.

(8) Minimum Allowables: After notice and hearing, the division may assign minimum allowables for prorated gas pools to avoid waste, encourage efficient operations, and to prevent the premature abandonment of wells. (see Special Pool Rules for minimum allowable amount.) In determining the volume of minimum allowable for a well with a standard proration unit, the division shall take into account economic and engineering factors such as drilling and operating costs, anticipated revenues, taxes, and any similar data that will establish that the ultimate recovery of hydrocarbons will be increased from the pool because of the adoption of a minimum allowable for the pool. Once adopted, the minimum allowable for wells with nonstandard proration units shall be proportionally adjusted.

(9) Deliverability Tests: In pools where acreage and deliverability are proration factors, wells on non-marginal GPUs will be tested in accordance with division rules and the test results shall be used in calculating deliverabilities for the succeeding proration period. Wells on GPUs reclassified to non-marginal shall be tested within 90 days of the order and thereafter in accordance with the appropriate testing schedule for the pool. Wells on marginal GPUs are exempt from deliverability testing.

D. Balancing of Production

(1) Underproduction: Any non-marginal GPU which has an underproduced status as of the end of a gas proration period shall be allowed to carry such underproduction forward in the next gas proration period and may produce such underproduction in addition to the allowable assigned during such succeeding period. Any underproduction carried forward into a gas proration period and remaining unproduced at the end of such gas proration period shall be canceled.

(2) Balancing Underproduction: Production during any one month of a gas proration period greater than the allowable assigned to a GPU for such a month shall be applied against the underproduction carried into such a period in determining the amount of allowable, if any, to be canceled.

(3) Overproduction: Any GPU which has an overproduced status as of the end of a gas proration period shall carry such overproduction forward into the next gas proration period. Said overproduction shall be made up by underproduction during the succeeding gas proration period. Any GPU which has not made up the overproduction carried into a gas proration period by the end of said period shall be shut in until such overproduction is made up.

(a) Twelve-Times Overproduced, Northwest: For the prorated gas pools of northwest New Mexico, if it is determined that GPU is overproduced in an amount exceeding twelve times its current year January allowable (or, in the case of a newly connected well, a marginal well, or a well recently reclassified as non-marginal, twelve times the January allowable assigned to a non-marginal GPU of similar acreage and deliverability factors), it shall be shut in until its overproduction is less than twelve times its January allowable, as determined hereinabove.

(b) Six-Times Overproduced, Southeast: For the prorated gas pools of southeast New Mexico, if it is determined that a GPU is overproduced in an amount exceeding six times its current year January allowable (or, in the case of a newly connected well, a marginal well, or a well recently reclassified as non-marginal, six times the January allowable assigned to a non-marginal GPU of a similar acreage factor), it shall be shut in until its overproduction is less than six times its January allowable, as determined hereinabove.

(4) Exception to Shut in for Overproduction: The director shall have authority to permit a GPU which is subject to shut-in, pursuant to Subparagraphs (a) or (b) of Paragraph (3) of Subsection D of 19.15.8.605 NMAC above to produce up to 250 MCF of gas per month upon proper showing to the director that complete shut-in would cause undue hardship, provided however, such permission may be rescinded for any GPU produced greater than the monthly rate authorized by the director.

(5) Balancing Overproduction: Allowable assigned to a GPU during any one month of a gas proration period greater than the production for the same month shall be applied against the overproduction chargeable to such GPU in determining the overproduction which must be made up pursuant to the provisions of Subparagraphs (a) or (b) of Paragraph (3) of Subsection D of 19.15.8.605 NMAC above.

(6) Exception to Balancing Overproduction: The director may allow overproduction to be made up at a lesser rate than permitted under Subparagraphs (a) or (b) of Paragraph (3) of Subsection D of 19.15.8.605 NMAC above upon a showing at public hearing that the same is necessary to avoid material damage to the well.

(7) Hardship Gas Wells: If a GPU containing a hardship gas well is overproduced, the operator must take the necessary steps to reduce production in order to reduce the overproduction. Any overproduction existing at the time of designation of a well as a hardship gas well or accruing to the GPU thereafter shall be carried forward until it is made up by underproduction. No GPU containing a hardship gas well, which GPU is overproduced, shall be permitted to produce at a rate higher than the minimum producing rate authorized by the division.

(8) Moratorium on Shut-ins: The director shall have authority to grant a pool-wide moratorium of up to three months as to the shutting in of gas wells in a pool during periods of high demand emergency upon proper showing that such emergency exists, and that a significant number of the wells in the pool are subject to shut-in pursuant to the provisions of Subparagraphs (a) or (b) of Paragraph (3) of Subsection D of 19.15.8.605 NMAC above. No moratorium beyond the aforementioned three months shall be granted except after notice and hearing.

(9) The director may reinstate allowable to wells which suffered cancellation of allowable under Paragraph (1) of Subsection D of 19.15.8.605 NMAC above or Paragraph (3) of Subsection E of 19.15.8.605 NMAC below or loss of allowable due to reclassification of a well under Paragraph (2) of Subsection E of 19.15.8.605 NMAC below. If such cancellation or loss of allowable was caused by non-access or limited access to the average market demand in the pool rather than inability of the well to produce. Upon petition, with a showing of circumstances which prevented production of the non-marginal allowable, and evidence that the well was capable of producing at allowable rates during the period for which reinstatement is requested, the allowable may be reinstated in such amounts needed to avoid curtailment or shut-in of the well for excessive overproduction. Such petition shall be approved administratively or docketed for hearing within 30 days after receipt in the division's Santa Fe office.

E. Classification of GPU's

(1) Reclassification by the Director: The director may reclassify a marginal or non-marginal GPU anytime the GPU's producing ability justifies such reclassification. The director may suspend the reclassification of GPU's on his own initiative, or upon proper showing by an affected interest owner, should it appear that such suspension is necessary to permit underproduced GPU's, which would otherwise be reclassified, a proper opportunity to make up such underproduction.

(2) Reclassification to Marginal: A non-marginal well may be reclassified as marginal in either of the following ways:

(a) After the production data is available for the last month of each classification period, any GPU which had an underproduced status at the beginning of the allocation period shall be reclassified to marginal if its highest single month's production during the classification period is less than its average monthly allowable during such period; however, the operator of any GPU so classified, or other affected interest owner, shall have 30 days after receipt of notification of marginal classification in which to submit satisfactory evidence to the division that the GPU is not of marginal character and should not be so classified; or

(b) A GPU which is underproduced more than the overproduction limit as described in -Subparagraphs (a) or (b) of Paragraph (3) of Subsection D of 19.15.8.605 NMAC above, whichever is applicable, shall be reclassified as marginal.

(3) Cancellation of Underproduction for Marginal GPU: A GPU which is classified as marginal shall not be permitted to accumulate underproduction, and any underproduction accrued to a GPU before its classification as marginal shall be canceled.

(4) Reclassification to Non-Marginal: If, at the end of any classification period, a marginal GPU has produced more gas during the proration period to that time than its shadow allowable for that same period, the GPU shall be reclassified as a non-marginal GPU.

(5) Reinstatement of Status: A GPU reclassified to non-marginal under the provisions of Paragraph (4) of Subsection E of 19.15.8.605 NMAC above shall have reinstated to it all underproduction which accrued or would have accrued as a non-marginal GPU from the current proration period, underproduction from the prior proration period may be reinstated after notice and hearing. All uncompensated-for overproduction accruing to the GPU while marginal shall be chargeable upon reclassification to non-marginal.

F. Reporting of Production - Filing C-111 and C-115 Reports: Transporters and operators shall file gas transportation and production reports pursuant to 19.15.13.1111 NMAC and 19.15.13.1115 NMAC of the division rules provided that upon approval by the director as to the specific program to be used, any producer or transporter of gas may be permitted to report metered production of gas on a chart-period basis; provided the following provisions shall be applicable to each gas well:

(1) Reports for a month shall include not less that 24 nor more than 32 reported days.

(2) Reported days may include as many as the last seven days of the previous month but no days of the succeeding month.

(3) The total of the monthly reports for a year shall include not less than 360 nor more than 368 reported days.

(4) For purposes of these rules, the term "month" shall mean "calendar month" for those reporting on a calendar month basis, and shall mean "reporting month" for those reporting on a chart-period basis according to the exception provided in this rule.

[5-30-98; 19.15.8.605 NMAC - Rn, 19 NMAC 15.H.605, 04-30-03]

19.15.8.606 TESTS AND TEST PROCEDURES FOR PRORATED POOLS IN NORTHWEST NEW MEXICO:

A. Type of Tests Required for Wells Completed in Prorated Gas Pools

(1) Reclassified GPUs: An operator of a well on a gas proration unit (GPU) that has been reclassified as non-marginal will conduct deliverability tests on that well within 90 days of the order reclassifying it, unless there are current tests on file with the division or that order requires a new test. A current test is a test which was conducted during the last test period for that pool or later.

(2) Non-marginal GPUs: Operators will conduct deliverability tests on wells on non-marginal GPUs every five years. If the division determines that a well's test data and production data warrant more frequent testing of a well, the division may set up special testing schedules for that well.

(3) Scheduling of Tests

(a) Notification of Pools to be Tested: By September 1 of each year the Aztec district office of the division will notify operators of non-marginal GPUs if their wells will be tested during the following test period.

(b) The results of all deliverability tests required must be filed with the Aztec district office within 90 days following the completion of each test. Provided however, that any test completed between December 31 of the test year and March 10 of the following year are due no later than March 31. No extension of time for filing tests beyond March 31 will be granted except after notice and hearing.

(c) Failure to file any test within the above-prescribed times will subject the GPU to the loss of one day's allowable for each day the test is late.

(d) Any well scheduled for testing during its test year may have the conditioning period, test flow period, and part of the seven-day shut-in period conducted in December of the previous year provided that, if the seven-day shut-in period immediately follows the test flow period, the seven-day shut-in pressure is to be measured in January of the test year. The earliest date that a well can be scheduled for a deliverability test would be such that the test flow period would end on December 25 of the previous year.

(e) Downhole commingled wells are to be scheduled for tests on dates for the pool of the lowermost prorated completion of the well.

(f) In the event a well is shut-in by the division for overproduction, the operator may produce the well for a period of time to secure a test after written notification to the division. All gas produced during this testing period will be used in determining the over/under produced status of the well.

(g) An operator may schedule a well for a deliverability retest upon notification to the Aztec district office at least ten days before the test is to be commenced. Such retest will be for substantial reason and will be subject to the approval of the division. A retest will be conducted in conformance with the deliverability test procedures of these rules. The division, at its discretion, may require the retesting of any well by notification to the operator to schedule such retest. These tests, as filed on form C-122A, should be identified as "RETEST" in the remarks column.

(4) Witnessing of Tests: Any deliverability test may be witnessed by any or all of the following: a representative of the division, an offset operator, a representative of the gas transportation facility connected to the well under test, or a representative of the gas transportation facility taking gas from an offset operator.

B. Procedure for Testing

(1) The test shall begin by producing a well in the normal operating manner into the pipeline through either the casing or tubing, but not both, for a period of fourteen consecutive days. This shall be known as the conditioning period. The production valve and choke settings shall not be changed during either the conditioning or flow periods, except during the first ten days of the conditioning period when maximum production would over-range the meter chart or location production equipment. The first ten days of the conditioning period shall not have more than 48 hours of cumulative interruptions of flow. The eleventh to fourteenth days, inclusive of the conditioning period, shall have no interruptions of flow whatsoever. Any interruption of flow that occurs as normal operation of the well as stop-cock flow, intermittent flow, or well blow down will not

be counted as shut-in time in either the conditioning or flow period.

(2) The daily flowing rate shall be determined from an average of seven or eight consecutive producing days, following a minimum conditioning period of 14 consecutive days of production. This shall be known as the flow period.

(3) Instantaneous pressure shall be measured by a deadweight gauge or other method approved by the division during the seven-day or eight-day flow period at the casinghead, tubinghead, and orifice meter, and shall be recorded along with instantaneous meter-chart static pressure reading.

(4) If a well is producing through a compressor that is located between the wellhead and the meter run, the meter run pressure and the wellhead casing pressure and the wellhead tubing pressure are to be reported on form C-122A. (Neither the suction pressure nor the discharge pressure of the compressor is considered **wellhead** pressure.) A note shall be entered in the remarks portion on form C-122A stating: "This well produced through a compressor."

(5) When it is necessary to restrict the flow of gas between the wellhead and the orifice meter, the ratio of the downstream pressure, psia, to the upstream pressure, psia, shall be determined. When this ratio is 0.57 or less, critical flow conditions shall be considered to exist across the restriction.

(6) When more than one restriction between the wellhead and the orifice meter causes the pressures to reflect critical flow between the wellhead and the orifice meter, the pressures across each of these restrictions shall be measured to determine whether critical flow exists at any restriction. When critical flow does not exist at any restriction, the pressures taken to disprove the critical flow shall be reported to the division on form C-122A in item (n) of the form. When critical flow conditions exist, the instantaneous flowing pressures required above shall be measured during the last 48 hours of the seven-day or eight-day flow period.

(7) When critical flow exists between the wellhead and the orifice meter, the measured wellhead flowing pressure of the string through which the well flowed during the test shall be used as P_t when calculating the static wellhead working pressure (P_w) using the method established below.

(8) When critical flow does not exist at any restriction, P_t shall be the corrected average static pressure from the meter chart plus friction loss from the wellhead to the orifice meter.

(9) The static wellhead working pressure (P_w) of any well under test shall be the calculated seven-day or eight-day average static tubing pressure if the well is flowing through the casing; it shall be the calculated seven-day or eight-day average static casing pressure if the well is flowing through the tubing. The static wellhead working pressure (P_w) shall be calculated by applying the tables and procedures set out in the "Gas Well Testing Manual for Northwest New Mexico" ("the Manual") available from the division.

(10) To obtain the shut-in pressure of a well under test, the well shall be shut-in some time during the current testing season for a period of seven to fourteen consecutive days, which have been preceded by a minimum of seven days of uninterrupted production. Such shut-in pressure shall be measured on the seventh to fourteenth day of shut-in of the well with a deadweight gauge or other method approved by the division. The seven-day shut-in pressure shall be measured on both the tubing and the casing when communication exists between the two strings. The higher of such pressures shall be used as P_c in the deliverability calculation. When any such shut-in pressure is determined by the division to be abnormally low or the well can not be shut-in due to "HARDSHIP" classification, the shut-in pressure to be used as P_c shall be determined by one of the following methods:

(a) A division-designated value.

(b) An average shut-in pressure of all offset wells completed in the same zone. Offset wells include the four side and four corner wells, if available.

(c) A calculated surface pressure based on a calculated bottom-hole pressure. Such calculations shall be made in accordance with the examples in the manual.

(11) All wellhead pressures, as well as the flowing meter pressure tests which are to be taken during the seven-day or eight-day deliverability test period as required above, shall be taken with a deadweight gauge or other method approved by the division. The pressure readings and the date and time according to the chart shall be recorded and maintained in the operator's records with the test information.

(12) Orifice meter charts shall be changed and arranged so as to reflect upon a single chart the flow data for the gas from each well for the full seven-day or eight-day deliverability test period; however, no tests shall be voided if satisfactory explanation is made as to the necessity for using test volumes through two chart periods. Corrections shall be made for pressure base, measured flowing temperature, specific gravity, and supercompressibility; provided however, if the specific gravity of the gas from any well under test is not available, an estimated specific gravity may be assumed therefore, based upon that of gas from near-by wells, the specific gravity of which has been actually determined by measurement.

(13) The average flowing meter pressure for the seven-day or eight-day flow period and the corrected integrated volume shall be determined by the purchasing company that integrates the flow charts and furnished to the operator or testing agency.

(14) The seven-day or eight-day flow period volume shall be calculated from the integrated readings as determined from the flow period orifice meter chart. The volume so calculated shall be divided by the number of testing days on the chart to determine the average daily rate of flow during said flow period. The flow period shall have a minimum of seven and a maximum of eight legibly recorded flowing days to be acceptable for test purposes. The volume used in this calculation shall be corrected to the division's standard conditions of 15.025 psia pressure base, 60 degrees F. temperature base and 0.60 specific gravity base.

(15) The daily volume of flow, as determined from the flow period chart readings, shall be calculated by applying the basic orifice meter formula or other acceptable industry standard practices.

$Q = C' (h_w P_f)^{.5}$

Where:

Q = Metered volume of flow Mcf/d @ 15.025 psia, 60 degrees F., and 0.60 specific gravity.

C' = The 24-hour basic orifice meter flow factor corrected for flowing temperature, gravity, and supercompressibility.

h_w = Daily average differential meter pressure from flow period chart.

P_f = Daily average flowing meter pressure from flow period chart.

(16) The basic orifice meter flow factors, flowing temperature factor, and specific gravity factor shall be determined from the tables in the manual.

(17) The daily flow period average corrected flowing meter pressure, psig, shall be used to determine the supercompressibility factor. Supercompressibility tables may be obtained from the division.

(18) When supercompressibility correction is made for a gas containing either nitrogen or carbon dioxide in excess of two percent, the supercompressibility factors of such gas shall be determined by the use of Table V of the C.N.G.A. Bulletin TS-402 for pressures 100-500 psig, or Table II, TS-461 for pressures in excess of 500 psig.

(19) The use of tables for calculating rates of flow from integrator readings which do not specifically conform to the division's "Back Pressure Test Manual", or the Manual, may be approved for determining the daily flow period rates of flow upon a showing that such tables are appropriate and necessary.

(20) The daily average integrated rate of flow for the seven-day or eight-day flow period shall be corrected for meter error by multiplication by a correction factor. Said correction factor shall be determined by dividing the square root of the deadweight flowing meter pressure, psia, by the square root of the chart flowing meter pressure, psia.

(21) "Deliverability pressure" is a defined pressure applied to each well and used in the process of comparing the abilities of wells in a pool to produce at static wellhead working pressures equal to a percentage of the seven-day shut-in pressure of the respective individual wells. Such percentage shall be determined and announced periodically by the division based on the relationship of the average static wellhead working pressures (P_w) divided by the average seven-day shut-in pressure (Pc) of the pool.

(22) The deliverability of gas at the deliverability pressure of any well under test shall be calculated from the test data derived from the tests above required by use of the following deliverability formula:

$$D = Q \left[\frac{(P_c^2 - P_d^2)}{(P_c^2 - P_w^2)} \right]^n$$

Where:

D = Deliverability Mcf/d at the deliverability pressure, (P_d), (at Standard Conditions of 15.025 psia, 60 degrees F. and 0.60 sp. gr.).

Q = Daily flow rate in Mcf/d, at wellhead pressure (P_w).

P_c = Seven-day shut-in wellhead pressure, psia.

P_d = Deliverability pressure, psia, as defined above.

P_w = Average static wellhead working pressure, as determined from seven-day or eight-day flow period, psia, and calculated from tables in the manual entitled "Pressure Loss Due to Friction Tables for Northwest New Mexico".

n = Average pool slope of back pressure curves as follows:

For pictured cliffs and shallower formations, 0.85

For formations deeper than pictured cliffs, 0.75

(Note: Special rules for any specific pool or formation may supersede the above values. Check special rules if in doubt.)

(23) The value of the multiplier in the above formula (ratio factor after the application of the pool slope) by which Q is multiplied shall not exceed a limiting value to be determined and announced periodically by the division. Such determination shall be made after a study of the test data of the pool obtained during the previous testing season.

(24) Downhole commingled wells are to be tested in the test year for the pool of the lowermost prorated completion of the well and shall use pool slope (n), and deliverability pressure of the lowermost pool. The total flow rate from the downhole commingled well will be used to calculate a value of deliverability. For each prorated gas zone of a downhole

commingled well, a form C-122A is required to be filed. Also, in the summary portion of that form all zones will indicate the same data for line h, P_c, Q, P_w, and P_d. The value shown for deliverability (D) will be that percentage of the total deliverability of the well that is applicable to this zone. A note shall be placed in the remarks column that indicates the percentage of deliverability to be allocated to this zone of the well.

(25) Any test prescribed herein will be considered acceptable if the average flow rate for the final seven-day or eight-day deliverability test is not more than ten percent in excess of any consecutive seven-day or eight-day average of the preceding two weeks. A deliverability test not meeting this requirement may be declared invalid, requiring the well to be re-tested.

(26) All charts relative to deliverability tests or copies thereof shall be made available to the division upon its request.

(27) Operators shall use only testing agencies, whether individuals, companies, pipeline companies, or operators, that maintain a log of all tests accomplished by them including all field test data. The operator shall maintain the above data for a period of not less than two years plus the current test year.

(28) All forms heretofore mentioned are hereby adopted for use in the northwest New Mexico area in open form subject to such modification as experience may indicate desirable or necessary.

(29) Deliverability tests for gas wells in all formations shall be conducted and reported in accordance with these rules. Provided, however, these rules shall be subject to any specific modification or change contained in Special Pool Rules adopted for any pool after notice and hearing.

C. Informational Tests

(1) One-Point Back Pressure Test: A one-point back pressure test may be taken on newly completed wells before their connection or reconnection to a gas transportation facility. This test shall not be a required official test, but may be taken for informational purposes at the option of the operator. When taken, this test must be taken and reported as prescribed below.

(2) Test Procedure

(a) This test shall be accomplished after a minimum shut-in of seven days. The shut-in pressure shall be measured with a deadweight gauge or other method approved by the division.

(b) The flow rate shall be that rate in Mcf/d measured at the end of a three hour test flow period. The flow from the well shall be for three hours through a positive choke, which has a 3/4 inch orifice.

(c) A 2-inch nipple which provides a mechanical means of accurately measuring the pressure and temperature of the flowing gas shall be installed immediately upstream from the positive choke.

(d) The absolute open flow shall be calculated using the conventional back pressure formula as shown in the manual or the division’s "Back Pressure Test Manual."

(e) The observed data and flow calculations shall be reported in duplicate on form C-122, "Multi-Point Back Pressure Test for Gas Wells."

(f) Non-critical flow shall be considered to exist when the choke pressure is 13 psig or less. When this condition exists the flow rate shall be measured with a pitot tube and nipple as specified in the manual or in the division's manual of "Tables and Procedure for Pitot Tests." The pitot test nipple shall be installed immediately downstream from the 3/4-inch positive choke.

(g) Any well completed with 2-inch nominal size tubing (1.995-inch ID) or larger shall be tested through the tubing.

(3) Other tests for informational purposes may be conducted prior to obtaining a pipeline connection for a newly completed well upon receiving specific approval therefore from the Aztec district office. Approval of these tests shall be based primarily upon the volume of gas to be vented.

19.15.9.701 INJECTION OF FLUIDS INTO RESERVOIRS

A. Permit for Injection Required - The injection of gas, liquefied petroleum gas, air, water, or any other medium into any reservoir for the purpose of maintaining reservoir pressure or for the purpose of secondary or other enhanced recovery or for storage or the injection of water into any formation for the purpose of water disposal shall be permitted only by order of the Division after notice and hearing, unless otherwise provided herein.

B. Method of Making Application

(1) Application for authority for the injection of gas, liquefied petroleum gas, air, water or any other medium into any formation for any reason, including but not necessarily limited to the establishment of or the expansion of water flood projects, enhanced recovery projects, pressure maintenance projects, and salt water disposal, shall be by submittal of Division Form C-108 complete with all attachments.

(2) The Applicant shall furnish, by certified or registered mail, a copy of the application to the owner of the surface of the land on which each injection or disposal well is to be located and to each leasehold operator within one-half mile of the well.

C. Administrative Approval

(1) If the application is for administrative approval rather than for a hearing, it must also be accompanied by a copy of a legal publication published by the applicant in a newspaper of general circulation in the county in which the proposed injection well is located. (The details required in such legal notice are listed on Side 2 of Form C-108).

(2) No application for administrative approval may be approved until 15 days following receipt by the Division of Form C-108 complete with all attachments including evidence of mailing as required under Subsection B, Paragraph (2) above of 19.15.9.701 NMAC and proof of publication as required by Subsection C, Paragraph (1) above of 19.15.9.701 NMAC.

(3 f no objection is received within said 15-day period, and a hearing is not otherwise required, the application may be approved administratively.

D. Hearings - If a written objection to any application for administrative approval of an injection well is filed within 15 days after receipt of a complete application, or if a hearing is required by these rules or deemed advisable by the Division Director, the application shall be set for hearing and notice thereof given by the Division.

E. Salt Water Disposal Wells

(1) The Division Director shall have authority to grant an exception to the requirements of Subsection A of 19.15.9.701 NMAC for water disposal wells only, without hearing, when the waters to be disposed of are mineralized to such a degree as to be unfit for domestic, stock, irrigation, or other general use, and when said waters are to be disposed of into a formation older than Triassic (Lea County only) and provided no objections are received pursuant to Subsection C of 19.15.9.701 NMAC.

(2) Disposal will not be permitted into zones containing waters having total dissolved solids concentrations of 10,000 mg/1 or less except after notice and hearing, provided however, that the Division may establish exempted aquifers for such zones wherein such injection may be approved administratively.

(3) Notwithstanding the provisions of Subsection E, Paragraph (2) above of 19.15.9.701 NMAC, the Division Director may authorize disposal into such zones if the waters to be disposed of are of higher quality than the native water in the disposal zone.

F. Pressure Maintenance Projects

(1) Pressure maintenance projects are defined as those projects in which fluids are injected into the producing horizon in an effort to build up and/or maintain the reservoir pressure in an area which has not reached the advanced or "stripper" state of depletion.

(2) All applications for establishment of pressure maintenance projects shall be set for hearing. The project area and the allowable formula for any pressure maintenance project shall be fixed by the Division on an individual basis after notice and hearing.

(3) Pressure maintenance projects may be expanded and additional wells placed on injection only upon authority from the Division after notice and hearing or by administrative approval.

(4) The Division Director shall have authority to grant an exception to the hearing requirements of

Subsection A of 19.15.9.701 NMAC for the conversion to injection of additional wells within a project area provided that any such well is necessary to develop or maintain efficient pressure maintenance within such project and provided that no objections are received pursuant to Subsection C of 19.15.9.701 NMAC.

G. Water Flood Projects

(1) Water flood projects are defined as those projects in which water is injected into a producing horizon in sufficient quantities and under sufficient pressure to stimulate the production of oil from other wells in the area, and shall be limited to those areas in which the wells have reached an advanced state of depletion and are regarded as what is commonly referred to as "stripper" wells.

(2) All applications for establishment of water flood projects shall be set for hearing.

(3) The project area of a water flood project shall comprise the proration units owned or operated by a given operator upon which injection wells are located plus all proration units owned or operated by the same operator which directly or diagonally offset the injection tracts and have producing wells completed on them in the same formation; provided however, that additional proration units not directly nor diagonally offsetting an injection tract may be included in the project area if, after notice and hearing, it has been established that such additional units have wells completed thereon which have experienced a substantial response to water injection.

(4) The allowable assigned to wells in a water flood project area shall be equal to the ability of the wells to produce and shall not be subject to the depth bracket allowable for the pool nor to the market demand percentage factor.

(5) Nothing herein contained shall be construed as prohibiting the assignment of special allowables to wells in buffer zones after notice and hearing. Special allowables may also be assigned in the limited instances where it is established at a hearing that it is imperative for the protection of correlative rights to do so.

(6) Water flood projects may be expanded and additional wells placed on injection only upon authority from the Division after notice and hearing or by administrative approval.

(7) The Division Director shall have authority to grant an exception to the hearing requirements of Subsection A of 19.15.9.701 NMAC for conversion to injection of additional wells provided that any such well is necessary to develop or maintain thorough and efficient water flood injection for any authorized project and provided that no objections are received pursuant to Subsection C of 19.15.9.701 NMAC.

H. Storage Wells

(1) The Division Director shall have authority to grant an exception to the hearing requirements of Subsection A of 19.15.9.701 NMAC for the underground storage of liquefied petroleum gas or liquid hydrocarbons in secure caverns within massive salt beds, and provided no objections are received pursuant to Subsection C of 19.15.9.701 NMAC.

(2) In addition to the filing requirements of Subsection B of 19.15.9.701 NMAC, the applicant for approval of a storage well under this rule shall file the following:

(a) With the Division Director, a plugging bond in accordance with the provisions of Rule 101;

(b) With the appropriate district office of the Division in TRIPLICATE:

(i) Form C-101, Application for Permit to Drill, Deepen, or Plug Back;
(ii) Form C-102, Well Location and Acreage Dedication Plat; and
(iii) Form C-105, Well Completion or Recompletion Report and Log.

[1-1-50…2-1-96; 19.15.9.701 NMAC - Rn, 19 NMAC 15.I.701, 11-30-00]

19.15.9.702 CASING AND CEMENTING OF INJECTION WELLS:

Wells used for injection of gas, air, water, or any other medium into any formation shall be cased with safe and adequate casing or tubing so as to prevent leakage, and such casing or tubing shall be so set and cemented as to prevent the movement of formation or injected fluid from the injection zone into any other zone or to the surface around the outside of any casing string. [1-1-50…2-1-96; 19.15.9.702 NMAC - Rn, 19 NMAC 15.I.702, 11-30-00]

19.15.9.703 OPERATION AND MAINTENANCE

A. Injection wells shall be equipped, operated, monitored, and maintained to facilitate periodic testing and to assure continued mechanical integrity which will result in no significant leak in the tubular goods and packing materials used and no significant fluid movement through vertical channels adjacent to the well bore.

B. Injection project, including injection wells and producing wells and all related surface facilities shall be operated and maintained at all times in such a manner as will confine the injected fluids to the interval or intervals approved and prevent surface damage or pollution resulting from leaks, breaks, or spills.

C. Failure of any injection well, producing well, or surface facility, which failure may endanger underground sources of drinking water, shall be reported under the "Immediate Notification" procedure of Rule 116.

D. Injection well or producing well failures requiring casing repair or cementing are to be reported to the Division prior to commencement of workover operations.

E. Injection wells or projects which have exhibited failure to confine injected fluids to the authorized injection zone or zones may be subject to restriction of injection volume and pressure, or shut-in, until the failure has been identified and corrected.

[7-1-81…2-1-96; 19.15.9.703 NMAC - Rn, 19 NMAC 15.I.703, 11-30-00]

19.15.9.704 TESTING, MONITORING, STEP-RATE TESTS, NOTICE TO THE DIVISION, REQUESTS FOR PRESSURE INCREASES

A. Testing

(1) Prior to commencement of injection and any time tubing is pulled or the packer is reseated, wells shall be tested to assure the integrity of the casing and the tubing and packer, if used, including pressure testing of the casing-tubing annulus to a minimum of 300 psi for 30 minutes or such other pressure and/or time as may be approved by the appropriate district supervisor. A pressure recorder shall be used and copies of the chart shall be submitted to the appropriate Division district office within 30 days following the test date.

(2) At least once every five years thereafter, injection wells shall be tested to assure their continued mechanical integrity. Tests demonstrating continued mechanical integrity shall include the following:

(a) measurement of annular pressures in wells injecting at positive pressure under a packer or a balanced fluid seal; or,

(b) pressure testing of the casing-tubing annulus for wells injecting under vacuum conditions; or,

(c) such other tests which are demonstrably effective and which may be approved for use by the Division.

(3) Notwithstanding the test procedures outlined above, the Division may require more comprehensive testing of the injection wells when deemed advisable, including the use of tracer surveys, noise logs, temperature logs, or other test procedures or devices.

(4) In addition, the Division may order special tests to be conducted prior to the expiration of five years if conditions are believed to so warrant. Any such special test which demonstrates continued mechanical integrity of a well shall be considered the equivalent of an initial test for test scheduling purposes, and the regular five-year testing schedule shall be applicable thereafter.

(5) The injection well operator shall advise the Division of the date and time any initial, five-year, or special tests are to be commenced in order that such tests may be witnessed.

B. Monitoring - Injection wells shall be so equipped that the injection pressure and annular pressure may be determined at the wellhead and the injected volume may be determined at least monthly.

C. Step-Rate Tests, Notice to the Division, Requests for Injection Pressure Limit Increases

(1) Whenever an operator shall conduct a step-rate test for the purpose of increasing an authorized injection or disposal well pressure limit, notice of the date and time of such test shall be given in advance to the appropriate Division district office.

(2) Copies of all injection or disposal well pressure-limit increase applications and supporting documentation shall be submitted to the Division Director and to the appropriate district office.

[7-1-81…2-1-96; 19.15.9.704 NMAC - Rn, 19 NMAC 15.I.704, 11-30-00]

19.15.9.705 COMMENCEMENT, DISCONTINUANCE, AND ABANDONMENT OF INJECTION OPERATIONS:

A. The following provisions apply to all injection projects, storage projects, salt water disposal wells and special purpose injection wells:

B. Notice of Commencement and Discontinuance

(1) Immediately upon the commencement of injection operations in any well, the operator shall notify the Division of the date such operations began.

(2) Within 30 days after permanent cessation of gas or liquefied petroleum gas storage operations or within 30 days after discontinuance of injection operations into any other well, the operator shall notify the Division of the date of such discontinuance and the reasons therefor.

(3) Before any injection well is temporarily abandoned or plugged, the operator shall obtain approval from the appropriate District Office of the Division in the same manner as when temporarily abandoning or plugging

oil and gas wells or dry holes.

C. Abandonment of Injection Operations

(1) Whenever there is a continuous one year period of non-injection into any injection project, storage project, salt water disposal well, or special purpose injection well, such project or well shall be considered abandoned, and the authority for injection shall automatically terminate *ipso facto*.

(2) For good cause shown, the Division Director may grant an administrative extension or extensions of injection authority as an exception to Subsection C, Paragraph (1) above of 19.15.9.705 NMAC.

[1-1-50…2-1-96; 19.15.9.705 NMAC - Rn, 19 NMAC 15.I.705, 11-30-00; A, 11-30-00; A, 07-15-03]

19.15.9.706 RECORDS AND REPORTS

A. The operator of an injection well or project for secondary or other enhanced recovery, pressure maintenance, natural gas storage, salt water disposal, or injection of any other fluids shall keep accurate records and shall report monthly to the Division gas or fluid volumes injected, stored, and/or produced as required on the appropriate form listed below:

(1) Secondary or Other Enhanced Recovery on Form C-115;

(2) Pressure Maintenance on Form C-115 and as otherwise prescribed by the Division;

(3) Salt Water Disposal on Form C-120-A;

(4) Natural Gas Storage on Form C-131-A; and

(5) Injection of other fluids on a form prescribed by the Division.

B. The operator of a liquefied petroleum gas storage project shall report annually on Form C-131-B, Annual LPG Storage Report.

[1-1-50…2-1-96; 19.15.9.706 NMAC - Rn, 19 NMAC 15.I.706, 11-30-00]

19.15.9.707 RECLASSIFICATION OF WELLS:

The Division Director shall have authority to reclassify an injection well from any category defined in Subsection B of 19.15.9.701 NMAC to any other category without notice and hearing upon request and proper showing by the operator thereof.

[7-1-81…2-1-96; 19.15.9.707 NMAC - Rn, 19 NMAC 15.I.707, 11-30-00]

19.15.9.708 TRANSFER OF AUTHORITY TO INJECT

A. Authority to inject granted under any order of the Division is not transferable except upon approval of the Division. Approval of transfer of authority to inject may be obtained by filing Form C-104 in accordance with Rule 1104 E.

B. The Division may require a demonstration of mechanical integrity prior to approving transfer of authority to inject.

[1-1-50…2-1-96; 19.15.9.708 NMAC - Rn, 19 NMAC 15.I.708, 11-30-00]

19.15.9.709 REMOVAL OF PRODUCED WATER FROM LEASES AND FIELD FACILITIES

A. Transportation of any produced water by motor vehicle from any lease, central tank battery, or other facility, without an approved Form C-133 (Authorization to Move Produced Water) is prohibited.

B. Authorization to transport produced water may be obtained by filing three copies of Form C-133 with the Director of the Division in Santa Fe.

C. No owner or operator shall permit produced water to be removed from its leases or field facilities by motor vehicle except by a person possessing an approved Form C-133.

[1-1-50…2-1-96; 19.15.9.709 NMAC - Rn, 19 NMAC 15.I.709, 11-30-00]

19.15.9.710 DISPOSITION OF TRANSPORTED PRODUCED WATER

A. No person, including any transporter, may dispose of produced water on the surface of the ground, or in any pit, pond, lake, depression, draw, streambed, or arroyo, or in any watercourse, or in any other place or in any manner which will constitute a hazard to any fresh water supplies.

B. Delivery of produced water to approved salt water disposal facilities, secondary recovery or pressure maintenance injection facilities, or to a drill site for use in drilling fluid will not be construed as constituting a hazard to fresh water supplies provided the produced waters are placed in tanks or other impermeable storage at such facilities.

C. The supervisor of the appropriate district office of the Division may grant temporary exceptions to Paragraph A. above for emergency situations, for use of produced water in road construction or maintenance, or for use of produced waters for other construction purposes upon request and a proper showing by a holder of an approved Form C-133 (Authorization to Move Produced Water).

D. Vehicular movement or disposition of produced water in any manner contrary to these rules shall be considered cause, after notice and hearing, for cancellation of Form C-133.

[2-1-82…2-1-96; 19.15.9.710 NMAC - Rn, 19 NMAC 15.I.710, 11-30-00]

19.15.9.711 APPLICABLE TO SURFACE WASTE MANAGEMENT FACILITIES ONLY:

A. A surface waste management facility is defined as any facility that receives for collection, disposal, evaporation, remediation, reclamation, treatment or storage any produced water, drilling fluids, drill cuttings, completion fluids, contaminated soils, bottom sediment and water (BS&W), tank bottoms, waste oil or, upon written approval by the Division, other oilfield related waste. Provided, however, if (a) a facility performing these functions utilizes underground injection wells subject to regulation by the Division pursuant to the federal Safe Drinking Water Act, and does not manage oilfield wastes on the ground in pits, ponds, below grade tanks or land application units, (b) if a facility, such as a tank only facility, does not manage oilfield wastes on the ground in pits, ponds below grade tanks or land application units or (c) if a facility performing these functions is subject to Water Quality Control Commission Regulations, then the facility shall not be subject to this rule.

(1) A commercial facility is defined as any surface waste management facility that does not meet the definition of centralized facility.

(2) A centralized facility is defined as a surface waste management facility that accepts only waste generated in New Mexico and that:

(a) does not receive compensation for waste management;

(b) is used exclusively by one generator subject to New Mexico's "Oil and Gas Conservation Tax Act" Section 7-30-1 NMSA-1978 as amended; or

(c) is used by more than one generator subject to New Mexico's "Oil and Gas Conservation Tax Act" Section 7-30-1 NMSA-1978 as amended under an operating agreement and which receives wastes that are generated from two or more production units or areas or from a set of jointly owned or operated leases.

(3) Centralized facilities exempt from permitting requirements are:

(a) facilities that receive wastes from a single well;

(b) facilities that receive less than 50 barrels of RCRA exempt liquid waste per day and have a capacity to hold 500 barrels of liquids or less or 1400 cubic yards of solids or less and when a showing can be made to the satisfaction of the Division that the facility will not harm fresh water, public health or the environment;

(c) emergency pits that are designed to capture fluids during an emergency upset period only and provided such fluids will be removed from the pit within twenty-four (24) hours from introduction;

(d) facilities that do not meet the requirements of the foregoing exemptions in Subsection A, Paragraph (3) of 19.15.9.711 NMAC, but that are shown by the facility operator to the satisfaction of the Division to not present a risk to public health and the environment.

B. Unless exempt from Section 19.15.9.711 NMAC, all commercial and centralized facilities including facilities in operation on the effective date of Section 19.15.9.711 NMAC, new facilities prior to construction and all existing facilities prior to major modification or major expansion shall be permitted by the Division in accordance with the following requirements:

(1) Application Requirements - An application, Form C-137, for a permit for a new facility or to modify an existing facility shall be filed in DUPLICATE with the Santa Fe Office of the Division and ONE COPY with the appropriate Division district office. The application shall comply with Division guidelines and shall include:

(a) The names and addresses of the applicant and all principal officers of the business if different from the applicant;

(b) A plat and topographic map showing the location of the facility in relation to governmental surveys (1/4 1/4 section, township, and range), highways or roads giving access to the facility site, watercourses, water sources, and dwellings within one (1) mile of the site;

(c) The names and addresses of the surface owners of the real property on which the management facility is sited and surface owners of the real property of record within one (1) mile of the site;

(d) A description of the facility with a diagram indicating location of fences and cattle guards, and detailed construction/installation diagrams of any pits, liners, dikes, piping, sprayers, and tanks on the facility;

(e) A plan for management of approved wastes.

(f) A contingency plan for reporting and cleanup of spills or releases;

(g) A routine inspection and maintenance plan to ensure permit compliance;

(h) A Hydrogen Sulfide Prevention and Contingency Plan to protect public health;

(i) A closure plan including a cost estimate sufficient to close the facility to protect public health and the environment; said estimate to be based upon the use of equipment normally available to a third party contractor;

(j) Geological/hydrological evidence, including depth to and quality of groundwater beneath the site, demonstrating that disposal of oilfield wastes will not adversely impact fresh water;

(k) Proof that the notice requirements of Section 19.15.9.711 NMAC have been met;

(l) Certification by an authorized representative of the applicant that information submitted in the application is true, accurate, and complete to the best of the applicant's knowledge.

(m) Such other information as is necessary to demonstrate that the operation of the facility will not adversely impact public health or the environment and that the facility will be in compliance with OCD rules and orders.

(2) Notice Requirements:

(a) Prior to public notice, the applicant shall give written notice of application to the surface owners of record within one (1) mile of the facility, the county commission where the facility is located or is proposed to be located, and the appropriate city official(s) if the facility is located or proposed to be located within city limits or within one (1) mile of the city limits. The distance requirements for notice may be extended by the Director if the Director determines the proposed facility has the potential to adversely impact public health or the environment at a distance greater than one (1) mile. The Director may require additional notice as needed. A copy and proof of such notice will be furnished to the Division.

(b) The applicant will issue public notice in a form approved by the Division in a newspaper of general circulation in the county in which the facility is to be located. For permit modifications, the Division may require the applicant to issue public notice and give written notice as above.

(c) Any person seeking to comment or request a public hearing on such application must file comments or hearing requests with the Division within 30 days of the date of public notice. Requests for a public hearing must be in writing to the Director and shall set forth the reasons why a hearing should be held. A public hearing shall be held if the Director determines there is significant public interest.

(d) The Division will distribute notice of the filing of an application for a new facility or major modifications with the next OCD and OCC hearing docket following receipt of the application.

(3) Financial Assurance Requirements:

(a) Centralized Facilities: Upon determination by the Director that the permit can be approved, any applicant of a centralized facility shall submit acceptable financial assurance in the amount of $25,000 per facility or a statewide "blanket" financial assurance in the amount of $50,000 to cover all of that applicant's facilities in a form approved by the Director.

(b) New Commercial Facilities or major expansions or major modification of Existing Facilities: Upon determination by the Director that a permit for a commercial facility to commence operation after the effective date of this rule can be approved, or upon determination by the Director that a major modification or major expansion of an existing facility can be approved, any applicant of such a commercial facility shall submit acceptable financial assurance in the amount of the closure cost estimated in Subsection B, Paragraph (1), Subparagraph (i) above of 19.15.9.711 NMAC in a form approved by the Director according to the following schedule:

(i) within one (1) year of commencing operations or when the facility is filled to 25% of the permitted capacity, whichever comes first, the financial assurance must be increased to 25% of the estimated closure cost;

(ii) within two (2) years of commencing operations or when the facility is filled to 50% of the permitted capacity, whichever comes first, the financial assurance must be increased to 50% of the estimated closure cost;

(iii) within three (3) years of commencing operations or when the facility is filled to 75% of the permitted capacity, whichever comes first, the financial assurance must be increased to 75% of the estimated closure cost;

(iv) within four (4) years of commencing operations or when the facility is filled to 100% of the permitted capacity, whichever comes first, the financial assurance must be increased to the estimated closure cost.

(c) Existing Commercial Facilities: All permittees of commercial facilities approved for operation at the time this rule becomes effective shall have submitted financial assurance in the amount of the closure cost estimated pursuant to Subsection B, Paragraph (1), Subparagraph (i) above of 19.15.9.711 NMAC but not less than $25,000 nor more than $250,000 per facility in a form approved by the Director.

(i) within one (1) year of the effective date of Section 19.15.9.711 NMAC the financial assurance amount must be increased to 25% of the estimated closure costs or $62,500.00, whichever is less;

(ii) within two (2) years of the effective date of Section 19.15.9.711 NMAC the financial assurance amounts must be increased to 50% of the estimated closure costs or $125,000.00, whichever is less;

(iii) within three (3) years of the effective date of Section 19.15.9.711 NMAC the financial assurance amounts must be increased to 75% of the estimated closure costs or $187,000.00, whichever is less;

(iv) within four (4) years of the effective date of Section 19.15.9.711 NMAC the financial assurance amounts must be increased to the estimated closure cost or $250,000.00, whichever is less.

(d) The financial assurance required in subparagraphs (a), (b), or (c), above shall be payable to the State of New Mexico and conditioned upon compliance with statutes of the State of New Mexico and rules of the Division, and acceptable closure of the site upon cessation of operation, in accordance with Subsection B, Paragraph (1), Subparagraph (i) of 19.15.9.711 NMAC. If adequate financial assurance is posted by the applicant with a federal or state agency and the financial assurance otherwise fulfills the requirements of this rule, the Division may consider the financial assurance as satisfying the requirement of Section 19.15.9.711 NMAC. The applicant must notify the Division of any material change affecting the financial assurance within 30 days of discovery of such change.

(4) The Director may accept the following forms of financial assurance:

(a) Surety Bonds

(i) A surety bond shall be executed by the permittee and a corporate surety licensed to do business in the State.

(ii) Surety bonds shall be noncancellable during their terms.

(b) Letter of Credit - Letter of credit shall be subject to the following conditions:

(i) The letter may be issued only by a bank organized or authorized to do business in the United States;

(ii) Letters of credit shall be irrevocable for a term of not less than five (5) years. A letter of credit used as security in areas requiring continuous financial assurance coverage shall be forfeited and shall be collected by the State of New Mexico if not replaced by other suitable financial assurance or letter of credit at least 90 days before its expiration date;

(iii) The letter of credit shall be payable to the State of New Mexico upon demand, in part or in full, upon receipt from the Director of a notice of forfeiture.

(c) Cash Accounts - Cash accounts shall be subject to the following conditions:

(i) The Director may authorize the permittee to supplement the financial assurance through the establishment of a cash account in one or more federally insured or equivalently protected accounts made payable upon demand to, or deposited directly with, the State of New Mexico.

(ii) Any interest paid on a cash account shall not be retained in the account and applied to the account unless the Director has required such action as a permit requirement.

(iii) Certificates of deposit may be substituted for a cash account with the approval of the Director.

(d) Replacement of Financial Assurances

(i) The Director may allow a permittee to replace existing financial assurances with other financial assurances that provide equivalent coverage.

(ii) The Director shall not release existing financial assurances until the permittee has submitted, and the Director has approved, acceptable replacements.

(5) A permit may be denied, revoked or additional requirements imposed by a written finding by the Director that a permittee has a history of failure to comply with Division rules and orders and state or federal environmental laws.

(6) The Director may, for protection of public health and the environment, impose additional requirements such as setbacks from an existing occupied structure.

(7) The Director may issue a permit upon a finding that an acceptable application has been filed and that the conditions of paragraphs 2 and 3 above have been met. All permits are revocable upon showing of good cause after notice and, if requested, hearing. Permits shall be reviewed a minimum of once every five (5) years for compliance with state statutes, Division rules and permit requirements and conditions.

C. Operational Requirements

(1) All surface waste management facility permittees shall file forms C-117-A, C-118, and C-120-A as required by OCD rules.

(2) Facilities permitted as treating plants will not accept sediment oil, tank bottoms and other miscellaneous hydrocarbons for processing unless accompanied by an approved Form C-117A or C-138.

(3) Facilities will only accept oilfield related wastes except as provided in Subsection C, Paragraph (4), Subparagraph (c) of 19.15.9.711 NMAC below. Wastes which are determined to be RCRA Subtitle C hazardous wastes by either listing or characteristic testing will not be accepted at a permitted facility.

(4) The permittee shall require the following documentation for accepting wastes, other than wastes returned from the wellbore in the normal course of well operations such as produced water and spent treating fluids, at commercial waste management facilities:

(a) Exempt Oilfield Wastes: As a condition to acceptance of the materials shipped, a generator, or his authorized agent, shall sign a certificate which represents and warrants that the wastes are: generated from oil and gas exploration and production operations; exempt from Resource Conservation and Recovery Act (RCRA) Subtitle C regulations; and not mixed with non-exempt wastes. The permittee shall have the option to accept on a monthly, weekly, or per load basis a load certificate in a form of its choice. While the acceptance of such exempt oilfield waste materials does not require the prior approval of the Division, both the generator and permittee shall maintain and shall make said certificates available for inspection by the Division for compliance and enforcement purposes.

(b) Non-exempt, Non-hazardous Oilfield Wastes: Prior to acceptance, a "Request For Approval To Accept Solid Waste", OCD Form C-138, accompanied by acceptable documentation to determine that the waste is non-hazardous shall be submitted to the appropriate District office. Acceptance will be on a case-by-case basis after approval from the Division's Santa Fe office.

(c) Non-oilfield Wastes: Non-hazardous, non-oilfield wastes may be accepted in an emergency if ordered by the Department of Public Safety. Prior to acceptance, a "Request To Accept Solid Waste", OCD Form C-138 accompanied by the Department of Public Safety order will be submitted to the appropriate District office and the Division's Santa Fe office. With prior approval from the Division, other non-hazardous, non-oilfield waste may be accepted into a permitted surface waste management facility if the waste is similar in physical and chemical composition to the oilfield wastes authorized for disposal at that facility and is either: (1) exempt from the “hazardous waste” provisions of Subtitle C of the federal Resource Conservation and Recovery Act; or (2) has tested non-hazardous and is not listed as hazardous. Prior to acceptance, a "Request For Approval to Accept Solid Waste," OCD Form C-138, accompanied by acceptable documentation to characterize the waste, shall be submitted to and approved by the Division’s Santa Fe office.

(5) The permittee of a commercial facility shall maintain for inspection the records for each calendar month on the generator, location, volume and type of waste, date of disposal, and hauling company that disposes of fluids or material in the facility. Records shall be maintained in appropriate books and records for a period of not less than five years, covering their operations in New Mexico.

(6) Disposal at a facility shall occur only when an attendant is on duty unless loads can be monitored or otherwise isolated for inspection before disposal . The facility shall be secured to prevent unauthorized disposal when no attendant is present.

(7) No produced water shall be received at the facility from motor vehicles unless the transporter has a valid Form

C-133, Authorization to Move Produced Water, on file with the Division.

(8) To protect migratory birds, all tanks exceeding 16 feet in diameter, and exposed pits and ponds shall be screened, netted or covered. Upon written application by the permittee, an exception to screening, netting or covering of a facility may be granted by the district supervisor upon a showing that an alternative method will protect migratory birds or that the facility is not hazardous to migratory birds.

(9) All facilities will be fenced in a manner approved by the Director.

(10) A permit may not be transferred without the prior written approval of the Director. Until such transfer is approved by the Director and the required financial assurance is in place, the transferor's financial assurance will not be released.

D. Facility Closure

(1) The permittee shall notify the Division thirty (30) days prior to its intent to cease accepting wastes and close the facility. The permittee shall then begin closure operations unless an extension of time is granted by the Director. If disposal operations have ceased and there has been no significant activity at the facility for six (6) months and the permittee has not responded to written notice as defined in Subsection D, Paragraph (2), Subparagraph (a) of 19.15.9.711 NMAC, then the facility shall be considered abandoned and shall be closed utilizing the financial assurance pledged to the facility. Closure shall be in accordance with the approved closure plan and any modifications or additional requirements imposed by the Director to protect public health and the environment. At all times the permittee must maintain the facility to protect public health and the environment. Prior to release of the financial assurance covering the facility, the Division will inspect the site to determine that closure is complete.

(2) If a permittee refuses or is unable to conduct operations at the facility in a manner that protects public health or the environment or refuses or is unable to conduct or complete the closure plan, the terms of the permit are not met, or the permittee defaults on the conditions under which the financial assurance was accepted, the Director shall take the following actions to forfeit all or part of the financial assurance:

(a) Send written notice by certified mail, return receipt requested, to the permittee and the surety informing them of the decision to close the facility and to forfeit all or part of the financial assurance, including the reasons for the forfeiture and the amount to be forfeited and notifying the permittee and surety that a hearing request must be made within ten (10) days of receipt of the notice.

(b) Advise the permittee and surety of the conditions under which the forfeiture may be avoided. Such conditions may include but are not limited to:

(i) An agreement by the permittee or another party to perform closure operations in accordance with the conditions of the permit, the closure plan and these Rules, and that such party has the ability to satisfy the conditions.

(ii) The Director may allow a surety to complete closure if the surety can demonstrate an ability to complete the closure in accordance with the approved plan. No surety liability shall be released until successful completion of closure.

(c) In the event forfeiture of the financial assurance is required by this rule, the Director shall proceed to collect the forfeited amount and use the funds collected from the forfeiture to complete the closure. In the event the amount forfeited is insufficient for closure, the permittee shall be liable for the deficiency. The Director may complete or authorize completion of closure and may recover from the permittee all reasonably incurred costs of closure and forfeiture in excess of the amount forfeited. In the event the amount forfeited was more than the amount necessary to complete closure and all costs of forfeiture, the excess shall be returned to the party from whom it was collected.

(d) Upon showing of good cause, the Director may order immediate cessation of operations of the facility when it appears that such cessation is necessary to protect public health or the environment, or to assure compliance with Division rules and orders.

(e) In the event the permittee cannot fulfill the conditions and obligations of the permit, the State of New Mexico, its agencies, officers, employees, agents, contractors and other entities designated by the State shall have all rights of entry into, over and upon the facility property, including all necessary and convenient rights of ingress and egress with all materials and equipment to conduct operation, termination and closure of the facility, including but not limited to the temporary storage of equipment and materials, the right to borrow or dispose of materials, and all other rights necessary for operation, termination and closure of the facility in accordance with the permit.

E. Waste management facilities in operation at the time Section 19.15.9.711 NMAC becomes effective shall:

(1) within one (1) year after the effective date permitted facilities submit the information required in Subsection B, Paragraph (1), Subparagraphs (a, h, i and l) of 19.15.9.711 NMAC not already on file with the Division;

(2) within one (1) year after the effective date unpermitted facilities submit the information required in Subsection B, Paragraph (1), Subparagraphs (a) through (j) and Subsection B, Paragraph (1), Subparagraph (l) of 19.15.9.711 NMAC;

(3) comply with Subsections C and D of 19.15.9.711 NMAC unless the Director grants an exemption from a requirement in these sections based upon a demonstration by the operator that such requirement is not necessary to protect public

health and the environment.
[6-6-88…2-1-96; 19.15.9.711 NMAC - Rn, 19 NMAC 15.I.711, 11-30-00; A, 4-15-03]

19.15.9.712. DISPOSAL OF CERTAIN NON-DOMESTIC WASTE AT SOLID WASTE FACILITIES.

A. General - Certain non-domestic waste arising from the exploration, development, production or storage of crude oil or natural gas, certain nondomestic waste arising from the oil field service industry, and certain non-domestic waste arising from the transportation, treatment or refinement of crude oil or natural gas, may be disposed of at a solid waste facility.

B. Definitions - The following words and phrases have particular meanings for purposes of this section:

(1) "BTEX." The acronym "BTEX" in this section refers to benzene, toluene, ethelbenzene and xylene.

(2) "Discharge Plan." A "discharge plan" is a plan submitted and approved by the Division pursuant to NMSA 1978, Section 70-2-12(B)(22) (2000 Cum.Supp.) and rules and regulations of the Water Quality Control Commission.

(3) "EPA." The acronym "EPA" refers to the United States Environmental Protection Agency.

(4) "EPA Clean." The phrase "EPA Clean" refers to cleanliness standards established by the EPA in 40 C.F.R. Part 261, Section 261.7(b).

(5) "NESHAP." The acronym "NESHAP" refers to the National Emission Standards for Hazardous Air Pollutants of the EPA, 40 C.F.R. Part 61.

(6) "NORM." The acronym "NORM" refers to naturally occurring radioactive materials regulated by 20 NMAC 3.1, Subpart 14.

(7) "Section." "Section" or "this section" refers to Section 19.15.9.712.

(8) "Solid Waste Facility." A "solid waste facility" is a facility permitted or authorized as a solid waste facility by the New Mexico Environment Department pursuant to the Solid Waste Act, NMSA 1978, Sections 74-9-1 et seq. and rules and regulations of the Environmental Improvement Board, to accept industrial solid waste or other special waste.

(9) "TCLP" The acronym "TCLP" in this section refers to the testing protocol established by the EPA in 40 C.F.R. Part 261, entitled "Toxicity Characteristic Leaching Procedure" or an alternative hazardous constituent analysis approved by the Division.

(10) "TPH." The acronym "TPH" in this section refers to the phrase "total petroleum hydrocarbons."

(11) "Waste." The word "waste" refers to nondomestic waste resulting from the exploration, development, production or storage of crude oil or natural gas pursuant to NMSA 1978, Section 70-2-12(B)(21) and nondomestic waste arising from the oil field service industry, and certain non-domestic waste arising from the transportation, treatment or refinement of crude oil or natural gas pursuant to NMSA 1978, Section 70-2-12(B)(22).

C. Procedure

(1) Waste Listed in Subsection D, Paragraph (1) of Section 19.15.9.712. Waste listed in Subsection D,

Paragraph (1) of Section 19.15.9.712 may be disposed of at a solid waste facility without prior written authorization of the Division.

(2) Waste Listed in Subsection D, Paragraph (2) of Section 19.15.9.712. Waste listed in Subsection D, Paragraph (2) of Section 19.15.9.712 may be disposed of at a solid waste facility after testing and prior written authorization of the Division. Before authorization is granted, copies of test results must be provided to the Division and to the solid waste facility where the waste is to be disposed. Disposal may commence only after written authorization of the Division. In appropriate cases and so long as a representative sample is tested, the Division may authorize disposal of a waste stream listed in Subsection D, Paragraph (2) of Section 19.15.9.712 without individual testing of each delivery.

(3) Waste Listed in Subsection D, Paragraph (3) of Section 19.15.9.712. Waste listed in Subsection D, Paragraph (3) of Section 19.15.9.712 may be disposed of at a solid waste facility on a case-by-case basis after testing required at the discretion of the Division and after prior written authorization of the Division. Before authorization is granted, copies of test results must be provided to the Division and to the solid waste facility where the waste is to be disposed. Disposal may commence only after written authorization of the Division.

(4) Simplified Procedure for Holders of Discharge Plans. Holders of an approved discharge plan may amend the discharge plan to provide for disposal of waste listed in Waste Listed in Subsection D, Paragraph (2) of Section 19.15.9.712 and, as applicable, Subsection D, Paragraph (3) of Section 19.15.9.712. If the amendment to the Discharge Plan is approved, wastes listed in Subsection D, Paragraph (2) of Section 19.15.9.712 and Subsection D, Paragraph (3) of Section 19.15.9.712 may be disposed of at a solid waste facility without the necessity of prior written authorization of the Division.

D. Waste Governed By This Section

(1) Waste That Does Not Require Testing Before Disposal:

(a) Barrels, drums, 5-gallon buckets, 1-gallon containers so long as empty and EPA-clean.

(b) Uncontaminated brush and vegetation arising from clearing operations.

(c) Uncontaminated concrete.

(d) Uncontaminated construction debris.

(e) Non-friable asbestos and asbestos contaminated waste material, so long as the disposal complies with all applicable federal and state regulations for nonfriable asbestos materials and so long as asbestos is removed from steel pipes and boilers and, if applicable, the steel recycled.

(f) Detergent buckets, so long as completely empty.

(g) Fiberglass tanks so long as the tank is empty, cut up or shredded, and EPA clean.

(h) Grease buckets, so long as empty and EPA clean.

(i) Uncontaminated ferrous sulfate or elemental sulfur so long as recovery and sale as a raw material is not possible.

(j) Metal plate and metal cable.

(k) Office trash.

(l) Paper and paper bags, so long as empty (paper bags).

(m) Plastic pit liners, so long as cleaned well.

(n) Soiled rags or gloves. If wet, must pass Paint Filter Test prior to disposal.

(o) Uncontaminated wood pallets.

(2) Waste That Must Be Tested:

(a) Activated alumina must be tested for TPH and BTEX.

(b) Activated carbon must be tested for TPH and BTEX.

(c) Amine filters must be tested for BTEX (and air-dried for at least 48 hours before testing).

(d) Friable asbestos and asbestos-contaminated waste material must be tested pursuant to NESHAP (and so long as the disposal otherwise complies with all applicable federal and state regulations for friable asbestos materials, and so long as asbestos is removed from steel pipes and boilers and, if applicable, the steel should be recycled before disposal).

(e) Cooling tower filters must be tested for TCLP/chromium (and drained and then air-dried for at least 48 hours before testing).

(f) Dehydration filter media must be tested for TPH and BTEX (and drained and then air-dried for at least 48 hours before testing).

(g) Gas condensate filters must be tested for BTEX (and drained and then air-dried for at least 48 hours before testing).

(h) Glycol filters must be tested for BTEX (and drained and then air-dried for at least 48 hours before testing).

(i) Iron sponge must be oxidized completely and then undergo Ignitability Testing.

(j) Junked pipes, valves, and metal pipe must be tested for NORM.

(k) Molecular sieve must be tested for TPH and BTEX (and must be cooled in a non-hydrocarbon inert atmosphere and hydrated in ambient air for at least 24 hours before testing).

(l) Pipe scale and other deposits removed from pipeline and equipment must be tested for TPH, TCLP/metals and NORM.

(m) Produced water filters must be tested for Corrosivity (and drained and then air-dried for at least 48 hours before testing).

(n) Sandblasting sand must be tested for TCLP/metals or, at the discretion of the Division, TCLP/total metals.

(o) Waste oil filters must be tested for TCLP/metals (and must be drained thoroughly of oil for at least 24 hours before testing and oil and metal parts must be recycled).

(3) Waste That May Be Disposed Of On A Case-By-Case Basis:

(a) Sulfur contaminated soil.

(b) Catalysts.

(c) Contaminated soil other than petroleum contaminated soil.

(d) Petroleum contaminated soil in the event of an emergency declared by the director.

(e) Contaminated concrete.

(f) Demolition debris not otherwise specified herein.

(g) Unused dry chemicals (in addition to any testing required by the Division, a copy of the Material Safety Data Sheet shall be forwarded to the Division and the solid waste facility on each chemical proposed for disposal).

(h) Contaminated ferrous sulfate or elemental sulfur.

(i) Unused pipe dope.

(j) Support balls.

(k) Tower packing materials.

(l) Contaminated wood pallets.

(m) Partial sacks of unused drilling mud (in addition to any testing required by the Division, a copy of the Material Safety Data Sheet shall be forwarded to Division and the solid waste facility at which the partial sacks will be disposed).

(n) Other wastes as applicable.

E. Testing

(1) General - Testing required herein shall be conducted according to the Test Methods for Evaluating Solid Waste, EPA No. SW-846. Any questions concerning the standards or a particular testing facility should be directed to the Division.

(2) Methodology - Testing must be conducted according to the test method listed:

(a) TPH: EPA method 418.1 or 8015 (D-R-O and G-R-O only) or an alternative hydrocarbon analysis approved by the Division.

(b) TCLP: EPA Method 1311 or an alternative hazardous constituent analysis approved by the Division.

(c) Paint Filter Testing: EPA Method 9095A.

(d) Ignitability Test: EPA Method 1030.

(e) Corrosivity: EPA Method 1110.

(f) Reactivity: Test procedures and standards established on a case-by-case basis by the Division.

(g) NORM. 20 NMAC 3.1, Subpart 14.

(3) Limits - To be eligible for disposal pursuant to this section, substances found during testing shall not exceed the following limits:

(a) Benzene: Less than 10 mg/Kg.

(b) BTEX: Less than 500 mg/Kg (sum of all).

(c) TPH: Shall not exceed 1000 mg/Kg.

(d) Hazardous Air Pollutants: Shall not exceed the standards set forth in NESHAP.

(e) TCLP: Shall not exceed the following:

(i) Arsenic: 5.0 mg/l
(ii) Barium: 100.0 mg/l
(iii) Cadmium: 1.0 mg/l
(iv) Chromium: 5.0 mg/l
(v) Lead: 5.0 mg/l
(vi) Mercury: 0.2 mg/l
(vii) Selenium: 1.0 mg/l
(viii) Silver: 5.0 mg/l

19.15.9.713 This entire section moved and renumbered to 19 NMAC 15.A.32.
[12-30-95, 2-1-96; A, 6-15-99; 19.15.9.713 NMAC - Rn, 19 NMAC 15.I.713; 11-30-00]

19.15.9.714 DISPOSAL OF REGULATED NATURALLY OCCURRING RADIOACTIVE MATERIAL (REGULATED NORM)

A. Purpose - This rule establishes procedures for the disposal of regulated naturally occurring radioactive material (Regulated NORM) associated with the oil and gas industry. Any person disposing of Regulated NORM, as defined at 19 NMAC 15.A.7, is subject to this rule and to the New Mexico Environmental Improvement Board regulations at 20 NMAC 3.1, Subpart 14.

B. Nonretrieved Flowlines and Pipelines

(1) The Division will consider a proposal for leaving flowlines and pipelines (hereinafter "pipeline") that contain Regulated NORM in the ground provided such abandonment procedures are performed in a manner to protect the environment, public health, and fresh waters. Division approval is contingent on the applicant meeting the following requirements as a minimum:

(2) An application submitted to the Division must contain the following as a minimum:

(a) The pipeline layout over its entire length on an OCD Form C-102 (Well Location and Acreage Dedication Plat) including the legal description of the location of both ends and all surface ownership along the pipeline.

(b) Results of a radiation survey conducted at all accessible points and a surface radiation survey along the complete pipeline route in a form approved by the Division. All surveys are to be conducted consistent with procedures approved by the Division.

(c) The type of material for which the pipeline had been used.

(d) The procedure to be used for flushing hydrocarbons and/or produced water from the pipeline.

(e) An explanation as to why it is more beneficial to leave the pipeline in the ground than to retrieve it.

(f) Proof of notice of the proposed abandonment to all surface owners where the pipeline is located. Additional notification may be required as described in Subsection F of 19.15.9.714 NMAC.

(3) Procedure

(a) Upon approval of the application by the Division, the operator must notify the OCD District office at least 24 hours prior to beginning any work on the pipeline abandonment.

(b) As a condition of completion of the pipeline abandonment, all accessible points must be permanently capped.

(4) General

(a) No additional Regulated NORM may be placed in any pipeline to be abandoned under this section other than that which accumulated in the pipeline under normal operation of the pipeline.

(b) Any pipeline that does not exhibit Regulated NORM pursuant to required surveys may be abandoned without application under this section in accordance with the operator's applicable lease agreements.

(c) If an appurtenance of a pipeline contains Regulated NORM, but upon removal of the appurtenance, no accessible point or surface above the pipeline exhibits the presence of

Regulated NORM, then the applicant must submit to the Division the information regarding the Regulated NORM in the appurtenance and a statement concerning management of that Regulated NORM. With respect to the pipeline left in the ground, the applicant will be subject to the requirements under Subsection B of 19.15.9.714 NMAC with the exception of Subsection B, Paragraph (2), Subparagraph (f) of 19.15.9.714 NMAC.

C. Commercial or Centralized Surface Waste Management Facilities

(1) The Division will consider proposals for the disposal of Regulated NORM in commercial or centralized surface waste management facilities, provided such disposal is performed in a manner to protect the environment, public health, and fresh waters. Division approval is contingent on the applicant obtaining a permit in accordance with Section 19.15.9.711 NMAC for the facility and complying with additional requirements specifically related to Regulated NORM disposal as described below.

(2) Application - All requests for authority to receive and dispose of Regulated NORM in commercial or centralized surface waste management facilities must be set for hearing by the Division in order for the operator of the facility to obtain or modify a permit in accordance with Section 19.15.9.711 NMAC. A request to dispose of Regulated NORM at a facility previously permitted under Section 19.15.9.711 NMAC will be considered a major modification to that facility. The hearing request must be submitted to the Division and must contain the following at a minimum:

(a) Complete plans for the facility, including the sources of Regulated NORM, radiation survey readings, quantities of Regulated NORM to be disposed, and monitoring proposals;

(b) A copy of this permit for the facility, if one has been issued by the Division;

(c) Proof of public notice of the application as required by Section 19.15.9.711 NMAC; and

(d) Evidence of issuance of a specific license pursuant to 20 NMAC 3.1, Subpart 14, a license pursuant to 20 NMAC 3.1, Subpart 13, and any other authorizations required by law.

(3) Procedures

(a) Operating procedures that are protective of the environment, public health, and fresh waters will be established in the Division's order.

(b) Any person desiring to dispose of Regulated NORM in an approved commercial or centralized surface waste management facility must furnish Regulated NORM information to the facility operator sufficient for the operator to submit Form C-138 (Request for Approval to Accept Solid Waste) for approval to the Division. The facility operator must receive Division approval prior to receiving the Regulated NORM at the disposal facility.

D. Downhole Disposal in Wells to be Plugged and Abandoned

(1) The Division will consider proposals for downhole disposal of Regulated NORM in wells that are to be plugged and abandoned, provided such plugging and abandonment procedures are performed in a manner to protect the environment, public health and fresh waters and in accordance with Division Rules pertaining to well plugging and abandonment.

(2) Application

(a) A plugging and abandonment (P&A) Form C-103 must be completed by the applicant and submitted to the Division for approval.

(b) In addition to all other information required for P&A submittal, the form must specifically state that Regulated NORM will be placed in the wellbore. The abandonment procedure contained in the application must identify depths at which the Regulated NORM will be placed, radiation survey results conducted on the Regulated NORM to be disposed, the procedure to be used to place the Regulated NORM in the wellbore, and the specific form of Regulated NORM being placed in the wellbore (e.g. scale, pipe, dirt, etc).

(c) Notice of the submittal of an application to dispose of Regulated NORM in a P&A well must be sent to the surface owner and the mineral lessor. Additional notification may be required as described in Subsection F of 19.15.9.714 NMAC.

(3) Procedures

(a) All P&A procedures routinely required by the Division must be followed unless specifically superseded at the instruction of the Division to facilitate the Regulated NORM disposal.

(b) No work will be commenced until the application for Regulated NORM disposal in a P&A well has been approved by the Division.

(c) The cement plug located directly above the Regulated NORM and the surface plug must be color-dyed with red iron oxide.

(4) General

(a) Regulated NORM must be disposed at a depth of at least 100 feet below the lower most known Underground Source of Drinking Water (USDW) zone. There must be evidence that there is cement across the known USDW zones.

(b) Abnormally pressured zone(s) in the wellbore that might result in migration of the Regulated NORM after it has been placed in the P&A well must be addressed in the application.

E. Injection

(1) The Division will consider proposals for injecting Regulated NORM into injection wells provided such injection is performed in a manner to protect the environment, public health, and fresh waters and such injection is in compliance with Division Rules pertaining to injection. Division approval is contingent on the applicant meeting the following requirements at a minimum:

(2) Disposal wells

(a) An application submitted to the Division must contain the following information at a minimum:

(i) For both existing and newly permitted disposal wells, a completed Form C-108 (Application for Authorization to Inject) with proof of required notification and a statement that Regulated NORM will be injected;

(ii) Description of Regulated NORM to be disposed including its source, radiation levels, and quantity; and

(iii) Description of any process used on the material to improve injectivity;

(b) Procedures

(i) Regulated NORM to be injected may only be from the applicant's operations.

(ii) Each time Regulated NORM is injected, a Form C-103 (Subsequent Report Form) must be submitted to the Division and District offices. This form must be submitted within five (5) working days following the injection and must contain the following information: source of Regulated NORM; NORM radiation level; quantity of material injected; description of any process used on the material to improve injectivity; the injection pressure while injecting; and date(s) of injection.

(iii) Failures and repairs - All mechanical failures must be reported to the appropriate District office within 24 hours of the occurrence. A description of the failure and immediate measures taken in response to the failure must be submitted no later than 15 days following the occurrence. The operator must notify the District office of proposed repair plans. Approval of repair plans must be received prior to any work commencing, and notice of commencement must be given to the District office such that the repairs may be witnessed and/or inspected. All well repairs must be monitored by the operator to ensure Regulated NORM does not escape the wellbore or is completely contained in the repair operations.

(iv) At the time of abandonment of the disposal well, the injection interval that was used for Regulated NORM injection must be squeezed with cement or a cement plug must be located directly above the injection interval. Cement in either case must contain red iron oxide.

(v) The injection zone must be at a depth of at least 100 feet below the lower most known USDW zone.

(3) Injection in Enhanced Oil Recovery (EOR) Injection Wells - The Division will consider issuing a permit for the disposal of Regulated NORM into injection wells within an approved Enhanced Oil Recovery (EOR) Project only after notice and hearing and upon a minimum demonstration that:

(a) such injection will not reduce the efficiency of the project or otherwise cause a reduction in the ultimate recovery of hydrocarbons from the project;

(b) such injection will not cause an increase in the radiation level of Regulated NORM produced from the EOR interval in any producing well located either within or offsetting the project area; and

(c) the operations will be in conformance with provisions of Subsection E, Paragraph (2) of 19.15.9.714 NMAC above.

(4) Injection Above Fracture Pressure

(a) The Division will consider issuing a permit for the disposal of Regulated NORM in a disposal well above fracture pressure only after notice and hearing and upon receiving the following minimum information from the applicant:

(i) A completed Form C-108 clearly stating that disposal of Regulated NORM at or above fracture pressure is proposed.

(ii) Information required under Subsection E, Paragraph (2) of 19.15.9.714 NMAC above.

(iii) Model results predicting the fracture propagation including the expected height, extension, direction, and any other evidence sufficient to demonstrate that the fracture will not extend beyond the injection interval or into the confining zones. The application must include the procedure, the anticipated pressures and the type and pressure rating of equipment that will be used. The current or potential utilization of zones immediately above and below the zone of interest may be considered by the Division in the acceptance or rejection of model predictions.

(iv) A contingency plan of the procedures, including containment plans, that will be employed if a mechanical failure occurs.

(b) Procedures

(i) 24 hour notice that injection will commence must be given to the District office.

(ii) Upon completion of the injection, the disposal interval must be squeezed with cement or a cement plug must be located directly above the injection interval (cement in either case must contain red iron oxide), and a Form C-103 (Subsequent Report Form) must be submitted to the Division and the District office within five working days of the injection. If the operator desires to return the well to injection below fracture pressure, such plans must be contained in the application.

(5) Injection in Commercial Disposal Facilities - The Division will consider issuing a permit for the commercial disposal of Regulated NORM by injection only after notice and hearing, and provided a specific license has been obtained pursuant to 20 NMAC 3.1, Subpart 14 and a license has been obtained pursuant to 20 NMAC 3.1, Subpart 13. In addition to obtaining these licenses the operator must also comply with Subsection E, Paragraph (2), Subparagraph (b), Sub-subparagraph (i) above of 19.15.9.714 NMAC.

F. Additional Notification

(1) The Director may, at his discretion, require additional notice for any application under this rule.

(2) Any notified party seeking to comment or request a public hearing on such an application must file comments or a hearing request with the Division within 20 days of notice. A request for a hearing must be in writing and must set forth the reasons why a hearing should be held.

(3) A public hearing will be held as required in 19.15.9.714 NMAC or if the Director determines there is sufficient cause.

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 15 OIL AND GAS
PART 10 OIL PURCHASING AND TRANSPORTING

19.15.10.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Dept., Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2/1/96; 19.15.10.1 NMAC - Rn, 19 NMAC 15.J.1, 04-15-03]

19.15.10.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2/1/96; 19.15.10.2 NMAC - Rn, 19 NMAC 15.J.2, 04-15-03]

19.15.10.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the Oil Conservation Division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights and the disposition of wastes resulting from oil and gas operations.
[2/1/96; 19.15.10.3 NMAC - Rn, 19 NMAC 15.J.3, 04-15-03]

19.15.10.4 DURATION: Permanent.
[2/1/96; 19.15.10.4 NMAC - Rn, 19 NMAC 15.J.4, 04-15-03]

19.15.10.5 EFFECTIVE DATE: February 1, 1996 [unless a later date is cited at the end of a section]
[2/1/96; 19.15.10.5 NMAC - Rn, 19 NMAC 15.J.5, 04-15-03]

19.15.10.6 OBJECTIVE: To regulate oil purchasing and transporting under the Oil and Gas Act.
[2/1/96; 19.15.10.6 NMAC - Rn, 19 NMAC 15.J.6, 04-15-03]

19.15.10.7 DEFINITIONS: [RESERVED]

19.15.10.8 - 800 [RESERVED]

19.15.10.801 ILLEGAL SALE PROHIBITED:
The sale or purchase or acquisition, or the transporting, refining, processing or handling in any other way, of crude petroleum oil or of any crude petroleum produced in excess of the amount allowed by any statute of this state, or by any rule, regulation or order of the division made thereunder, is prohibited.
[1/1/50...2/1/96; 19.15.10.801 NMAC - Rn, 19 NMAC 15.J.801, 04-15-03]

19.15.10.802 RATABLE TAKE; COMMON PURCHASER:
A. Every person now engaged or hereafter engaging in the business of purchasing oil to be transported through pipelines shall be a common purchaser thereof, and shall without discrimination in favor of one producer as against another in the same field, purchase any oil tendered to it which has been lawfully produced in the vicinity of, or which may be reasonably reached by pipelines through which it is transporting oil, or the gathering branches thereof, or which may be delivered to the pipeline or gathering branches thereof by truck or otherwise and shall fully perform all the duties of a common purchaser. If any common purchaser shall not have need for all such oil lawfully produced within a field, or if for any reason it shall be unable to purchase all such oil, then it shall purchase from each producer in a field ratably, taking and purchasing the same quantity of oil from each well to the extent that each well is capable of producing its ratable portions; provided, however, nothing herein contained shall be construed to require more than one pipeline connection for each producing well. In the event any such common purchaser of oil is likewise a producer or is affiliated with a producer, directly or indirectly, it is hereby expressly prohibited from discriminating in favor of its own production or in favor of the production of an affiliated producer as against that of others and the oil produced by such common purchaser, or by the affiliate of such common purchaser shall be treated as that of any other producer for the purposes of ratable taking.

B. It shall be unlawful for any common purchaser, to unjustly or unreasonably discriminate as to the relative quantities of oil purchased by it in various fields of the state; the question of the justice or reasonableness to be determined by the division, taking into consideration the production and age of wells in the respective fields and all other factors. It is the intent of this rule that all fields shall be allowed to produce and market a just and equitable share of the oil produced and marketed in the state, insofar as the same can be effected economically and without waste.

C. In order to preclude premature abandonment, the common purchaser within its purchasing area is authorized and directed to make 100 percent purchases from units of settled production producing ten (10) barrels or less daily of crude petroleum in lieu of ratable purchases or takings. Provided, however, where such purchaser's takings are curtailed below ten (10) barrels per unit of crude petroleum daily, then such purchaser is authorized and directed to purchase equally from all such units within its purchasing area, regardless of their producing ability insofar as they are capable of producing.
[7/1/52…2/1/96; 19.15.10.802 NMAC - Rn, 19 NMAC 15.J.802, 04-15-03]

19.15.10.803 PRODUCTION OF LIQUID HYDROCARBONS FROM GAS WELLS:
A. All liquid hydrocarbons produced incidental to the authorized production of gas from a well classified by the division as a gas well shall, for all purposes, be legal production.
B. For purposes of this rule, all gas produced from a gas well shall be considered to be authorized production with the following exceptions:
(1) When the well is being produced without an approved form C-104, designating the gas transporter and the oil or condensate transporter for said well.
(2) When the well has been directed to be shut in by the division.
C. In the event a gas well is directed to be shut in by the division, both the gas transporter and oil transporter named on the well's form C-104 shall be immediately notified of such fact.
[12/1/57...2/1/96; 19.15.10.803 NMAC - Rn, 19 NMAC 15.J.803, 04-15-03]

19.15.10.804 DOCUMENTATION REQUIRED:
A. All off-lease transportation of crude oil or lease condensate by motor vehicle shall be pursuant to an approved form C-104 and shall be accompanied by a run ticket or equivalent document. The documentation shall identify the name and address of the transporter, the name of the operator and of the lease or facility from which the oil was taken, the date of removal, the API gravity of the oil, the observed percentage of BS and W, the volume of oil or opening and closing tank gauges or meter readings and the signature of the driver. The document shall provide space for recording of the lease number and for signature of the operator or his representative.
B. After August 1, 1982, all such transportation must be accompanied by documentation sufficient to verify the location of the tanks or facility from which the liquid was removed. The location may be shown on the run ticket or equivalent document or may be carried separately.
C. All off-lease transportation of liquids which may contain crude oil, lease condensate, sediment oil or miscellaneous hydrocarbons shall be accompanied by a run ticket, work order or equivalent document, i.e., form C-117-A. The documentation shall identify the name and address of the transporter, the name of the operator and of the lease or facility from which the liquid was removed, the nature of the liquid removed including the observed percentage of liquid hydrocarbons, the volume or estimated volume of liquids and the destination.
D. After August 1, 1982, all such transportation must be accompanied by documentation sufficient to verify the location of the tanks or facility from which the liquid was removed. The location may be shown on the run ticket or equivalent document or may be carried separately.
E. The documentation required under Subsections A and B of 19.15.10.804 NMAC above shall be carried in the vehicle during transportation and shall be produced for examination and inspection by any employee of the division, any state police officer or any other law enforcement officer upon identification and request.
F. Except where the owner and the transporter are the same, one copy of such documentation shall be left at the facility from which the oil or other liquids were removed.

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 15 OIL AND GAS
PART 11 GAS PURCHASING AND TRANSPORTING

19.15.11.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Dept., Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2/1/96; 19.15.11.1 NMAC - Rn, 19 NMAC 15.K.1, 09-30-03]

19.15.11.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2/1/96; 19.15.11.2 NMAC - Rn, 19 NMAC 15.K.2, 09-30-03]

19.15.11.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights and the disposition of wastes resulting from oil and gas operations.
[2/1/96; 19.15.11.3 NMAC - Rn, 19 NMAC 15.K.3, 09-30-03]

19.15.11.4 DURATION: Permanent.
[2/1/96; 19.15.11.4 NMAC - Rn, 19 NMAC 15.K.4, 09-30-03]

19.15.11.5 EFFECTIVE DATE: February 1, 1996 [unless a later date is cited at the end of a section].
[2/1/96; 19.15.11.5 NMAC - Rn, 19 NMAC 15.K.5, 09-30-03]

19.15.11.6 OBJECTIVE: To regulate gas purchasing and transporting and enable the oil conservation division to fulfill its statutory mandate pursuant to the Oil and Gas Act.
[2/1/96; 19.15.11.6 NMAC - Rn, 19 NMAC 15.K.6, 09-30-03]

19.15.11.7 DEFINITIONS: [RESERVED]

19.15.11.8 - 900 [RESERVED]

19.15.11.901 ILLEGAL SALE PROHIBITED:
The sale, purchase or acquisition or the transporting, refining, processing or handling in any other way, of natural gas in whole or in part (or of any product of natural gas so produced) produced in excess of the amount allowed by any statute of this state, or by any rule, regulation or order of the division made thereunder, is prohibited.
[1/1/50...2/1/96; 19.15.11.901 NMAC - Rn, 19 NMAC 15.K.901, 09-30-03]

19.15.11.902 RATABLE TAKE:
A. Any person now or hereafter engaged in purchasing from one or more producers, gas produced from gas wells or casinghead gas produced from oil wells shall be a common purchaser thereof within each common source of supply from which it purchases, and as such it shall purchase gas lawfully produced from gas wells or casinghead gas produced from oil wells with which its gas transportation facilities are connected in the pool and other gas lawfully produced within the pool and tendered to a point on its gas transportation facilities. Such purchases shall be made without unreasonable discrimination in favor of one producer against another in the price paid, the quantities purchased, the bases of measurement or the gas transportation facilities afforded for gas of like quantity, quality and pressure available from such wells. In the event any such person is likewise a producer, he is prohibited to the same extent from discriminating in favor of himself on production from gas wells or casinghead gas produced from oil wells in which he has an interest, direct or indirect, as against other production from gas wells or casinghead gas produced from oil wells in the same pool. For the purposes of Section 902 of 19.15.11 NMAC, reasonable differences in prices paid or facilities afforded, or both, shall not constitute unreasonable discrimination if such differences bear a fair relationship to differences in quality, quantity or pressure of the gas available or to the relative lengths of time during which such gas will be available to the purchaser. The provisions of this Subsection shall not apply to:
(1) any wells or pools used for storage and withdrawal from storage of natural gas originally produced not in violation of the rules, regulations or orders of the division; or
(2) persons purchasing gas principally for use in the recovery or production of oil or gas, or
(3) any well which has been designated a "hardship well" by the division.

B. Any common purchaser taking gas produced from gas wells or casinghead gas produced from oil wells from a common source of supply shall take ratably under such rules, regulations and orders, concerning quantity, as may be promulgated by the division consistent with Section 902 of 19.15.11 NMAC. The division, in promulgating such rules, regulations and orders may consider the quality and the deliverability of the gas, the pressure of the gas at the point of delivery, acreage attributable to the well, market requirements in the case of unprorated pools and other pertinent factors.

C. Nothing in Section 902 of 19.15.11 NMAC shall be construed or applied to require, directly or indirectly, any person to purchase gas of a quality or under a pressure or under any other condition by reason of which such gas cannot be economically and satisfactorily used by such purchaser by means of his gas transportation facilities then in service.
[1/1/50...2/1/96; 19.15.11.902 NMAC - Rn, 19 NMAC 15.K.902, 09-30-03]

19.15.12.8 - 1000 [RESERVED]

19.15.12.1001 REFINERY REPORTS:
Each refiner of oil within the state of New Mexico shall furnish for each calendar month a "Refiner's Monthly Report," form C-113, containing the information and data indicated by such form, respecting oil and products involved in such refiner's operations during each month. Such report for each month shall be prepared and filed according to instructions on the form, on or before the 15th day of the next succeeding month.
[1/1/50...2/1/96; 19.15.12.1001 NMAC - Rn, 19 NMAC 15.L.1001, 10/15/03]

19.15.12.1002 GASOLINE PLANT REPORTS:

A. Each operator of a gasoline plant, cycling plant or any other plant at which gasoline, butane, propane, condensate, kerosene, oil or other liquid products are extracted from natural gas within the state of New Mexico shall furnish for each calendar month a Gas Purchaser's Monthly Report, form C-111, containing the information indicated by such form respecting natural gas and products involved in the operation of each plant during each month. (19.15.12.1002 NMAC shall also be applicable to plants in the state of New Mexico processing carbon dioxide gas into liquid or solid form.)

B. Form C-111 shall be filed in accordance with the provisions of Rule 1111 [now 19.15.13.1111 NMAC].
[1/1/50...2/1/96; 19.15.12.1002 NMAC - Rn, 19 NMAC 15.L.1002, 10/15/03]

19.15.13.6 OBJECTIVE: To provide for the filing of reports to enable the oil conservation division to carry out its statutory mandates under the Oil and Gas Act.
[2-1-96; 19.15.13.6 NMAC - Rn, 19 NMAC 15.M.6, 06/30/04]

19.15.13.7 DEFINITIONS: [RESERVED].

19.15.13.8 - 1099 [RESERVED].

19.15.13.1100 GENERAL:

A. Where to file reports: Unless otherwise specifically provided for in any rule or order of the division, all forms and reports required by these rules shall be filed with the appropriate district office of the division as provided in 19.15.15.1301 NMAC and 19.15.15.1302 NMAC.

B. Additional data: These rules shall not be construed to limit or restrict the authority of the oil conservation division to require the furnishing of such additional reports, data or other information relative to the production, transportation, storing, refining, processing or handling of crude petroleum oil, natural gas or products in the state of New Mexico as may appear to it to be necessary or desirable, either generally or specifically, for the prevention of waste and the conservation of natural resources of the state of New Mexico.

C. Books and records: All producers, injectors, transporters, storers, refiners, gasoline or extraction plant operators, treating plant operators, and initial purchasers of natural gas within the state of New Mexico shall make and keep appropriate books and records for a period of not less than five years, covering their operations in New Mexico, from which they may be able to make and substantiate the reports required by these rules.

D. Written notices, requests, permits and reports: The forms listed below shall be used for the purpose shown in accordance with the instructions printed thereon and the rule covering the use of the form, or any special rule or order pertaining to its use:

(1) Form C-101 Application for Permit to Drill, Deepen or Plug Back
(2) Form C-102 Well Location and Acreage Dedication Plat

(3) Form C-103 Sundry Notices and Reports on Wells
(4) Form C-104 Request for Allowable and Authorization to Transport Oil and Natural Gas
(5) Form C-105 Well Completion or Recompletion Report and Log
(6) Form C-106 Notice of Intention to Utilize Automatic Custody Transfer Equipment
(7) Form C-107 Application for Multiple Completion
(8) Form C-108 Application to Dispose of Salt Water by Injection into a Porous Formation
(9) Form C-109 Application for Discovery Allowable and Creation of a New Pool
(10) Form C-111 Gas Transporter's Monthly Report (Sheet 1 and Sheet 2)
(11) Form C-112 Transporter's and Storer's Monthly Report
(12) Form C-113 Refiner's Monthly Report (Sheet 1 and Sheet 2)
(13) Form C-115 Operators Monthly Report
(14) Form C-115-EDP Operator's Monthly Report (electronic data processing)
(15) Form C-116 Gas-Oil Ratio Tests
(16) Form C-117-A Tank Cleaning, Sediment Oil Removal, Transportation of Miscellaneous Hydrocarbons and Disposal Permit
(17) Form C-117-B Monthly Sediment Oil Disposal Statement
(18) Form C-118 Treating Plant Operator's Monthly Report (Sheet 1 and Sheet 2)
(19) Form C-119 Carbon Black Plant Monthly Report
(20) Form C-120-A Monthly Water Disposal Report
(21) Form C-121 Crude Oil Purchaser's Nomination
(22) Form C-121-A Purchaser's Gas Nomination
(23) Form C-122 Multi-Point and One Point Back Pressure Test for Gas wells
(24) Form C-122-A Gas Well Test Data Sheet-San Juan Basin (Initial Deliverability Test, blue paper; Annual Deliverability Test, white)
(25) Form C-122-B Initial Potential Test Data Sheet
(26) Form C-122-C Deliverability Test Report
(27) Form C-122-D Worksheet for Calculation of Static Column Wellhead Pressure (P_w).
(28) Form C-122-E Worksheet for Stepwise Calculation of (Surface) (Subsurface) Pressure (Pc & Pw)
(29) Form C-122-F Worksheet for Calculation of Wellhead Pressures (Pc or Pw) from Known Bottomhole Pressure (Pf or Ps)
(30) Form C-122-G Worksheet for Calculation of Static Column Pressure at Gas Liquid Interface
(31) Form C-123 Request for the Creation of a New Pool
(32) Form C-124 Reservoir Pressure Report
(33) Form C-125 Gas Well Shut-in Pressure Report
(34) Form C-126 Permit to Transport Recovered Load Oil
(35) Form C-127 Request for Allowable Change
(36) Form C-129 Application for Exception to No-Flare Rule 306
(37) Form C-130 Notice of Disconnection
(38) Form C-131-A Monthly Gas Storage Report
(39) Form C-131-B Annual LPG Storage Report
(40) Form C-133 Authorization to Move Produced Water Exhibit "A"
(41) Form C-134 Application for Exception to Division Order R-8952, (Protection of Migratory Birds Rule Subsection B of 19.15.3.105 NMAC, Subsection H of 19.15.5.312 NMAC, 19.15.5.313 NMAC, or Paragraph (8) of Subsection C of 19.15.9.711 NMAC
(42) Form C-135 Gas Well Connection, Reconnection or Disconnection Notice
(43) Form C-136 Application for Approval To Use An Alternate Gas Measurement Method
(44) Form C-137 Application for Waste Management Facility
(45) Form C-138 Request for Approval to Accept Solid Waste
(46) Form C-139 Application For Qualification of Production Restoration Project and Certification

of Approval

(47) Form C-140 Application For Qualification of Well Workover Project and Certification of Approval

[1-1-50...2-1-96; 19.15.13.1100 NMAC - Rn, 19 NMAC 15.M.1100, 06/30/04]

19.15.13.1101 APPLICATION FOR PERMIT TO DRILL, DEEPEN OR PLUG BACK (Form C-101):

A. Before commencing drilling or deepening operations, or before plugging a well back to another zone, the operator of the well must obtain a permit to do so. To obtain such permit, the operator shall submit to the division five copies of form C-101, application for permit to drill, deepen or plug back, completely filled out. If the operator has an approved bond in accordance with 19.15.3.101 NMAC, one copy of the drilling permit will be returned to him on which will be noted the division's approval, with any modification deemed advisable. If the proposal cannot be approved for any reason, the forms C-101 will be returned with the cause for rejection stated thereon.

B. Form C-101 must be accompanied by three copies of form C-102, well location and acreage dedication plat. (See 19.15.13.1102 NMAC.)

C. If the well is to be drilled on state land, submit six copies of form C-101 and four copies of form C-102, the extra copy of each form being for the state land office.

[1-1-64...2-1-96; 19.15.13.1101 NMAC - Rn, 19 NMAC 15.M.1101, 06/30/04]

19.15.13.1102 WELL LOCATION AND ACREAGE DEDICATION PLAT (Form C-102):

A. Form C-102 is a dual purpose form used to show the exact location of the well and the acreage dedicated thereto. The form is also used to show the ownership and status of each lease contained within the dedicated acreage. When there is more than one working interest or royalty owner on a given lease, designation of the majority owner et al. will be sufficient.

B. All information required on form C-102 shall be filled out and certified by the operator of the well except the well location on the plat. This is to be plotted from the outer boundaries of the section and certified by a professional surveyor, registered in the state of New Mexico, or surveyor approved by the division.

C. Form C-102 shall be submitted in triplicate or quadruplicate as provided in 19.15.13.1101 NMAC.

D. Amended form C-102 (in triplicate or quadruplicate) shall be filed in the event there is a change in any of the information previously submitted. The well location need not be certified when filing amended form C-102.

[1-1-65...2-1-96; 19.15.13.1102 NMAC - Rn, 19 NMAC 15.M.1102, 06/30/04]

19.15.13.1103 SUNDRY NOTICES AND REPORTS ON WELLS (Form C-103):

Form C-103 is a dual purpose form to be filed with the appropriate district office of the division to obtain division approval prior to commencing certain operations and also to report various completed operations.

A. Form C-103 as a notice of intention

(1) Form C-103 shall be filed in triplicate by the operator and approval obtain from the division prior to:

(a) Effecting a change of plans from those previously approved on form C-101 or form C-103.

(b) Altering a drilling well's casing program or pulling casing or otherwise altering an existing well's casing installation.

(c) Temporarily abandoning a well.

(d) Plugging and abandoning a well.

(e) Performing remedial work on a well which, when completed, will affect the original status of the well. (This shall include making new perforations in existing wells or squeezing old perforations in existing wells, but is not applicable to new wells in the process of being completed nor to old wells being deepened or plugged back to another zone when such recompletion has been authorized by an approved form C-101, application for permit to drill, deepen or plug back, nor to acidizing, fracturing or cleaning out previously completed wells, nor to installing artificial lift equipment.)

(2) In the case of well plugging operations, the notice of intention shall include a detailed statement of the proposed work, including plans for shooting and pulling casing, plans for mudding, including weight of mud, plans for cementing, including number of sacks of cement and depths of plugs, and the time and date of the proposed plugging operations. If not previously filed, a complete log of the well on form C-105 (See 19.15.13.1105 NMAC.) shall accompany the notice of intention to plug the well; the bond will not be released until this is complied with.

B. Form C-103 as a subsequent report

(1) Form C-103 as a subsequent report of operations shall be filed in accordance with the section of this rule applicable to the particular operation being reported.

(2) Form C-103 is to be used in reporting such completed operations as:

(a) commencement of drilling operations;

(b) casing and cement test;

(c) altering a well's casing installation;

(d) temporary abandonment;

(e) plug and abandon;

(f) plugging back or deepening;

(g) remedial work;

(h) installation of artificial lifting equipment;

(i) change of operator of a drilling well;

(j) such other operations which affect the original status of the well but which are not specifically covered herein.

C. Information to be entered on form C-103, subsequent report, for a particular operation is as follows: Report of commencement of drilling operations. Within ten days following the commencement of drilling operations, the operator of the well shall file a report thereof on form C-103 in triplicate. Such report shall indicate the hour and the date the well was spudded.

D. Report of results of test of casing and cement job; report of casing alteration: A report of casing and cement test shall be filed by the operator of the well within ten days following the setting of each string of casing or liner. Said report shall be filed in triplicate on form C-103 and shall present a detailed description of the test method employed and the results obtained by such test and any other pertinent information required by 19.15.1.107 NMAC. The report shall also indicate the top of the cement and the means by which such top was determined. It shall also indicate any changes from the casing program previously authorized for the well.

E. Report of temporary abandonment: A report of temporary abandonment of a well shall be filed by the operator of the well within thirty days following completion of the work. The report shall be filed in triplicate and shall present a detailed account of the work done on the well, including location and type of plugs used, if any, and status of surface and downhole equipment and any other pertinent information relative to the overall status of the well.

F. Report on plugging of well

(1) A report of plugging operations shall be filed by the operator of the well within 30 days following completion of plugging operations on any well. Said report shall be filed in triplicate on form C-103 and shall include the date the plugging operations were begun and the date the work was completed, a detailed account of the manner in which the work was performed including the depths and lengths of the various plugs set, the nature and quantities of materials employed in the plugging operations including the weight of the mud used, the size and depth of all casing left in the hole and any other pertinent information. (See 19.15.4.201 NMAC - 19.15.4.204 NMAC regarding plugging operations.)

(2) No plugging report will be approved by the division until the pits have been filled and the location levelled and cleared of junk. It shall be the responsibility of the operator to contact the appropriate district office of the division when the location has been so restored in order to arrange for an inspection of the plugged well and the location by a division representative.

G. Report of remedial work - A report of remedial work performed on a well shall be filed by the operator of the well within 30 days following completion of such work. Said report shall be filed in quadruplicate on form C-103 and shall present a detailed account of the work done and the manner in which such work was performed; the daily production of oil, gas and water both prior to and after the remedial operation; the size and depth of shots; the quantity of and, crude, chemical or other materials employed in the operation, and any other pertinent information. Among the remedial work to be reported on form C-103 are the following:

(1) report on shooting, fluid fracturing or chemical treatment of a previously completed well;

(2) report of squeeze job;

(3) report on setting of liner or packer;

(4) report of installation of pumping equipment or gas lift facilities;

(5) report of any other remedial operations which are not specifically covered herein.

H. Report on deepening or plugging back within the same pool - A report of deepening or plugging back shall be filed by the operator of the well within 30 days following completion of such operations on any well. Said report shall be filed in quadruplicate on form C-103 and shall present a detailed account of work done and the manner in which such work was performed. If the well is recompleted in the same pool, it shall also report the daily production of oil, gas, and water both prior to and after recompletion. If the well is recompleted in another pool, forms C-101, C-102, C-104 and C-105 must be filed in accordance with Sections 1101, 1102, 1104 and 1105 of 19.15.13 NMAC.

I. Report of change of operator of a drilling well - A report of change of ownership shall be filed by the new operator of any drilling well within ten days following actual transfer of ownership or responsibility. Said report shall be filed in triplicate on form C-103 and shall include the name and address of both the new operator and the previous operator, the effective date of the change of ownership or responsibility and any other pertinent information. No change in the operator of a drilling well will be approved by the division unless the new operator has an approved bond in accordance with 19.15.3.101 NMAC. (Form C-104 shall be used to report transfer of operator of a completed well; see 19.15.13.1104 NMAC.

J. Other reports on wells - Reports on any other operations which affect the original status of the well but which are not specifically covered herein shall be submitted to the division on form C-103, in triplicate, by the operator of the well ten days following the completion of such operation.

[1-1-65...2-1-96; 19.15.13.1103 NMAC - Rn, 19 NMAC 15.M.1103, 06/30/04]

19.15.13.1104 REQUEST FOR ALLOWABLE AND AUTHORIZATION TO TRANSPORT OIL AND NATURAL GAS (Form C-104):

A. Form C-104 completely filled out by the operator of the well must be filed in quintuplicate before an allowable will be assigned to any newly completed or recompleted well. (A recompleted well shall be considered one which has been deepened or plugged back to produce from a different pool than previously.) Form C-104 must be accompanied by a tabulation of all deviation tests taken on the well as provided by 19.15.3.111 NMAC.

B. The allowable assigned to an oil well shall be effective at 7:00 o'clock a.m. on the date of completion, provided the form C-104 is received by the division during the month of completion. Date of completion shall be that date when new oil is delivered into the stock tanks. Unless otherwise specified by special pool rules, the allowable assigned to a gas well shall be effective at 7:00 o'clock a.m. on the date of connection to a gas transportation facility, as evidenced by an affidavit of connection from the transporter to the division, or the date of receipt of form C-104 by the division, whichever date is later.

C. No allowable will be assigned to any well until a standard unit for the pool in which the well is completed has been dedicated by the operator, or a non-standard unit has been approved by the division, or a standard unit has been communitized or pooled and dedicated to the well.

D. No allowable will be assigned to any well until all forms and reports due have been received by the division and the well is otherwise in full compliance with these rules.

E. Form C-104 with sections I, II, III and VI, completely filled out shall be filed in quintuplicate by the operator of the well in the event there is a change of operator of any producing well, injection well or disposal well, a change in pool designation, lease name or well number, or any other pertinent change in condition of any such well. When filing form C-104 for change of operator, the new operator shall file the form in the above manner, and shall give the name and address of the previous as well as the present operator. The form C-104 will not be approved by the division unless the new operator has an approved bond in compliance with 19.15.3.101 NMAC.

[1-1-65...2-1-96; A, 7-31-97; 19.15.13.1104 NMAC - Rn, 19 NMAC 15.M.1104, 06/30/04]

19.15.13.1105 WELL COMPLETION OR RECOMPLETION REPORT AND LOG (Form C-105):

A. Within 20 days following the completion or recompletion of any well, the operator shall file form C-105 with the division. It must be filed in quintuplicate and each copy accompanied by a summary of all special tests conducted on the well, including drill stem tests. In addition, one copy of all electrical and radio-activity logs run on the well must be filed with form C-105. If the form C-105 with attached log(s) and summaries is not received by the division within the specified 20-day period, the allowable for the well will be withheld until this rule has been complied with.

B. In the case of a dry hole, a complete record of the well on form C-105 with the above attachments shall accompany the notice of intention to plug the well, unless previously filed. The plugging report will not be approved nor the bond released until this rule has been complied with.

C. Form C-105 and accompanying attachments will not be kept confidential by the division unless so requested in writing by the owner of the well. Upon such request, the division will keep these data confidential for 90 days from the date of completion of the well, provided, however, that the report, log(s) and other attached data may, when pertinent, be introduced in any public hearing before the division or its examiners or in any court of law, regardless of the request that they be kept confidential.

19.15.13.1106 NOTICE OF INTENTION TO UTILIZE AUTOMATIC CUSTODY TRANSFER EQUIPMENT (Form C-106):

Form C-106, when applicable, shall be filed in accordance with Subsection A of 19.15.5.309 NMAC.
[1-1-65...2-1-96; 19.15.13.1106 NMAC - Rn, 19 NMAC 15.M.1106, 06/30/04]

19.15.13.1107 APPLICATION FOR MULTIPLE COMPLETION (Form C-107):

Form C-107, when applicable, shall be filed in accordance with Subsection A of 19.15.3.112 NMAC.
[1-1-65...2-1-96; 19.15.13.1107 NMAC - Rn, 19 NMAC 15.M.1107, 06/30/04]

19.15.13.1108 APPLICATION FOR AUTHORIZATION TO INJECT (Form C-108):

Form C-108 shall be filed in accordance with Subsection B of 19.15.9.701 NMAC.
[1-1-65...2-1-96; 19.15.13.1108 NMAC - Rn, 19 NMAC 15.M.1108, 06/30/04]

19.15.13.1109 APPLICATION FOR DISCOVERY ALLOWABLE AND CREATION OF A NEW POOL (Form C-109):

Form C-109, when applicable, shall be filed in accordance with 19.15.7.509 NMAC.
[9-1-66...2-1-96; 19.15.13.1109 NMAC - Rn, 19 NMAC 15.M.1109, 06/30/04]

19.15.13.1110 No Rule; there is no form C-110 at present.
[1-1-65...2-1-96; 19.15.13.1110 NMAC - Rn, 19 NMAC 15.M.1110, 06/30/04]

19.15.13.1111 GAS TRANSPORTER'S MONTHLY REPORT (Form C-111):

A. Form C-111, gas transporter's monthly report, shall be filed monthly in accordance with the rules below. It shall be postmarked on or before the 15th day of the second month following the month gas was taken. One copy shall be filed with the appropriate district office of the division and one copy with the Santa Fe office of the division. One additional copy shall also be sent to the Hobbs office of the division. Information on sheet no. 2 of form C-111 shall be itemized by pools, by operators and by leases, in alphabetical order.

B. Form C-111 shall be filed each month by the operator of any gas gathering system, gas transportation system, recycling system, fuel system, gas lift system, gas drilling operation, etc. The form shall cover all natural gas, casinghead gas and carbon dioxide gas taken into any such system during the preceding month and shall show the source of the gas and the disposition thereof.

C. Form C-111 shall also be filed each month by the operator of any gasoline plant, cycling plant or other plant at which gasoline, butane, propane, kerosene, oil or other products are extracted from gas within the state of New Mexico. The form shall cover all natural gas, casinghead gas and carbon dioxide gas taken by any such plant during the preceding month and shall show the source of the gas and the disposition thereof. If a plant operator owns more than one plant in a given division district, sheet no. 1 of form C-111 shall be filed for each such plant. In preparing sheet no. 2, the plant operator shall consolidate all requisitions for all plants in the district, itemized in the order described in the Subsection A of 19.15.13.1111 NMAC.

D. Where gas is taken by the producer and utilized by the producer for any of the above uses, the producer shall file Form C-111 itemizing such gas. The producer shall also include this gas on the operator's monthly report, form C-115. Gas used on the lease from which it was produced for consumption in lease houses, treaters, compressors, combustion engines and other similar equipment, or gas which is flared, shall also be included on the Form C-115 but is not to be included on the form C-111.

[1-1-65...2-1-96; 19.15.13.1111 NMAC - Rn, 19 NMAC 15.M.1111, 06/30/04]

19.15.13.1112 TRANSPORTER'S AND STORER'S MONTHLY REPORT (Form C-112):
Each transporter and each storer of crude petroleum oil and liquid hydrocarbons within the state of New Mexico shall file for each calendar month a transporter's and storer's monthly report, form C-112, containing complete information and data indicated by such form respecting stocks of crude petroleum oil and liquid hydrocarbons on hand and receipts and deliveries of crude petroleum oil and liquid hydrocarbons by pipeline and trucks within the state of New Mexico, and receipts and deliveries from leases to storers or refiners; between transporters within the state; between storers and refiners within the state. Form C-112 shall be filed in duplicate and postmarked on or before the 15th day of the second succeeding month.

[1-1-65...2-1-96; 12-31-96; 19.15.13.1112 NMAC - Rn, 19 NMAC 15.M.1112, 06/30/04]

19.15.13.1113 REFINER'S MONTHLY REPORT (Form C-113):
Every refiner of crude petroleum oil within the state of New Mexico shall furnish for each calendar month refiner's monthly report, form C-113, containing the information and data indicated by such form respecting crude petroleum oil and products involved in such refiner's operation during each month. Such report for each month shall be filed in duplicate and be postmarked on or before the 15th day of the next succeeding month.

[1-1-65...2-1-96; 12-31-96; 19.15.13.1113 NMAC - Rn, 19 NMAC 15.M.1113, 06/30/04]

19.15.13.1114 No Rule; there is no form C-114 at present.

[1-1-65...2-1-96; 12-31-96; 19.15.13.1114 NMAC - Rn, 19 NMAC 15.M.1114, 06/30/04]

19.15.13.1115 OPERATOR'S MONTHLY REPORT (Form C-115):

A. Operator's monthly report, form C-115 or form C-115-EDP, shall be filed on each producing lease and each secondary or other enhanced recovery project or pressure maintenance project injection well within the state of New Mexico for each calendar month, setting forth complete information and data indicated on said forms in the order, format and style prescribed by the division director. Oil production from wells which are producing into common storage shall be estimated as accurately as possible on the basis of periodic tests.

B. The reports required to be filed by 19.15.13.1115 NMAC shall be filed by the operator as follows:

(1) Any operator which operates fewer than one hundred (100) wells in the state of New Mexico shall file a C-115 either electronically or by delivery of a printed copy of the report to the oil conservation division at its Santa Fe office on or before the fifteenth (15th) day of the second month following the month of production, or if such day falls on a weekend or holiday, the first workday following the fifteenth.

(2) Any operator which operates one hundred (100) or more wells in the state of New Mexico shall file a C-115 electronically, either by physical delivery of electronically readable media or by electronic transfer of data, to the oil conservation division at its Santa Fe office on or before the fifteenth day of the second month following the month of production, or if such day falls on a weekend or holiday, the first workday following the fifteenth. Any operator otherwise required to file electronically may apply to the division for exemption from this requirement based upon a demonstration that such electronic filing requirement would operate as an economic or other hardship.

(3) If an operator fails to file a C-115 or if the division finds errors in any C-115, the division shall, within thirty (30) days of the appropriate filing date, prepare and send to the operator an error/omission message which identifies the specific well as to which the report has not been filed or is in error and a statement of the error. The operator to whom the error/omission message is addressed shall respond to the division within thirty (30) days acknowledging receipt of the error/omission message and informing the division of the operator's schedule to file the report or correct the error. If the division does not receive the operator's response within thirty (30) days, the division shall send notice to the operator that operator has failed to comply with the provisions of 19.15.13.1115 NMAC and may be subjected to loss of authority to produce from the affected well if the operator does not respond to the division. Willful failure of the operator to respond to the notice and to correct the error or omission may result in the division informing the operator by certified return receipt letter that thirty (30) days from the date of such letter the division will cancel the C-104 authority of operator to produce or inject into the well. Any operator which receives such notice may contact the division and request that the matter of the cancellation of authority to produce or inject be set for hearing before a hearing officer duly appointed by the division. If the division sends certified return receipt correspondence informing the operator of cancellation of authority to produce and the operator does not request a hearing, the division may cancel the authority of the operator to produce the well on the date set forth in the letter.

(4) The electronic filing requirements set forth in Paragraph (2), Subsection B, of 19.15.13.115 NMAC shall be phased in with all operators of three hundred (300) or more wells being required to file electronically for January 1997 production, all operators of two hundred (200) or more wells being required to file electronically for July 1997 production and all operators of one hundred (100) or more wells being required to file electronically for January 1998 production.

19.15.13.1116 GAS-OIL RATIO TESTS (Form C-116):
Gas-oil ratio tests shall be made and reported on form C-116 as prescribed in 19.15.5.301 NMAC, Gas-Oil Ratio Tests, and any applicable special pool rules. This form shall be submitted in duplicate.
[1-1-65…2-1-96; 19.15.13.1116 NMAC - Rn, 19 NMAC 15.M.1116, 06/30/04]

19.15.13.1117 TANK CLEANING, SEDIMENT OIL REMOVAL, TRANSPORTATION OF MISCELLANEOUS HYDROCARBONS AND DISPOSAL PERMIT (Form C-117-A) AND MONTHLY SEDIMENT OIL DISPOSAL STATEMENT (Form C-117-B):

A. Form C-117-A, tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit, shall be submitted to the appropriate district office of the division in quintuplicate and in accordance with Subsections B, C and H of 19.15.5.311 NMAC.

B. Form C-117-B, monthly sediment oil disposal statement, shall be submitted both to the Santa Fe office and the appropriate district office(s) of the division in accordance with Subsection D of 19.15.5.311 NMAC.
[1-1-65...2-1-96; 19.15.13.1117 NMAC - Rn, 19 NMAC 15.M.1117, 06/30/04]

19.15.13.1118 TREATING PLANT OPERATOR'S MONTHLY REPORT (Form C-118):
Form C-118 shall be submitted in duplicate to the appropriate district office of the division in accordance with 19.15.9.711 NMAC, and shall contain all the information required thereon. Column 1 of sheet 1-A of form C-118 entitled "permit number," has reference to the tank cleaning, sediment oil removal, transportation of miscellaneous hydrocarbons and disposal permit, form C-117-A, for each lot of oil picked up for processing.
[1-1-65...2-1-96; 19.15.13.1118 NMAC - Rn, 19 NMAC 15.M.1118, 06/30/04]

19.15.13.1119 CARBON BLACK PLANT MONTHLY REPORT (Form C-119):
Each operator of a carbon black plant within the state of New Mexico shall file for each calendar month the monthly volume of gas received by him from a gasoline extraction plant or plants, and a monthly volume or volumes

of gas received by him from each lease operator delivering natural gas directly to such plant, together with the opening and closing stocks and the production and deliveries by grades of carbon black or other products produced. Such reports shall be filed in duplicate on form C-119, carbon black plant monthly report, and be postmarked on or before the 15th day of the next succeeding month. In addition, form C-111 shall be filed each month in accordance with 19.15.13.1111 NMAC if the carbon black plant operator makes any purchase directly from a lease or operates any gas gathering or transmission system.
[1-1-65...2-1-96; 19.15.13.1119 NMAC - Rn, 19 NMAC 15.M.1119, 06/30/04]

19.15.13.1120 MONTHLY WATER DISPOSAL REPORT (Form C-120-A):
Each operator of a salt water disposal system shall report such operations on form C-120-A. Form C-120-A shall be filed in duplicate (one copy with the Santa Fe office and one copy with the appropriate district office) and shall be postmarked no later than the 15th day of the second succeeding month.
[1-1-65...2-1-96; 19.15.13.1120 NMAC - Rn, 19 NMAC 15.M.1120, 06/30/04]

19.15.13.1121 PURCHASER'S NOMINATION FORMS (Form C-121 and Form C-121-A):

A. Unless requested otherwise by the division director, one copy of form C-121, crude oil purchaser's nomination, shall be submitted to the Santa Fe office of the division not later than the 20th day of each odd-numbered month. Nominations shall be filed by each person expecting to purchase oil from producing wells in New Mexico during the second and third succeeding two months. As an example, nominations submitted by the 20th day of July shall indicate the amount of oil the purchaser desires to purchase daily during September and October

B. One copy of form C-121-A, purchaser's gas nomination, shall be submitted to the Santa Fe office of the division by the first day of the month during which the division will consider at the gas allowable hearing the nominations for the purchase of gas from producing wells in New Mexico during the succeeding month. As an example, purchaser's nominations to take gas from a pool during the month of August would be considered by the division at a hearing during July, and should be submitted to the Santa Fe office of the division by July 1.

C. In addition to the monthly gas nominations, twelve-months nominations shall be filed in accordance with the appropriate pool rules.
[1-1-65...2-1-96; 19.15.13.1121 NMAC - Rn, 19 NMAC 15.M.1121, 06/30/04]

19.15.13.1122 MULTIPOINT AND ONE POINT BACK PRESSURE TEST FOR GAS WELL (Form C-122):

A. Gas well test data sheet - san juan basin (form C-122-A)

B. Initial potential test data sheet (form C-122-B)

C. Deliverability test report (form C-122-C)

D. Worksheet for calculation of static column wellhead pressure (P_w) (form C- 122-D)

E. Worksheet for stepwise calculation of (surface) (subsurface) pressure (P_c & P_w) (P_f & P_s) (form C-122-E)

F. Worksheet for calculation of wellhead pressures (P_c or P_w) from known bottomhole pressure (P_f or P_s) (form C-122-F)

G. Worksheet for calculation of status column pressure at gas liquid interface (form C-122-G). The above forms shall be submitted to the appropriate district office of the division in accordance with the provisions of the "manual for back-pressure testing of natural gas wells," or "gas well testing manual for northwest New Mexico", 19.15.6.401 NMAC of the division rules and regulations, and applicable special pool rules and proration orders. These forms shall be submitted in duplicate except form C-122-A which shall be submitted in triplicate.
[1-1-66...2-1-96; 19.15.13.1122 NMAC - Rn, 19 NMAC 15.M.1122, 06/30/04]

19.15.13.1123 REQUEST FOR THE CREATION OF A NEW POOL (Form C-123):
The operator of a well which requires the creation of a pool shall be given written instructions by the appropriate district office regarding the filing of form C-123 in duplicate.
[1-1-65...2-1-96; 19.15.13.1123 NMAC - Rn, 19 NMAC 15.M.1123, 06/30/04]

19.15.13.1124 RESERVOIR PRESSURE REPORT (Form C-124):
Form C-124 shall be submitted in triplicate and shall be used to report bottom hole pressures as required under the provisions of 19.15.5.302 NMAC and any applicable special pool rules.
[1-1-65...2-1-96; 19.15.13.1124 NMAC - Rn, 19 NMAC 15.M.1124, 06/30/04]

19.15.13.1125 GAS WELL SHUT-IN PRESSURE TESTS (Form C-125):
Form C-125 shall be submitted in triplicate and shall be used to report shut-in pressure tests on gas wells as required under the provisions of 19.15.6.402 NMAC and any applicable special pool rules.
[1-1-65...2-1-96; 19.15.13.1125 NMAC - Rn, 19 NMAC 15.M.1125, 06/30/04]

19.15.13.1126 PERMIT TO TRANSPORT RECOVERED LOAD OIL (Form C-126):
Form C-126 shall be submitted in quadruplicate to the appropriate district office of the division and shall be used in conformance with 19.15.7.508 NMAC.
[1-1-65...2-1-96; 19.15.13.1126 NMAC - Rn, 19 NMAC 15.M.1126, 06/30/04]

19.15.13.1127 REQUEST FOR ALLOWABLE CHANGE (Form C-127):
One copy of form C-127 shall be filed by the oil producer with the appropriate district office of the division not later than the 10th day of the month preceding the month for which oil well allowable changes are requested.
[1-1-65...2-1-96; 19.15.13.1127 NMAC - Rn, 19 NMAC 15.M.1127, 06/30/04]

19.15.13.1128 FORMS REQUIRED ON FEDERAL LAND:
A. Federal forms shall be used in lieu of state forms when filing application for permit to drill, deepen or plug back and sundry notices and reports on wells and well completion or recompletion report and log for wells on federal lands in New Mexico. However, it shall be the duty of the operator to submit two extra copies of each of such forms to the BLM, which, upon approval, will transmit same to the division. The following BLM forms will be used in lieu of division forms by operators of wells on federal land:

BLM Form No	Title of Form (Same for both agencies)	Form No.
3160-3 (Nov. 1993)	Application for Permit to Drill, Deepen or Plug Back	C-101
3160-5 (Nov. 1983)	Sundry Notices and Reports on Wells	C-103
3160-4 (Nov. 1983)	Well Completion or Recompletion Report and Log	C-105

B. The above forms as may be revised are the only forms that may be submitted in place of division forms.
C. After a well is completed and ready for pipeline connection, division form C-104 shall be filed along with a copy of form C-105 or BLM form No. 3160-4, whichever is applicable, with the division on any and all wells drilled in the state, regardless of land status. Further, all reports and forms as required under the preceding rules of this section of the rules and regulations that pertain to production must be filed on the proper oil conservation division form as set out in said rule - no other forms will be accepted.
D. Failure to comply with the provisions of this rule will result in the cancellation of form C-104 for the affected well or wells.
[1-1-65...2-1-96; 19.15.13.1128 NMAC - Rn, 19 NMAC 15.M.1128, 06/30/04]

19.15.13.1129 APPLICATION FOR EXCEPTION TO NO-FLARE RULE 306 (Form C-129):
Form C-129, when applicable, shall be filed in accordance with 19.15.5.306 NMAC.
[9-1-72...2-1-96; 19.15.13.1129 NMAC - Rn, 19 NMAC 15.M.1129, 06/30/04]

19.15.13.1130 NOTICE OF DISCONNECTION (Form C-130):

A. Form C-130, notice of disconnection, shall be filed in triplicate with the division by the operator of the well as provided in 19.15.6.407 NMAC.

B. The operator shall state, to the best of his knowledge, the reasons for disconnecting any gas well from gas transportation facilities.

C. The division shall furnish the New Mexico public service commission with any form C-130 indicating that a disconnected gas well may or will be reconnected to a gas transportation facility for ultimate distribution to consumers outside of the state of New Mexico.

[8-23-77...2-1-96; 19.15.13.1130 NMAC - Rn, 19 NMAC 15.M.1130, 06/30/04]

19.15.13.1131 MONTHLY GAS STORAGE REPORT (Form C-131-A) ANNUAL LPG STORAGE REPORT (Form C-131-B):

A. Each operator of an underground natural gas storage project shall report its operation monthly on form C-131-A. Form C-131-A shall be filed in duplicate (one copy to the appropriate district office) and shall be postmarked not later than the 24th day of the next succeeding month.

B. Each operator of an underground liquefied petroleum gas storage project approved by the division shall report its operation annually on form C-131-B.

[7-1-81...2-1-96; 19.15.13.1131 NMAC - Rn, 19 NMAC 15.M.1131, 06/30/04]

19.15.13.1132 [RESERVED].

19.15.13.1133 AUTHORIZATION TO MOVE PRODUCED WATER:

A. Each person who is a transporter of produced water shall obtain approval of form C-133, authorization to move produced water, in accordance with Subsection C of 19.15.9.709 NMAC. prior to any such transportation.

B. Approval of a single form C-133 is valid for all leases served by such transporter.

[2-1-82...2-1-96; 19.15.13.1133 NMAC - Rn, 19 NMAC 15.M.1133, 06/30/04]

19.15.13.1134 [RESERVED].

19.15.13.1135 GAS WELL CONNECTION, RECONNECTION OR DISCONNECTION NOTICE:

Every gas transporter accepting gas for delivery from a wellhead or central point of delivery shall notify the division within thirty (30) days of a new connection or reconnection to or disconnection from the gathering or transportation system by filing form C-135 in duplicate with the appropriate district office of the division.

[2-1-91...2-1-96; 19.15.13.1135 NMAC - Rn, 19 NMAC 15.M.1135, 06/30/04]

19.15.13.1136 APPLICATION FOR APPROVAL TO USE AN ALTERNATE GAS MEASUREMENT METHOD (Form C-136):

A. Form C-136 shall be used to request and approve use of an alternate procedure for measuring gas production from a well which is not capable of producing more than 15 MCFD (Paragraph (1) of Subsection B of 19.15.6.403 NMAC or for any well which has a producing capacity of 100 MCFD or less and is on a multi-well lease (Paragraph (2) of Subsection B of 19.15.6.403 NMAC.)

B. All applicable information required on form C-136 shall be filled out with the required supplemental information attached, and shall be submitted in quadruplicate to the appropriate district office of the division.

[12-23-91; 2-1-96; 19.15.13.1136 NMAC - Rn, 19 NMAC 15.M.1136, 06/30/04]

HISTORY OF 19.15.13 NMAC:

Pre-NMAC History: The material in this Part was derived from that previously filed with the State Records Center and Archives:

Rule 1100, General, 1/8/82.

Rule 1100, Amendment No. 1, General M-Reports, 1/27/82.
Rule 1100, Amendment No. 2, General M-Reports, 5/6/82.
Rule 1100, General M-Reports, 3/17/86.
Rule 1100, General, 10/11/89.
Rule 1100, General, 2/5/91.
Rule 1101, Application for Permit to Drill, Deepen, or Plug Back (Form C-101), 1/8/82.
Rule 1101, Application for Permit to Drill, Deepen, or Plug Back (Form C-101), 2/5/91.
Rule 1102, Well Location and Acreage Dedication Plat (Form C-102), 1/8/82.
Rule 1102, Well Location and Acreage Dedication Plat (Form C-102), 3/15/89.
Rule 1102, Well Location and Acreage Dedication Plat (Form C-102), 2/5/91.
Rule 1103, Sundry Notices and Reports on Wells (Form C-103), 1/8/82.
Rule 1103, Sundry Notices and Reports on Wells (Form C-103), 2/5/91.
Rule 1104, Request for Allowable and Authorization to Transport Oil and Natural Gas (Form C-104), 1/8/82.
Rule 1104, Request for Allowable and Authorization to Transport Oil and Natural Gas (Form C-104), 2/5/91.
Rule 1105, Well Completion or Recompletion Report and Log (Form C-105), 1/8/82.
Rule 1105, Well Completion or Recompletion Report and Log (Form C-105), 2/5/91.
Rule 1106, Notice of Intention to Utilize Automatic Custody Transfer Equipment (Form C-106), 1/8/822.
Rule 1106, Notice of Intention to Utilize Automatic Custody Transfer Equipment (Form C-106), 2/5/91.
Rule 1107, Application for Multiple Completion (Form C-107), 1/8/82.
Rule 1107, Amendment No. 1, Application for Multiple Completion (Form C-107), 1/27/82.
Rule 1107, Application for Multiple Completion (Form C-107), 2/5/91.
Rule 1108, Application for Authorization to Inject (Form C-108), 1/8/82.
Rule 1108, Application for Authorization to Inject (Form C-108), 2/5/91.
Rule 1109, Application for Discovery Allowable and Creation of a New Pool (Form C-109), 1/8/82.
Rule 1109, Application for Discovery Allowable and Creation of a New Pool (Form C-109), 2/5/91.
Rule 1111, Gas Transporter’s Monthly Report (Form C-111), 1/8/82.
Rule 1111, Gas Transporter’s Monthly Report (Form C-111), 3/17/86.
Rule 1111, Gas Transporter’s Monthly Report (Form C-111), 2/5/91.
Rule 1112, Transporter’s and Storer’s Monthly Report (Form C-112), 1/8/82.
Rule 1112, Transporter’s and Storer’s Monthly Report (Form C-112), 2/5/91.
Rule 1113, Refiner’s Monthly Report (Form C-113), 1/8/82.
Rule 1113, Refiner’s Monthly Report (Form C-113), 10/11/89.
Rule 1113, Refiner’s Monthly Report (Form C-113), 2/5/91.
Rule 1115, Operator’s Monthly Report (Form C-115), 1/8/82.
Rule 1115, Operator’s Monthly Report (Form C-115), 2/5/91.
Rule 1116, Gas-Oil Ratio Tests (Form C-116), 1/8/82.
Rule 1116, Gas-Oil Ratio Tests (Form C-116), 2/5/91.
Rule 1117, Sediment Oil Disposition Permits (Form C-117-A and C-117-B), 1/8/82.
Rule 1117, Amendment No. 1, Tank Cleaning, Sediment Oil Removal, Transportation of Miscellaneous Hydrocarbons and Disposal Permit (Form C-117-A) and Monthly Sediment Oil Disposal Statement (Form C-117-B), 1/27/82.
Rule 1117, Tank Cleaning, Sediment Oil Removal, Transportation of Miscellaneous Hydrocarbons and Disposal Permit (Form C-117-A) and Monthly Sediment Oil Disposal Statement (Form C-117-B), 2/5/91.
Rule 1118, Treating Plant Operator’s Monthly Report (Form C-118), 1/8/82.
Rule 1118, Amendment No. 1, Treating Plant Operator’s Monthly Report (Form C-118), 1/27/82.
Rule 1118, Treating Plant Operator’s Monthly Report (Form C-118), 2/5/91.
Rule 1119, Carbon Black Plant Monthly Report (Form C-119), 1/11/82.
Rule 1119, Carbon Black Plant Monthly Report (Form C-119), 2/5/91.
Rule 1120, Monthly Water Disposal Report (Form C-120), 1/11/82.
Rule 1120, Monthly Water Disposal Report (Form C-120), 2/5/91.

Rule 1121, Purchaser's Nomination Forms (Form C-121 and Form C-121-A), 1/11/82.
Rule 1121, Purchaser's Nomination Forms (Form C-121 and Form C-121-A), 2/5/91.
Rule 1122, Multipoint and One Point Back Pressure Test for Gas Well (Form C-122), 1/11/82.
Rule 1122, Multipoint and One Point Back Pressure Test for Gas Well (Form C-122), 10/11/89.
Rule 1122, Multipoint and One Point Back Pressure Test for Gas Well (Form C-122), 2/5/91.
Rule 1123, Request for the Creation of a New Pool (Form C-123), 1/11/82.
Rule 1123, Request for the Creation of a New Pool (Form C-123), 2/5/91.
Rule 1124, Reservoir Pressure Report (Form C-124), 1/11/82.
Rule 1124, Reservoir Pressure Report (Form C-124), 2/5/91.
Rule 1125, Gas Well Shut-In Pressure Tests (Form C-125), 1/11/82.
Rule 1125, Amendment No. 1, Gas Well Shut-In Pressure Tests (Form C-125), 2/23/84.
Rule 1125, Gas Well Shut-In Pressure Tests (Form C-125), 2/5/91.
Rule 1126, Permit to Transport Recovered Load Oil (Form C-126), 1/11/82.
Rule 1126, Permit to Transport Recovered Load Oil (Form C-126), 2/5/91.

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 15 OIL AND GAS
PART 14 PROCEDURE

19.15.14.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco St., Santa Fe, New Mexico 87505 (505) 827-7131.
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1, 8-29-03]

19.15.14.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.2, 8-29-03]

19.15.14.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the Oil and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the conservation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.3, 8-29-03]

19.15.14.4 DURATION: Permanent.
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.4, 8-29-03]

19.15.14.5 EFFECTIVE DATE: February 1, 1996 [unless a later date is cited at the end of a section.]
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.5, 8-29-03]

19.15.14.6 OBJECTIVE: The objective of this Part is to set forth general provisions and definitions pertaining to the authority of the oil conservation division and the oil conservation commission pursuant to the Oil and Gas Act, NMSA 1978, Sections 70-2-1 through 70-2-38.
[2-1-96; 19.15.14 NMAC - Rn, 19 NMAC 15.N.6, 8-29-03]

19.15.14.7 DEFINITIONS: [RESERVED]

19.15.14.8 - 1200 [RESERVED]

19.15.14.1201 RULEMAKING PROCEEDINGS:
A. Before any rule, including revocation or amendment of an existing rule, shall be made by the division or commission, a public hearing before the commission or a duly appointed division examiner shall be held at such time and place as may be prescribed by the commission in accordance with Section 10-15-1 NMSA 1978.
B. When the commission, the division, an operator or any interested person applies to adopt, amend or rescind any rule, such application shall constitute a request for rulemaking, and the division shall publish notice of the proposed rulemaking:
(1) one time in a newspaper of general circulation in the counties in New Mexico affected by the proposed rule (or if the proposed rule will be of statewide application, in a newspaper of general circulation in this state), with the publication date not less than 20 days prior to the date set for the public hearing;
(2) on the applicable docket for the commission or division hearing at which the matter will be heard, which shall be sent by regular mail or electronic mail to all who have requested such notice, not less than 20 days prior to the public hearing;
(3) one time in the New Mexico register, with the publication date not less than 10 days prior to the public hearing; and
(4) by posting to the division's website not less than 20 days prior to the public hearing.
C. If the rule proposed to be adopted, amended or rescinded is of statewide application, the hearing

shall be conducted before the commission in the first instance unless the division director otherwise directs.

D. 19.15.14.1201 NMAC shall not apply to special pool rules, which may be adopted, amended or rescinded in adjudicatory proceedings subject to the notice provisions of Sections 1204 and 1207 of 19.15.14 NMAC.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1201, 8-29-03; A, 06/15/04]

19.15.14.1202 EMERGENCY ORDERS AND RULES:

A. Notwithstanding any other provision of 19.15 NMAC, in the event an emergency is found to exist by the division or commission, which requires adoption of a rule or the issuance of an order without a hearing, such emergency rule or order shall have the same validity as if a hearing had been held before the division or commission after due notice. Such emergency rule or order shall remain in force no longer than 15 days from its effective date.

B. Notwithstanding any other provision of 19.15.14 NMAC, in the event an emergency is found to exist by the division or commission, a hearing may be conducted upon any application within less than twenty-three (23) days after the filing thereof, and notice of such hearing may be given within such lesser time than twenty (20) days as the director of the division shall order.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1201, 8-29-03; A, 06/15/04]

19.15.14.1203 INITIATING A HEARING:

A. The division, the attorney general, any operator or producer or any other person may apply for a hearing. The application shall be signed by the person seeking the hearing or by an attorney representing that person. Two copies of the application must be filed and shall state:

(1) the name of the applicant;

(2) the name or general description of the common source or sources of supply or the area affected by the order sought;

(3) briefly, the general nature of the order or rule sought;

(4) a list of the names and addresses of persons to whom notice has been sent;

(5) a proposed notice advertisement for publication; and

(6) any other matter required by these rules or order of the division.

B. Applications for hearing before the division or commission must be in writing and received by the division at least 23 days in advance of the hearing on that application.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1203, 8-29-03]

19.15.14.1204 PUBLICATION OF NOTICE OF HEARING:

A. The division shall give notice of each hearing before the commission or a division examiner by (1) posting notice on the division's website, and (2) delivering notice by ordinary first class United States mail or electronic mail to each person who has requested in writing to be notified of such hearings.

B. In addition, the division shall give notice of each hearing before the commission by publication once in accordance with the requirements of Chapter 14, Article 11 NMSA 1978, in a newspaper of general circulation in the counties that are affected by the application or, if the effect of the application will be statewide, in a newspaper of general circulation in this state.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1204, 8-29-03; A, 06/15/04]

19.15.14.1205 CONTENTS OF NOTICE OF HEARING:

A. Published notices shall be issued in the name of "The State of New Mexico" and signed by the director of the division, and the seal of the commission shall be impressed thereon.

B. The notice shall specify: whether the case is set for hearing before the commission or a division examiner; the number and style of the case; the time and place of hearing; and the general nature of the application. The notice shall also state the name of the applicant. If the application seeks to adopt, revoke or amend special pool rules, establish or alter a non-standard unit, permit an unorthodox location, or establish or affect the allowable of any well or proration unit, the notice shall specify each pool or common source of supply that may be affected if the

application is granted. If the application seeks compulsory pooling or statutory unitization, the notice shall contain a legal description of the spacing unit or geographical area sought to be pooled or unitized. In all other cases, the notice shall reasonably identify the subject matter so as to alert persons who may be affected if the application is granted.
[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1205, 8-29-03; A, 06/15/04]

19.15.14.1206 [RESERVED] [Formerly "PREPARATION OF NOTICES"]

19.15.14.1207 NOTICE REQUIREMENTS FOR SPECIFIC ADJUDICATIONS:

A. Applicants for the following adjudicatory hearings before the division or commission shall give notice, in addition to that required by 19.15.14.1204 NMAC, as set forth below:

(1) Compulsory pooling and statutory unitization.

(a) Notice shall be given to any owner of an interest in the mineral estate of any portion of the lands proposed to be pooled or unitized whose interest is evidenced by a written document of conveyance either of record or known to the applicant at the time of filing the application and whose interest has not been voluntarily committed to the area proposed to be pooled or unitized (other than a royalty interest subject to a pooling or unitization clause).

(b) When notice is given as required in Subparagraph (a) of Paragraph (1) of Subsection A of 19.15.14.1207 NMAC, of an application for compulsory pooling and the application is unopposed by those owners located, the applicant may file under the following alternate procedure. The application shall include the following:

(i) a statement that no opposition is expected and why;

(ii) a map outlining the spacing unit(s) to be pooled, showing the nature and percentage of the ownership interests and location of the proposed well;

(iii) the names and last known addresses of the interest owners to be pooled and the nature and percent of their interests and an attestation that a diligent search has been conducted of all public records in the county where the well is located and of phone directories, including computer searches;

(iv) the names of the formations and pools to be pooled (note: this procedure does not apply to an application to pool a spacing unit larger in size than provided in 19.15.3.104 NMAC or applicable special pool orders);

(v) a statement as to whether the pooled unit is for gas and/or oil production (see note under item (iv) of Subparagraph (b) of Paragraph (1) of Subsection A of 19.15.14.1207 NMAC;

(vi) written evidence of attempts made to gain voluntary agreement including but not limited to copies of relevant correspondence;

(vii) proposed overhead charges (combined fixed rates) to be applied during drilling and production operations along with the basis for such charges;

(viii) the location and proposed depth of the well to be drilled on the pooled units; and

(ix) a copy of the authorization for expenditure (AFE) to be submitted to the interest owners in the well.

(c) All submittals required shall be accompanied by sworn and notarized statements by those persons who prepared the submittals, attesting that the information is correct and complete to the best of their knowledge and belief.

(d) All unopposed pooling applications will be set for hearing. If the division finds the application complete, the information submitted with the application will constitute the record in the case, and an order will be issued based on the record.

(e) At the request of any interested person or upon the division's own initiative, any pooling application submitted shall be set for full hearing with oral testimony by the applicant.

(2) Unorthodox well locations.

(a) Definition "affected persons" are the following persons owning interests in the adjoining spacing units:

(i) the division-designated operator;

(ii) in the absence of an operator, any lessee whose interest is evidenced by a written document of conveyance either of record or known to the applicant as of the date the application is filed; and

(iii) in the absence of an operator or lessee, any mineral interest owner whose interest is evidenced by a written document of conveyance either of record or known to the applicant as of the date the application was filed. In the event the operator of the proposed unorthodox well is also the operator of an existing adjoining spacing unit and ownership is not common between the adjoining spacing unit and the spacing unit containing the proposed unorthodox well, then "affected persons" include all working interest owners in that spacing unit.

(b) If the proposed location is unorthodox by being located closer to the outer boundary of the spacing unit than permitted by 19.15.3.104 NMAC or applicable special pool orders, notice shall be given to the affected persons in the adjoining spacing units towards which the unorthodox location encroaches.

(c) If the proposed location is unorthodox by being located in a different quarter-quarter section or quarter section than provided in special pool orders, notice shall be given to all affected persons.

(3) Non-standard proration unit. Notice shall be given to all owners of interests in the mineral estate to be excluded from the proration unit in the quarter-quarter section (for 40-acre pools or formations), the one-half quarter section (for 80-acre pools or formations), the quarter section (for 160-acre pools or formations), the half section (for 320-acre pools or formations), or section (for 640-acre pools or formations) in which the non-standard unit is located and to such other persons as required by the division.

(4) Special pool orders regulating or affecting a specific pool.

(a) Except for non-standard proration unit applications, if the application involves changing the amount of acreage to be dedicated to a well, notice shall be given to:

(i) all division-designated operators in the pool; and

(ii) all owners of interests in the mineral estate in existing spacing units with producing wells.

(b) If the application involves other matters, notice shall be given to:

(i) all division-designated operators in the pool; and

(ii) all division-designated operators of wells within the same formation as the pool and within one (1) mile of the outer boundary of the pool which have not been assigned to another pool.

(5) Special orders regarding any division-designated potash area. Notice shall be given to all potash lessees, oil and gas operators, oil and gas lessees and unleased mineral interest owners within the designated potash area. (a) through (d). The material on unorthodox locations was moved to Paragraph (2) of Subsection A of 19.15.14.1207 NMAC.

(6) Downhole commingling. Notice shall be given to all owners of interests in the mineral estate in the spacing unit if ownership is not common for all commingled zones within the spacing unit.

(7) Surface disposal of produced water or other fluids. Notice shall be given to any surface owner within one-half mile of the site.

(8) Surface commingling. Notice shall be given as prescribed in 19.15.5.303 NMAC.

(9) Adjudications not listed above. Notice shall be given as required by the division.

B. Type and content of notice. Any notice required by 19.15.14.1207 NMAC shall be sent by certified mail, return receipt requested, to the last known address of the person to whom notice is to be given at least 20 days prior to the date of hearing of the application and shall include a copy of the application, the date, time and place of the hearing, and the means by which protests may be made. When an applicant has been unable to locate all persons entitled to notice after exercising reasonable diligence, notice shall be provided by publication, and proof of publication shall be submitted at the hearing. Such proof shall consist of a copy of the legal advertisement that was published in a newspaper of general circulation in the county or counties in which the property is located or if the effect of the application is statewide, in a newspaper of general circulation in this state.

C. At the hearing, the applicant shall make a record, either by testimony or affidavit signed by the applicant or its authorized representative, that: (a) the notice provisions of 19.15.14.1207 NMAC have been complied with; (b) the applicant has conducted a good-faith diligent effort to find the correct address of all persons entitled to notice; and (c) pursuant to 19.15.14.1207 NMAC notice has been given at that correct address as required by 19.15.14.1207 NMAC. In addition, the record shall contain the name and address of each person to whom notice was sent and, where proof of receipt is available, a copy of the proof.

D. Evidence of failure to provide notice as required in 19.15.14.1207 NMAC may, upon proper showing, be considered cause for reopening the case.

E. In the case of an administrative application where the required notice was sent and a timely filed protest was made, the division shall notify the applicant and the protesting party in writing that the case has been set for hearing and the date, time and place of the hearing. No further notice is required.

[1-1-86…2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1207, 8-29-03; A, 06/15/04]

19.15.14.1208 PLEADINGS, COPIES AND PRE-HEARING STATEMENTS:

A. For pleadings and correspondence filed in cases pending before a division examiner, two copies must be filed with the division. For pleadings and correspondence filed in cases pending before the commission, five copies must be filed with the division. The division will disseminate copies to the members of the commission. The party filing the pleading or correspondence shall at the same time either hand deliver or transmit by facsimile or electronic mail to any party who has entered an appearance therein or the attorneys of record, a copy of the pleading or correspondence. An appearance of any interested party shall be made either by letter addressed to the division or in person at any proceeding before the commission or before a division examiner, with notice of such appearance to the parties of record.

B. Parties to an adjudicatory proceeding who intend to present evidence at the hearing shall file a pre-hearing statement, and serve a copy thereof on opposing counsel of record in the manner provided in Subsection A of 19.15.14.1208 NMAC, at least four days in advance of a scheduled hearing before the division or the commission, but in no event later than the Friday preceding the scheduled hearing. The statement must include: the names of the parties and their attorneys; a concise statement of the case; the names of all witnesses the party will call to testify at the hearing; the approximate time the party will need to present its case; and identification of any procedural matters that are to be resolved prior to the hearing.

[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1208, 8-29-03; A, 06/15/04]

19.15.14.1209 CONTINUANCE OF HEARING WITHOUT NEW SERVICE:

Any hearing before the commission or a division examiner held after due notice may be continued by the person presiding at such hearing to a specified time and place without the necessity of notice of the same being again served or published.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1209, 8-29-03; A, 06/15/04]

19.15.14.1210 CONDUCT OF HEARINGS:

A. Hearings before the commission or a division examiner shall be conducted without rigid formality. A transcript of testimony shall be taken and preserved as a part of the permanent records of the division. Any person testifying shall do so under oath. However, relevant unsworn comments and observations by any interested party will be designated as such and included in the record.

B. The division director may order the parties to file prepared written testimony in advance of the hearing for cases pending before the commission. The witness must be present at the hearing and shall adopt, under oath, the prepared written testimony, subject to cross-examination and motions to strike unless the presence of the witness at hearing is waived upon notice to and without objection of the parties. Pages of the prepared written testimony shall be numbered and contain line numbers on the left-hand side.

[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1210, 8-29-03]

19.15.14.1211 POWER TO REQUIRE ATTENDANCE OF WITNESSES AND PRODUCTION OF EVIDENCE:

A. The commission or any member thereof and the division director or the division director’s authorized representative have statutory power to subpoena witnesses and to require the production of books, papers, and records in any proceeding before the commission or division. A subpoena will be issued for attendance at a hearing upon the written request of any party. In case of the failure of a person to comply with the subpoena issued, an attachment of the person may be issued by the district court of any district in the state. Any person found guilty of testifying falsely at any hearing may be punished for contempt.

B. A pre-hearing conference may be held prior to the hearing on the merits in cases pending before the division or the commission either upon request of a party or upon notice by the division director or a division examiner. The pre-hearing conference will be to narrow issues, eliminate or resolve other preliminary matters and to encourage settlement. The division director or the division examiner may issue a pre-hearing order following the pre-hearing conference.

[1-1-50…2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1211, 8-29-03]

19.15.14.1212 RULES OF EVIDENCE AND EXHIBITS:

A. Full opportunity shall be afforded all interested parties at a hearing before the commission or division examiner to present evidence and to cross-examine witnesses. In general, the rules of evidence applicable in a trial before a court without a jury shall be applicable, provided that such rules may be relaxed, where, by so doing, the ends of justice will be better served. No order shall be made that is not supported by competent legal evidence.

B. Parties introducing exhibits at hearings before the commission or a division examiner must provide a complete set of exhibits for the court reporter, each commissioner or division examiner and other parties of record.

[1-1-50…2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1212, 8-29-03]

19.15.14.1213 DIVISION EXAMINERS' QUALIFICATIONS AND APPOINTMENT:

The division director shall appoint division examiners. Each division examiner so appointed shall be a member of the staff of the division. Each individual appointed as a division examiner must have at least six years of experience as a geologist, petroleum engineer or licensed lawyer, or at least two years of such experience and a college degree in geology, engineering or law; provided however, that nothing herein shall prevent any member of the commission from serving as a division examiner.

[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1213, 8-29-03]

19.15.14.1214 REFERRAL OF CASES TO DIVISION EXAMINERS:

The division director may refer any matter or proceeding to a division examiner for hearing in accordance with these rules. The division examiner appointed to hear any specific case shall be designated by name.

[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1214, 8-29-03]

19.15.14.1215 DIVISION EXAMINER'S POWER AND AUTHORITY:

The division director may limit the powers and duties of the division examiner in any particular case to such issues or to the performance of such acts as the director deems expedient; however, subject only to such limitations as may be ordered by the director, the division examiner to whom any matter is referred under these rules shall have full authority to hold hearings on such matter in accordance with these rules. The division examiner shall have the power to perform all acts and take all measures necessary or proper for the efficient and orderly conduct of such hearing, including administering oaths to witnesses and receiving testimony and exhibits offered in evidence subject to such objections as may be imposed. The division examiner shall cause a complete record of the proceedings to be made and transcribed and shall certify same to the director as hereinafter provided.

[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1215, 8-29-03]

19.15.14.1216 HEARINGS THAT MUST BE HELD BEFORE COMMISSION:

Notwithstanding any other provisions of these rules, the hearing on any matter shall be held before the commission if:

A. it is a hearing pursuant to Section 70-2-13 NMSA 1978; or

B. the division director desires the commission to hear the matter.

[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1216, 8-29-03]

19.15.14.1217 [RESERVED]
[9-15-55...2-1-96; Repealed 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1217, 8-29-03]

19.15.14.1218 REPORT AND RECOMMENDATIONS FROM DIVISION EXAMINER'S HEARING:
Upon the conclusion of any hearing before a division examiner, the division examiner shall promptly consider the proceedings in such hearing, and based upon the record of such hearing the division examiner shall prepare a written report with recommendations for the disposition of the matter or proceeding by the division. Such report shall either be accompanied by a proposed order or shall be in the form of a proposed order and shall be submitted to the division director with the certified record of the hearing.
[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1218, 8-29-03]

19.15.14.1219 DISPOSITION OF CASES HEARD BY DIVISION EXAMINERS:
After receipt of the report of the division examiner, the division director shall enter the division's order disposing of the matter.
[9-15-55…2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1219, 8-29-03]

19.15.14.1220 HEARING BEFORE COMMISSION AND STAYS OF DIVISION ORDERS:
A. When an order has been entered by the division pursuant to a hearing held by a division examiner, a party of record adversely affected by the order has the right to have the matter heard de novo before the commission, provided that within 30 days from the date the order is issued the party files with the division a written application for such hearing. If an application is filed, the matter or proceeding shall be set for hearing before the commission.
B. Any party requesting a stay of a division order must file the request with the division and provide copies of the request to the parties of record or their attorneys in the case at the time the request is filed. The request must have attached a proposed stay order. The director may grant stays under other circumstances if such a stay is necessary to prevent waste, protect correlative rights, protect public health and the environment or prevent gross negative consequences to any affected party.
C. Any party of record adversely affected by the order issued by the commission after hearing may apply for rehearing pursuant to 19.15.14.1222 NMAC.
[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1220, 8-29-03]

19.15.14.1221 COPIES OF COMMISSION AND DIVISION ORDERS:
Within 10 days after an order, including any order granting or refusing rehearing or order following rehearing, has been issued, a copy of such order shall be mailed by the division to each party or its attorney of record. For purposes of 19.15.14.1221 NMAC only, the parties to a case are the applicant and each person who has entered an appearance in the case, in person or by attorney, either by filing a protest, pleading or notice of appearance with the division or by entering an appearance on the record at a hearing.
[9-15-55...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1221, 8-29-03; A, 06/15/04]

19.15.14.1222 REHEARINGS:
Within 20 days after entry of any order of the commission any party of record adversely affected thereby may file with the division an application for rehearing on any matter determined by such order, setting forth the respect in which the order is believed to be erroneous. The commission shall grant or refuse any such application in whole or in part within 10 days after it is filed and failure to act within such period shall be deemed a refusal and a final disposition of such application. In the event the rehearing is granted, the commission may enter a new order after rehearing as may be required under the circumstances.
[1-1-50...2-1-96; A, 7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1222, 8-29-03]

19.15.14.1223 EX PARTE COMMUNICATIONS:
A. In an adjudicatory proceeding, except for filed pleadings, at no time after the filing of an application for hearing shall any party, interested participant or their representatives communicate regarding the issues involved

in the application with any commissioner or the division examiner appointed to hear the case when all other parties of record to the proceedings have not had the opportunity to be present.

B. The prohibition in Subsection A of 19.15.14.1223, above, does not apply to those applications that are believed by the applicant to be unopposed. However, in the event that an objection is filed in a case previously believed to be unopposed, the prohibition in A, above, is immediately applicable.
[7-15-99; 19.15.14 NMAC - Rn, 19 NMAC 15.N.1223, 8-29-03]

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 15 OIL AND GAS
PART 15 ADMINISTRATION

19.15.15.1 ISSUING AGENCY: Energy, Minerals and Natural Resources Department, Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, (505) 827-7131.
[2-1-96; 19.15.15.1 NMAC - Rn, 19 NMAC 15.O.1, 07-30-04]

19.15.15.2 SCOPE: All persons/entities engaged in oil and gas development and production within New Mexico.
[2-1-96; 19.15.15.2 NMAC - Rn, 19 NMAC 15.O.2, 07-30-04]

19.15.15.3 STATUTORY AUTHORITY: Sections 70-2-1 through 70-2-38 NMSA 1978 sets forth the and Gas Act which grants the oil conservation division jurisdiction and authority over all matters relating to the observation of oil and gas, the prevention of waste of oil and gas and of potash as a result of oil and gas operations, the protection of correlative rights, and the disposition of wastes resulting from oil and gas operations.
[2-1-96; 19.15.15.3 NMAC - Rn, 19 NMAC 15.O.3, 07-30-04]

19.15.15.4 DURATION: Permanent.
[2-1-96; 19.15.15.4 NMAC - Rn, 19 NMAC 15.O.4, 07-30-04]

19.15.15.5 EFFECTIVE DATE: February 1, 1996. [Unless a later date is cited at the end of a section.]
[2-1-96; 19.15.15.5 NMAC - Rn, 19 NMAC 15.O.5, 07-30-04]

19.15.15.6 OBJECTIVE: The objective of this part is to provide for administration of the authority granted to the Oil Conservation Division under the Oil and Gas Act.
[2-1-96; 19.15.15.6 NMAC - Rn, 19 NMAC 15.O.6, 07-30-04]

19.15.15.7 DEFINITIONS: [RESERVED].

19.15.15.8-1300 [RESERVED].

19.15.15.1301 DISTRICT OFFICES:

A. To expedite administration of the work of the oil conservation division of the New Mexico energy, minerals and natural resources department and the enforcement of its rules and regulations, the state shall be divided into four districts as follows:

(1) district 1: Lea, Roosevelt, and Curry counties, and that portion of Chaves county lying east of the north-south line dividing ranges 29 and 30 east, NMPM; the district office shall be in Hobbs, New Mexico.

(2) district 2: Eddy, Otero, Dona Ana, Luna, Hidalgo, Grant, Sierra, Lincoln, and De Baca counties, and that portion of Chaves county lying west of the north-south line dividing ranges 29 and 30 east, NMPM; the district office shall be in Artesia, New Mexico.

(3) district 3: San Juan, Rio Arriba, McKinley, and Sandoval counties; the district office shall be in Aztec, New Mexico;

(4) district 4: remainder of state; the district office shall be in Santa Fe, New Mexico; each district office shall be under the charge of a district supervisor, an oil and gas inspector, or a deputy oil and gas inspector; unless otherwise specifically required, all matters pertaining to the division shall be taken care of through the district office of the district in which the affected land is located.
[1-1-50...2-1-96; 19.15.15.1301 NMAC - Rn, 19 NMAC 15.O.1301, 07-30-04]

19.15.15.1302 WHERE TO FILE REPORTS AND FORMS:
All reports and forms required by the rules to be filed with the division shall be filed in the number and at the time specified on the form or report or by the applicable rules in 19.15.13 NMAC. Unless otherwise specified, all such reports and forms shall be filed at the district office of the district in which the land that is the subject matter of the report is located. All plugging bonds shall be filed directly with the Santa Fe office of the division. A list of all plugging bonds approved and in force shall be kept in each district office.
[1-1-50...2-1-96; 19.15.15.1302 NMAC - Rn, 19 NMAC 15.O.1302, 07-30-04]

19.15.15.1303 DUTIES AND AUTHORITY OF FIELD PERSONNEL:
Oil and gas inspectors, deputy oil and gas inspectors, scouts, engineers and geologists duly appointed by the division have the authority and duty to enforce the rules and regulations of the division. Only oil and gas inspectors and their deputies shall have discretion to allow minor deviations from requirements of the rules as to field practices where, by so doing, waste will be prevented or burdensome delay or expenses on the part of the operator will be avoided.
[1-1-50...2-1-96; 19.15.15.1303 NMAC - Rn, 19 NMAC 15.O.1303, 07-30-04]

19.15.15.1304 NUMBERING OF DIVISION ORDERS:
A. All orders of the division made after January 1, 1950, pertaining to the allocation of production of oil and gas are prefixed with the letter "A" or "AG" in the case of gas pools and are numbered consecutively, commencing with the number 1, i.e., the first allocation order issued after January 1, 1950, is No. A-1, the next A-1, etc or AG-1 and AG-2.
B. All other orders of the division made after January 1, 1950, are prefixed with the letter "R" and are numbered consecutively, commencing with the number 1, i.e., the first such order issued after January 1, 1950, is No. R-1, the next R-2, etc.
[1-1-50...2-1-96; 19.15.15 NMAC.1304 - Rn, 19 NMAC 15.O.1304, 07-30-04]

History of 19.15.15 NMAC:
Pre-NMAC History: The material in this Part was derived from that previously filed with the State Records Center and Archives:
Rule 1301, District Offices, filed 1-11-82;
Rule 1301, District Offices, filed 2-5-91;
Rule 1302, Where to File Reports and Forms, filed 1-11-82;
Rule 1302, Where to File Reports and Forms, filed 2-5-91;
Rule 1303, Duties and Authority of Field Personnel, filed 1-11-82;
Rule 1303, Duties and Authority of Field Personnel, filed 2-5-91;
Rule 1304, Numbering of Division Orders, filed 1-11-82;
Rule 1304, Numbering of Division Orders, filed 10-11-89;
Rule 1304, Numbering of Division Orders, filed 2-5-91.

History of Repealed Material: [Reserved]

Other History: Rule 1301, District Offices (filed 2-5-91); Rule 1302, Where to File Reports and Forms (filed 2-5-91); Rule 1303, Duties and Authority of Field Personnel (filed 2-5-91); and Rule 1304, Numbering of Division Orders (filed 2-5-91) were all renumbered, reformatted and replaced by 19 NMAC 15.O, Administration, effective 2-1-96.
19 NMAC 15.O, Administration (filed 1-18-96) was renumbered, reformatted and replaced by 19.15.15 NMAC, Administration, effective 07-30-04.

SUBCHAPTER 1. ADMINISTRATION

PART 1. GENERAL PROVISIONS

[BLANK PAGE]

PART 1. GENERAL PROVISIONS

165:10-1-1. Purpose

The rules of this Chapter were promulgated in furtherance of the public policy and statutory laws of the State of Oklahoma to prevent the waste of oil and gas, to assure the greatest ultimate recovery from the State's reservoirs, to protect the correlative rights of all interest owners, and to prevent pollution.

165:10-1-2. Definitions.

The following words and terms, when used in this Chapter, shall have the following meaning unless the context clearly indicates otherwise:

"Agent" means any person authorized by another person to act for him.

"Aquifer" means a geological formation, group of formations, or part of a formation that is capable of yielding a significant amount of water to a well or spring.

"Area of exposure" means an area within a circle constructed with the point of escape of poisonous gas (hydrogen sulfide) as its center and the radius of exposure as its radius.

"Associated gas" means any gas produced from a Commission ordered combination oil and gas reservoir in which allowed rates of production are based upon volumetric withdrawals.

"BS&W" means basic sediment and water which is that portion of fluids and/or solids that settle in the bottom of storage tanks and/or treating vessels and is unsaleable to the first purchaser in its present form. BS&W usually consists of water, paraffin, sand, scale, rust, and other sediments.

"Barrel" means 42 (U.S.) gallons at 60 F at atmospheric pressure.

"Basic sediment pit" means a pit used in conjunction with a tank battery for storage of basic sediment removed from a production vessel or from the bottom of an oil storage tank.

"Blowout" means the uncontrolled escape of oil or gas, or both, from any formation.

"Blowout preventer" means a heavy casinghead control fitted with special gates and/or rams which can be closed around the drill pipe or which completely closes the top of the casing.

"Blowout preventer stack" means the assembly of well control equipment including preventers, spools, valves, and nipples connected to the top of the casinghead.

"Carrier", or **"transporter"**, or **"taker"** means any person moving or transporting oil or gas away from a lease or from any common source of supply.

"Casing pressure" means the pressure within the casing or between the casing and tubing at the wellhead.

"Choke manifold" means an assembly of valves, chokes, gauges, and lines used to control the rate of flow from the well when the blowout preventers are closed.

"Closed drilling fluid/mud system" means a system where drilling fluids/muds are circulated in the well bore and contained in non-earthen tanks.

"Closure" means the practice of dewatering, trenching, filling, leveling, terracing, and/or vegetating a pit site after its useful life is reached in order to restore or reclaim the site to near its original condition.

"Commercial disposal well" means a disposal well which:

(A) Is operated primarily for profit from the disposal of salt water and/or other deleterious substances for a fee; and

(B) Disposes of salt water and/or other deleterious substances transported by truck to the facilities used in conjunction with said disposal well or is a disposal well for which none of its owners is an owner in any of the oil and gas wells which produce the salt water and/or other deleterious substances which will be disposed into said disposal well.

"Commercial pit" is a disposal facility which is authorized by Commission order and used for the disposal, storage, and handling substances or soils contaminated by deleterious substances produced, obtained, or used in connection with drilling and/or production operations. This does not include a disposal well pit.

"Commercial soil farming" means the practice of soil farming or land applying drilling fluids and/or other deleterious substances produced, obtained, or used in connection with the drilling of a well or wells at an off-site location. Multiple applications to the same land are likely.

"Commission" means the Corporation Commission of the State of Oklahoma.

"Common source of supply" or **"pool"** means "that area which is underlaid or which, from geological or other scientific data, or from drilling operations, or other evidence, appears to be underlaid by a common accumulation of oil and/or gas; provided that, if any such area is underlaid, or appears from geological or other scientific data or from drilling operations, or other evidence, to be underlaid by more than one common accumulation of oil or gas or both, separated from each other by strata of earth and not connected with each other, then such area shall, as to each said common accumulation of oil or gas or both, shall be deemed a separate common source of supply." [52. O.S.A. §86.1(c)].

"Completion/fracture/workover pit" means a pit used for temporary storage of spent completion fluids, frac fluids, workover fluids, drilling fluids, silt, debris, water, brine, oil scum, paraffin, or other deleterious substances which have been cleaned out of the wellbore of a well being completed, fractured, recompleted, or worked over.

"Condensate" means a liquid hydrocarbon which:

(A) Was produced as a liquid at the surface,

(B) Existed as gas in the reservoir, and

(C) Has an API gravity greater than or equal to fifty degrees, unless otherwise proven.

"Conductor casing" means a casing string which is often set and cemented at a shallow depth to support and protect the top of the borehole from erosion while circulating and drilling the surface casing hole.

"Conservation Division" means the Division of the Commission charged with the administration and enforcement of the rules of this Chapter.

"Contingency plan" is a written document which provides for an organized plan of action for alerting and protecting the public within an area of exposure following the accidental release of a potentially hazardous volume of poisonous gas such as hydrogen sulfide.

"Contractor" means any person who contracts with another person for the performance of prescribed work.

"Cubic foot of gas" means the volume of gas contained in one cubic foot of space at an absolute pressure of 14.65 pounds per square inch and at a temperature of 60°F. Conversion of volumes to conform to standard conditions shall be made in accordance with Ideal Gas Laws corrected for deviation from Boyle's Law when the pressure at point of measurement is in excess of 200 pounds per square inch gauge.

"Date of completion" means:

(A) For an oil well, the date that the well first produces oil into the lease tanks through permanent wellhead equipment.

(B) For a gas well, the date of completion of a gas well is the date that gas is capable of being delivered to a pipeline purchaser.

(C) For a well, which does not produce either oil or gas, is the date on which attempts to obtain production from the well cease.

"Day" means a period of 24 consecutive hours. For reporting purposes, it shall be from 7:00 a.m. to 7:00 a.m. the following day.

"Deleterious substances" means any chemical, salt water, oil field brine, waste oil, waste emulsified oil, basic sediment, mud, or injurious substance produced or used in the drilling, development, production, transportation, refining, and processing of oil, gas and/or brine mining.

"Design mud weight" means the planned drilling mud weight to be used. This mud weight is used in the design of the casing strings.

"Design wellhead pressure" means the maximum anticipated wellhead pressure which is expected to be experienced on the inside of the casing string and on wellhead equipment. This pressure is used to design the casing string and to select wellhead equipment with sufficient working pressure rating.

"Development" means any work which actively looks toward bringing in production, such as erecting rigs, building tankage, drilling wells, etc.

"Directional drilling" means intentional changing of the direction of the well from the vertical.

"Director of Conservation" means the person in official charge of the Conservation Division.

"Discharge" means the release or setting free by any spilling, leaking, pumping, pouring, emitting, emptying, or dumping of substances.

"Distressed well" means a well authorized by Commission order to produce at an unrestricted rate in the interest of public safety due to technical difficulties which temporarily cannot be controlled.

"Diverter" means a device attached to the wellhead to close the vertical access and direct any flow into a line away from the rig. Diverters differ from blowout preventers in that flow is not stopped but rather the flow path is redirected away from the rig.

"Duly authorized representative" means, for the purpose of underground injection well applications, that person or position having a responsibility for the underground injection well.

"Emergency pit" means a pit used for the storage of excessive or unanticipated amounts of fluids during an immediate emergency situation in the drilling or operation of a well, such as a well blowout or a pipeline rupture. This does not include a spill prevention structure required by local, state, or federal regulations.

"Enhanced recovery operation" means the introduction of fluid or energy into a common source of supply for the purpose of increasing the recovery of oil therefrom according to a plan which has been approved by the Commission after notice and hearing.

"Enhanced recovery well" means a well producing in an enhanced recovery operation in accordance with Commission order.

"Exchangeable Sodium Percentage (ESP)" is the relative amount of the sodium ion present on the soil surface, expressed as a percentage of the total Cation Exchange Capacity (CEC). Since the determination of CEC is time consuming and expensive, a practical and satisfactory correlation between the Sodium Adsorption Ratio (SAR) and ESP was established. The SAR is defined elsewhere in this Section. ESP can be estimated by the following empirical formula:

$$ESP = 100 \quad (-0.0126 + 0.01475 \times SAR) \div 1 + (-0.0126 + 0.01475 \times SAR)$$

"Exempted aquifer" means an aquifer or its portion that meets the criteria in the definition of "underground source of drinking water" or in the definition of "treatable water", but which has been exempted according to the procedures in 165:5-7-28 and 165:10-5-14.

"Facility" means, for the purposes of 165:10-21-15, any building(s), parts of a building, equipment, property, or vehicles that are actively engaged in the reuse, recycling, or ultimate destruction of deleterious substances pursuant to 68 O.S. Supp. 1986, §2357.14-§2357.20.

"Field" means the general area underlaid by one or more common sources of supply.

"Flare pit" means a pit which contains flare equipment and which is used for temporary storage of liquid hydrocarbons which are sent to the flare but are not burned due to equipment malfunction. Flare pits may be used in conjunction with tank batteries or wells.

"Flowing well" means any well from which oil or gas is produced naturally and without artificial lifting equipment.

"Fresh water strata" means a strata from which fresh water may be produced in economical quantities.

"Gas" means any petroleum hydrocarbon existing in the gaseous phase.

(A) Casinghead gas means any gas or vapor, or both, indigenous to an oil stratum and produced from such stratum with oil.

(B) Dry gas or dry natural gas means any gas produced in which there are no appreciable hydrocarbon liquids recoverable by separation at the wellhead.

(C) Condensate gas means any gas which is produced with condensate as defined as "condensate".

"Gas allowable" or **"allowable gas"** means the amount of natural gas authorized to be produced from any well by order of the Commission or as provided by statute.

"Gas lift" means any method of lifting liquid to the surface by injecting gas into the well bore from which production is obtained.

"Gas repressuring" means the injection of gas into a common source of supply to restore or increase the gas energy of a reservoir.

"GOR (Gas/Oil Ratio)" means the ratio of the gas produced in standard cubic feet to one barrel of oil produced during any stated period. Condensate and load oil excepted under 165:10-13-6 shall not be considered as oil for purposes of determining GOR.

"Hardship well" means a well authorized by Commission order to produce at a specified rate because reasonable cause exists to expect that production below said rate would damage the well and cause waste.

"Hydrogen sulfide gas (H_2S)" means a toxic poisonous gas with a chemical composition of H_2S which is sometimes found mixed with and produced with fluids from oil and gas wells.

"Hydrostatic head" or **"hydrostatic pressure"** means the pressure which exists at any point in the wellbore due to the weight of the column of fluid or gas above that point.

"Illegal gas" means gas which has been produced within the State from any well or wells in violation of any rule, regulation, or order of the Commission, as distinguished from gas produced within the State not in violation of any such rule, regulation, or order which is "legal gas".

"Illegal oil" means oil which has been produced within the State from any well or wells in violation of any rule, regulation or order of the Commission, as distinguished from oil produced within the State not in violation of any such rule, regulation, or order which is "legal oil".

"Intermediate casing" means the casing string or strings run after setting the surface casing and prior to setting the production string or liner.

"Kick" means the intrusion of formation liquids or gas that results in an increase in circulation pit volume. Without corrective measures, this condition can result in a blowout.

"Land application" is the application of deleterious substances and/or soils contaminated by deleterious substances to the land for the purpose of disposal or land treatment; also known as soil farming.

"Lease allowable" means the total of the allowables of the individual wells on the lease.

"Liner" means a length of casing used downhole as an extension to a previously installed casing string to case the hole for further drilling operations and/or for producing operations.

"Load Ticket" means a document or bill of lading describing the source, contents and destination of any load of petroleum tank bottoms, BS&W or deleterious substance, the name and address of the company owning or leasing the transporting vehicle, either the Oklahoma Tax Commission Gross production Vehicle Permit number of the vehicle or the Oklahoma Corporation Commission Motor Carrier License number, the date of transport, the name of the company or person owning the lease or storage facility from which the product is being removed, or if different, the name of the company or person owning the product before its removal, the OTC assigned production unit number of the lease or a precise description of the location of non-lease storage from which the product is removed, a description of the product being transported, the name and address of the person or firm who will receive or store the load and the driver's signature.

"Meter" means an instrument for measuring and indicating or recording the volumes of gases or liquids.

"Mud" means any mixture of water and clay or other material as the term is commonly used in the industry.

"Multiple zone completion" means the completion of any well so as to permit the production from more than one common source of supply, with such common sources of supply completely segregated.

"Noncommercial pit" means an earthen pit which is located either on-site or off-site and is used for the handling, storage, or disposal of deleterious substances or soils contaminated by deleterious substances produced, obtained, or used in connection with the drilling and/or operation of a well or wells, and is operated by the generator of the waste. This does not include a disposal well pit.

"Normal pressure" means a formation pore pressure, proportional to depth, which is roughly equal to the hydrostatic pressure gradient of a column of salt water (.465 psi/ft).

"Off-site reserve pit" means a reserve pit used for the handling, storage and/or disposal of drilling fluids/muds and cuttings where all parts of the pit are located further than 300 feet from the well bore.

"Oil" or **"crude oil"**, means, for purposes of these regulations, any petroleum hydrocarbon, except condensate, produced from a well in liquid form by ordinary production methods.

"Oil allowable" or **"allowable oil"** means the amount of oil authorized to be produced from any well by order of the Commission.

"Operator" means the person who is duly authorized and in charge of the development of a lease or the operation of a producing property.

"Overage" means the oil or gas delivered to a carrier, transporter, or taker in excess of the allowable set by the Commission for any given period.

"Owner" means the person or persons who have the right to drill into and to produce from any common source of supply, and to appropriate the production either for himself, or for himself and others.

"Person" means any natural person, corporation, association, partnership, receiver, trustee, guardian, executor, administrator, fiduciary, or representative of any kind, and shall include the plural.

"Plug" means the closing off, in a manner prescribed by the Commission, of all oil, gas, and waterbearing formations in any producing or nonproducing wellbore before such well is abandoned.

"Pollution" means the contamination of fresh water or soil, either surface or subsurface, by salt water, mineral brines, waste oil, oil, gas, and/or other deleterious substances produced from or obtained or used in connection with the drilling, development, producing, refining, transporting, or processing of oil or gas within the State of Oklahoma.

"Pool" See "common source of supply".

"Potential" means the properly determined capacity of a well to produce oil or gas, or both, under conditions prescribed by the Commission.

"Producer" See "Operator" or "Owner".

"Production casing" means the casing string set above or through the producing zone of a well which serves the purpose of confining and/or producing the well production fluids.

"Productivity index" means the daily production of oil in barrels per unit pressure differential between the static reservoir pressure and the stabilized flowing pressure during flow at a stated rate.

"Proration period" means:

(A) The proration period for any well, other than an unallocated gas well, shall be one calendar month which shall begin at 7 a.m. on the first day of such month and end at 7 a.m. on the first day of the next succeeding month unless otherwise specified by order of the Commission.

(B) The proration period for any unallocated gas well shall be one calendar year which shall begin at 7:00 a.m. the first day of such year and end at 7:00 a.m. on the first day of the next succeeding year unless otherwise specified by order of the Commission.

"Public area" means a dwelling place, a business, school, hospital, school bus stop, government building, a public road, all or any portion of a park, city, town, village, or other similar area that can be expected to be populated.

"Public street" or **"road"** means any federal, state, county, or municipal street or road owned or maintained for public access or use.

"Purchaser" or **"transporter"** means any person who acting alone or jointly with any person or persons, via his own, affiliated or designated carrier, transporter, or taker, shall directly or indirectly purchase, take, or transport by any means whatsoever or otherwise remove from any lease, oil or gas, and/or other hydrocarbons produced from any common source of supply in this State, excepting royalty portions from leases owned by that person.

"Radius of exposure" means that radius constructed with the point of escape of poisonous (hydrogen sulfide) gas as its starting point and its length calculated by use of the Pasquill-Gifford equations.

"Reclaimer" or **"reclamation plant"** includes any person licensed by the Oklahoma Tax Commission pursuant to 68 O.S.§1015.1 who reclaims or salvages or in any way removes or extracts oil from waste products associated with the production, storage, or transportation of oil including, but not limited to BS&W, tank bottoms, pit and waste oil, and/or waste oil residue.

"Recomplete" or **"recompletion"** means any operation to:

(A) Convert an existing well from an injection well or disposal well, to a producing well, or

(B) Add or change common sources of supply in an existing well.

"Recycling" is the reuse, processing, reclaiming, treating, neutralizing, or refining of materials and by-products into a product of beneficial use which, if discarded, would be deleterious substances.

"Recycling/reuse pit" means a pit which is used for the recycling or reuse of deleterious substances, is located off-site, and is operated by the generator of the waste.

"Re-enter" or **"re-entry"** is the act of entering a plugged well for the purpose of utilizing said well for the production of oil or gas, for the disposal of fluids therein, for a service well, or for the salvaging of tubing or casing therefrom.

"Remediation pit" means a pit which is used for the handling, storage, or disposal of deleterious substances and/or soils contaminated by deleterious substances which are relocated to the pit for the purpose of remediating a site which is known to be or suspected to be causing pollution.

"Reserve pit" or **"circulation pit"** means a pit located either on-site or off-site which is used in conjunction with a drilling rig for the handling, storage, or disposal of drilling fluids and/or cuttings.

"Reservoir" See "common source of supply".

"Reservoir pressure" means the static or stabilized pressure in pounds per square inch existing at the face of the formation of an oil or gas well.

"Reuse" is the introduction (or reintroduction) into an industrial, manufacturing, or disposal process of a material which would otherwise be classified as a deleterious substance. A material will be considered "used or reused" if it is either:

(A) Employed as an ingredient (including use as an intermediate) in an industrial, manufacturing, or disposal process to make or recover a product.

(B) Employed in a particular function or application as an effective substitute for a commercial product or non-deleterious substance.

"Rotating head" means a rotating, pressure sealing device used in drilling operations utilizing air, gas, foam, or any other drilling fluid whose hydrostatic pressure is less than the formation pressure.

"Secretary" means the duly appointed and qualified Secretary of the Commission or any person appointed by the Commission to act as such Secretary during the absence of the Secretary, his inability, or disqualification to act.

"Separator" means any apparatus for separating oil, gas, and water as they are produced from a well at the surface.

"Seismic shot hole" shall mean any hole drilled to allow explosive charges to provide an energy source for seismic exploration.

“Slick spot” means a small area of soil having a puddled, crusted, or smooth surface and an excess of exchangeable sodium. The soil is generally silty or clayey, is slippery when wet, and is low in productivity.

"Sodium Adsorption Ratio (SAR)" means the index which indicates the relative abundance of sodium ions in solution as compared to the combined concentration of calcium and magnesium ions. It is calculated as follows:

$$\text{SAR} = \frac{(\text{Na ppm}/23.0)}{\text{sq. root of } [\ \{(\text{Ca ppm}/20.02) + (\text{Mg ppm}/12.16)\}\ /\ 2]}$$

where Na=Sodium
Ca=Calcium

Mg=Magnesium

"Soil farming" means the application of oilfield drilling or produced wastes to the soil for the purpose of disposing of the waste without being a detriment to water or land; also known as land application.

"Spill containment pit" means a permanent pit which is used for the emergency storage of oil and/or saltwater spilled as a result of any equipment malfunction.

"Stratigraphic test hole" shall mean any hole drilled to obtain geological information which may lead to the discovery of hydrocarbons. Such wells are drilled without the intention of being completed for hydrocarbon production.

"Subnormal pressure" means the formation pore pressure, proportional to depth, which is less than a hydrostatic pressure gradient of .465 psi/ft.

"Sulfide stress cracking" means the cracking phenomenon which is the result of corrosive action of hydrogen sulfide on susceptible metals under stress.

"Surface casing" means the first casing string designed and run to protect the treatable water formations and/or control fluid or gas flow from the well.

"Tank bottoms" means the liquids and/or solids in a storage facility that are unsaleable to the crude oil first purchaser in its present form. Tank bottoms may consist of a combination of several elements including, but not limited to, crude oil, BS&W, and spent treating fluids.

"Treatable water" means, for purposes of setting surface casing and other casing strings, subsurface water in its natural state, useful or potentially useful for drinking water for human consumption, domestic livestock, irrigation, industrial, municipal, and recreational purposes, and which will support aquatic life, and contains less than 10,000 mg/liter total dissolved solids or less than 5,000 ppm chlorides. Treatable water includes, but is not limited to, fresh water.

"Trenching" means the practice of constructing trenches in or adjacent to a pit for the purpose of relocating all or a portion of the solids so as to facilitate closure.

"Ultimate destruction" means the treatment of a deleterious substance such that both its weight and volume remaining for disposal have been substantially reduced, and there is no demonstrated process or technology commercially available to further reduce its weight and volume and remove or reduce its harmful properties, if any. For the purposes of demonstrating a substantial reduction in weight and volume, any aqueous portion separated from the balance of a waste that meets drinking water standards or is evaporated into the ambient air shall count toward the weight and volume reduction.

"Underage" means the volume of allowable oil or gas not actually delivered to a carrier, transporter, or taker during any given proration period.

"Underground Source of Drinking Water (USDW)" means an aquifer or its portion which:

(A) Supplies any public water system; or

(B) Contains a sufficient quantity of ground water to supply a public water system; and

(i) Currently supplies drinking water for human consumption; or

(ii) Contains fewer than 10,000 mg/l total dissolved solids; and

(C) Is not an exempted aquifer.

"Unit operations" means a unit consisting of a portion of a lease, a lease, or more than one lease or portions thereof which covers contiguous lands containing one or more common sources of supply which has been approved by Commission order as a unit for the purpose of unitized management, after notice and hearing.

"Vacuum" means pressure below the prevailing pressure of the atmosphere.

"Waste" means:

(A) As applied to the production of oil, in addition to its ordinary meaning, "shall include economic waste, underground waste, including water encroachment in the oil or gas bearing strata; the use of reservoir energy for oil producing purposes by means or methods that unreasonably interfere with obtaining from the common source of supply the largest ultimate recovery of oil; surface waste and waste incident to the production of oil in excess of transportation or marketing facilities or reasonable market demands." [52 O.S.A., 86.2]

(B) As applied to gas, in addition to its ordinary meaning, shall include economic waste; "the inefficient or wasteful utilization of gas in the operation of oil wells drilled to and producing from a common source of supply; the inefficient or wasteful utilization of gas in the operation of gas wells drilled to and producing from a common source of supply; the production of gas in such quantities or in such manner as unreasonably to reduce reservoir pressure or unreasonably to diminish the quantity of oil or gas that might be recovered from a common source of supply; the escape, directly or indirectly, of gas from oil wells producing from a common source of supply into the open air in excess of the amount necessary in the efficient drilling, completion or operation thereof; waste incident to the production of natural gas in excess of transportation and marketing facilities or reasonable market demand; the escape, blowing, or releasing, directly or indirectly, into the open air, of gas from well productive of gas only, drilled into any common source of supply, save only such as is necessary in the efficient drilling and completion thereof; and the unnecessary depletion or inefficient utilization of gas energy contained in a common source of supply." [52 O.S.A. §86.3]

(C) The use of gas for the manufacture of carbon black or similar products predominately carbon, except as specifically authorized by the Commission, shall constitute waste.

(D) The flaring of tail gas at gasoline, pressure maintenance, or recycling plants where a market is available.

"Waste oil" shall include, but not be limited to, crude oil or other hydrocarbons used or produced in the process of drilling for, developing, producing, or processing oil or gas from wells, oil retained on cuttings as a result of the use of oil-based drilling muds, or any residue from any oil storage facility on a producing lease or on a commercial disposal operation or pit. The term "waste oil" shall not include any refined hydrocarbons to which lead has been added.

"Waste oil residue" means that portion of waste oil remaining after treatment and after the saleable liquids and water have been extracted. Waste oil residue is a type of waste oil.

"Well log" or **"well record"** means a systematic, detailed and correct record of formations encountered in the drilling of a well.

[**Source:** Amended at 12 Ok Reg 2017, eff 7-1-95; Amended in Rule Making 97000002, eff 7-1-97; Amended in Rule Making 980000034, eff 7-1-99; Amended in Rule Making 200000002, eff 7-1-2000]

165:10-1-3. Scope of rules

All rules of general application in this Chapter promulgated to prevent waste, assure the greatest ultimate recovery from the reservoirs of this state, protect the correlative rights of all interests, and to prevent pollution shall be effective throughout the State of Oklahoma and be in force in all pools except as amended, modified, altered, or enlarged in specific individual pools by orders now in effect or hereafter issued by the Commission.

165:10-1-4. Citation effective date

(a) These rules shall be cited as OAC Title 165 Chapter 10 (OAC 165:10).
(b) The effective date of the rules of this Chapter is as set out below:
(1) Order No. 937 - Effective 06/16/15
(2) Order No. 1299 - Effective 08/20/17
(3) Order No. 1986 - Effective 01/05/22
(4) Order No. 6251 - Effective 04/12/33
(5) Order No. 6252 - Effective 04/15/33
(6) Order No. 6393 - Effective 07/19/33
(7) Order No. 6394 - Effective 07/20/33
(8) Order No. 7263 - Effective 04/10/34
(9) Order No. 8229 - Effective 10/31/33
(10) Order No. 17528 - Effective 01/24/45

(11) Order No. 19334 - Effective 10/24/46
(12) Order No. 29232 - Effective 10/06/54
(13) Order No. 30712 - Effective 09/09/55
(14) Order No. 44297 - Effective 04/01/61
(15) Order No. 47397 - Effective 12/01/61
(16) Order No. 53568 - Effective 12/08/63
(17) Order No. 53749 - Effective 01/03/64
(18) Order No. 62481 - Effective 05/11/66
(19) Order No. 62631 - Effective 06/01/66
(20) Order No. 63817 - Effective 10/04/66
(21) Order No. 64203 - Effective 11/10/66

165:10-1-5. Conservation Division [RESERVED]

165:10-1-6. Duties and authority of the Conservation Division

(a) It shall be the duty of the Conservation Division to administer and enforce the statutes of this State and the rules, regulations, and orders of the Commission relating to the conservation of oil and gas and the prevention of pollution in connection with the exploration, drilling, producing, transporting, purchasing, processing, and storage of oil and gas, and to administer and enforce the applicable provisions of the Natural Gas Policy Act of 1978.

(b) The Conservation Division shall have the right at all times to go upon and inspect any oil and gas properties, pipelines, tank farms, refineries, and other processing plants and pump stations for the purpose of making any investigations or tests to ascertain whether the rules, regulations, and orders of the Commission are being complied with, and shall report to the Commission any violation thereof.

(c) The Conservation Division may require the testing or retesting of any oil, gas, injection, or disposal well upon 48-hour notice. Until the test is completed or excused, no allowable will be assigned the well and the purchaser or taker of oil or gas from such well shall not run oil or gas until authorized by the Conservation Division.

(d) The Director of the Conservation Division may administratively reclassify a well according to the gas-oil ratio as specified in 165:10-13-2 if the retesting of a well pursuant to this Section as reported on Form 1029A indicates a change in the original gas-oil ratio. This administrative reclassification shall only be used for allowable or priority purposes pursuant to 165:10-17-12. The operator shall be notified in writing by the Conservation Division within 15 days of the effective date of any change in classification.

(e) If the operator of the well which has been reclassified objects to said reclassification, he may file a written objection with the Conservation Division within 15 days of receiving notice of the reclassification. At the same time that the objection is filed, the operator shall file an application and notice setting cause for hearing with the Court Clerk Commission. The notice shall be published one time at least 15 days prior to the hearing in a newspaper of general circulation published in Oklahoma County and in a newspaper of general circulation published in each county in which lands embraced in the application are located.

(f) The Conservation Division shall have access to all well records, wherever located. All companies, operators, drilling contractors, drillers, service companies, or other persons shall permit any authorized employee of the Commission to come upon any lease or property operated or controlled by them, and to inspect the records of wells; provided, that information so obtained

shall be confidential. Any person who attempts, by means of any threat or violence, to deter or prevent any authorized employee of the Commission from performing any duty hereunder shall be prosecuted to the fullest extent of the law.
(g) Upon request of the Conservation Division, service companies or other persons shall furnish and file reports and records showing gun perforating, hydraulic fracturing, cementing, shooting, chemical treatment, and all other service operations on any well.

[**SOURCE:** Amended at 9 Ok Reg 2337, eff 6-25-92]

165:10-1-7. Prescribed forms
(a) Required Conservation Division forms may be submitted to the Commission on forms supplied by the Commission or on xerographic copies of Commission forms or by operator computer generated forms. Operator computer generated forms will be printed from Commission designed files made available to operators via the electronic Bulletin Board Service (BBS), Internet (World Wide Web) or magnetic disk. Operator computer generated forms must contain the exact language and wording of Commission forms. Any alteration of Commission forms language and wording may subject the signature party and/or operator to perjury charges.
(b) The following Conservation Division forms are prescribed for filing purposes:

(1) **Form 1000 - Notice of Intention to Drill application:** Operator shall file Form 1000 before any oil, gas, injection, disposal, or service well is drilled, recompleted, or re-entered. Such notice shall include the name(s) and address(es) of the surface owner(s) of the land upon which the well is to be located. The Commission shall process the application and, if approved, return a computer-generated permit to the operator. The Commission shall mail a copy of the permit to drill or re-enter to the land owner(s). Upon approval, the operator will have six months to commence the permitted operations. A six month extension may be granted without fee providing the Conservation Division staff determines that no material change of condition has occurred, if written request for such extension is received from the operator prior to the expiration of the original permit. Only one extension may be granted. A copy of the approved permit shall be posted at the well site. [Reference 165:10-3-1 and 165:10-1-25]

(2) **Form 1000A - Request for Reserve Pit Requirements:** The operator shall file Form 1000A in duplicate for information before any noncommercial pit is constructed. The Commission shall indicate the necessary liner requirements, if any, and return to the operator. [Reference 165:10-7-16]

(3) **Form 1000B - Application to Drill Deep Anode Groundbeds:** Form 1000B is required to be filed for wells drilled for deep anode groundbeds as required by OAC 165:10-7-14. The purpose of Commission Form 1000B is to ensure groundwater is being protected in construction of the deep anode groundbed. [Reference 165:10-7-14]

(4) **Form 1000S - Application to Drill Seismograph and Stratigraphic Test Holes:** The applicant must post a $50,000 bond with the Surety Department in the Oil and Gas Conservation Division. The application must also be accompanied with a plat of the project area. [Reference 165:10-7-31]

(5) **Form 1001 - Notification of Intention to Plug:** Operator shall file notice on Form 1001, in duplicate, five days prior to plugging operations and shall notify the appropriate Commission District Office before work is started. If the well is an exhausted producer, list OTC assigned county and lease number. If the Intent to Plug is cancelled, the operator shall notify the Commission by letter. The operator of each offset producing lease shall be notified prior to the plugging of any well other than a dry hole. [Reference 165:10-11-4, 165:10-11-5, and 165:10-11-6]

(6) **Form 1001A - Notification of Spudding of New Well:** Form 1001A is mailed to the operator with the intent to drill permit. Operator shall file with the Conservation Division within 14 days of spudding a new well or reentering a previously plugged well. [Reference 165:10-3-1]

(7) **Form 1002A - Well completion report:** Operator shall furnish a complete well record on Form 1002A within 30 days after completion of operations to

drill, recomplete, re-enter, or convert to injection or disposal well. Effective for both dry hole and/or producer. If well is an oil or gas producer, list OTC assigned county and lease number. Gas-oil ratio must be shown when Form 1002A is filed. List on a 24-hour basis both oil and gas. [Reference 165:10-3-25]

(A) **Oil well:** GOR less than 15,000:1

(B) **Gas well:** GOR 15,000:1 or more

(8) **Form 1002B - Confidential Filing of Electric Logs:** Operator shall file Form 1002B within 60 days of the running of the last formation evaluation type wire line log to hold logs confidential for one year period. Optional extension for six months may be requested by operator in writing to the Technical Department of the Conservation Division. [Reference 165:10-3-26]

(9) **Form 1002C - Cementing Report to accompany Well Completion Report:** Operator shall file Form 1002C with the Well Completion Report (Form 1002A) describing all cementing operations on surface, intermediate, and production casing strings, including multistage cementing jobs. The form shall be completed and signed by employees of both the operator and the cementing company. [Reference 165:10-3-4(h)]

(10) **Form 1003 - Plugging Record:** Operator will file Form 1003, in duplicate, within 30 days after plugging operations are completed. Both copies are to be mailed to the applicable Commission District Office. If a depleted producer, list OTC assigned county and lease number. [Reference 165:10-11-6 and 165:10-11-7]

(11) **Form 1003A - Notice of Temporary Exemption from Well Plugging**: Form 1003A shall be filed with the appropriate District Office. [Reference 165:10-11-3]

(12) **Form 1003C - Cementing Report to accompany Plugging Record:** operator shall file Form 1003/1003C when well has been plugged. Form 1003/1003C shall be completed and signed by employees of both the operator and the cementing company. [Reference 165:10-11-6 and 165:10-11-7]

(13) **Form 1004 - Monthly Report of Unallocated Natural Gas Wells Production:** Each operator of the required meter under 165:10-17-5 shall make a monthly well on Form 1004 report with the Commission of all natural gas volumes transferred through the meter for the preceding month, by the last day of the month following such transfer. List formation name plus OTC assigned county and lease number. If more than one meter, the operator of each shall file this form. [Reference 165:10-1-47]

(14) **Form 1004B - Notice of Gas Purchase Curtailments:** In any month wherein a first purchaser or first taker has a market demand/supply imbalance and must curtail purchases or takes in compliance with 165:10-17-12, Form 1004B shall be filed by said first purchaser or first taker with the Conservation Division. [Reference 165:10-17-12]

(15) **Form 1005 - Monthly Report of Purchasers** (Gas: subject to field rules): [Reference 165:10-1-47 and 165:10-15-1]

(A) **GAS:** Each operator of the required meter or meters under 165:10-17-5 shall complete computer-generated Form 1005, and return a copy to the Conservation Division indicating the gas amounts transferred through the meter for the preceding month on allocated and special allocated gas wells.

(B) **OIL:** Each first purchaser, or first taker of oil from wells and projects which are capable of producing in excess of their maximum assigned allowables, must complete computer-generated Form 1005 and return a copy to the Conservation Division indicating the amount of oil taken from each well or unit for the preceding month.

(16) **Form 1006 - Surety bond for oil, gas, injection, or disposal wells**: Prior to drilling and/or operating a well, the operator shall furnish the Conservation Division a surety bond ($25,000.00) or other present alternate surety, Form 1006A or 1006C. Operator must file the original copy only with a copy of the power of attorney from the bonding company. The name and address of the Oklahoma resident service agent shall be endorsed on the bond form. [Reference 165:10-1-12]

(17) **Form 1006A - Financial Statement for oil, gas, injection or disposal wells**: Prior to drilling and/or operating a well, the operator shall furnish the Conservation Division a verifiable financial statement (minimum net worth $50,000.00 within the State of Oklahoma) or other present

alternate surety, Form 1006 or 1006C. Operator must file an original copy on Form 1006A, which must be updated annually from the last filing date. [Reference 165:10-1-11]

(18) **Form 1006B - Operator Agreement to plug oil, gas, and service wells within the State of Oklahoma:** Operator shall agree to plug well(s) in compliance with the Commission rules. This agreement must accompany the operator's elective choice of surety (Form 1006, 1006A, or 1006C). The operator is required to file a Form 1006B with the Conservation Division once every twelve (12) months. [Reference 165:10-1-10, 165:10-1-11, 165:10-1-12, 165:10-1-13, and 165:10-1-14]

(19) **Form 1006BR – Recycling, Reclaiming Operator's Agreement to Close the Reclaiming Facility:** Prior to operating a recycling or reclaiming facility the operator shall file an agreement to close the facility in compliance with OCC rules. This agreement must accompany the application for certification (Form 1020A). [Reference 165:10-8-1 and/or 165:10-8-2]

(20) **Form 1006C - Irrevocable commercial letter of credit:** Prior to drilling and/or operating a well, the operator shall furnish the Conservation Division an irrevocable commercial letter of credit ($25,000.00) or other present alternate surety, Form 1006A or 1006. Operator must file the original copy with the bank seal affixed. A letter of credit must be valid for at least a one year period. [Reference 165:10-1-13]

(21) **Form 1006SB - Surety bond for seismic shot hole plugging within the State of Oklahoma:** Before commencing any seismic operation that requires the drilling of shot holes, those companies actually doing the work in the field must secure a bond in the amount of $50,000.00. Seismic companies must file the original Form 1006B only with a copy of the power of attorney from the bonding company. The name and address of the Oklahoma resident service agent shall be endorsed on the bond form. Form 1006S shall be filed with the bond. [Reference 165:10-11-6]

(22) **Form 1007A - IBM operator annual unallocated natural gas wells survey:** Annual Survey Form 1007A will be furnished to all operators at the end of each calendar year in duplicate. The form shall be updated by the operator as of December 31 notifying the Commission of any new wells, wells sold (to whom and address), or abandoned since the last 1007A was filed. Original only shall be forwarded to Conservation Division by February 15th for the previous year's activity. List OTC assigned county and lease number (if not imprinted). See 165:10-17-11 for production penalties on overproduced wells. [Reference 165:10-17-1 and 165:10-17-16]

(23) **Form 1008S - Operators agreement to plug seismic shot holes with the State of Oklahoma:** Before commencing any seismic operation that requires the drilling of shot holes, those companies actually doing the work in the field shall be duly registered with the Conservation Division on Form 1006SB. [Reference 165:10-11-6]

(24) **Form 1010 - Application for Cancelled Underage:** Operator shall file, within 30 days for oil, and six months for special allocated and allocated gas from the date of cancellation, to reinstate cancelled underage; stating reason for this request and notifying all offset operators. List OTC assigned county and lease number. [Reference 165:10-15-5]

(25) **Form 1012 - Annual Fluid Injection Report:** Operators shall file Form 1012 by April 1 of each year covering the previous calendar year (January 1 through December 31) on all enhanced recovery projects, pressure maintenance projects, and salt water disposal wells (commercial disposal wells will report twice per year on January 31 and July 31 for the previous six months) for each UIC well. The completed form will list well identification including API number, the Commission order number, injection volume and pressure, etc., as required on the form. No UIC well is to be operated for injection or disposal unless the Form 1012 is filed by the above dates. [Reference 165:10-5-7].

(26) **Form 1013 - Application for adjusting an allowable for an Excessive Water Exemption or Reservoir Dewatering Oil Spacing unit:** An operator in an unallocated oil pool may be permitted to produce at a full capacity allowable rate, provided that the water- oil ratio at the well is greater than or equal to 3:1 as in excessive water exemption. To qualify for the

reservoir dewatering oil spacing unit allowable shown on Appendix J, the operator must provide data to show that the water - oil ratio is greater than 1:1 [Reference 165:10-15-1, 165:10-15-16, 165:10-15-17 and 165:10-15-18].

(27) **Form 1014 - Application for Permit to Use Earthen Pit:** The operator of a proposed off-site reserve pit, recycling/reuse pit, spill containment pit, or remediation pit must submit Form 1014 in duplicate to the appropriate District Office for approval before constructing or using the pit. [Reference 165:10-7-16]

(28) **Form 1014CS - Application for Commercial Soil Farming:** For a commercial soil farming site which has an order to operate, the operator shall submit a Form 1014CS to the Pollution Abatement Department for prior approval each time that soil farming is proposed to be done. The application must be processed within ten (10) days of submission. [Reference 165:10-9-2]

(29) **Form 1014D - Application for Surface Discharge:** Each application for surface discharge of produced water must be submitted to a Field Operations office on Form 1014D in quadruplicate. Applications will be processed within five working days. [Reference 165:10-7-17 or 165:10-7-32]

(30) **Form 1014HD - Application for Disposal of Hydrostatic Test Water:** Company wishing to discharge water as required by OAC 165:10-7-17, used to test a pipeline or tank, must submit a Form 1014HD to the Pollution Abatement Department for prior approval. [Reference 165:10-7-17]

(31) **Form 1014L - Surface Owner Permission for Land Application:** Each application for land application must include an original Form 1014L, whereby the applicable surface owner gives permission for the applicant to land apply certain deleterious substances to a specific property. [Reference 165:10-7-19 and 165:10-7-26]

(32) **Form 1014N - Application for Commercial Pit Construction:** After a Commission order is obtained, Form 1014N must be submitted for approval by the Manager of Pollution Abatement prior to the construction of each commercial pit authorized by the order. [Reference 165:10-9-1]

(33) **Form 1014S - Application for Land Application:** Each application for land application of materials must be submitted to a Field Operations office on Form 1014S. An original and three copies are required. The applicant must be the operator of the well or other operator responsible for generating the waste to be land applied, except that a commercial pit operator may also apply in case of emergency or for the purpose of facilitating repair or closure, and the Oklahoma Energy Resources Board or its contractor may apply in cases where there is no responsible party. The Form 1014S shall be processed within five working days of submission of all required or requested information. [Reference 165:10-7-19 and 165:10-7-26]

(34) **Form 1014W - Application for waste oil or drill cuttings use by County Commissioners:** Application to apply waste oil, waste oil residue, or freshwater drill cuttings must be made by any Board of County Commissioners on Form 1014W. An original and one copy are required to be submitted to the appropriate District Manager. [Reference 165:10-7-22 and 165:10-7-28]

(35) **Form 1014X - Application for waste oil or drill cuttings use by operators:** Application to apply waste oil, waste oil residue, or freshwater drill cuttings must be made by any operator on Form 1014X. An original and one copy are required to be submitted to the appropriate District Manager. [Reference 165:10-7-27 and 165:10-7-29]

(36) **Form 1015 - Application for Administrative Approval to Dispose of or Inject Water into Well(s):** Applicant shall file an original and six copies of application and one complete set of attachments to the Commission on Form 1015. Applicant will also furnish one copy of the application on Form 1015 to the landowner and a copy of the application to each operator of a producing leasehold within one-half (1/2) mile of the well location. Applicant will submit an affidavit of delivery or mailing not later than five days after the application is filed and shall file proof of publication in an Oklahoma City newspaper and a county newspaper in which the well is located. [Reference 165:10-5-5]

(37) **Form 1015SI - Application for Permit for Simultaneous Injection Well:** Operator shall file original and three copies with the Underground Injection

Control Department on Form 1015SI. A copy of the form will also be supplied to the operator of any producing lease within (1/2) mile of the proposed injection well. [Reference 165:10-5-15]

(38) **Form 1015T - Application for Injection of Reserve Pit Fluids:** Each application for the on-site injection of reserve pit fluids (i.e., drilling mud fluids or fracture fluids) used in drilling or well completion shall be filed with the Underground Injection Control Department by the well operator on Form 1015T. The original and three copies of the application and one complete set of attachments shall be furnished to the Underground Injection Control Department. A copy of the application will also be supplied to the land owner and the operator of any producing lease within 1/2 mile of the proposed well. [Reference 165:10-5-13]

(39) **Form 1015U - Unit-wide application for Injection:** Optionally, the operator can file a unit-wide application for injection (Form 1015U) that fulfills all the requirements of 165:5-7-27 (b) through (e). Upon review and approval, the operator receives a unit-wide order that allows the operator to file an individual well application (Form 1015) and if it fits the unit-wide criteria, the UIC order can be issued immediately without an additional area of review, notice, or protest period. [Reference 165:5-7-27]

(40) **Form 1016 - Back Pressure Test for Natural Gas Wells:** Operators and/or purchasers, on the Form 1016, will report all single-point and four-point potential tests as required by pool rule orders or general rules. List OTC assigned county and lease numbers and special allocated pool numbers, first date of sales, and complete flow data. [Reference 165:10-17-6 and 165:10-17-7]

(41) **Form 1017 - Guymon-Hugoton Field Gas Well Deliverability Tests:** Operators and/or purchasers of gas in this field shall take deliverability tests between January 1 and August 31 of each year, and on the test sheet Form 1017 file the results with the Commission. List OTC assigned lease number for each well. [Reference Orders No. 17867 and 87291]

(42) **Form 1019 - Guymon-Hugoton Field Acreage Statement for Gas Wells:** A fact statement as to acreage attributable to each well shall be filed with the Commission on Form 1019 within 30 days of the well completion with a plat or map showing location of the well. List OTC assigned county and lease number. [Reference Order No. 17867]

(43) **Form 1020A - Application for Certification for the Recycling, Reuse of Deleterious Substances:** Applicant shall file an original Form 1020A with necessary attachments with the Pollution Abatement Department. Form 1020A is filed prior to construction of facility or change of operator. [Reference 165:10-8-1 and/or 165:10-8-2]

(44) **Form 1021 - Application for Priority Hardship Classification:** The applicant shall file Form 1021 and the necessary attachments with the Technical Department for review prior to any hearing for priority one hardship classification. In addition, a formal application for hearing must be filed with the Court Clerk's Office of the Commission. [Reference 165:10-17-12]

(45) **Form 1021A - Application for limited deviation from the priority gas rules:** The applicant shall file Form 1021A and the necessary attachments with the Technical Department for review prior to any hearing for deviation from the priority gas rules. In addition, a formal application for hearing must be filed with the Court Clerk's Office of the Commission. [Reference 165:10-17-12]

(46) **Form 1022 - Application to flare or vent gas:** Operator shall file one copy of Form 1022 to the Technical Department of the Conservation Division listing OTC assigned county lease number. [Reference 165:10-3-15]

(47) **Form 1022A - Application to operate vacuum pump:** Operator shall file one copy of Form 1022A with the required attachments to the Technical Department of the Conservation Division. No filing fee will be required for application to operate a vacuum pump. Notice requirements as set out in OAC 165:5-7-25 shall apply. [Reference 165:10-3-31]

(48) **Form 1023 - Application for multiple completion, multichoke assembly or commingle completion:** Operator will file the original and four copies

of Form 1023 with the required attachments. List OTC assigned county and lease number. [Reference 165:10-3-35; 165:10-3-39; 165:10-3-37]

(49) **Form 1024 - Packer setting affidavit:** Operator will submit Form 1024 as required. [Reference 165:10-3-35 and pertinent field rules]

(50) **Form 1025 - Packer leakage test:** Operator will submit Form 1025 as required. [Reference 165:10-3-35 and pertinent field rules]

(51) **Form 1027 - Bottom hole pressure test:** Operator, on the pink sheet of Form 1027, shall take BHP tests in the manner and during periods prescribed by special field rules. List OTC assigned county and lease numbers. [Reference Special Field Rules and 165:10-13-3]

(52) **Form 1028 - Application for discovery oil allowable:** Operator shall file Form 1028 with the required exhibits and tests within 30 days of completion of each new well in a discovery oil pool. [Reference 165:10-15-7]

(53) **Form 1029A - Production or potential test - oil only:** Operator of each newly completed oil well shall file a potential test Form 1029A not later than 30 days after completion of the well. All tests, if requested, shall be witnessed by another operator.

(54) **Form 1030 - Application for allowable adjustment:** Each operator or other interested parties desiring to adjust the allowable for a well or wells shall file Form 1030 for administrative review and approval. The allowable may be increased, decreased, or transferred as the evidence may indicate for the most efficient rate of production from the well or wells. [Reference 165:10-13-5, 165:10-13-8, 165:10-15-18 and 165:5-7-12]

(55) **Form 1034 - Nominations and purchasers report:** [Reference 165:10-1-49]

(A) **Oil:** Purchasers will furnish nomination data, actual runs from leases, stocks, and other information on Form 1034 to the Conservation Division not later than noon Friday of the week preceding each scheduled market demand hearing. On months in which no market demand hearing is held, Form 1034 shall be filed by the 20th of the month listing crude oil runs for the previous month on line 5 only. Any change in nominations from the previous hearing shall be so indicated on this monthly report.

(B) **Gas:** Purchasers shall file their nominations by letter for wells in special allocated pools no later than one week prior to the market demand hearing.

(56) **Form 1040 - Monthly allocation schedule (gas):** Monthly gas schedule Form 1040 will be forwarded to operators by the Conservation Division indicating the status of special allocated gas wells and their current allowables. Operators will inform the Conservation Division of errors, if any, found in Form 1040 as promptly as possible. Additionally, purchasers will receive the monthly schedule and shall return the production from each well as requested. [Reference 165:10-1-47]

(57) **Form 1062 - Field Operations Inspection Report:** IN-HOUSE USE ONLY.

(58) **Form 1070 - Inventory of authorized existing enhanced recovery wells:** Operators shall file reporting Form 1070 before injecting into any enhanced recovery well. [Reference 165:10-5-3]

(59) **Form 1071 - Inventory of authorized existing disposal wells:** Operators shall file the reporting Form 1071 before disposing into any disposal well. [Reference 165:10-5-3]

(60) **Form 1072 - Notice of (commencement) (termination) of injection:** Within 30 days of either the commencement or termination of injection Form 1072 must be filed. Failure to file Form 1072 within 18 months from the date of authorization results in termination of the Commission order. [Reference 165:10-5-7]

(61) **Form 1073 - Notice of transfer of well operatorship:** The new operator shall file Form 1073 to notify the Conservation Division of any change of operation or purchaser of any oil, gas injection, disposal, or enhanced recovery injection well within 30 days after transfer of the well. [Reference 165:10-5-10 and 165:10-1-15]

(62) **Form 1073I - Notice of transfer of well operatorship:** The new operator shall file Form 1073I to notify the Underground Injection Control Section of any change of operation of any injection, disposal, or enhanced

recovery injection well within 30 days after transfer of the well. [Reference 165:10-5-10 and 165:10-1-15]

(63) **Form 1075 - Mechanical integrity pressure test:** A pressure or monitoring test must be performed on new and existing enhanced recovery injection wells and disposal wells. Information must be submitted on Form 1075 and witnessed by a Field Inspector. Forms shall be submitted to the Conservation Division's Underground Injection Control Department. [Reference 165:10-5-6]

(64) **Form 1081 - Mineral owners escrow account:** Operator shall file, in quadruplicate, Form 1081 annually on anniversary date of first pooling order issued after effective date of Senate Bill 299 (7-1-84) and shall include all applicable orders issued during the twelve-month reporting period. [Reference 165:10-25-1 through 165:10-25-10]

(65) **Form 1085 - Complaint report:** Form 1085 is used by Commission personnel to report violations of General Rules of the Commission to report progress on ongoing remedial actions. Copies are sent to all parties concerned with investigation. Form 1085 combines and replaces old Forms 1034 and 1062. [Reference 165:10-7-7]

(66) **Form 1139 - Application for gross production tax exemption:** Operators shall file one copy of Form 1139 with the required attachments to the Technical Department of the Conservation Division. [Reference 165:10-21-75 through 165:10-21-80]

(67) **Form 1534 - Application for tax rebate:** Operators shall file one original of Form 1534 with the required attachments to the Technical Department of the Conservation Division. To obtain the tax exemption of the gross production tax, the operator shall forward a copy of the Commission order to the Oklahoma Tax Commission, together with any other data required by that agency. [OTC Rule 10.030.03] [Reference 165:10-21-23, 165:10-21-37, 165:10-21-47, 165:10-21-57, 165:10-21-67 and 165:10-21-82.2]

(68) **Form 1535 - Application for classification of reservoir dewatering project for exemption of sales tax on electricity used for such operations:** Operators shall file one original of Form 1535 with the required attachments to the Technical Department of the Conservation Division. To obtain the exemption of sales tax on the sale of electricity and associated delivery and transmission used for reservoir dewatering operations, the operator shall contact the Director's Office, Taxpayer Assistance Division, Oklahoma Tax Commission, 2501 N. Lincoln Blvd., Oklahoma City, Ok. 73194. [Reference 165:10-21-83, 165:10-21-83.1 and 165:10-21-83.2]

PART 3. SURETY

165:10-1-10. Operator's agreement; Category A and Category B surety

(a) "Any person who drills or operates any well for the exploration, development or production of oil or gas, or as an injection or disposal well, within this State, shall furnish in writing, on forms approved by the Corporation Commission, his agreement to drill, operate and plug wells in compliance with the rules and regulations of the Commission and the laws of this state, together with evidence of financial ability to comply with the requirements for plugging, closure of surface impoundments, removal of trash and equipment as established by the rules of the Commission and by law." [52 O.S. § 318.1] Any operator violating this Section shall be fined $500.00. To establish evidence of financial ability, the Commission shall require:

(1) Category A surety which shall include a financial statement listing assets and liabilities and including a general release that the information may be verified with banks and other financial institutions. The statement shall prove a net worth of not less than $50,000.00 in U.S. dollars; or

(2) Category B surety shall include an irrevocable commercial letter of credit, cash, a cashier's check, a certificate of deposit, bank joint custody receipt, other approved negotiable instrument, or a blanket surety bond. Except as provided in (3) of this subsection, the amount of such Category B surety shall be in the amount of $25,000.00 in U.S. dollars but may be set higher at the discretion of the Director of the Conservation Division. The Commission is authorized to establish Category B surety in an amount greater than $25,000.00 in U.S. dollars based upon the past performance of the operator and its insiders and affiliates regarding compliance with the laws of this state, and compliance with any rules promulgated thereto including but not limited to the drilling, operation and plugging of wells, closure of surface impoundments, or removal of trash and equipment. Any such Category B surety shall constitute an unconditional promise to pay and be in a form negotiable by the Commission.
(3) The Commission may grant Category B surety in an amount less than $25,000.00 in U.S. dollars to an operator whose statewide well plugging liability is less than $25,000.00 in U.S. dollars. Said Category B surety shall be in an amount that is sufficient to cover the total estimated cost of properly plugging and abandoning each and every well, the operations for which, an operator is responsible. Statewide well plugging liability shall be documented by an affidavit filed on Form 1006D and shall be properly executed by a duly licensed pipe pulling and well plugging company and shall be approved by the Conservation Division. Said affidavit shall state, among other things, an estimated cost of plugging, closure, and removal operations for each well in accordance with 165:10-11-3 through 165:10-11-8 inclusively and shall be accompanied by a Form 1000 (Intent to Drill) if the estimate involves a proposed well or by a Form 1002A (Completion Report) if the estimate involves a well that is a producing, injection, or disposal well. The estimated cost shall not include any salvage value as to recoverable casing, tubing, or well head equipment. The total statewide well plugging liability of an operator utilizing this Category B surety shall be kept current and shall be increased as additional wells are added to the responsibility of the operator and may be decreased as included wells are plugged and abandoned, but in no event shall exceed $25,000.00 in U.S. dollars unless otherwise ordered by the Commission.
(b) Operators of record as of June 7, 1989, who do not have any outstanding contempt citations or fines and whose insiders or affiliates have no outstanding contempt citations or fines may post Category A surety.
(1) New operators, operators who have outstanding fines or contempt citations and operators whose insiders or affiliates have outstanding contempt citations or fines as of June 7, 1989, shall be required to post Category B surety. Operators who have posted Category B surety and have operated under this type surety and have no outstanding fines at the end of three years may post Category A surety.
(2) Operators using Category A surety who are assessed a fine of $2,000.00 or more and who do not pay the fine within the specified time shall be required to post a Category B surety within 30 days of notification by the Commission.
(c) If a bond is required, the bond shall be executed by a corporate surety authorized to do business in this State and shall be renewed and continued in effect until the conditions have been met or release of the bond is authorized by the Commission.
(d) Irrespective of (a), (b), and (c) of this Section, for good cause shown concerning pollution or improper plugging of wells by an operator posting either Category A or Category B surety or by an insider or affiliate of such operator, the Commission, upon application of the Director of the Conservation Division after notice and hearing, may require the filing of additional Category B surety in an amount greater than $25,000.00 in U.S. dollars but not to exceed $100,000.00 in U.S. dollars.
(e) The agreement (Form 1006B-Operator’s Agreement to Plug Oil, Gas and Service Wells Within the State of Oklahoma) provided for in (a) of this Section shall provide that if the Commission determines, after notice and hearing, that the person furnishing the agreement has neglected, failed, or refused to plug and abandon, or cause to be plugged and abandoned, or replug any well or has neglected, failed or refused to close any surface impoundment or remove or cause to be removed trash and equipment in compliance with the rules of this Chapter,

then the person shall forfeit from his bond, letter of credit, or negotiable instrument or shall pay to this State, through the Commission for deposit in the State Treasury, a sum equal to the cost of plugging the well, closure of any surface impoundment, or removal of trash and equipment. The Commission may cause the remedial work to be done, issuing a warrant in payment of the cost thereof drawn against the monies accruing in the State Treasury from the forfeiture or payment. Any monies accruing in the State Treasury by reason of a determination that there has been a noncompliance with the provisions of the agreement (Form 1006B) or the rules and regulations of the Commission, in excess of the cost of remedial action ordered by the Commission, shall be credited to the Conservation Fund. The Commission shall also recover any costs arising from litigation to enforce this provision if the Commission prevails. Provided, before a person is required to forfeit or pay any monies to the State pursuant to this Section, the Commission shall notify the person at his last-known address of the determination of neglect, failure, or refusal to plug or replug any well, or close any surface impoundment, or remove trash and equipment, and said person shall have ten days from the date of notification within which to commence remedial operations. Failure to commence remedial operations shall result in forfeiture or payment as provided in this subsection. If the operator is a corporation, association, partnership, limited liability company or any entity other than an individual, the operator shall file as part of its Form 1006B a complete list, in tabular form, of the names, addresses, telephone numbers, social security numbers or driver license numbers, and percentages of ownership of all officers, directors, partners or principals of the operator and the insiders and affiliates of the operator. The operator shall also file as part of its Form 1006B the current names and addresses of all service agents of the operator and the operator's insiders and affiliates. The operator is required to file a Form 1006B with the Conservation Division every twelve (12) months.

(f) No person shall drill or operate any well, or receive an allowable, without complying with the provisions of this Section.

(g) The Commission shall shut in, without notice, hearing or order of the Commission, the wells of any such person violating the provisions of this Section and such wells shall remain shut in for noncompliance until the required evidence of Category B surety is obtained and verified by the Commission. No taker, transporter, or purchaser of oil or gas shall take, transport, or purchase oil or gas from the wells of any such drillers or operators after receiving a copy of the shut-in order or notice by certified mail of the issuance of such an order.

(h) If title to property or a well is transferred, the transferee shall furnish the evidence of financial ability to plug the well and close surface impoundments required by the provisions of this section, prior to the transfer.

(i) The following words, when used in this Section, shall have the following meaning:

(1) "Affiliate" means an entity which owns twenty percent (20%) or more of the operator, or an entity of which twenty percent (20%) or more is owned by the operator.

(2) "Insider" means officer, director, or person in control of the operator; general partners of or in the operator; general or limited partnership in which the operator is a general partner; spouse of an officer, director, or person in control of the operator; spouse of a general partner of or in the operator; corporation of which the operator is a director, officer, or person in control; affiliate, or insider of an affiliate as if such affiliate were the operator; or managing agent of the operator.

165:10-1-11. Financial statement as surety

(a) A plugging agreement shall be accompanied by surety. The surety requirement may be met by furnishing the operator's current financial statement (Form 1006A) to the Conservation Division, which shall be a full statement of

the operator's assets and liabilities and shall reflect the operator's total net worth of not less than $50,000.00 in U.S. dollars located in this State.
(b) The value of producing oil and gas leaseholds for which the financial statement stands as surety will be deducted from total net worth unless the financial statement is accompanied by the written appraisal of a recognized independent appraiser of oil and gas properties showing the fair market value of the leasehold interest owned by the operator.
(c) The Director of Conservation may require proof in the form of an appraisal or other proof of the fair market value of any asset listed in the financial statement, and the Director of Conservation may also require proof that the financial statement truly shows the net fair market value of all assets over and above all debts and encumbrances.
(d) A current financial statement shall be filed every twelve (12) months on Form 1006A.
(e) Only one operator's name shall appear on each Form 1006A.
(f) Along with the Form 1006A, an operator is required to file a Form 1006B (Operator's Agreement to Plug Oil, Gas and Service Wells Within the State of Oklahoma) with the Conservation Division.
(g) The Commission shall reject the operator's Form 1006A if the operator fails to file the documentation required by this Section with the Conservation Division.

[SOURCE: Amended at 13 Ok Reg 2373, eff 7-1-96]

165:10-1-12. Corporate surety bond
(a) An operator may file a blanket surety bond in the principal amount of $25,000.00 in U.S. dollars on Form 1006 as surety. In the alternative, the operator may file a surety bond of a lesser amount but that is sufficient to cover the total estimated cost of properly plugging and abandoning each and every well, the operations for which, the operator is responsible. Said estimated cost shall be documented on Form 1006D (Affidavit of Well Plugging Cost) for each and every well. Said alternative surety bond shall be increased upward, but not to exceed $25,000.00 in U.S. dollars, as additional wells are added to the operator's responsibilities, unless otherwise ordered by the Commission.
(b) For purposes of (a) of this Section, an operator may file a surety bond issued by a corporation authorized to issue such bonds in the State of Oklahoma.
(c) The Conservation Division shall not accept a bond unless the surety agrees to give the Conservation Division six months written notice before cancellation of a bond prior to expiration of the bond and evidence furnished of acceptable alternate surety if required.
(d) Only one operator's name shall appear on each Form 1006.
(e) Along with the Form 1006, an operator is required to file a Form 1006B (Operator's Agreement to Plug Oil, Gas and Service Wells Within the State of Oklahoma) with the Conservation Division.
(f) The Commission shall reject the operator's Form 1006 if the operator fails to file the documentation required by this Section with the Conservation Division.

[SOURCE: Amended at 13 Ok Reg 2373, eff 7-1-96]

165:10-1-13. Irrevocable commercial letter of credit
(a) At his option, an operator may file an irrevocable commercial letter of credit of a bank in the sum of $25,000.00 in U.S. dollars on Form 1006C as surety. In the alternative, the operator may file an irrevocable commercial letter of credit of a lesser amount but that is sufficient to cover the total estimated cost of properly plugging and abandoning each and every well, the operations for which, the operator is responsible. Said estimated cost shall be documented on Form 1006D (Affidavit of Well Plugging Cost) for each and every well. Said alternative irrevocable commercial letter of credit shall be

increased upward, but not to exceed $25,000.00 in U.S. dollars, as additional wells are added to the operator's responsibilities, unless otherwise ordered by the Commission.
(b) The letter of credit shall be for a term of not less than one year.
(c) The bank issuing the letter of credit shall endorse thereon that the letter of credit shall remain in effect until canceled or revoked by the bank or principal/operator upon six months notice in writing to the Conservation Division and evidence furnished of acceptable alternate surety if required.
(d) Only one operator's name shall appear on each Form 1006C.
(e) Along with the Form 1006C, an operator is required to file a Form 1006B (Operator's Agreement to Plug Oil, Gas and Service Wells Within the State of Oklahoma) with the Conservation Division.
(f) The Commission shall reject the operator's Form 1006C if the operator fails to file the documentation required by this Section with the Conservation Division.

[SOURCE: Amended at 13 Ok Reg 2373, eff 7-1-96]

165:10-1-14. Cashier's check, certificate of deposit, or other negotiable instrument
(a) An operator may deposit cash, a cashier's check, a certificate of deposit, bank joint custody receipt, or other negotiable instrument in the amount of $25,000.00 in U.S. dollars as surety. In the alternative, the operator may deposit cash, a cashier's check, a certificate of deposit, bank joint custody receipt, or other negotiable instrument of a lesser amount but that is sufficient to cover the total estimated cost of properly plugging and abandoning each and every well, the operations for which, the operator is responsible. Said estimated cost shall be documented on Form 1006D (Affidavit of Well Plugging Cost) for each and every well. Said alternate amount shall be increased upward, but not to exceed $25,000.00 in U.S. dollars, as additional wells are added to the operator's responsibilities, unless otherwise ordered by the Commission. However, any instrument must constitute an unconditional promise to pay and be in the form negotiable by the Commission.
(b) A certificate of deposit shall be for a term of no less than three hundred sixty-five (365) days.
(c) Financial institutions issuing certificates of deposit pursuant to this Section shall do so in the following manner: **"Oklahoma Corporation Commission or Oklahoma Corporation Commission and (Name of the Operator)."** Financial institutions issuing the certificates of deposit shall retain the original documents and copies of the certificates of deposit shall be furnished to the Commission.
(d) Along with the negotiable instruments described in (a) of this Section, an operator is required to file a Form 1006B (Operator's Agreement to Plug Oil, Gas and Service Wells Within the State of Oklahoma) with the Conservation Division.
(e) The Commission shall reject the negotiable instruments described in (a) of this Section if the operator fails to file the documentation required by this Section with the Conservation Division.

[SOURCE: Amended at 13 Ok Reg 2373, eff 7-1-96]

165:10-1-15. Transfer of operatorship of wells
(a) Before the operations of a well can be transferred to a new operator, the following must be submitted:
(1) The new operator, or transferee, must comply with 165:10-1-10 before a change in operator is approved.
(2) Change of operator Form 1073 must be signed by both the transferor and transferee, with both stipulating that the facts presented are true and correct as to the area covered and the wells being transferred. Unless otherwise stated, the new operator assumes all responsibility for the wells specified within the boundaries of the outlined area. For transfers

involving more than ten (10) wells, a transferor and transferee may file a single Form 1073 with the Conservation Division indicating the transfer of multiple wells, provided that such multiple well transfer shall be accompanied by a well list containing the following information regarding each well being transferred:

(A) API number of the well;

(B) Well name and number;

(C) Legal location of the well, described by section, township and range.

(3) The well list may be provided in spreadsheet form, if possible, and may be filed in digital format specified by the Conservation Division. In lieu of the spreadsheet, the transferor and transferee, at their option, may file one Form 1073 indicating the transfer of multiple wells with an OCC Form 1002A Completion Report attached for each well transferred. Upon review by the Conservation Division, it may require additional information from the transferor and/or the transferee to assist in identifying the specific well(s) being transferred. The additional information may include, but not be limited to, the quarter, quarter, quarter section calls, footages from the south and west quarter section lines, and the drilling and completion dates.

(4) The Conservation Division shall notify both the transferor and transferee of approval of the transfer of operatorship within thirty (30) days of the Conservation Division's approval of said transfer.

(5) Compliance with 165:5-7-11 when and if operatorship was designated by orders of the Commission in pooling, increased density, and location exception applications.

(b) Before the operatorship of a well can be transferred to a new operator when the current or former operator is unavailable for signature, one of the following may be submitted as proof of operatorship:

(1) A certified copy of a recorded lease or assignment transferring all rights, title, and interest to the wells described on Form 1073 to the new operator.

(2) A certified copy of a journal entry of judgment rendered by a district court of Oklahoma having jurisdiction over the wells described on Form 1073 vesting legal title to the new operator.

(3) A certified copy of bankruptcy proceeding by the federal district court having jurisdiction over the wells described on Form 1073.

(c) If an operator is not in compliance with an enforceable order of the Commission, the Conservation Division shall not approve any Form 1073 transferring well(s) to said operator until the operator complies with the order. The transferor of the well(s) listed on the Form 1073 remains responsible for the well(s) until any transfer is approved by the Commission.

165:10-1-16. Change of address

Each operator of a well or other facility subject to a permit shall give written notice of his change of address. Such notice shall be sent to the Director of the Conservation Division. It shall be due within 30 days after changing address.

PART 5. SPACING

165:10-1-20. Spacing [RESERVED]

165:10-1-21. General well spacing requirements

Any well drilled for oil or gas to an unspaced common source of supply 2,500 feet or more in depth shall be located not less than 330 feet from any property line or lease line, and shall be located not less than 600 feet from any other producible or drilling oil or gas well when drilling to the same common source of supply; provided and except that in drilling to an unspaced common source of supply that is less than 2,500 feet in depth, the well shall be located not less than 165 feet from any property line or lease line and not less than 300 feet from any other producible or drilling oil or gas well in the same common source of supply; provided, however, that the completed depth of the discovery well shall be recognized as the depth of the common source of supply for the purpose of this Section; provided further, when an exception to this Section is granted, the Commission may adjust the allowable or take such other action as it deems necessary for the prevention of waste and protection of correlative rights.

165:10-1-22. Drilling and spacing units

(a) The Commission may establish drilling and spacing units in any common source of supply as provided by law, and the special orders creating drilling and spacing units shall supersede the provisions of 165:10-1-21. It shall be the responsibility of any operator who proposes to drill a well to ascertain the existence and provisions of special spacing orders.
(b) The drilling of a well or wells into a common source of supply in an area covered by an application pending before the Commission seeking the establishment of drilling and spacing units is prohibited except by special order of the Commission. However, if an Intent to Drill (Form 1000) has been approved by the Commission and operations commenced prior to the filing of a spacing application, the operator shall be permitted to drill and complete the well without a special order of the Commission.
(c) Standard drilling and spacing units shall be either approximately square or rectangular; if rectangular, the drilling and spacing unit shall consist of two approximately square tracts.
(d) Standard square drilling and spacing units shall be those containing approximately 10, 40, 160, or 640 acres; standard rectangular units shall contain approximately 20, 80, or 320 acres.
(e) The drilling and spacing units within any common source of supply of oil or gas shall be of approximately uniform size and shape. In a combination reservoir, the drilling and spacing units within the oil portion of the reservoir shall be of approximately uniform size and shape, and the drilling and spacing units within the gas portion of the reservoir shall be of approximately uniform size and shape; provided, however, the drilling and spacing units within the gas portion of a combination reservoir along the gas-oil contact line or transition zone may be of nonuniform size and shape.

[**SOURCE:** Amended at 9 Ok Reg 2337, eff 6-25-92]

165:10-1-23. Extension of pool rules

(a) Any application to establish pool rules for a common source of supply shall include the entire common source of supply.
(b) To extend pool rules to a drilling and spacing unit, an application shall be filed and notice provided in the same manner as required to establish pool rules. In the event that more than one set of pool rules are in effect within a field, the Commission shall extend the appropriate pool rules consistent with available geological and engineering reservoir information.

165:10-1-24. Permitted well locations within standard drilling and spacing units

(a) The permitted well location within any standard square drilling and spacing unit shall be the center of the unit. The permitted well locations within standard rectangular drilling and spacing units shall be the centers of alternate square tracts constituting the units (alternate halves of the units);

provided, however, a well will be deemed drilled at the permitted location if drilled within the following tolerance areas:

(1) Not less than 165 feet from the boundary of any standard 10-acre drilling and spacing unit or the proper square 10-acre tract within any standard 20-acre drilling and spacing unit.

(2) Not less than 330 feet from the boundary of any standard 40-acre drilling and spacing unit or the proper square 40-acre tract within any standard 80-acre drilling and spacing unit.

(3) Not less than 660-feet from the boundary of any standard 160-acre drilling and spacing unit or the proper square 160-acre tract within any standard 320-acre drilling and spacing unit.

(4) Not less than 1320 feet from the boundary of any standard 640-acre drilling and spacing unit.

(b) The proper square tract of a rectangular drilling and spacing unit established prior to January 1, 1971, for which a slot drilling pattern was prescribed, shall be the northeast quarter and the southwest quarter of the governmental section, quarter section, or quarter quarter section containing two abutting rectangular drilling and spacing units; provided, slot patterns may be established or re-established upon application, notice, and hearing where consistent with available geological and engineering information when necessary to prevent waste or protect correlative rights.

(c) The permitted well location tolerance areas set out in (a) of this Section shall apply to each standard drilling and spacing unit heretofore or hereafter established, notwithstanding the provisions of any special order of the Commission prescribing a different permitted well location tolerance area; provided, however, this Section shall not affect any adjusted allowable or penalty applied to any well by special order of the Commission prior to the effective date of this Section, nor shall any well heretofore drilled within a then permitted tolerance area be deemed outside the permitted tolerance area by reason of this Section.

(d) Wells drilled offpattern without first obtaining an exception after notice and hearing by the Commission are hereby prohibited from producing either oil or gas.

(e) Whenever permission is granted to drill a well at a location other than specified in this Chapter, the allowable or production therefrom, or both, may be adjusted for the protection of the correlative rights of all persons entitled to share in the common source of supply.

(f) Unless the order granting a well location exception provides otherwise, the permission to drill the well at the excepted location shall expire twelve (12) months after the date of the order, unless a well was commenced at the excepted location on or before the expiration date. The order granting the well location exception will thereafter expire when the well is plugged, abandoned, or converted.

(g) An application for an emergency order granting a well location exception may be granted if the applicant has obtained the written consent of the operator of each adjoining or cornering tract of land or drilling and spacing unit, currently producing from the same formation, toward which the well location is proposed to be moved. Provided, however, if the applicant is the operator of the well in an adjoining or cornering tract of land or drilling and spacing unit, currently producing from the same formation, toward which the well location is proposed to be moved, the applicant shall obtain the written consent of each working interest owner in such well.

(1) Letters evidencing the written consent of off-set operators and working interest parties as described in this subsection shall be introduced and received into evidence at the time of the emergency hearing and reviewed. Copies of said letters shall be filed with the Court Clerk of the Commission.

(2) If the written consent described in this subsection cannot be obtained, the applicant may send written notice to said non-consenting party giving that party at least five days notice of the emergency hearing. If said non-consenting party fails to appear, then the emergency application shall be considered and may be granted without the non-consenting party's written consent. The applicant shall file an affidavit of mailing with the Court Clerk to prove the mailing of the five day notice.

(h) If a spacing application is currently pending and the applicant or any party who owns the right to drill needs to commence a well prior to issuance of the spacing order, the applicant or party shall obtain an emergency order to commence such well and an emergency location exception order if:

(1) The proposed well is offpattern according to the existing spacing for any formation involved, or

(2) The well is offpattern according to 165:10-1-21 governing well patterns for unspaced areas.

(i) Whenever an order permits an offpattern well, the order permitting said well may provide, at the request of a party of record in the cause, for said party to have the right, at his sole cost and risk, to attend and monitor the initial potential testing and all subsequent annual testing of the proposed offpattern well. If the order permits witnessing of tests as prescribed above, then the order shall further provide that at least five days prior to the initial potential testing and each subsequent annual testing of the proposed well, the operator of the well shall notify, in writing, all parties of record in the cause who requested to attend and monitor these tests of the date and time upon which said testing shall commence.

165:10-1-25. Replacement well

(a) Approval by the Conservation Division of a Notice of Intent to Drill (Form 1000) for a second well to be drilled in a common source of supply in a single drilling and spacing unit as a replacement well may be permitted when:

(1) The replacement well is to be drilled at a location permitted for the common source of supply by either an order or rule of the Commission; and

(2) The operator of the replacement well is either the operator or a working interest owner in the original unit well; and

(3) The Notice of Intent to Drill for the replacement well is accompanied by an affidavit from the operator, stating that on completion of the second well as a commercial producer, the common source of supply in the first well shall be plugged off immediately. The affidavit shall be attached to Notice of Intent to Drill.

(b) A replacement well shall not receive an allowable to produce oil or gas from the same common source of supply as the first well until:

(1) Said common source of supply in the original well in the drilling and spacing unit is plugged off; or

(2) The Commission issues an order authorizing the replacement well as an increased density well for said common source of supply; or

(3) The Commission issues an order reforming the drilling and spacing units in said common source of supply thereby placing the original well and the replacement well in different drilling and spacing units for the common source of supply.

165:10-1-26. Permitted producing well location within an enhanced recovery project

Any well drilled for or used for the production of oil or gas within any enhanced recovery project shall be located not less than 165 feet from the lease or project line, whichever is the outside boundary.

165:10-1-27. Increased density well

Upon application after notice and hearing, the Commission may issue an order permitting one or more additional wells within a drilling and spacing unit, if each additional well will prevent or assist in preventing the various types of waste prohibited by statute or if each additional well will protect or assist in protecting the correlative rights of interest owners in said common source of supply.

165:10-1-28. Geological correlation chart

The chart initially prepared by Phillips Petroleum and maintained by the Oklahoma City Geologic Society entitled "Geologic Section of Oklahoma and Northern Arkansas", along with ensuing revisions, shall be used as a guideline for stratigraphic nomenclature in all oil and gas conservation applications which are submitted to the Commission.

PART 7. MARKET DEMAND

165:10-1-35. Market demand [RESERVED]

165:10-1-36. Regulation, classification, and naming of pools

(a) When the Commission finds, upon notice and hearing, that oil or gas production from any source of supply exceeds the current market demand therefor or finds that the operation of the reservoir should be regulated in order to prevent waste, increase ultimate recovery, or protect correlative rights, the Commission shall thereupon promulgate appropriate pool rules to accomplish such objectives. Where any of the above findings are made by the Commission, the total production from the pool may be restricted and equitable allocation made to the various wells located therein, or the operation of the reservoir may be otherwise regulated and controlled to insure proper and adequate conservation.
(b) Any pool may be classified or reclassified by the Commission, upon hearing, as an oil pool, gas pool, combination pool, or condensate pool. All pool rules so promulgated shall be based on operating and technical data and shall be consistent with the characteristics attributable to each classification.
(c) All oil and gas pools in the State shall be named by the Commission.

165:10-1-37. Determination of market demand

(a) The Commission shall instruct the Director of Conservation to determine the reasonable market demand for oil, gas, and other hydrocarbon products produced in Oklahoma for consumption in and outside the State for the ensuing proration period(s) that can be produced from each common source of supply on a statewide basis without avoidable waste and with equitable participation in production and markets by all operators and other interested parties.
(b) Waste, in addition to its statutory and ordinary meaning, shall include but not be restricted to economic waste, underground waste, surface waste, and waste incident to the production of oil and gas in excess of the transportation or marketing facilities or reasonable market demand.
(c) Reasonable market demand shall include, but not be restricted to, the demand for oil, gas, and other hydrocarbons for reasonable current requirements for current consumption and use within and outside the State, with such adjustment as may be necessary upward or downward to maintain adequate aboveground stocks of crude oil and its products and underground stocks of natural gas, so as to provide a continuous supply of petroleum products to the consumer and essential strategic supplies for national defense.
(d) In determining the reasonable market demand, the Commission may consider:
  (1) Any statement communicated to the Commission by any purchaser or taker of oil and gas, stating the amount of oil or gas produced from common sources of supply that such purchaser or taker contemplates or intends to purchase during the period of time involved; or in lieu thereof, the capacity of the purchaser's transportation or marketing facilities which will be, during the time involved, available for transporting and/or marketing the oil or gas that may be produced from common sources of supply.
  (2) Official records, reports, and statistical information compiled and kept by the Conservation Division that can be utilized in determining reasonable market demand.
  (3) Reports, facts, and materials by the Bureau of Mines or any other recognized authority that impartially reflects reasonable market demand.

(4) Sworn or unsworn statements of interested parties and any other evidence which the Commission may deem relevant to the determination of reasonable market demand.

(e) For purposes of periodic market demand hearings, the Manager of Production and Proration for the Conservation Division shall prepare exhibits summarizing the nominations from the various interested parties specified in (d) in this Section. Said exhibits shall be available for public inspection not less than five days before the hearing. At the time of hearing, if no one announces any objection to the introduction of said exhibits, then the exhibits shall be admitted into evidence without need for sponsoring testimony.

(f) After the Commission has determined the amount of oil or gas to be produced from all oil and/or gas pools during the following proration period, the amount so determined will be allocated ratably and without discrimination among the various pools within the State.

PART 9. PURCHASERS AND TRANSPORTERS

165:10-1-45. Purchasers and transporters [RESERVED]

165:10-1-46. Reports of purchasers and/or transporters

Purchasers and/or transporters of oil, waste oil, or waste oil residue, including truckers, shall file reports with the Commission as follows:

(1) On or before the last day of the succeeding month, transporters shall file a report showing monthly takings by barrels from leases in all pools in the State, other than wells or leases as specified in (2), (3), (4), and (5) of this Section; a copy of the Gross Production Tax Report made to the Oklahoma Tax Commission will satisfy this requirement.

(2) A report on computer generated Form 1005 showing monthly takings by barrels from leases or wells with capacities greater than the maximum allowable determined by the appropriate rule governing the classification of the oil pool or order of the Commission. The report shall be filed on or before the last day of the succeeding month.

(3) Upon request, storage and nomination information shall be filed on Form 1034.

(4) All truck transporters hauling crude oil shall file a report showing the amount of all crude oil taken by them during the preceding proration period, and showing the source and the disposition of the crude oil, waste oil, or waste oil residue. The report shall be filed on or before the last day of the succeeding month.

(5) All truck transporters hauling crude shall provide their drivers with copies of standard run tickets which must be in the possession of the drivers at all times and which run tickets shall show the source and the disposition of crude oil, including but not limited to waste oil or waste oil residue.

165:10-1-47. Gas volume reports to Conservation Division

(a) On or before the last day of the succeeding month, the person responsible for operating the required meter under 165:10-17-5 for each well classified as an unallocated gas well for allowable purposes shall report to the Conservation Division on Form 1004 the amount of gas in MCF which passed through the meter on a monthly basis.

(b) If a well classified as a gas well for allowable purposes is subject to special pool rules other than the Guymon-Hugoton or South Guymon Fields, the Conservation Division shall mail Form 1005 (Monthly Allocated Schedule) to the operator of record for each such well(s) on or before the 15th day of each month. The operator of record shall, in turn, complete said form by listing the gas volume sold on a monthly basis in MCF by well and return a copy to the

Conservation Division on or before the last day of the month succeeding the sales.
(c) If a well classified as a gas well for allowable purposes is subject to the special pool rules for the Guymon-Hugoton or South Guymon Fields, the Conservation Division shall mail Form 1005 (Monthly Allocated Schedule) to the operator of record for each such well(s) on or before the tenth day of each month. The operator of record shall, in turn, complete said form by listing the gas volume sold, including gas bought by the landowner, on a monthly basis in MCF by well and return a copy to the Conservation Division on or before the 15th day of the month succeeding the sales.
(d) If there is a split connection at the well site, then the operator of record measuring gas volumes shall be responsible for reporting the total volume sold for each well.
(e) If a well classified as a gas well for allowable purposes is subject to special pool rules (including the Guymon-Hugoton Field), the Conservation Division shall mail Form 1040 to each operator on or before the tenth day of the second succeeding month following the custody transfer indicating the reported volume of gas taken from each well.
(f) If a well classified as a gas well for allowable purposes is subject to multiple gas purchase contracts or interest owners taking their gas in kind, the producing owner shall report and account to the well operator all volumes sold and the identity of all purchasers on or before the last day of the following month after sale of such gas. The operator(s) of the required meter(s) under 165:10-17-5 shall report and account to the well operator all volumes of gas measured by such meter(s) on or before the last day of the following month after measurement. Failure to comply with this subsection will result in such gas production being ordered shut-in.
(g) Failure of an operator to timely file sales volumes on Form 1005 shall result in a zero allowable being assigned to the operator's wells for the month in which the sales volumes would have been used in calculating the field allowable. Allocation factors for a pool shall not be recalculated as a result of the filing of a late Form 1005.

[**Source:** Amended at 12 Ok Reg 2017, eff 7-1-95]

165:10-1-48. Common purchaser and carrier rules
(a) 52 O.S., l961, Sections 54, 55, 56, and 240 are hereby adopted as common purchaser and common carrier rules as fully as if set out verbatim herein.
(b) No person shall purchase, take, or transport any oil or gas in excess of the allowable fixed by the Commission, or, when notified by the Conservation Division, such oil or gas being produced in violation of any rule, regulation, or order of the Commission; provided, this Section shall not require splitting a tank.

165:10-1-49. Filing of nominations
(a) All purchasers, buyers, and takers of crude oil in Oklahoma shall file their nominations for purchases of crude oil from wells in allocated pools, unallocated pools, and enhanced oil recovery pools with the Conservation Division on Form 1034-0 not later than noon Friday of the week preceding the regularly scheduled market demand hearing.
(b) All operators of natural gas wells in special allocated gas pools shall file their pool nominations on Form 1034-G not later than one week prior to the date of the market demand hearing.
(1) Nominations shall be restricted to the volume not to exceed the wellhead absolute open flow (WHAOF) times calendar days for each well in a pool. For wells in pools where the WHAOF is not utilized, the equivalent well deliverability or calculated rate of flow applicable to that particular pool may be used in lieu of the WHAOF. For wells exempt from testing, nominations shall be restricted to a volume not to exceed the well's minimum, double minimum, or special allowable time calendar days.

(2) Operators shall attach to Form 1034-G a listing of each of their special allocated wells by pool, OTC Lease Number, API Number, well name and number, and location as recorded on Form 1040, plus the applicable WHAOF, deliverability, or rate of flow value as determined by the appropriate well test for that time period. Wells exempt from testing shall be indicated as test-exempt on the list.

(3) Failure of an operator to properly file nominations on Form 1034-G shall result in a zero allowable being assigned to the operator's wells for the month in which the nominations would have been used in calculating the field allowable. Allocation factors for a pool shall not be recalculated as a result of the filing of a late Form 1034-G.

SUBCHAPTER 3. DRILLING, DEVELOPING, AND PRODUCING

PART 1. DRILLING

Section

PART 3. COMPLETIONS

PART 5. OPERATIONS

PART 7. PRODUCTION

[BLANK PAGE]

PART 1. DRILLING

165:10-3-1. Required approval of notice of intent to drill, deepen, re-enter, or recomplete; Permit to Drill

(a) **Permit to Drill.**

(1) Except as provided in (1) of this Section, on temporary authorization to commence, the operator shall obtain for the well a Permit to Drill approved by the Conservation Division before:

(A) Spudding a well for the exploration for and production of oil or gas.

(B) Spudding a well for use as an injection, disposal, or service well.

(C) Re-entry into a plugged well.

(D) Recompletion of a well.

(2) A Permit to Drill shall be valid only for each common source of supply listed on the permit.

(3) Any operator who drills, deepens or reenters a well without a permit to drill shall be subject to a fine of $1,000.00.

(b) **Amended or additional Form 1000 requirements.**

(1) **When required.** If the Conservation Division has issued a Permit to Drill for a well, the operator of the well shall submit an amended Form 1000 for the well and obtain an amended Permit to Drill before:

(A) Completing the well in a common source of supply which is not listed on the current unexpired Permit to Drill for the well.

(B) Recompleting the well in a common source of supply which is not listed on the current unexpired Permit to Drill for the well.

(C) Installing less surface casing than the amount approved on the unexpired Permit to Drill for the well.

(D) Deviating from an alternative casing and cementing procedure which the Conservation Division approved on the unexpired Permit to Drill for the well.

(E) Completing a well in a common source of supply at a subsurface location which does not correspond with the surface location on the most recently issued Permit to Drill for the well.

(2) **Effect of amended or additional Permit to Drill on prior Permit to Drill.** Each approved, amended, or additional Permit to Drill for a well cancels any previously issued Permit to Drill for the well.

(c) **Expired or revoked Permit to Drill.** If a Permit to Drill for a well expires or is revoked, the operator shall be subject to the requirements of (a) of this Section.

(d) **Casing and cementing requirements.** Each Permit to Drill shall list the minimum amount of surface casing to be used or an approved alternative casing and cementing program under 165:10-3-4.

(e) **Spud report and well spacing requirements.** In addition to complying with the requirement of obtaining a Permit to Drill, the operator shall comply with the following:

(1) The spud report requirement of 165:10-3-2.

(2) Any well spacing requirements applicable by order or rule of the Commission. Well spacing requirements do not apply to injection or disposal wells.

(f) **Disposal of drilling fluids.**

(1) The operator shall indicate on Form 1000 the proposed method(s) for disposal of drilling fluids. These methods shall include, but not be limited to:

(A) Evaporation/dewatering and leveling of the reserve pit.

(B) Soil farming.

(C) Recycling.

(D) Commercial off-site earthen pit disposal.

(E) Annular injection.

(F) Hauling to a facility or location other than a commercial earthen pit.

(2) If the method in (1)(F) in this subsection is used, the operator shall provide the location to which the drilling fluids are to be hauled.

(3) Issuance of the Permit to Drill shall not be construed as constituting approval of the disposal method(s) indicated. An operator who desires to

dispose of drilling fluids through either evaporation/dewatering and leveling of the reserve pit, soil farming, commercial earthen pit disposal, or annular injection must comply with 165:10-7-16, 165:10-7-19 or 165:10-9-2, 165:10-9-1, or 165:10-5-13 respectively.

(4) If the proposed method for drilling fluid disposal is changed, the operator shall notify the appropriate District Office of the Conservation Division, either by telephone or in writing, within a reasonable time after the change. An amended Form 1000 for the well shall not be required for a change in disposal method.

(g) **Notice to surface owners.**

(1) The operator shall include on each Form 1000 submitted to the Conservation Division, the name and address of each surface owner of record for the wellsite.

(2) For each Permit to Drill other than a Permit to Drill for a recompletion, the Conservation Division shall mail by regular U.S. mail a copy of the Permit to Drill to each surface owner listed on the Form 1000.

(h) **Disapproval for noncompliance with Commission order.** If an operator is not in compliance with an enforceable order of the Commission, the Conservation Division shall not issue any Permit to Drill for the operator, until the operator complies with the order.

(i) **Erroneous approval.** Erroneous issuance of a Permit to Drill shall not excuse noncompliance with any order or rule of the Commission.

(j) **Expiration.**

(1) **Six-month period.** Except as provided in (2) of this subsection for expiration after submission of a completion report, a permit to drill shall expire six months from the date of issuance, unless drilling operations are commenced and thereafter continued with due diligence to completion.

(2) **Six-month extension.** A six month extension may be granted without fee providing the Conservation Division staff determines that no material change of condition has occurred, if written request for such extension is received from the operator prior to the expiration of the original permit. Only one extension may be granted.

(3) **If Form 1002A is filed.** If the operator of the well submits to the Conservation Division a Completion Report (Form 1002A) for the well, the Permit to Drill for the well shall expire on the date the Completion Report is approved by the Conservation Division.

(k) **Posting of Permit to Drill at the wellsite.** During any activity subject to this Section, the operator shall maintain at the wellsite an original or legible copy of the Permit to Drill for inspection by Commission personnel.

(l) **Temporary authorization without approval of a Permit to Drill.** In an emergency, the Manager of the Technical Services Department of the Conservation Division may temporarily authorize commencement of activities without a Permit to Drill for a period up to five working days.

(m) **Limits of authority.** A Permit to Drill does not grant the operator authority to produce, inject or dispose without the required permits or allowable assignment.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-2. Notification of spudding of new well

(a) Except as provided in (c) of this Section, the operator of a new well shall file with the Conservation Division a Notice of Spudding of New Well on Form 1001A within 14 days after spudding of the well.

(b) For the purposes of (a) of this Section, spudding of a new well refers to:

(1) The first boring of the hole in the drilling of a well for the production of oil and gas or for the use as an injection or disposal well.

(2) Reentry into a previously plugged well for purposes of producing oil and gas or for use as an injection or disposal well.

(c) Filing of a Notice of Spudding of a New Well on Form 1001A shall not apply to:

(1) Any workover operation to deepen, plug-back, or recomplete.

(2) An unplugged hole spudded before January 9, 1986.
(3) Recompletion attempts in an unplugged hole for which a Notice of Spudding of New Well has been filed.

165:10-3-3. Surface and production casing
(a) Owners, operators, and drilling contractors shall comply with 165:10-3-4 and 165:10-5-2.
(b) In the event a rupture, break, or opening occurs in the surface or production casing, the owner, operator, or drilling contractor shall take immediate action to repair it and shall report the occurrence to the appropriate District Office or the Manager of Pollution Abatement.
(c) Any operator who fails to timely report a rupture, break, or opening in the surface casing shall be fined $1,000.00, and the well shall be shut down until it is repaired or plugged.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92]

165:10-3-4. Casing, cementing, wellhead equipment, and cementing reports
(a) **Scope.**
(1) This Section governs the following:
(A) Surface casing and cementing requirements.
(B) Alternate casing and cementing procedure used instead of adequate surface casing and cement.
(C) Minimum cementing and testing requirements for intermediate and production casing.
(D) Minimum valve and blowout preventer requirements.
(E) Cementing reports.
(2) This Section shall apply to the following:
(A) Wells drilled or reentered for the production of oil, gas or brine.
(B) Wells drilled or reentered for disposal of oilfield wastes.
(C) Wells drilled for enhanced recovery injection.
(D) Wells drilled in subsurface gas storage units created by order of the Commission.
(E) Other oilfield related service wells.
(b) **Effect on area rules.**
(1) If any area rules promulgated by order of the Commission require less casing and cement than required by this Section, then this Section shall supersede the area rules.
(2) If an applicable area rule promulgated by order of the Commission has more stringent casing and cementing requirements than what are required by this Section, the Conservation Division shall enforce the area rules.
(c) **Surface casing and cementing requirements for wells listed in (a)(2) of this Section:**
(1) **Minimum surface casing requirements.** Unless an alternate casing program is authorized by the Conservation Division or by an order of the Commission, suitable and sufficient surface casing shall be run and cemented from bottom to top with a minimum setting depth which is the greater of:
(A) Ninety feet below the surface, or
(B) Fifty feet below the base of treatable water.
(2) **Penalty for noncompliance.** An operator setting less than the required amount of surface casing or failing to remediate uncirculated cement before resuming operations shall be fined $5,000.00.
(3) **Exceptions to (c)(1).** Operators having wells producing hydrocarbons which were in compliance with the surface casing requirements at the time of completion shall not be required to comply with (1) of this subsection.
(4) **Well to be used for annular injection under 165:10-5-13.** If the operator intends to dispose of drilling or stimulation fluids by annular injection, then the operator shall comply with 165:10-5-13 which requires a surface casing string to be set not less than 200 feet below the base of treatable water, unless a Commission order provides otherwise.

(5) **Depth limitation on setting surface casing.** The well operator shall run and cement the surface casing string required by this subsection before drilling the well more than 250 feet below the base of treatable water, unless otherwise approved on the Permit to Drill.
(6) **Penalties.** Operators failing to obtain permission to drill a well more than 250 feet below the treatable water, or to obtain permission for an alternate casing and cementing procedure may be fined $2,500.00.
(7) **Cementing procedures.**
(A) **Approved methods.** Except as provided in (B) of this paragraph for bradenhead cementing, cement shall be run by either the tubing and pump method, the pump and plug method, or the displacement method.
(B) **Bradenhead cementing prohibited.** Bradenhead cementing is prohibited without written permission from the District Office of the Conservation Division.
(C) **Restrictions on stage cementing.**
(i) **Above 200 feet.** Running cement through small tubulars is permitted above 200 feet in depth without special permission.
(ii) **Below 200 feet.** Below 200 feet in depth, the operator shall obtain permission from the District Office of the Conservation Division before using small tubulars to run cement.
(D) **Steel casing required.** For purposes of the surface casing requirements of this Section, surface casing shall be oil field grade steel casing.
(E) **Witnessing of setting of surface casing.** The operator shall give at least 24 hours notice by telephone to the appropriate District Office or Field Inspector as to the time when surface casing will be run.
(F) **Minimum cement setup time.** The cement behind the surface casing shall set at least eight hours before further drilling.
(G) **Down-hole testing of surface casing and cement.** Before drilling the shoe of the surface casing, the operator shall test the surface casing using the procedure prescribed by (f) of this Section.
(H) **Failure to circulate cement or fall back of cement behind surface casing.**
(i) **Verifying the top of cement.** If no conductor string is set and the cement did not circulate to the surface or falls back more than five feet, the operator shall determine the top of the cement using a method approved by the District Manager or Field Inspector.
(ii) **Top of cement less than 200 feet from the surface.** If the top of the cement is found less than 200 feet from the surface, the operator may circulate cement to surface using small tubulars.
(iii) **Top of cement greater than 200 feet from the surface.** If a conductor string has been set and the cement has been found to be ten feet or more above the base of the conductor string, no corrective action is required. If no conductor string has been set and the top of the cement is greater than 200 feet from the surface, the operator shall perform a corrective cementing operation by circulating cement to the surface from a point 50 feet below the base of the treatable water or from the determined top of the cement, whichever is shallower. The District Manager or Field Inspector may grant permission to circulate cement through small tubulars.
(I) **Insufficient surface casing or mechanical failure.** Within 24 hours after discovery of a problem with the surface casing or cement, the operator shall notify the appropriate District Office of the Conservation Division by telephone of:
(i) Any mechanical failure of the surface casing or cement.
(ii) Discovery of a treatable water formation below the shoe of the surface casing.
(J) **Penalty.** An operator, failing to report a rupture, break, or opening in the surface casing, shall be fined $1,000.00 and the well shut down.
(K) **Notice.** The District Manager or Field Inspector shall be given at least 24 hours notice prior to any cementing operation in order that they may have the opportunity to witness.
(d) **Alternate casing and cementing procedures.**

(1) **Requirement of approval on the Permit to Drill.** Use of an alternative casing and cementing procedure instead of surface casing and cement required by (c) of this Section is prohibited without authorization on the Permit to Drill for the well.

(2) **Disapproval.** The Manager of Technical Department may not issue a permit for an alternate casing string and cementing procedure if one or more of the following conditions exist:

(A) The well will penetrate a known lost circulation zone.

(B) The treatable water bearing formation(s) will be endangered.

(C) The projected depth of the well is less than 100 feet from the top of any authorized secondary project or gas storage facility.

(3) **Applicability of other casing and cementing standards.** Alternate casing and cementing procedures under this subsection are subject to the provisions of (c)(7) of this Section.

(4) **Alternate casing and cementing procedure.**

(A) An operator having permission to run an alternate casing string may, for protection of the treatable water, drill the well to casing point and circulate cement to the surface, or circulate cement from a depth of 100 feet below the base of treatable water to the surface after following the procedures set out in (f) of this Section.

(B) Oil based drilling mud shall be prohibited.

(C) If a well is completed using an alternate casing and cementing procedure, a bond log covering the interval from 100 feet below the base of the treatable water to the surface shall be required. The District Manager may waive this requirement. A completion attempt, in cases where the protection of treatable water is questionable, is strictly prohibited.

(D) Unless extended by the District Manager, the operator shall have 72 hours after drilling and testing is completed to run production casing or plug the well. A minimum of 24 hours prior notice must be given to the appropriate District Office prior to cementing operations so that a Field Inspector may have the opportunity to witness the cementing or plugging procedures. If the well is plugged and abandoned, procedures set out in (e) of this Section shall be followed.

(E) In the event that casing is run and cement does not circulate to the surface, or falls back, the operator shall determine the top of the cement using a method approved by the District Manager.

(5) **Remedial actions.**

(A) If the top of the cement is less than 200 feet from the surface, the operator may circulate cement from that point to the surface using small tubulars or by perforating the casing at that point and circulating cement to the surface.

(B) If the top of the cement is greater in depth than 200 feet, the operator shall perforate the casing at the top of the cement and circulate cement to the surface, or with the written permission of the Field Inspector, use small tubulars.

(C) In the event that a conductor string had been set and the top of the cement is at least ten feet above the base of the conductor casing no remedial action is needed.

(D) Unless waived by the District Office, all corrective cementing operations shall be approved and witnessed by the Field Inspector.

(E) In wells where corrective actions were needed for casing or cementing problems, a completion attempt shall not be made without approval by the District Manager.

(e) **Permanent well marker.** In the event that the well is a dry hole and no casing has been run, then during the plugging of the well the operator shall run and cement from bottom to top at least one joint of casing at the surface not less than 25 feet in length for use as a permanent well marker. The casing used as a well marker shall be oil field grade steel casing with an outside diameter of at least seven inches. The top of the marker shall be three feet below the surface and be capped with a steel plate inscribed or embedded with the well number and date of plugging on the steel plate. An operator failing to run and cement the well marker as required shall be fined $1,000.00 and shall, under the supervision of the Commission, replug the well.

(f) **Minimum cement for additional casing strings.** If additional casing other than surface casing is run, except for temporary purposes, it shall be run, set, and cemented with a calculated volume of cement sufficient to fill the annular space behind the casing string from the base of the casing string to a minimum height which is the greater of five percent of the depth to which the casing string is set or a height of 200 feet. Wells approved for horizontal completion are exempt upon approval of the Conservation Division.
(g) **Pressure testing of casing strings.**
(1) Before drilling the cement plug in a casing string, the operator shall pressure test the installed casing for 30 minutes at a minimum pressure which is the lesser of the surface gauge pressure equal in pounds per square inch to 0.2 of the length of the casing in feet or 1500 psig.
(2) During the 30 minute test, if the surface pressure drops ten percent or more, the operator shall:
(A) Repair and retest the casing until the requirements of this subsection are met; or
(B) Plug the well according to the rules of this Chapter.
(h) **Minimum wellhead equipment for drilling wells.** Except in proven areas where less equipment is known to be adequate, every drilling well shall be equipped with a mastergate, or its equivalent, or an adequate blowout preventer. A flow line valve of proper size and working pressure shall be attached.
(i) **Cementing reports.**
(1) The operator of the well shall submit, attached to Form 1002A Completion Report, a Form 1002C Cementing Report describing all cementing operations on surface, intermediate, and production casing strings, including multistage cementing jobs.
(2) If additional cementing operations occur after submission of the Cementing Report, the operator shall submit an amended Form 1002C for the well.
(j) **Surface casing requirements for re-entry wells.** For a re-entry as defined by 165:10-1-2, casing and cementing requirements at the time of re-entry shall apply.
(k) **Surface casing requirement for recompletions.** For a recompletion as defined by 165:10-1-2, casing and cementing requirements applicable to wells commenced on the latter of the spud date or re-entry date for the well shall apply.
(l) **Casing and cementing requirements for wells converted for injection or disposal.** If a well is converted for use as an injection or disposal well, it shall be subject to the casing and cementing requirements of this Section effective at the time of conversion of the well.
(m) **Casing and cementing requirements for wells penetrating unitized common sources of supply.** Each newly drilled or re-entered well which penetrates a common source of supply in which enhanced recovery operations are being conducted shall be properly cased and cemented from not less than 100 feet below to not less than 100 feet above each unitized common source of supply to prevent migration of formation fluids and contain formation pressure. In the event the well is to be plugged without being cased, the well shall be properly cemented over the aforementioned interval(s) during plugging procedures.
(n) **Insufficient surface casing and cement.** When it has been determined that a treatable water-bearing formation has not been properly cased and cemented, the operator shall take such measures designated by the Director of Conservation or ordered by the Commission to protect any treatable water-bearing formation.

[**SOURCE:** Amended at 9 Ok Reg 2337, eff 6-25-92]

165:10-3-5. Underground storage

(a) **Scope.** This Section shall apply to all operations pertaining to the drilling, completion, recompletion, or remedial work on wells located within the boundaries of an underground storage facility as defined in (b)(4) of this Section.
(b) **Definitions.**

(1) "Underground storage" shall mean storage of natural gas in a subsurface stratum or formation of the earth.

(2) "Natural gas" shall mean gas either while in its natural state or after the same has been processed by removal therefrom of component parts not essential to its use for lights and fuel.

(3) "Storage operator" shall mean any person, firm, or corporation which operates an underground storage facility.

(4) "Underground storage facility" shall mean any subsurface stratum or formation of the earth used for underground storage. Provided that, in the case of a natural gas bearing subsurface stratum or formation, the commercially producible native gas shall have been substantially depleted and the gas therein shall not be used primarily for the secondary recovery of oil in paying quantities from the subsurface stratum or formation.

(5) "Well" means a well drilled or bored or to be drilled or bored within the boundaries of an underground storage facility.

(6) "Well operator" shall be the person, firm, or corporation that is the operator of a well.

(7) "Major remedial work" shall mean any workover operations requiring wire line or pump truck services.

(8) "Good quality cement" means that cement that would obtain a compressive strength to prevent oil, gas, or water migration within an eight (8) hour period.

(c) **Operational procedures.**

(1) Before spudding a well within the boundaries of a gas underground storage facility, the well operator shall mail a copy of the Permit to Drill to the storage operator at the address listed at the Commission. The storage operator will inform the well operator of the estimated depth, thickness, and pressure of the underground storage facility at that location. Failure of the storage operator to provide the data to the well operator shall not be a cause to delay drilling, but the well operator is required to notify the storage operator, by phone a minimum of 24 hours prior to commencing drilling operations at a 24 hour telephone number furnished to the Commission by the storage operator.

(2) A well operator shall comply with the provisions of 165:10-3-4(c). Alternate casing programs shall not be permitted.

(3) Drilling rigs shall be equipped with a blowout preventer. The preventer shall be installed and tested at least 500 psig above the anticipated underground storage facility pressure before drilling below the base of the surface casing.

(4) The storage operator shall receive drilling reports daily and shall be notified at a 24 hour telephone number furnished to the Commission by the storage operator in ample time to witness any tests or logging operations from the surface to 500 feet below the base of the underground storage facility. Any abnormal conditions occurring during the drilling operation, such as abnormal pressures and/or lost circulation, shall be reported immediately to the storage operator.

(5) The well operator shall drill the well in such a manner as to prevent invasion of drilling fluids into, or the escape of natural gas from, the underground storage facility. The well operator shall be required to mud up at least 100 feet above the anticipated depth of the underground storage facility.

(6) If run, a copy of either an open hole porosity or resistivity well log run from the base of surface casing to total depth shall be promptly forwarded to the storage operator. At the option of the well operator, the logs submitted to the storage operator may be terminated 500 feet below the base of the underground storage facility. The storage operator shall be given prior notice of logging operations of the underground storage facility interval and has the option of witnessing the open hole logging operation.

(7) In the event that the well is noncommercial and is to be plugged and abandoned, the well operator shall place a cement plug using a good quality cement, covering from not less than 100 feet below the base to not less than 100 feet above the top of the underground storage facility. The storage operator shall be given prior notice so as to have the option of witnessing

the plugging operation. The field inspector may invoke the provisions of 165:10-11-6 (l), (m), and (n).

(8) In the event that casing is run, the well operator will cause the underground storage facility interval to be covered with steel casing and be cemented from not less than 100 feet below the base to not less than 100 feet above the top of the underground storage facility using a good quality cement. The Commission field inspector for the area and storage operator shall be given prior notice so as to have the option of witnessing the operation.

(9) The well operator shall be required to run a cement bond log through the underground storage facility formation before any completion attempts are made. The storage operator shall be given prior notice so that he will have the option of witnessing the logging operation and be furnished with a copy of the bond log from the top of cement to total depth or, at the option of the well operator, to 500 feet below the base of the underground storage facility. If the integrity of the bond log is questioned by the storage operator, the storage operator may, at its sole risk and expense, run additional logs. No completion work shall be permitted until the fact has been established, between the parties concerned, and the district manager of the Commission, that the integrity of the cement is sound and that the underground storage facility is isolated from the remainder of the bore hole. The remedial work, if needed to protect the storage reservoir, shall be at the risk and expense of the well operator.

(10) The storage operator shall be notified in ample time to witness completion, recompletion, or major remedial work operations. The well site shall be made accessible at all times to the storage operator and all information pertaining to the completion shall be forwarded daily to the storage operator. If the completion, recompletion, or major remedial operations attempt is to be made in any formation within 500 feet in depth to the underground storage facility, the proposed plan of completion shall be forwarded to the storage operator ten days prior to commencement of operations. The storage operator shall have five days after receipt of the proposed plan to forward any objection to the well operator. Completion operations, recompletion, or major remedial operations shall not be permitted until the matter is resolved.

(11) At any time that the storage operator shall reasonably believe that damage may be occurring to the underground storage facility or that gas may be escaping into any other formations or otherwise believe that a well may be compromising the integrity of the underground storage facility, the storage operator may request that the operator of the well conduct specific tests solely at the storage operator's risk and expense. If an agreement cannot be obtained between the parties concerned, the storage operator may bring the matter before the Corporation Commission for determination by application, notice, and hearing following the procedure set out in OAC 165:5-7.

(12) If tests establish that damage is occurring and/or that natural gas is escaping by the continued operation of the well, the well shall be shut down immediately and the remedial operation to rectify the condition shall be commenced within ten days, at the sole risk and expense of the well operator.

(13) All information furnished to the storage operator shall be kept confidential until released in writing by the well operator.

PART 3. COMPLETIONS

165:10-3-10. Fracture and acidizing

In the completion of an oil, gas, injection, disposal, or service well, where acidizing or fracture processes are used, no oil, gas, or deleterious substances shall be permitted to pollute any surface and subsurface fresh water.

165:10-3-11. Swabbing and bailing

In swabbing, bailing, or purging a well, all deleterious substances removed from the borehole shall be placed in adequate pits or tanks, and no such substances shall be permitted to pollute any surface and subsurface fresh water.

165:10-3-12. Leakage prevention in producing oil and gas wells

All wellhead connections, surface equipment, and tank batteries shall be maintained at all times so as to prevent leakage of oil, gas, saltwater, or other deleterious substances.

165:10-3-13. Water pollution prevention in tanks; protection of migratory birds

(a) Tanks for drilling mud or deleterious substances used in the drilling, completion, or recompletion of wells shall be constructed and maintained so as to prevent pollution of surface and subsurface fresh water.
(b) The protection of migratory birds shall be the responsibility of the operator. Therefore, the Conservation Division recommends that to prevent the loss of birds due to oil, all open top tanks containing oil on the surface be protected from access to birds. [See Advisory Notice 165:10-7-3(c)].

165:10-3-14. Waste of oil or gas

Except as provided in 165:10-3-15, waste of oil, condensate, or gas as defined in 165:10-1-2, is hereby prohibited.

PART 3. COMPLETIONS

165:10-3-15. Venting and flaring

(a) **Conditioning a well without a permit.** An operator may blow a producing well without permit if:
(1) Blowing the well is necessary for efficient operation of the well.
(2) Blowing the well will not damage any producing formation in the well.
(3) The operator complies with the H_2S requirements of 165:10-3-16.
(b) **Gas volumes less than or equal to 50 mcf/d.** An operator may vent or flare up to 50 mcf/d without a permit if:
(1) It is not economically feasible to market the gas.
(2) A suitable stand, line, or stack is used to prevent a hazard to people.
(3) H_2S content of gas exceeds 100 ppm, then the gas must be flared.
(c) **Permit to vent or flare gas volumes in excess of 50 mcf/d.**
(1) The Conservation Division may administratively grant a permit to vent or flare on a daily basis gas volumes in excess 50 mcf/d, if:
(A) The operator applies for the permit on Form 1022.
(B) The application lists the location of the well and the maximum daily volume of gas to be vent or flared.
(C) It is not economically feasible to market the gas.
(D) A suitable stack, stand, or line will be used to prevent a hazard to people or property.
(2) The operator shall file an amended application in the event that the amount of gas to be vented exceeds the permitted volume.
(d) **Application for an order permitting venting or flaring.**
(1) If the Conservation Division denies a Form 1022 application for a well, the operator of a well may apply for an order permitting venting or flaring of gas.
(2) The application and notice shall be accordance with OAC 165:5-7.
(3) Upon application, notice, and hearing, the Commission may grant or deny an application made pursuant to OAC 165:5-7.

[**SOURCE:** Amended in Rule Making 980000033]

165:10-3-16. Operation in hydrogen sulfide areas

(a) **Applicability.** Each operator who conducts operations as described in this subsection shall be subject to this Section and shall provide safeguards to protect the general public from the harmful effects of hydrogen sulfide:

(1) Operations including drilling, working over, producing, injecting, gathering, processing, transporting, and storage of hydrocarbon fluids that are part of, or directly related to, field production, transportation, and handling of hydrocarbon fluids that contain gas in the system which has hydrogen sulfide as a constituent of the gas to the extent as specified in (b) of this Section.

(2) This Section shall not apply to:

(A) Operations involving processing oil, gas, or hydrocarbon fluids which are either an industrial modification or products from industrial modifications, such as refining, petrochemical plants, or chemical plants.

(B) Operations involving gathering, storing, and transporting stabilized liquid hydrocarbons.

(C) Operations where the concentration of hydrogen sulfide in the system is less than 100 PPM.

(b) **General provisions.**

(1) Each operator shall determine the hydrogen sulfide concentration in the gaseous mixture in the operation or system. Tests shall be made in accordance with standards as set by ASTM Standard D-2385-81 or other methods approved by the Commission.

(2) For all operations subject to this Section, the radius of exposure shall be determined, except in the cases of storage tanks, by the following Pasquill-Gifford equations or by other methods approved by the Commission such as air dispersion models accepted or approved by the U.S. Environmental Protection Agency:

(A) For determining the location of the 100 ppm radius of exposure: x = [(1.589)(mole fraction H_2S)(Q)] to the power of (.6258).

(B) For determining the location of the 300 ppm radius of exposure: x = [(0.6743) (mole fraction H_2S) (Q)] to the power of (.6258).

(C) For determining the location of the 500 ppm radius of exposure: x = [(0.4546)(mole fraction H_2S)(Q)] to the power of (.6258); **Where: x =** radius of exposure in feet; **Q =** maximum volume determined to be available for escape in cubic feet per day; **H_2S** = mole fraction of hydrogen sulfide in the gaseous mixture available for escape.

(3) The volume used as the escape rate in determining the radius of exposure shall be that specified below as is applicable:

(A) The maximum daily volume rate of gas containing hydrogen sulfide handled by that system for which the radius of exposure is calculated.

(B) For existing gas wells, the current adjusted open flow rate or the operator's estimate of the well's capacity to flow against zero back-pressure at the well head shall be used.

(C) For new wells drilled in developed areas, the escape rate shall be determined by using the current adjusted open-flow rate of offset wells or the field average current adjusted open-flow rate, whichever is larger.

(D) The escape rate used in determining the radius of exposure shall be corrected to standard conditions of 14.65 psia and 60° Fahrenheit.

(4) For drilling of a well in an area where insufficient data exists to calculate a radius of exposure but where hydrogen sulfide may be expected, then a 100 ppm radius of exposure equal to 3,000 feet shall be assumed. A lesser-assumed radius may be considered upon written request setting out the justification for same.

(c) **Storage tank provision.** Storage tanks which are utilized as a part of a production operation, and which are operated at or near atmospheric pressure and where the vapor accumulation has a hydrogen sulfide concentration in excess of 500 ppm, shall be subject to the following:

(1) It shall not be necessary to determine a radius of exposure for storage tanks as described in this Section.

(2) A warning sign shall be posted at the facility. A wind indicator is to be located at the tank battery site so that it may be seen from the entrance to the site and from the storage tanks.
(3) Fencing as a security measure is required when storage tanks are located inside the populated limits of a townsite or city, where conditions cause the storage tanks to be exposed to the public. In other areas where storage tanks may be considered to be a danger the Commission may require a hearing to establish security measures. (See definitions.)
(4) **Vapor safety.**
(A) A vent, flare or vapor recovery system shall be installed on all tanks over 500 ppm H_2S.
(B) The vent pipe shall be required to extend a minimum of 25 ft. horizontally from the center of the last tank.
(5) **Sign requirements.** In satisfying the sign requirement of this subsection, the following will be acceptable:
(A) A sign shall be located within 50 feet of the facility and of sufficient size to be readable from the road or at the entrance to the facility.
(B) The warning sign shall state at a minimum that; hydrogen sulfide has been found and could be present.
(C) New signs constructed to satisfy this subsection shall use the language **"Caution, Poisonous Gas May Be Present"**, using black and yellow colors or **"Danger Poison Gas (Hydrogen Sulfide)"**, using red and white colors or equivalent language. Colors shall satisfy Table 1 of American National Standards Institute Standard 253.1-1967. Signs installed to satisfy this subsection are to be compatible with the regulations of the Federal Occupational Safety and Health Administration.
(d) **Drilling, completion, workover and production operations.** All operators whose operations are subject to this Section, and where the 100 ppm radius of exposure is in excess of 50 feet, shall be subject to the following:
(1) **Warning and marker provision.**
(A) For aboveground and fixed surface facilities, the operator shall post, where permitted by law, clearly visible warning signs on access roads or public streets, or roads which provide direct access to facilities located within the area of exposure.
(B) In populated areas such as townsites and cities where the use of signs is not considered to be appropriate, an alternative warning plan may be approved upon written request to the Commission.
(C) For buried lines subject to this Section, the operator shall comply with the following:
(i) A marker sign shall be installed at public road crossings on both sides of the road as close to the pipeline as possible.
(ii) Marker signs shall be installed along the line, when it is located within a public area or along a public road, at intervals frequent enough in the judgment of the operator so as to provide warning to avoid the accidental rupturing of line by excavation.
(iii) The marker sign shall contain the name of the operator and a 24-hour phone number (including area code), and shall indicate by the use of the words "Warning", "Caution", or "Danger" and "Poison Gas" that a potential danger exists. Markers installed in compliance with the regulations of the Federal Department of Transportation shall satisfy the requirements of this provision. Marker signs installed prior to the June 12, 1987 shall be acceptable provided they are in good condition and indicate the existence of a potential hazard.
(D) In satisfying the sign requirement of this subsection, the following will be acceptable:
(i) Sign of sufficient size to be readable from the road or at the entrance to the facility.
(ii) New signs constructed to satisfy this subsection shall refer to (c) (5) (iii) of this Section.
(2) **Security provision.**
(A) Unattended fixed surface facilities shall be protected from public access when located within one-forth (1/4) mile of a dwelling, place of business, hospital, school, church, government building, school bus stop,

public park, town, city, village, or similarly populated area. This protection shall be provided by fencing and locking, or removal of pressure gauges and plugging of valve openings, or other similar means. For the purpose of this paragraph, surface pipeline shall not be considered as a fixed surface facility.

(B) For well sites, fencing as a security measure is required when a well is located inside populated limits of a townsite or city, where conditions cause the well to be exposed to the public. In other areas considered to be a danger, the Commission may require a hearing to establish security requirements.

(C) The fencing provision will be considered satisfied where the fencing structure is a deterrent to public access.

(e) **Control and equipment safety; contingency plan.**

(1) **Applicability; radius of exposure.** All operations subject to (a) of this Section shall be subject to (2) and (3) of this subsection, if any of the following conditions apply:

(A) The 100 ppm radius of exposure is in excess of 50 feet and includes any part of a "public area" except a public road.

(B) The 500 ppm radius of exposure is in excess of 50 feet and includes any part of a "public road".

(C) The 100 ppm radius of exposure is greater than 3,000 feet.

(2) **Control and equipment safety provision.** Operators subject to this subsection shall either install safety devices and maintain them in an operable condition, or shall establish written safety procedures designed to prevent the undetected continuing escape of hydrogen sulfide. Safety devises should be tested annually and a record kept of such tests.

(3) **Contingency plan provision.** A contingency plan provision shall be developed for each drilling, producing, well servicing, and plant operation that could reasonably result in accidental exposure of the public to a concentration of hydrogen sulfide in excess of 300 ppm. The operator should make appropriate contacts with any public agency listed in the contingency plan. The contingency plan shall provide an organized plan of action for alerting and protecting the public. The details of a contingency plan are determined largely by the time required for a potentially hazardous concentration of hydrogen sulfide to reach a public area and by the population density in the public area. A copy of the contingency plan should be maintained at the location which lends itself best to activation of the plan. A copy shall be submitted to the Conservation Division's District Office.

(A) The plan shall include instructions and procedures for alerting the general public and public safety personnel of the existence of an emergency.

(B) The plan shall include procedures for requesting assistance and for follow-up action to remove the public from an area of exposure.

(C) The plan shall include a call list which shall include the following as they may be applicable:

(i) Local supervisory personnel.
(ii) County Sheriff.
(iii) Department of Public Safety.
(iv) City Police.
(v) Ambulance Service.
(vi) Hospital.
(vii) Fire Department
(viii) Contractors for supplemental equipment.
(ix) District Commission Office.
(x) Local Department of Environmental Quality Office.
(xi) Other public agencies.

(D) The plan shall include a plat detailing the area of exposure. The plat shall include the locations of private dwellings or residential areas, public facilities, such as schools, business locations, public roads, or other similar areas where the public might reasonably be expected within the area of exposure.

(E) The plan shall include provisions for advance briefing of occupied dwellings within the 300 ppm radius of exposure. The following provisions apply;

(i) The hazards and characteristics of hydrogen sulfide.

(ii) The necessity for an emergency action plan.

(iii) the possible sources of hydrogen sulfide within the area of exposure.

(iv) Instructions for reporting a gas leak.

(v) The manner in which the public will be notified of an emergency.

(vi) Steps to be taken in case of an emergency.

(F) In a high density population area, or the case where the population density may be unpredictable, a reaction type of plan, in lieu of advance briefing for public notification, will be acceptable. The reaction plan option must be approved by the Commission.

(G) The plan shall include names and telephone numbers of residents within the area of exposure, except in cases where the reaction plan option has been approved by the Commission.

(H) The plan shall include a list of the names and telephone numbers of the responsible parties for each of the possibly occupied public areas, such as schools, churches, businesses, or other public areas or facilities within the area of exposure.

(f) **Training and requirement provision.** Each operator shall provide appropriate H_2S training for its employees who will be on-site. This training should include:

(1) Hazards and characteristics of hydrogen sulfide.

(2) Effect on metal components of the system.

(3) Operations of safety equipment and life support systems.

(4) First aid in event of an employee exposure.

(5) Use and operation of H_2S monitoring equipment.

(6) Emergency response procedures to include corrective actions, shut-down procedures, evacuation routes, and rescue methods.

(g) **Injection of fluids.** Injection of fluids containing hydrogen sulfide shall not be allowed under the conditions specified in this Section unless first approved by the Commission.

(h) **Venting and flaring.** Venting and flaring of gas shall be conducted in accordance with OAC 165:10-3-15.

(i) **Other requirements.** In addition to any other requirements of this Section, drilling and workover operations and processing plant sites where the 100 ppm radius of exposure is 50 feet or greater shall be subject to the following:

(1) Protective breathing equipment shall be maintained in good operating condition at two or more locations at the site.

(2) Wind direction indicators shall be installed at strategic locations at or near the site and be readily visible from the site.

(3) Automatic hydrogen sulfide detection and alarm equipment that will warn of the presence of hydrogen sulfide gas in harmful concentrations shall be utilized at the site.

(4) The Commission District Office shall be notified of the intention to conduct a drill stem test of a formation containing hydrogen sulfide in sufficient concentration to meet the requirements of this Section.

(j) **Accident notification.** Operators shall immediately notify the appropriate Commission District Office or field inspector of any accidental release of hydrogen sulfide gas of sufficient volume to present a public hazard and hydrogen sulfide related accident resulting in death or hospitalization of personnel.

(k) **Exception provision.** Any application for exception to the provisions of this Section should specify the provisions to which exception is requested, and set out in detail the basis on which the exception is to be requested.

(l) **Referenced organizations and publications.** The following organizations and publications are referenced in this Section:

(1) ANSI - American National Standards Institute 1430 Broadway, New York, New York 10018; Table I, Standard 253.1-1967.

(2) API - American Petroleum Institute 300 Corrigan Tower Building, Dallas, Texas 75201; Publication API RP-55.

(3) ASTM - American Society for Testing and Materials 1916 Race Street, Philadelphia, Pennsylvania 19103; Standard D-2385-81.
(4) EPA - U.S. Environmental Protection Agency, Office or Air Quality Planning and Standards, Technical Support Division, Research Triangle Park, North Carolina 27711; Screen 2 Model User's Guide.

[**SOURCE:** Amended at 13 Ok Reg 2395, eff 7-1-96; Amended in Rule Making 980000013; eff 7-15-98]

165:10-3-17. Well site and surface facilities

(a) **Scope.** This Section shall be applicable to all operators and owners of oil and gas wells, leases, secondary recovery units, converted or newly drilled saltwater disposal or injection wells, and re-entries or reworkings of the above; however, this Section does not cover pits used in connection with oil and gas operations (see 165:10-7-16).

(b) **Removal of fire hazards.** Any material that might constitute a fire hazard shall be removed a safe distance from the well location, tanks, and separator. All waste oil shall be burned or disposed of in a manner to avoid creating a fire hazard.

(c) **Removal of surface trash.**

(1) All surface trash, debris, and junk associated with the operations of the property shall be removed from the premises. Equipment and material that may be useable and related to the operations of the property are not considered trash, debris and junk. With written permission from the surface owner, the operator may, without applying for an exception to 165:10-3-17(b), bury all nonhazardous material at a minimum depth of three feet; cement bases are included.

(2) The District Office or field inspector may issue a Form 1036 for any alleged violation of this subsection. If the operator fails to remove trash, debris, and junk after written notice, the Commission may fine the operator up to $1,000.

(d) **Required lease signs.** Within 30 days after the completion of any producing oil or gas well, a sign shall be posted and maintained at the location showing operator of the well and the operator's business phone number, name of farm, number of the well, and legal description of the well; provided, however, where more than one well is producing on a lease, the operator may post and maintain a sign at the principal lease entrance showing the lease name, operator, legal description, and number of wells, and on each well designate the number of the well. Within 30 days after completion or recompletion of an enhanced recovery injection well or a disposal well, a sign shall be posted and maintained at the well location showing the operator of well, name of farm, well number, legal description of the well, and the Commission order number by which it was authorized. The legal description of each well completed on or after March 1, 1976, shall be posted at the well and shall describe the location of the well to the nearest quarter quarter quarter section and shall show the section, township, and range. On a 160-acre or larger drilling and spacing unit, a sign shall also be posted at the entrance to the well site. The District Office or field inspector may issue Form 1036A for failure to post a required sign. If an operator fails to post a sign as directed, the Commission may fine the operator $50.00 per violation; provided that total fines per incident shall not exceed $500.00 per lease.

(e) **Notice of fire or blowout.** In case of a fire or blowout, the well operator shall notify by telephone or telegraph, as soon as possible, either the Conservation Division or the appropriate District Office of the Conservation Division.

(f) **OTC numbers on stock tanks for oil and condensate.**

(1) On all oil and gas producing leases, the first purchaser of crude oil or condensate shall print its name or affix the company logo and print or affix the OTC Gross Production Division Purchaser Reporting Number on at least one of the storage tanks from which marketable liquids are being delivered.

(2) On all oil and gas producing leases, the well operator shall print or affix the OTC Gross Production Division assigned Production Unit Number and

the OTC Gross Production Division Operator Reporting Number on at least one of the tanks from which marketable liquids are being stored. In the case of an enhanced recovery or unitization operation where several OTC Gross Production Division assigned Production Unit Numbers exist for the wells in the unit, the word "unitized" shall be printed or affixed to one of the storage tanks from which marketable liquids are being delivered to the purchaser.

(3) The identification numbers required in this subsection shall always be clearly legible. All letters and numbers shall be a minimum of two inches in height. Any operator failing to post required information shall be fined $50.00 per violation; provided that total fines per incident shall not exceed $500.00 per well.

(g) **OTC numbers on gas meter or meter house.**

(1) On all gas producing leases, the operator of the well site gas meter required under 165:10-17-5 shall print or affix its name and OTC reporting number on the outside of the meter house or on the outside of the meter itself if no meter house exists.

(2) The operator of the lease shall print its OTC lease number and operator reporting number on the meter house or on outside of the meter if no meter house exists.

(3) The identification required in this subsection shall always be clearly legible. All letters and numbers shall be a minimum of two inches in height.

(h) **Valve and seals on stock tanks.** The operator shall install tank valves such that metal identification seals can be properly utilized. These seals shall be used on all delivery tank valves to lessen unauthorized movement of marketable products.

(i) **Man-ways on frac tanks.** Each frac tank used at the wellsite shall have protective man-ways to prevent persons from accidentally falling into the frac tank.

(j) **Guy line anchors.** All guy line anchors left buried for use in future operations of the well shall be properly marked by a marker of bright color not less than four feet in height and not greater than one foot east of the guy line anchor.

(k) **Well site cleared.** Within 90 days after a well is plugged and abandoned, the well site shall be cleared of all equipment, trash, and debris. Any foreign surface material is to be removed and the location site restored to as near to its natural state as reasonably possible, except by written agreement with the surface owner to leave the surface in some other condition. If the location site is restored but the vegetative cover is destroyed or significantly damaged, a bona fide effort shall be made to restore or re-establish the vegetative cover within 180 days after abandonment of the well.

(l) **Restored surface.** Within 90 days after a lease has been abandoned, surface equipment such as stock tanks, heater, separators, and other related items shall be removed from the premises. The surface shall be restored to as near to its natural state as reasonably possible, except by written agreement with the surface owner to leave the surface in some other condition. If the surface is restored but the vegetative cover is destroyed or significantly damaged, a bona fide effort shall be made to restore or re-establish the vegetative cover within 180 days after abandonment of the lease.

(m) **Leasehold roads.** All leasehold roads shall be kept in a passable condition and shall be made accessible at all times for representatives and field inspectors of the Commission. At the time of abandonment of the property, the area of the road shall be restored to as near to its natural state as reasonably possible, except by written agreement with the surface owner to leave the surface in some other condition. If the road area is restored but the vegetative cover is destroyed or significantly damaged, a bona fide effort shall be made to restore or re-establish the vegetative cover within 180 days after abandonment of the property.

(n) **Extension of time.**

(1) An operator may request an extension of time required in (k), (l), and (m) of this Section for not more than six months by applying to the District Office and showing that there is no imminent danger to the environment and that one of the following conditions exists:

(A) That an agreement with the surface owners is not possible.

(B) That adverse weather conditions exist or existed.
(C) That the equipment needed to conform to (k), (l), and (m) of this Section was not or is not available.
(2) If approved by the District Manager, the extension shall be granted and the surface owner shall be notified by the operator. Any extension beyond six months shall require application, notice and hearing pursuant to OAC 165:5-7-41.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended in Rule Making 980000034]

PART 5. OPERATIONS

165:10-3-25. Completion Reports

(a) **Initial Completion Report.** A Completion Report shall be filed with the Commission on Form 1002A within 30 days after completion of operations regardless of whether or not the well was completed as a dry hole, producer, injection, disposal, or service well. An operator who fails to file a complete and correct Form 1002A Completion Report within the allotted time limit shall be subject to a fine of $250.00.
(b) **Amended Completion Report.** An amended Completion Report shall be filed with the Commission on Form 1002A within 30 days after completion of operations to reenter, recomplete and/or convert to injection or disposal well regardless of whether or not the well was completed as a dry hole, producer, injection, disposal, or service well.
(c) **No allowable without Completion Report.** The Conservation Division shall not assign an allowable to a well without an up-to-date Completion Report on file with the Conservation Division.

[**SOURCE:** Amended at 9 OK Reg 2295, eff 6-25-92]

165:10-3-26. Well logs

(a) **60 days to submit well log(s).** All well logs required by this Section shall be submitted to the Conservation Division within 60 days from the earlier of the date of completion of the well or the date that the last formation evaluation type wireline log was run. An operator who fails to properly submit wireline surveys, if run, shall be subject to a warning with time limit followed by a fine of $250.00.
(b) **Wireline logs.** This Section does not require an operator to run a wireline survey. However, if an operator does run wireline surveys, the operator shall only be required under this Section to submit a resistivity type wireline log and a porosity type wireline log, if available. Resistivity and porosity type wireline logs include but are not limited to spontaneous potential, induction, laterolog, density, and gamma ray neutron logs.
(c) **Other logs to be available upon request.** Dipmeter, velocity, and radioactive tracer logs, if available, shall be submitted to the Technical Services Department upon Commission order or special request of the Conservation Division.
(d) **Requirements for submitting a copy of a log.** A copy of a log submitted under this Section, instead of the original log, shall be a legible finished copy, complete, in one piece and with the well's legal description noted on it. If there are separate runs for multiple casing strings, the operator shall submit the separate runs.
(e) **Obtaining confidential treatment of well log(s).**
(1) Unless the operator requests confidential treatment of a well log(s), any well log(s) submitted to the Conservation Division shall be available for public inspection.
(2) To obtain confidential treatment of a well log, the operator of the well shall:

(A) Place the well log(s) in a sealed envelope with a completed Form 1002B attached to the envelope.
(B) Submit to the Technical Services Department of the Conservation Division the envelope with the log(s) and Form 1002B within 60 days from the earlier of:
(i) The completion date of the well, or
(ii) The date that the last formation evaluation log was run.
(3) A confidential well log under (2)(B) of this Section, shall remain confidential for one year from the date the last log was run on the well. Upon written request, the Conservation Division may administratively extend the period of confidentiality for six months. Under no circumstances shall confidentiality be granted for a period in excess of 18 months from the date the last log was run on the well.
(f) **No allowable before submission of well logs.** The Conservation Division shall not assign an allowable to a well before the operator of the well submits to the Conservation Division any well log required to be submitted under (b) of this Section.

[**SOURCE:** Amended at 9 OK Reg 2295, eff 6-25-92]

3-10-3-27. Deviation from the vertical
(a) **Well location for purposes of well spacing.** For purposes of the well spacing requirements of 165:10-1-21 and 165:10-1-24, the location of a well in a common source of supply is the point at which the wellbore penetrates the top of the common source of supply.
(b) **Presumed bottom hole location.** For purposes of review of Form 1000 applications, the Conservation Division may presume that the location in a common source of supply of a well without a horizontal drainhole is the same as the surface location for the well unless:
(1) The operator submits a bottom hole survey, if the well has been drilled; or
(2) The operator complies with (c)(1) of this Section.
(c) **Permitted and prohibited locations.**
(1) **Offpattern surface location; permitted subsurface location.**
(A) The Conservation Division may approve a Form 1000 for a well to be commenced without a location exception at an offpattern surface location for a common source of supply when:
(i) The Form 1000 lists a subsurface location which is a permitted location for the common source of supply.
(ii) Issuance of a Permit to Drill is conditioned on the operator running a bottom hole survey within 30 days after reaching total depth and on the operator submitting the survey to the Conservation Division within 45 days after the well reaches total depth.
(B) The well shall not receive an allowable for the common source of supply until a bottom hole survey shows that the well is at a permitted location or until the operator obtains a location exception order for the subsurface location.
(2) **Offpattern subsurface location.**
(A) The Conservation Division shall not approve a Form 1000 without a location exception order for an offpattern subsurface location.
(B) Issuance of a Permit to Drill under (1) of this subsection does not permit an operator to have, without a location exception order, an offpattern subsurface location for a common source of supply.
(d) **Required directional and bottom hole surveys.** For good cause, the Commission may order an operator to run directional and/or bottom-hole surveys for a common source of supply in a well:
(1) Upon application, notice, and hearing; or
(2) In any case involving the location of a well, upon motion of an affected party or upon the Commission's own motion.

165:10-3-28. Horizontal drilling

(a) **Scope.** This Section affects a horizontal well with one or more laterals.

(b) **Definitions.**

(1) **"Horizontal well"** shall mean a well drilled, completed, or recompleted in a manner in which the horizontal component of the completion interval in the geological formation exceeds the vertical component thereof and which horizontal component extends a minimum of 150 feet in the formation.

(2) **"Geological formation"** shall mean the common source of supply.

(3) **"Point of entry"** shall mean the point at which the borehole first intersects the top of the common source of supply.

(4) **"True vertical depth"** shall mean that depth at the point of entry in a horizontal borehole perpendicular to the surface as measured from the elevation of the kelly bushing on the drilling rig.

(5) **"Terminus"** shall mean the end point of the borehole in the common source of supply.

(6) **"Lateral"** shall mean the measured distance drilled from the point of entry to the terminus.

(7) **"Horizontal well unit"** shall mean a drilling and spacing unit established by the Commission, after application, notice, and hearing, for a common source of supply into which a horizontal well has been or will be drilled.

(8) **"Directional survey"** shall mean that survey or report showing the location of any point of the wellbore as it relates to the surveyed surface location from the surface to the terminus of each lateral.

(9) **"Date of first production"** shall mean the date hydrocarbons are first produced from the horizontal well, whether or not production occurs during drilling, completion, or through permanent surface equipment.

(10) **"Vertical component"** shall mean the calculated vertical distance from the point of entry to the terminus of the lateral.

(11) **"Horizontal component"** shall mean the calculated horizontal distance from the point of entry to the terminus.

(c) **Drilling and producing on a lease basis or in a conventional drilling and spacing unit.**

(1) This subsection shall apply to a horizontal well, not a part of a horizontal well unit. For purposes of 165:10-1-21, 165:10-1-24, and 165:10-1-25, compliance with well location requirements shall be determined considering:

(A) The location at which the wellbore penetrates the top of the common source of supply.

(B) The location of each lateral and its terminus in the common source of supply.

(2) No operator shall be assigned an allowable to produce oil, gas, or gas condensate from the well until he submits a downhole survey showing that each lateral is at location permitted by general rule or location exception order. For allowable purposes, the well shall be considered as a single wellbore. For a gas well, the Conservation Division shall compute the gross allowable in the manner prescribed for a vertically drilled gas well at that location in the common source of supply. For an oil well, the Conservation Division shall compute the gross allowable using the provisions applicable to a horizontal well unit.

(d) **Horizontal well units.** Subsections (e) through (l) of this Section establish criteria for spacing, pooling, drilling, and producing a horizontal well with one or more laterals.

(e) **Drilling and spacing units.**

(1) A horizontal well may be drilled on any drilling and spacing unit.

(2) A horizontal well unit may be created in accordance with 165:10-1-22 and 165:5-7-6, 165:5-15-8, and 165:5-15-9. Such units shall be created as new units after notice and hearing as provided for by the Rules of Practice, OAC 165:5.

(3) A horizontal well unit may be established for a common source of supply for which there are already established non-horizontal drilling and spacing units, and said horizontal well unit may include within the boundaries thereof more than one existing non-horizontal drilling and spacing unit for the common source of supply.

(A) Horizontal well units may exist concurrently with producing non-horizontal drilling and spacing units.
(B) Horizontal well units shall supersede existing non-developed non-horizontal drilling and spacing units for the duration of the horizontal well unit.

(f) **Single wellbore.**
(1) All laterals in the same common source of supply in a horizontal well with at least one lateral which exceeds 150 feet of total horizontal component shall be considered as a single wellbore for allowable purposes.
(2) Laterals in the same common source of supply directly connected through the wellbore to the same surface location in a horizontal well and which form an angle of 90 degrees or more shall be considered a single lateral in determining projected horizontal displacement for horizontal well unit purposes. The horizontal lateral displacement used to determine the appropriate horizontal well unit where multiple laterals exist shall be the horizontal displacement of the longest lateral, plus the projection of any other lateral on a line that extends in a one hundred eighty degree (180°) direction from the longest lateral.

(g) **Location.** For purposes of 165:10-1-22 and Appendix C (Table HD) to this Chapter, compliance with well location requirements shall be determined considering:
(1) The location of the point of entry.
(2) The location of each lateral in terms of direction and depth.
(3) The terminus of each lateral.

(h) **Determination of unit size and allowable.**
(1) The size of the proposed horizontal well unit shall be determined by the projected length of the horizontal component as shown in Appendix C (Table HD) to this Chapter.
(2) The allowable for the horizontal oil well shall be determined by the actual length of the lateral as shown in Appendix C (Table HD) to this Chapter.

(i) **Horizontal well spacing requirements.**
(1) A horizontal wellbore from its point of entry and along any part of the lateral shall be located not closer than the minimum distance as set out below from any other wellbore completed in or drilling to the same common source of supply except by a special order of the Commission:
(A) Three hundred feet from any other producible or drilling oil or gas well when drilling to the same common source of supply that is less than 2,500 feet in depth.
(B) Six hundred feet from any other producible or drilling oil or gas well when drilling to the same common source of supply that is 2,500 feet or more in depth.
(C) This paragraph does not apply to horizontal wells drilled in a unit created for secondary or enhanced recovery operations pursuant to 52 O.S. 287.1 et seq.
(2) A horizontal wellbore from its point of entry and along any part of the lateral shall be located not less than the minimum tolerance distance from the boundary of the horizontal well unit as follows:
(A) Not less than 165 feet from the boundary of any 10, 20, or 40 acre horizontal well unit.
(B) Not less than 330 feet from the boundary of any 80 or 160 acre horizontal well unit.
(C) Not less than 660 feet from the boundary of any 320 acre or 640 acre horizontal drilling and spacing unit.
(3) Any horizontal wellbore drilled into an unspaced common source of supply may not be located closer to the lease line or voluntary unit or to another wellbore completed in the same common source of supply than the tolerance distance prescribed for a well drilled in a standard horizontal well unit as determined by the length of the horizontal component of the unspaced horizontal wellbore.

(j) **Allowable.**
(1) Horizontal oil well allowables may be established administratively based on Appendix C (Table HD) to this Chapter.

(2) Allowables will be effective as of the date of first production. Underproduction will not be accumulated during drilling.
(3) Bonus allowables will be established for multilaterals by the summation of each individual lateral in an otherwise qualifying horizontal oil well, as provided in (f) of this Section.

(k) **Establishing allowables.** To establish an allowable for a horizontal well, the following must be submitted to the Commission:
(1) Directional survey.
(2) A plat constructed from data gathered from the directional survey showing point of entry, true vertical depth at point of entry, actual length, and direction of the lateral and horizontal component.
(3) An approved copy of Form 1002A.
(4) Total amount of oil or gas that has been produced from the well prior to the date of completion.

(l) **Pooling.** Horizontal well units may be pooled as provided for under 52 O.S. 87.1 and Commission Rules of Practice, OAC 165:5.

165:10-3-29. Oil storage

Oil storage tanks shall be constructed so as to prevent leakage. Dikes or walls, where necessary, shall be constructed so as to prevent oil or deleterious substances from polluting surface and subsurface water.

165:10-3-30. Use of gas for artificial lifting

(a) **Use of gas for artificial lifting of oil.** Gas may be used for the artificial lifting of oil; provided, all gas returned to the surface with the oil is not vented or otherwise wasted

(b) **The use of production.** The use of production from one common source of supply to assist in lifting the production from another common source of supply by commingling the production from both common sources of supply in the tubing string shall be permitted when the operator has authority to commingle the production in the tubing.

(c) **Use of artificial lift.** Artificial lift, initial or subsequent, in conjunction with the separate orifice or choke assembly shall be governed by OAC 165:10-3-37.

[**SOURCE:** Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-31. Use of vacuum

(a) **Prohibited without an order.** Imposing vacuum on an oil or gas bearing formation is prohibited without an order of the Commission.

(b) **Requirement.** A vacuum shall not be permitted unless it can be shown that to use a vacuum as permitted will prevent waste and protect correlative rights.

(c) **Application for an order.** Each application for an order authorizing use of vacuum on a common source of supply shall be made according to 165:5-7-25.

(d) **Records required to be kept by the operator.**
(1) If an operator obtains an order authorizing use of vacuum, the operator shall make a record on a monthly basis of:
(A) The vacuum imposed in pounds per square inch or inches of mercury.
(B) The amount of gas, oil and water production per day.
(2) Any record required to be kept under this Section shall be made available to the Conservation Division upon request.

PART 7. PRODUCTION

165:10-3-35. Multiple zone production

(a) Production from more than one common source of supply from a single well is hereby prohibited except as authorized by the Conservation Division.
(b) For the purpose of this Section, completion of a well so as to separately produce or account for the production from two or more common sources of supply shall be a multiple completion, and the production from more than one common source of supply without segregation of the production shall be commingling.
(c) Any operator violating this Section shall be subject to a fine of $500.00. The Conservation Division may shut down a multiply completed well pending compliance with this Section.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-36. Multiple zone completions
(a) Each application for the approval of the multiple completion of a well shall be filed on Form 1023 and shall be verified.
(b) A copy of the application shall be mailed or delivered to each operator of a producing leasehold within one-half (1/2) mile of the well location. The applicant shall file an affidavit of delivery or mailing not later than five (5) days after the application is filed.
(c) If a written objection to the application is filed within fifteen (15) days after the application is filed, or if hearing is required by the Commission, the application shall be set for hearing and notice thereof shall be given as the Commission shall direct. If no objection is filed and the Commission does not require a hearing, the matter shall be presented administratively to the Director of Conservation or his designee who shall file his report and make his recommendations. If the Conservation Division denies an application, the applicant may request a hearing on said application in accordance with OAC 165:5-7-22.

[**SOURCE:** Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-37. Control of multiply completed wells
(a) Every multiply completed well shall be equipped, operated, produced, and maintained so that there will be no commingling of the production from separate common sources of supply in the well, except as hereinafter provided. The production from each common source of supply shall be separately accounted for or separately stored and measured on the lease. The production shall be measured by either:
 (1) A positive displacement dump-type device;
 (2) A continuous-flow measuring device; or
 (3) A measuring device of any other type authorized by the Commission.
(b) Each application for the approval of production through a multiple choke assembly in a well shall be filed on Form 1023 and shall be verified. The multiple choke assembly must be so designed and located in the wellbore as to prevent commingling within the common sources of supply, but to permit commingling in the tubing string through individual choke orifices. The commingled production shall be measured at the surface and allocated to each common source of supply.
(c) A copy of the application shall be mailed or delivered to each operator of a producing leasehold within one-half (1/2) mile of the well location. The applicant shall file an affidavit of delivery or mailing not later than five days after the application is filed.
(d) If a written objection to the application is filed within 15 days after the application is filed, or if hearing is required by the Commission, the application shall be set for hearing and notice thereof shall be given as the Commission shall direct. If no objection is filed and the Commission does not require a hearing, the matter shall be presented administratively to the Director of Conservation who shall file his report and make his recommendations.

[**SOURCE:** Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-38. Testing of multiply completed wells

The Conservation Division may at any time require a multiply completed well to be tested to determine the effectiveness of the separation of common sources of supply. The tests may be witnessed by representatives of the Conservation Division and may be witnessed by any offset operator. Testing procedures must be acceptable to a representative of the Conservation Division.

[**SOURCE:** Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-39. Commingling of production

(a) **Commingling order required.** Commingling of production from a well from separate common sources of supply is prohibited without a commingling order. A commingling order shall be required when production is from more than one source of supply, without segregation of the production in the wellbore, or is produced separately in the wellbore and then combined together downstream of the wellhead prior to measurement. Commingling downstream of the wellhead shall require Form 1024 (Packer Setting Affidavit) and Form 1025 (Packer Leakage Test) to be filed and approved. The Commission shall assess a fine of $500.00 for non-permitted commingling either down hole or downstream prior to measurement.

(b) **Restrictions.**

(1) Commingling shall only be authorized when it would prevent waste and protect correlative rights.

(2) Commingling shall be prohibited where one producing zone is predominately gas and a second zone is predominately oil, unless the operator can verify in writing, submitted with the application, that no cross flow will occur resulting in reservoir damage.

(c) **Application requirements.** Each application for a commingling order shall comply with OAC 165:5-7-24.

(d) **Commingled allowables.**

(1) **Single allowable for commingled production.** Common sources of supply commingled under this Section receive a single allowable as if they constituted a single common source of supply in the wellbore.

(2) **Gross daily allowable for commingled production.** The gross daily allowable shall be based on the classification of the well as an oil or gas well for allowable purposes under OAC 165:10-13-2.

(A) **Unallocated oil well (GOR < 15,000:1).** The gross daily allowable shall be based on what would be the allowable if commingled production comes from the deepest commingled common source of supply.

(B) **Unallocated gas well (GOR > 15,000:1).** The gross daily allowable shall be a single unallocated gas allowable, as determined by OAC 165:10-17-11(c). Upon request in a commingling application or in any other appropriate application and upon proper notice thereof, the Commission may designate in the commingling order or other appropriate order the specific gas formation, completed and producing in the applicable well, to which the allowable for such well is to be attributed when the Commission determines that such designation is necessary to prevent waste and to protect correlative rights.

(C) **Special allocated gas pool.** The gross daily allowable shall be based on what would be the allowable if the commingled production came from the special allocated gas pool in the well.

(3) **Operator option if multiple pool rules exist.** If more than one common source of supply under a commingling order for a gas well is subject to gas pool rules, the order shall designate which set of pool rules is applicable for allowable purposes.

(4) **Net daily allowable.** The net daily allowable is the gross daily allowable under (3) of this subsection:

(A) Reduced accordingly by any penalty against any of the commingled common sources of supply under the order.

(B) Reduced accordingly by any overage carried forward against a commingled common source of supply.
(C) Increased by any underage carried forward for the well under applicable allocated or special allocated pool rules.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended in Rule Making 980000033, eff 7-1-99]

165:10-3-40. Production of brine

(a) All wells in excess of 300 feet in depth and producing brine for the extracting of minerals shall be under the full jurisdiction of the Conservation Division.
(b) The establishment of a unitized area for the purpose of efficient operations, prevention of waste, and the protection of correlative rights may be formed by following the procedures set out in 165:5-7-21
(c) Category B surety shall be a requirement for all brine producing wells or units. [See 165:5-7-21(f)]

[BLANK PAGE]

SUBCHAPTER 5. UNDERGROUND INJECTION CONTROL

Section

[BLANK PAGE]

165:10-5-1. Classification of underground injection wells

Underground injection wells shall be classified as follows:

(1) **Enhanced recovery injection well.** An enhanced recovery injection well is a well which injects fluids to increase the recovery of hydrocarbons.

(2) **Disposal well.** A disposal well is a well which injects, for purposes other than enhanced recovery, those fluids brought to the surface in connection with oil or natural gas production.

(3) **Storage well.** A storage well is a well used to inject, for storage purposes, hydrocarbons which are liquid at standard temperature and pressure.

(4) **Simultaneous injection well.** A well that injects or disposes of salt water at the same time it is producing oil and/or gas to the surface.

[SOURCE: Amended at 13 Ok Reg 2387, eff 7-1-96]

165:10-5-2. Approval of enhanced recovery injection wells or disposal wells

(a) The subsurface injection or disposal of any substance for any purpose is prohibited except upon approval of the Commission pursuant to 165:10-5-5 or 165:10-5-12 and 165:10-5-13. This authorization may be conditioned upon the applicant taking corrective action to protect treatable water as specified by the Commission in its order. The Commission shall fine an operator $5,000.00 for any violation of this subsection.

(b) Except as provided in (c) and (d) in this Section, every well used for injection or disposal shall be cased and tested in accordance with 165:10-3-4 and 165:10-5-6.

(c) The testing requirements of 165:10-5-6 shall not apply to wells permitted by Commission order for subsurface injection of onsite reserve pit fluids.

(d) The Conservation Division may approve a Form 1015 application to convert for injection or disposal an existing well which does not comply with 165:10-3-4 if:

(1) The operator attaches to the Form 1015 application a description of an alternate method of protecting treatable water.

(2) The Conservation Division approves the proposed alternate method.

(3) The application is filed in accordance with OAC 165:5-7 if a hearing is required.

(4) The application is not protested.

(e) Any newly drilled or newly converted injection or disposal well which is within one-half (1/2) mile of any active or reserve municipal water supply well shall not be approved without notice and hearing, and the Commission shall not issue an order authorizing injection or disposal into said well until the applicant proves by substantial evidence that said well shall not pollute said water supply well. A commercial disposal well shall not be approved within a designated wellhead protection area.

[**SOURCE:** Amended at 9 Ok Reg 2295; Amended at 9 Ok Reg 2337, eff 6-25-92]

165:10-5-3. Authorization for existing enhanced recovery injection wells and existing disposal wells

(a) Each enhanced recovery injection well authorized under order of the Commission on the effective date of this Section is an existing enhanced recovery injection well. Injection is prohibited in any existing enhanced recovery injection well unless the operator has included that well on a completed Form 1070 submitted to the Commission within one year following the effective date of this Section. Form 1070 (Inventory of Authorized Existing Enhanced Recovery Injection Wells) shall include each well name, location, authorizing Commission order number (including all orders authorizing exceptions), date of order, maximum authorized injection rate, and maximum authorized injection pressure.

(b) Each disposal well being operated under order of the Commission on the effective date of this Section is an existing disposal well. Injection is prohibited in any existing disposal well unless the operator has included that well on a completed Form 1071 submitted to the Commission within one year following the effective date of this Section. Form 1071 (Inventory of Authorized Existing Disposal Wells) shall include each well name, location, authorizing Commission order number (including all orders authorizing exceptions), date of order, maximum authorized injection rate, and maximum authorized injection pressure.

165:10-5-4. Application for approval of enhanced recovery projects

(a) An enhanced recovery project shall be permitted only by order of the Commission after notice and hearing.

(b) The application for an order authorizing an enhanced recovery project shall contain the following:

(1) The names and addresses of the operator or operators of the project.

(2) A plat showing the lease, group of leases, or unit included within the proposed project; the location of the proposed injection well or wells, and the location of all oil and gas wells including abandoned and drilling wells and dry holes; and the names of all operators offsetting the area encompassed within the project.

(3) The common source of supply in which all wells are currently completed.

(4) The name, description, and depth of each common source of supply to be affected.

(5) A log of a representative well completed in the common source of supply.

(6) A description of the existing or proposed casing program for injection wells and the proposed method of testing casing.

(7) A description of the injection medium to be used, its source, and the estimated amounts to be injected daily.

(8) For a project with an allocated pool, a tabulation showing recent gas-oil ratio and oil and water production tests for each of the producing oil and gas wells.

(9) The proposed plan of development of the area included within the project.

(c) A copy of the application and notice of hearing shall be mailed to the owner or owners of the surface of the land upon which the project is located and to each operator offsetting the project as shown on the application within five days after the application is filed. An affidavit of compliance with this Section shall be filed on or before the hearing.

165:10-5-5. Application for approval of enhanced recovery injection and disposal operations

(a) Each application for approval of a well for use as an injection well or disposal well shall be filed in accordance with 165:5-7-27.

(b) In addition to the requirements of 165:5-7-27, the Resource Conservation Department may request the applicant to submit the following information as a prerequisite to approval of the application:

(1) For those wells included in 165:5-7-27(b)(1) which penetrate the top of the injection interval, a tabulation of the wells indicating the following information, if available, from public records:

(A) Dates the wells were drilled.

(B) The present status of the wells.

(C) The identity of any abandoned well which was improperly plugged or remains unplugged.

(2) A list of the following information, if available, to the applicant:

(A) The shut-in bottom hole formation pressure in psi; or the stabilized shut-in surface pressure and fluid level in the proposed injection well.

(B) The permeability of the proposed injection zone expressed in millidarcies.

(C) The porosity of the proposed injection zone expressed as a percentage of pore volume.
(D) Documentation of the methods used to arrive at the data requested above.

(c) An order authorizing an enhanced oil recovery injection well or a disposal well or a commercial disposal well will expire and become null and void if no well completion report (Form 1002A) is filed within six months from the date of completion or recompletion of the well.

(d) In addition to the well construction requirements as set out in 165:10-3-1, commercial saltwater disposal wells shall comply with the following requirements:

(1) At a minimum, the well shall be constructed with a wellhead, surface casing, production casing, tubing, and packer.
(2) The surface casing shall be set and cemented at least fifty (50) feet below the base of the treatable water bearing zone.
(3) The production casing must be set and cemented through the injection zone with the cement circulated behind the casing to a height at least two hundred fifty (250) feet above the disposal zone. A cement bond log showing quality and placement of the cement must be furnished to and approved by the Commission before the application will be approved. The production casing will not be allowed to also serve as the surface casing.
(4) The annulus between the tubing and the casing must be open from the surface to the packer to allow for pressure testing and monitoring of the injection tubing and packer and the annulus filled with a packer fluid that protects against corrosion.
(5) The packer must be set at least within seventy-five (75) feet of the top of the perforations.
(6) Adequate gauges shall be installed on each annulus to allow proper monitoring of the disposal operation.
(7) Tubing must be internally coated or lined to prevent corrosion from injected fluids. PVC, Plastic Coated, Stainless Steel or Fiberglass will qualify.
(8) The packer must either internally coated or stainless steel.
(9) Commercial disposal wells authorized with a positive injection pressure must be equipped with a down hole shut-off device with a seal divider installed between the packer and the tubing. A Stainless Steel Profile Nipple and an "ON-OFF" Tool will qualify under this Section.

(e) No Commercial disposal well will be permitted whose injection pressure approaches or exceeds the demonstrated frac gradient of the injection zones(s).

(f) All permitted injection zones must be completed for injection. Authorization for any zones not initially completed as an injection zone will expire within 60 days following initial completion or recompletion date.

[**Source:** Amended at 11 Ok Reg 3691, eff 7-11-94]

165:10-5-6. Testing and monitoring requirements for enhanced recovery injection wells and disposal wells

(a) **Mechanical integrity during injection.** The operator of an injection, disposal or commercial disposal well must maintain mechanical integrity in order to continue operation of the well.

(b) **Initial pressure test requirements for wells permitted on or after December 2, 1981.**

(1) **Mandatory initial mechanical test.** Before commencement of operation, each well authorized for enhanced recovery injection or disposal by a Commission order issued on or after December 2, 1981, must pass an initial pressure test of the casing tubing annulus according to the minimum testing standards of (2) of this subsection, unless a Commission order permits other test procedures of the mechanical integrity of the well. Any operator failing to comply with initial mechanical integrity testing and reporting requirements shall be subject to a fine of $500.00.
(2) **Minimum testing standards for initial tests.** For each initial test required by (1) of this subsection, the minimum testing standards are:

(A) **Witnessing of the test.** The test shall be witnessed by an authorized representative of the Conservation Division. It shall be the responsibility of the well operator to secure the presence of the Commission representative.
(B) **Down-hole equipment.** Injection and disposal shall be through adequate tubing and packer.
(C) **Aboveground extensions and fittings.** Adequate aboveground extensions shall be installed in each annulus in the well. In addition, the operator shall install a one-fourth (1/4) inch female fitting, with cutoff valve to the tubing, so that the amount of injection pressure may be measured by the Commission representative using a gauge having a one-fourth (1/4) inch male fitting.
(D) **Packer setting depth under the order.** The mechanical packer shall be set within 20 feet of the packer setting depth prescribed by the order permitting the well for injection.
(E) **Verification of packer setting depth.** The Commission District Manager may require the operator of the well to verify the packer setting depth by running a wireline or other method approved by the Manager of the Underground Injection Control Department.
(F) **Minimum testing pressure.** Noncommercial disposal and injection wells shall be tested as follows:
(i) If the maximum authorized injection pressure for the well is less than 300 psig under the order permitting the well for injection, the minimum testing pressure shall be 300 psig.
(ii) If the maximum authorized injection pressure is greater than 300 psig under the order permitting the well for injection, the minimum testing pressure shall be the lesser of 1000 psig or the maximum authorized injection pressure under the order permitting the well.
(G) **Thirty minute minimum testing period.** The minimum testing period shall be 30 minutes at the testing pressure.
(H) **Ten percent maximum permitted bleed-off.** The maximum permitted bleed-off during the testing period shall be ten percent of the maximum testing pressure used.
(I) **Test report on Form 1075.** The operators shall submit the results of the mechanical integrity test on Form 1075 within 30 days from the date the test is performed.
(J) **Cement circulated above injection zone.** The minimum cement height circulated above the injection or disposal zone in the annulus between the casing and the borehole shall be 250 feet.
(K) **Packer setting depth.** The packer must be set at a depth which is at least 50 feet below the depth of the top of cement behind the production casing.
(3) **Alternative testing procedures.** Operators can test at a maximum of 500 psi if there is in place an automatic and continuous pressure monitor on the tubing-casing annulus that will shut-in the well if there is a significant pressure increase on the annulus. Application for this alternative test procedure shall be made in writing to the Manager of the UIC Department.
(4) **Use of fluid seal without a mechanical packer.** Use of a fluid seal without a mechanical packer is prohibited.

(c) **Initial pressure test requirements for wells permitted prior to December 2, 1981.**
(1) **Mandatory initial pressure test or monitoring test.**
(A) Each well authorized for enhanced recovery injection or disposal by Commission order issued prior to December 2, 1981, must pass an initial mechanical integrity test according to the minimum testing standards of (2) of this subsection.
(B) In lieu of casing test required in (A) of this paragraph, the operator shall monitor and record during actual injection the pressure in the casing-tubing annulus monthly and report the pressure annually on Form 1075. A measurable positive pressure must be maintained at the casing valve and be continuously measured to qualify.
(2) **Minimum testing standards for initial mechanical integrity tests.**

(A) **Wells with casing-tubing annulus.** The minimum testing standards of (a)(2) of this Section for an initial test of a well with a casing tubing annulus shall apply with the following modifications:

(i) The District Manager shall have the option to waive witnessing of the test.

(ii) If the test is not witnessed, the well operator shall submit documentation of the test to the Conservation Division within 30 days after the test on Form 1075.

(iii) The minimum testing pressure shall be 200 psig.

(B) **Wells without a casing-tubing annulus or wells with perforations above the packer.** The minimum testing standards for an initial test of a well without a casing-tubing annulus or wells with perforations above the packer are:

(i) **Witnessing of the test.** The test shall be witnessed by an authorized representative of the Conservation Division unless the District Manager for the Conservation Division waives the requirement of witnessing the initial test. It shall be the responsibility of the well operator to secure the presence of the commission representative for witnessing the test.

(ii) **Documentation for unwitnessed tests.** If the test is not witnessed, then the operator shall submit on Form 1075 documentation of the test to the Conservation Division within 30 days after the test.

(iii) **Aboveground extensions and fittings.** The operator shall install a one-fourth (1/4) inch female fitting, with cutoff valve to the tubing, so that the amount of injection pressure may be measured by the Commission representative using a gauge having a one-fourth (1/4) inch male fitting.

(iv) **Setting depth for plug.** For purposes of the test, a mechanical packer, retrievable bridge plug, or seating nipple plug shall be placed in the injection string not more than 75 feet above the top of the injection interval.

(v) **Pressure testing of tubing string.** The well operator shall pressure test the tubing string for at least 30 minutes. The minimum testing pressure shall be the greater of 300 psig, or the maximum authorized injection pressure provided that the actual working injection pressure for the well may be used instead of the maximum authorized injection pressure when necessary to prevent damage to the casing or packer.

(vi) **Ten percent maximum permitted bleedoff.** The maximum permitted bleedoff during the testing period shall be ten percent of the maximum testing pressure used.

(vii) **Radioactive tracer survey.** A radioactive tracer survey shall be run demonstrating that the injected fluid is going into the authorized zone when there is no cement bond log or cementing reports to demonstrate sufficient cement behind pipe to isolate the injection zone or to insure the packer is properly set.

(viii) **Pressure test using a gas media.** In lieu of a pressure test using a liquid testing media, the UIC Department may approve a mechanical integrity test using a gas media if it conforms to a method previously approved by the EPA.

(ix) **Test report on Form 1075.** The operator shall submit the results of the mechanical integrity test on Form 1075 to the Conservation Division within 30 days after the test.

(d) **Subsequent mechanical integrity test requirements.**

(1) **Pressure test every five years.** Unless a well has been approved by an order of the Commission for other testing procedures or monitoring, each well permitted for injection shall demonstrate mechanical integrity at least once every five years according to the minimum testing standards of (3) of this subsection. Any operator failing to comply with periodic mechanical integrity testing and reporting requirements shall be subject to a fine of $500.00.

(2) **Required retest if down-hole equipment is moved or replaced.** After a well passes a pressure test required by this Section, if the operator moves the packer or replaces either the packer or the tubing, then the operator

shall retest the well according to the minimum testing standards of (3) of this subsection.

(3) **Minimum testing standards.**

(A) **Wells with casing-tubing annulus.** For a five year test or retest required by this subsection, the minimum testing standards of (a)(2) of this Section shall apply to wells with casing-tubing annulus with the following modifications:

(i) The District Manager shall have the option to waive witnessing of the test.

(ii) If the test is not witnessed, the well operator shall submit documentation of the test to the Conservation Division within 30 days after the test.

(iii) The minimum testing pressure shall be:

(I) 200 psig for a noncommercial well.

(II) 300 psig or the authorized injection pressure, whichever is greater, for commercial disposal wells.

(B) **Wells without a casing-tubing annulus or wells with perforations above the packer.** For a five year test or retest required by this subsection, the minimum testing reporting standards of (b)(3)(B) of this Section, shall apply to wells without a casing-tubing annulus or wells with perforations above the packer.

(C) **Wells with automatic monitoring of positive tubing-casing pressure.** Subsequent pressure tests will not be required if there is in place a pressure monitor on the annulus to demonstrate the maintenance of a certain, positive pressure. This monitor will be connected to an automatic alarm or a continuous chart recorder. Application for this alternative shall be made in writing to the Manager of the UIC Department. Monitoring records will be sent annually attached to Form 1012 to the UIC Department.

(e) **Monitoring requirements.**

(1) **Report on Form 1075.** In lieu of a mechanical integrity test every five years, the operator of a well permitted for injection or disposal may demonstrate the mechanical integrity by:

(A) Monitoring and recording the injection rate, volume, and casing-tubing annulus pressure monthly.

(B) Submitting to the Conservation Division the results of monthly monitoring for the calendar year on Form 1075 by the first day of April of the next calendar year.

(2) **Required positive casing-tubing annulus pressure.** A measurable positive pressure must be maintained at the casing valve and be continuously measured to qualify for mechanical integrity.

(f) **Testing requirements for commercial disposal wells.**

(1) **Before commencement of operation.** Before commencement of operation, each commercial disposal well must pass a pressure test of the casing tubing annulus.

(2) **Minimum testing standards.**

(A) The test shall be witnessed by an authorized representative of the Conservation Division.

(B) The well shall be tested at the maximum authorized injection pressure, but not less than 300 psig.

(C) The minimum testing period shall be thirty (30) minutes.

(D) The maximum allowable change in pressure during the testing period shall be ten percent (10%) of the testing pressure.

(E) The results of the test shall be submitted on Form 1075 within 30 days from the date of the test.

(3) **Subsequent mechanical integrity tests.**

(A) The well shall be tested a minimum of every twelve (12) months.

(B) After a well passes a pressure test required by this Section, if the operator moves the packer or replaces the packer or tubing, then the operator shall notify the Commission and retest the well according to the minimum testing standards of (2) of this subsection.

(4) **Alternative testing procedures.** Operators can test at a maximum of 500 psi if there is in place an automatic and continuous pressure monitor on the tubing-casing annulus that will shut-in the well if there is a significant

pressure increase on the annulus. Application for this alternative test procedure shall be made in writing to the Manager of the UIC Department.

[SOURCE: Amended at 9 Ok Reg 2295; Amended at 9 Ok Reg 2337, eff 6-25-92; Amended at 11 Ok Reg 3691, eff 7-11-94; Amended at 13 Ok Reg 2387, eff 7-1-96; Amended in Rule Making 97000002, eff 7-1-97; Amended in Rule Making 200000002, eff 7-1-2000]

165:10-5-7. Monitoring and reporting requirements for wells covered by 165:10-5-1

(a) **Scope.** This Section applies to:
(1) Notice of Commencement of Injection and Disposal Operations on Forms 1012 and 1072.
(2) Annual Report of Injection Projects, saltwater disposal wells and LPG storage wells on Form 1012.
(3) Notice of Voluntary Termination of Operations on Form 1072.
(4) Notice of mechanical failure or down-hole problems.

(b) **Annual report of enhanced recovery injection projects, saltwater disposal wells and LPG storage wells.**
(1) **Submit Form 1012 by April 1st.** Each operator of a saltwater disposal well, LPG storage well or an authorized waterflood, pressure maintenance project, gas repressuring project, or other enhanced recovery project shall submit annually Form 1012 for every well to the Conservation Division as follows:
(A) Form 1012 shall be submitted by April 1st for the previous calendar year for all noncommercial wells.
(B) For commercial disposal wells Form 1012 shall be submitted February 28 and August 31, for the previous six months.
(2) **Failure to submit Form 1012.** Any operator who fails to submit the report on Form 1012 as required by (c)(1) of this Section shall be subject to a fine of $500.00 and:
(A) Injection into the project is prohibited until the operator submits Form 1012 for each injection well.
(B) The order is voidable.
(3) **Required monthly monitoring.** On a monthly basis, the operator of each enhanced recovery injection well and disposal well and LPG storage well shall monitor and record the injection rate and surface injection pressure for the well.
(4) **All UIC wells.** Saltwater disposal wells, injection wells and storage wells shall be reported on Form 1012 individually according to the order authorizing disposal.

(c) **Monitoring requirements for commercial disposal well.**
(1) The operator of a commercial disposal well shall monitor and record the casing tubing annulus pressure and the injection pressure on a daily basis.
(2) The operator of a commercial saltwater disposal well shall make available upon request of the Commission a log of all loads of deleterious substances disposed at the well. The log shall be kept on file for a period of at least five (5) years. The log of record shall include at a minimum, the amount, the location of the source, and the operator and/or owner of the source of the deleterious substance.

(d) **Notice of voluntary termination.**
(1) If an operator permanently terminates injection into a well, the operator shall submit to the Conservation Division Form 1072 within 30 days after termination of injection. Form 1072 shall state:
(A) The legal description of the well.
(B) The reason for termination.
(C) The status of other wells, if the well is in an enhanced recovery project.
(2) Submission of Form 1072 to permanently terminate injection shall terminate the authority under the order.

(e) **Notice of mechanical integrity problem.**

(1) **Notice of mechanical failure or down-hole problem.** When a mechanical problem occurs, then:

(A) The well operator shall notify the Field Inspector for Conservation within 24 hours after discovery of the problem.

(B) Within five days after discovery of the problem, the well operator shall submit to the Manager of Underground Injection Control written notice of the failure and a plan to repair and/or retest the well.

(C) Repair shall be reported on the annual Form 1012 for the well.

(D) Any operator failing to timely notify the Commission shall be subject to a fine of $1,500.00.

(2) **Shutdown.**

(A) **Administrative shutdown.** The Conservation Division may shut down a well if a mechanical failure or down-hole problem indicates that injected substances are not or may not be entering the injection interval authorized by order of the Commission.

(B) **Administrative authority to recommence injection.**

(i) If a well is shut down under (1)(A) of this subsection, the well operator shall be responsible for proving to the satisfaction of the Manager of Underground Injection Control:

(I) The mechanical integrity of the well for injection.

(II) That the injected substances are going into and are confined to the permitted injection interval.

(ii) Upon submission of proper proof of the satisfactory capability of the well for injection, the Manager of Underground Injection Control may authorize recommencement of injection.

(C) **Resolution of disputes by order of the Commission.** In the event of a dispute between the Manager of Underground Injection Control and any person as to the suitability of a well for injection, the affected person may seek relief by order of the Commission. Upon application, notice, and hearing meeting the requirements of 165:5-7-27(c) and (d) for protested applications, the Commission may issue an order determining whether or not the well should be used for further injection.

(3) **Notice of unreported repairs.** Any prior unreported repair of the well shall be reported on the next annual Form 1012 to be submitted to the Manager of the UIC Department.

[SOURCE: Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 11 Ok Reg 3691, eff 7-11-94; Amended at 13 Ok Reg 2389, eff 7-1-96]

165:10-5-8. Liquid hydrocarbon storage wells

Authorization for storage wells will be granted by order of the Commission after notice and hearing, provided there is a finding that the proposed operation will not endanger fresh water strata.

165:10-5-9. Duration of underground injection well orders

(a) Subject to 165:10-5-10, orders authorizing injection into enhanced recovery injection wells and disposal wells shall remain valid for the life of the well, unless revoked by the Commission for just cause or lapses and becomes null and void under the provisions of 165:10-5-5(c) or 165:10-5-7(f).

(b) An order granting underground injection may be modified, vacated, amended, or terminated during its term for cause. This may be at the Commission's initiative or at the request of any interested person through the prescribed complaint procedure of the Conservation Division. All requests shall be in writing and shall contain facts or reasons supporting the request.

(c) An order may be modified, vacated, amended, or terminated after notice and hearing if:

(1) There is a substantial change of conditions in the enhanced recovery injection well or the disposal well operation, or there are substantial changes in the information originally furnished.

(2) Information as to the permitted operation indicates that the cumulative effects on the environment are unacceptable.

(d) If an operator fails to submit to the Conservation Division any initial report required by this Section within eighteen (18) months after the effective date of the order permitting the well, then the terms of the order permitting the well or enhanced recovery project shall expire.

[**Source:** Amended at 11 Ok Reg 3691, eff 7-11-94]

165:10-5-10. Transfer of authority to inject

(a) An order authorizing an enhanced recovery well(s), salt water disposal well, commercial salt water disposal well, or hydrocarbon storage well(s) shall not be transferred from one operator to another without the following:

(1) Notice in writing to the Commission on Form 1073I. For transfers involving more than ten (10) wells, a transferor and transferee may file a single Form 1073I with the Conservation Division indicating the transfer of multiple wells, provided that such multiple well transfer shall be accompanied by a well list containing the following information for each well transferred:

(A) API number of the well;

(B) Well name and number;

(C) Legal location of the well, described by section, township and range; and

(D) The Commission Order number(s) authorizing the injection, disposal, or hydrocarbon storage activity.

(2) The well list may be provided in spreadsheet form, if possible, and may be filed in digital format specified by the Conservation Division. In lieu of the information listed in subparagraphs (a)(1)(A) through (D), the transferor and transferee, at their option, may file one Form 1073I indicating the transfer of multiple wells with an OCC Form 1002A Completion Report attached for each well transferred. Upon review by the Conservation Division, it may require additional information from the transferor and/or the transferee to assist in identifying the specific well(s) being transferred. The additional information may include, but not be limited to, the quarter, quarter, quarter section calls, footages from the south and west quarter section lines, and the drilling and completion dates, and initial injection, disposal or storage dates.

(3) Notice in writing to the Commission on Form 1075 demonstrating that a mechanical integrity test was performed within one year prior to the date of transfer. For commercial disposal wells, the Mechanical Integrity Test shall be conducted within 30 days prior to the date of transfer.

(4) The performance of the mechanical integrity test required in (a)(2) of this subsection shall not apply to any operator transfer when the following conditions are present:

(A) The interest of the currently designated operator is transferred to its subsidiary or parent company, or a subsidiary of a parent company;

(B) The interest of the currently designated operator is transferred to a surviving or resulting corporation or business entity due to, respectively, a merger, consolidation or reorganization involving the transferor and transferee. As used in this subparagraph, "business entity" means a domestic or foreign partnership, whether general or limited; limited liability company; business trust; common law trust, or other unincorporated business; or

(C) The currently designated operator undergoes a name change. The relief afforded by this subparagraph is not applicable to situations where the name change involves the following conditions:

(i) The assignment of a new Federal Employer Identification number by the Internal Revenue Service to the new company;

(ii) The name change is accompanied by a change in the majority of partners in a partnership;

(iii) The name change is associated with a divorce between a husband and wife when the husband and wife comprise a partnership;

(iv) The name change is associated with the death of one spouse in a partnership comprised of a husband and wife;
(v) The name change involves a sole proprietorship; or
(vi) The name change is associated with such other circumstances where the Commission determines upon application, notice and hearing that the relief provided in this subparagraph is not applicable, or that an exception to any exclusion should be granted.
(vii) As used in this subparagraph, the term "partnership" means a domestic or foreign partnership, whether general or limited.

(b) The Commission shall, within 30 days therefrom, return a copy of Form 1073I to the new and previous operator, designating approval or denial of the transfer of authority to inject for the subject well(s).

[**SOURCE:** Amended at 13 Ok Reg 2390, eff 7-1-96; Amended in Rule Making 97000002, eff 7-1-97; Amended in Rule Making 200000002, eff 7-1-00]

165:10-5-11. Notarized reports

In lieu of notarization, all Conservation Division reports shall contain the following statement signed and dated by the responsible party representing the entity which is submitting the report:
"I declare that I have knowledge of the contents of this report, which was prepared by me or under my supervision and direction, with the data and facts stated herein to be true, correct, and complete to the best of my knowledge and belief".

165:10-5-12. Application for administrative approval for the subsurface injection of onsite reserve pit fluids

Except upon a case-by-case approval of the Commission pursuant to 165:10-5-13, the subsurface injection of reserve pit fluids is prohibited into:
(1) A newly drilled well which is to be plugged and abandoned, or
(2) The casing annulus of:
(A) A well being drilled.
(B) A recently completed well.
(C) A well which has been worked over.

165:10-5-13. Application for permit for one time injection of reserve pit fluids

(a) **General.**
(1) Injection of reserve pit fluids shall be limited to injection of only those fluids generated in the drilling, deepening, or workover of the specific well for which authorization is requested.
(2) An annular injection site shall be inspected by a duly authorized representative of the Commission prior to injection.
(3) The applicant shall file with the Underground Injection Control an affidavit of delivery or mailing not later than five days after the application is filed.
(4) An operator who disposes of drilling fluid into the surface casing or annulus without approval from the Manager of Pollution Abatement shall be fined $2,500.00.

(b) **Criteria for approval.**
(1) Casing string injection may be permitted if the following conditions are met and injection will not endanger treatable water:
(A) Surface casing injection may be authorized provided that surface casing is set and cemented at least 200 feet below the base of treatable water, except as otherwise provided by the Commission; or
(B) Intermediate casing injection may be authorized provided that intermediate casing is set at least 200 feet below the base of treatable water, except as otherwise provided by the Commission.

(2) Injection pressure shall be limited so that vertical fractures will not extend to the base of treatable water.
(3) **Required form and attachments.** Each application for annular injection shall be submitted to the UIC Department on Form 1015T in quadruplicate. The forms must be properly completed and signed. Attached to one copy of the form shall be the following:
(A) Affidavit of mailing a copy of the Form 1015T or Form 1000 to the landowner and to each operator of a producing lease within 1/2 mile of the subject well.
(B) Cement Bond Log of subject well (if run).
(4) **Expiration of the permit.** The permit shall expire on its own terms three months after the date of issuance of the permit.
(c) **Emergency authority to inject into the annulus.** The Manager of the UIC Department may grant emergency authority to inject pit fluids into the annulus provided an imminent environmental endangerment exists.
(d) **Protest period.** If no protest is received within 15 days of the mailing of Form 1015T, the application shall be submitted for administrative approval. If a protest is received within the protest period, the operator shall, within 30 days, set and give proper notice of a date for hearing on the Pollution Docket before an Administrative Law Judge.

[SOURCE: Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 13 Ok Reg 2390, eff 7-1-96]

165:10-5-14. Exempt aquifers
(a) Upon application after notice and hearing, the Commission may issue an order designating an underground source of drinking water (USDW) as an exempted aquifer if the USDW:
(1) Does not currently serve as a source of drinking water.
(2) Cannot now and has no reasonable future prospect of serving as a source of drinking water because:
(A) It is mineral, hydrocarbon or geothermal energy producing source; or
(B) It is situated at a depth or location which makes recovery of water for drinking water purposes economically or technologically impractical; or
(C) It is so contaminated that it would be economically or technologically impractical to render that water fit for human consumption.
(b) For purposes of 165:10-3-4 and 165:10-5-2 through 165:10-5-13, an exempted aquifer shall not be considered as productive of treatable water.
(c) Each application under subsection (a) of this Section shall comply with 165:5-7-28.
(d) Each order designating a USDW as an exempted aquifer shall be subject to approval by the U.S. Environmental Protection Agency.

165:10-5-15. Application for permit for simultaneous injection well.
(a) **General.**
(1) Simultaneous injection of salt water without a valid permit from the Underground Injection Control Department will be subject to a fine of up to $5,000 per day of operation.
(2) A simultaneous injection facility shall be inspected by a representative of the commission prior to operation.
(b) **Criteria for approval.**
(1) Simultaneous injection may be permitted if the following conditions are met and injection will not adversely affect offsetting production nor endanger treatable water.
(A) Injection zone is located below the producing zone in the borehole.
(B) Injection pressure is limited to less than the local fracture gradient.
(C) If injection is by gravity flow, no Area of Review will be required.

(D) If injection is by positive pump pressure, a 1/4 mile Area of Review will be required. If unplugged or mud-plugged boreholes are located within the 1/4 mile radius, the operator of the proposed simultaneous injection well will be required to reconcile these boreholes prior to a permit being issued.
(E) Simultaneous injectors must meet the requirements of 165:10-3-4 as they apply to producing wells.
(F) Simultaneous injectors may be authorized to accept produced water from other wells. The UIC Department will determine on a case-by-case basis whether such a well warrants designation as a simultaneous injector, or whether the well requires a Commission order.

(2) **Required form and attachments.** Each application for simultaneous injection shall be submitted to the UIC Department on Form 1015SI in quadruplicate. The forms must be properly completed and signed. Attached to one copy of the application form shall be the following:
(A) Affidavit of mailing a copy of the completed Form 1015SI to each operator of a producing lease within 1/2 mile of the subject well.
(B) Schematic diagram of the well showing all casing and tubing strings, packers, perforations and pumps.

(3) **Monitoring, testing and reporting requirements for simultaneous injection wells.**
(A) Upon receiving a permit, operator shall file an amended Completion Report Form 1002A within 30 days of recompletion.
(B) Mechanical integrity will be demonstrated by filing annual reports of surface casing pressure, production casing pressure and fluid level.
(C) Annual Report Form 1012 shall be submitted prior to April 1 of each year for the previous calendar year.

(4) If no protest is received within 15 days of the mailing of Form 1015SI, the application shall be submitted for administrative approval. If a protest is received within the protest period, the operator shall, within 30 days, set and give proper notice of a date for hearing on the Pollution Docket before an Administrative Law Judge.

(c) **Expiration of the permit.** The permit shall expire on its own terms if the subject well is not recompleted or if a revised Form 1002A is not submitted within 180 days from the date on the permit.

SUBCHAPTER 7. POLLUTION ABATEMENT

PART 1. GENERAL PROVISIONS

PART 2. ANODE GROUNDBEDS

PART 3. STORAGE AND DISPOSAL OF FLUIDS

[BLANK PAGE]

PART 1. GENERAL PROVISIONS

165:10-7-1. Pollution abatement [RESERVED]

165:10-7-2. Administration and enforcement of rules

The Manager of Pollution Abatement shall supervise and coordinate the administration and enforcement of the rules of this Subchapter under the direction of the Director of Conservation and the Commission.

165:10-7-3. Cooperation with other agencies

(a) The rules of this Subchapter shall not be construed as modifying the rights, obligations, or duties of any person under any law of this State or under any order, rule, or regulation of the Oklahoma Water Resources Board, State Department of Health, Oklahoma Wildlife Conservation Commission, State Board of Agriculture, Department of Pollution Control, or any other agency of this State with respect to the pollution of fresh water.
(b) Whenever a written complaint against any person is filed with the Commission alleging pollution as prohibited by 165:10-7-5, the Manager of Pollution Abatement shall immediately initiate such action as may be necessary or appropriate to abate the pollution.
(c) OPERATORS TAKE NOTE: Federal statutes, such as the Bald Eagle Protection Act (16 U.S.C. Sections 668-668d), the Migratory Bird Treaty Act (16 U.S.C. Sections 703-711), the Endangered Species Act (16 U.S.C. Sections 1531-1542), and the Lacey Act Amendments of 1981 (16 U.S.C. Sections 3371-3378), dictate substantial fines and penalties for persons who allow birds of certain species to become fatally injured due to incidental contact with oil or oil by-products. These fines may be levied upon persons allowing such fatalities to occur, whether accidental or not. Misdemeanor and felony convictions may include imprisonment. Information on affected bird species, regulations under these Acts, and measures which can be taken to prevent such occurrences, such as the netting or covering of open-topped tanks and pits which contain oil or oil by-products, can be obtained from the U.S. Fish and Wildlife Service Office in Oklahoma City or the nearest Oklahoma Department of Wildlife Office.

165:10-7-4. Water quality standards

(a) **Scope.** The Commission hereby adopts the State water quality standards established and promulgated by the Oklahoma Water Resources Board (OWRB) or its successors effective October 7, 1987, and additions and revisions as lawfully published in the Oklahoma Register effective as provided by statute. The Commission's Oil and Gas Conservation Division (Conservation Division) shall implement the water quality standards with regard to its particular jurisdictional areas as referred to in (c).
(b) **General considerations.**
   (1) The primary goal of the implementation of the water quality standards in the context of a remediation project subject to Commission jurisdiction shall be the protection and/or restoration of the beneficial use of the land, the soil and any surface or subsurface waters of the State adversely impacted or impaired by pollution from a Commission regulated site or facility.
   (2) A remediation project utilizing the water quality standards shall adhere to the general practices appearing in the Conservation Division's *Oklahoma Water Quality Standards Implementation Plan (WQSIP)*.
   (3) Where appropriate, a remediation project utilizing the water quality standards shall follow the use support assessment protocols (OWRB-OAC 785:46-7) as specified in *Oklahoma Water Quality Standards Implementation Plan*.

(c) **Specific areas of Conservation Division jurisdiction.** Compliance with the water quality standards for specific areas of the Conservation Division's jurisdiction requires compliance with rules applicable to these operations, found in Oklahoma Corporation Commission Oil and Gas Conservation rules OAC 165, Chapter 10. Responsible parties shall refer to and comply with the rules in OAC 165:10 that pertain to each of the environmental jurisdictional areas listed below as (1) through (10). The completion of a remediation project pursuant to this paragraph and compliance with rules pertaining to specific areas of Conservation Division jurisdiction shall be considered compliance with the water quality standards. The partial listing of rules in the Commission's "Guidance Document of Technical Measures" for technology-based pollution prevention measures in areas of jurisdictional responsibility (1) through (8) and (10), listed below, is for guidance only and is not intended to be an exhaustive notation. Similar applicable rules for jurisdictional area (9), below, are listed in the WQSIP. Review of the Conservation Division rules will be made on a case by case basis to determine compliance:

(1) Field operations for geologic and geophysical exploration for oil, gas and/or brine, including seismic shot holes, stratigraphic test holes or other test wells.

(2) Exploration, drilling, development, production or processing of oil, gas and/or mineral brine at the lease site.

(3) The exploration, drilling, development and operation of wells used in connection with the recovery, injection, or disposal of mineral brines including construction, operation, maintenance, closure and abandonment of the facilities and activities.

(4) Reclaiming and/or recycling facilities associated with the exploration, drilling, development, production or transportation of oil and/or gas (including the processing of saltwater, crude oil, natural gas condensate, tank bottoms or basic sediment from crude oil tanks, pipelines, pits and equipment).

(5) Underground injection control pursuant to the federal Safe Drinking Water Act and 40 CFR parts 144 through 148 for Class II injection wells, Class V wells used for the recovery, injection or disposal or mineral brines as defined in the Oklahoma Brine Development Act.

(6) Tank farms for storage of crude oil and petroleum products located outside the boundaries of refineries, petrochemical manufacturing plants, natural gas liquid extraction plants, or other facilities that are not subject to the jurisdiction of the Oklahoma Department of Environmental Quality.

(7) Construction and operation of pipelines and associated rights-of-way, equipment, facilities or buildings used in the transportation of oil, gas, petroleum, petroleum products, anhydrous ammonia or mineral brine, or in the treatment of oil, gas or mineral brine during the course of transportation [not including pipelines in natural gas liquids extraction plants, refineries, or reclaiming facilities other than those specified in OAC 165:10-7-4(c)(6)].

(8) The handling, transportation, storage and disposition of saltwater, drilling fluids, mineral brines, waste oil and other deleterious substances produced from or obtained or used in connection with the drilling, development, production, and operation of oil and gas wells at any facility or activity specifically subject to Commission jurisdiction or other oil and gas extraction facilities and activities.

(9) Spills of deleterious substances associated with facilities and activities specified in OAC 165:10-7-4(c)(8) or otherwise associated with oil and gas extraction and transportation activities.

(10) Groundwater protection for activities subject to the jurisdictional areas of environmental responsibility of the Commission.

(d) **Monitoring of sites.** Before consideration for closure by the Conservation Division or the Commission, the responsible party shall monitor a remediation project subject to implementation of the water quality standards for a period of one (1) year, unless:

(1) Otherwise provided by Commission order, or

(2) As directed by the Manager of Pollution Abatement or designated Conservation Division staff.

(e) **Public participation; Resolution of complaint or disagreement with Conservation Division staff.**

(1) In any case where the Conservation Division determines the need for public participation in the resolution of a pollution complaint involving the implementation of the water quality standards or other issues relating to pollution, the Conservation Division may file an application and notice of hearing to request resolution of the complaint by adjudicative hearing and Commission order.

(2) In any case where a pollution complaint involving the implementation of the water quality standards or other issues relating to pollution cannot be resolved administratively between the responsible party and the complainant or because of a disagreement with the Conservation Division's Manager of Pollution Abatement, Manager of Field Operations, or other Conservation Division staff, regarding the complaint, the responsible party or the complainant may file an application and notice of hearing to request resolution of the complaint by adjudicative hearing and Commission order.

[**SOURCE:** Amended in Rule Making 200100005, eff 7-1-01]

165:10-7-5. Prohibition of pollution

(a) **General.** Pollution is prohibited. All operators, contractors, drillers, service companies, pit operators, transporters, pipeline companies, or other persons shall at all times conduct their operations in a manner that will not cause pollution.

(b) **Workable coal seams.** Sections 305, 306, 307, and 308 of Title 52, Oklahoma Statutes Annotated, governing the drilling, operations, and plugging of oil and gas wells in workable coal beds are hereby adopted as rules of the Commission as fully as if set out verbatim herein.

(c) **Reporting nonpermitted discharges (spills, etc.).**

(1) All operators, contractors, drillers, service companies, pit operators, transporters, pipeline companies, or other persons conducting operations regulated by the Commission shall:

(A) Report verbally, with respect to their operations, to the Commission District Office or Field Inspector within 24 hours of discovery:

(i) Any non-permitted discharge of deleterious substances of ten bbls. or more (single event) to the surface.

(ii) Any discharge of a deleterious substance, regardless of quantity, to the waters of the State.

(B) File a written or oral report with the District Office within ten working days specifying the following:

(i) Name of party reporting, firm name, and telephone number.
(ii) Legal location.
(iii) Lease or facility name.
(iv) Operator.
(v) Circumstances surrounding discharge and whether discharge was to water or soil.
(vi) Date of occurrence.
(vii) Volumes discharged.
(viii) Type of materials discharged.
(ix) Method of cleanup (if any) undertaken and completed.
(x) Volumes recovered.

(C) Maintain adequate records of each non-permitted discharge reflecting the information, time, and manner of reporting pursuant to this Section for a minimum of three (3) years.
Such documents shall be produced upon demand by an authorized representative of the Commission.

(D) Report hazardous substances that meet reportable quantities under Comprehensive Environmental Response Compensation and Liability Act (CERCLA) (40 C.F.R. Part 302) in the format as required under this subsection.

(2) Any operator, contractor, driller, service company, pit operator, transporter, or pipeline company who fails to comply with provisions of this rule may be fined $500.00 per incident.

[**SOURCE:** Amended at 9 Ok Reg 2295; Amended at 9 Ok Reg 2337, eff 6-25-92; Amended in Rule Making 97000002, eff 7-1-97]

165:10-7-6. Protection of municipal water supplies

The Commission, upon application of any municipality or other governmental subdivision, may enter an order establishing special field rules within a defined area to protect and preserve fresh water and fresh water supplies.

165:10-7-7. Informal complaints, citations, red tags, and shut down of operations

(a) This Section applies only to Field Operations Department of the Oil and Gas Conservation Division.

(b) For an alleged violation of an order or provision of this Chapter, a district manager or field inspector may attempt to contact the alleged violator or his agent, in person or by telephone. In addition, the district manager of field inspector may notify the alleged violator by mailing or delivering either Form 1036. The Form 1036 shall warn a person about an alleged violation, and it shall specify a time period for compliance. The Form 1036A shall be used for purposes of the monetary fines procedure in 165:10-7-9. Mailing of either form may be to the last known address of the alleged violator according to Commission records.

(c) Where surface or subsurface pollution is apparent, a district manager or field inspector may direct an alleged violator to take steps necessary to stop and/or clean up pollution. Said steps may include a temporary shut down of the lease or facility. If an alleged violator cannot be located, the district manager or field inspector may take emergency action necessary to abate pollution.

(d) If a district manager or field inspector issues a Form 1036, an inspection of the lease or facility shall be made after the compliance period shown on the form. If the inspection shows that the alleged violator failed to comply as directed, the district manager or field inspector may:

(1) Issue a Form 1036A, where applicable,

(2) Refer the matter to the Office of General Counsel for prosecution, and/or

(3) Temporarily shut down the lease or facility until further notice from the Commission.

(e) In shutting down a lease or facility, the district manager or field inspector shall affix at the site a red tag (directive to shut down). If the alleged violator removes or ignores a red tag, the Commission shall levy a monetary fine against him. The fine shall be $5,000.00.

[**Source:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 12 Ok Reg 2017, eff 7-1-95]

165:10-7-8. Inspection and enforcement [RESERVED]

165:10-7-9. Scheduled monetary fines

(a) **Scope.** This Section prescribes amounts and procedure for imposing monetary fines arising from the categories of rule violations shown on Schedules A and B, Appendix E and F, respectively to this Chapter.

(b) **Issuance of complaint-citations.**

(1) If the Conservation Division discovers an alleged violation in any category on Schedule A, it may issue a complaint-citation on Form 1036A.

Said form shall describe the alleged rule violation, and it shall prescribe a monetary fine.

(2) If the Conservation Division discovers an alleged violation in any category on Schedule B, it may issue a complaint-citation on Form 1036A. Said form shall describe the alleged rule violation. It shall establish a time period for compliance without a monetary fine. It shall prescribe a Schedule B fine if the alleged violator fails to comply with Commission rules within the specified time period for compliance.

(c) **Notice.** Any complaint-citation (OCC Form 1036A) issued under this Section shall be mailed or delivered to the alleged violator at the last known address shown on Commission records.

(d) **Hearing option.**

(1) Any alleged violator shall have the option to pay the prescribed fine or contest it at an evidentiary hearing. Payment of the fine within the time provided on the complaint-citation shall be considered and accepted as a plea of no contest.

(2) To obtain an evidentiary hearing, the alleged violator must request it at the preliminary hearing described on the complaint-citation. Failure to timely request an evidentiary hearing may result in an order assessing the fine prescribed by the complaint-citation.

(3) Appeal from any report of the Administrative Law Judge shall be to the panel of Commissioners in accordance with the Rules of Practice, OAC 165:5.

(e) **Payment of fines.** A person may pay a fine with cash, a money order, or check; provided, that any cash payment must be made at a Commission cashier's window. All checks must be made payable to the Oklahoma Corporation Commission. A copy of the complaint-citation must accompany payment to ensure proper credit.

(f) **Additional enforcement measures.**

(1) The Conservation Division and the Secretary of the Corporation Commission may issue one or more complaint-citations to a person who fails to bring a lease and/or facility into compliance with the rules of this Chapter.

(2) Until payment in full or payment schedule has been determined, the Conservation Division may shut-down any lease and/or facility associated with an overdue fine assessed by Commission order after notice and hearing.

[**SOURCE:** Added at 9 Ok Reg 2295, eff 6-25-92]

PART 2. ANODE GROUNDBEDS

165:10-7-14. Anode groundbeds

(a) **Definitions.** The following words or terms, when used in this Section, shall have the following meaning, unless the context clearly indicates otherwise:

(1) **"Anode"** means the electrode of an electrochemical cell at which oxidation occurs.

(2) **"Cathodic protection"** means a technique used to reduce the corrosion of a metal surface by making that surface the cathode of an electrochemical cell.

(3) **"Deep anode groundbed"** means one or more anodes installed vertically at a depth of fifty (50) feet or more below the earth's surface in a drilled hole for the purpose of providing cathodic protection.

(4) **"Shallow anode groundbed"** means one or more anodes installed either vertically or horizontally at a nominal depth of less than fifty (50) feet.

(5) **"Annular space"** means the space between the surface casing and the borewall or the space between two or more strings of casing placed in the borehole.

(6) **"Operator"** means the person who is duly authorized and in charge of the development of the operation of the pipeline or the development of a lease for the production of hydrocarbons.

(b) **Permit to drill.**

(1) The operator shall make application on Form 1000B and obtain a permit to drill a deep anode groundbed.
(2) A permit to drill shall be valid only for one or more deep anode groundbeds within a designated 10 acre tract.
(3) The Commission shall approve or deny the application within 30 days of date of receipt.
(4) Any contractor drilling a deep anode groundbed shall be licensed within the State of Oklahoma.
(5) Any operator who drills a deep anode groundbed without a permit shall be subject to a fine of one thousand dollars ($1,000.00).

(c) **Expiration.** A permit to drill shall expire six (6) months from the date of issuance, unless drilling operations are commenced.

(d) **Posting of permit to drill at the site.** During any activity subject to this Section the operator shall maintain at the site a legible copy of the permit to drill for inspection.

(e) **Notice.** The Commission's District Manager or Field Inspector shall be given at least twenty-four (24) hours notice prior to commencing drilling operations.

(f) **Notice of failure to comply with permit conditions.** The operator shall notify the district office or the field inspector within twenty-four (24) hours of any failure to comply with the construction requirements approved on the permit.

(g) **Deep anode groundbed abandonment.**
(1) In the event the hole is lost during drilling, the hole will be plugged as soon as possible.
(2) Upon abandonment of a deep anode groundbed, the hole shall be plugged within thirty (30) days of abandonment.

(h) **Construction standards.**
(1) **Shallow anode groundbeds.**
(A) Shallow anode groundbeds shall be constructed in order to prevent runoff water from entering the anode system or the commingling of water from separate groundwater bearing formations.
(B) Vertical shallow groundbeds shall be sealed by backfilling the hole with native cuttings or an approved sealing material.
(2) **Deep anode groundbeds.**
(A) Deep anode groundbeds shall be constructed in order to prevent runoff water from entering the anode system or the commingling of groundwater formations with different water quality.
(B) Surface casing shall be set a minimum of twenty (20) feet below ground level, or at a depth previously approved by the Oil and Gas Division's Technical Department.
(C) If surface casing is not placed in the hole, the hole shall be filled with bentonite or cement from the top of the Coke Breeze Column to three (3) feet below surface. Native cuttings or soil shall be used to fill the remaining portion of the hole.
(D) The annular space between the casing and drilled hole shall be a minimum of two (2) inches to allow for a proper seal.
(E) The sealing material for the annular space for surface casing shall be bentonite, cement or a material previously approved by the Oil and Gas Division's Technical Department.
(F) Centralizers shall be used at a minimum of one (1) for every twenty-five (25) feet of surface casing run in the hole unless previously approved by the Oil and Gas Division's Technical Department on form 1000B.
(G) The groundbed shall be capped to prevent the entry of foreign material. Allowances for a vent pipe will be approved.

(i) **Groundbed materials.** Groundbed materials that do not contaminate groundwater shall be required at all times.

(j) **Plugging requirements.**
(1) All wires and vent pipe must be cut off at the top of the ten (10) foot surface plug, and the vent pipe must be securely capped and plugged.
(2) Cased holes shall be filled to at least ten (10) feet from the surface with native cuttings, anode materials, cement or with a material approved by the Pollution Abatement Department.

(3) Cement or bentonite shall be placed in the hole at a minimum of ten (10) feet below the surface to within three (3) feet of the surface. The remainder of the hole shall be filled with native cuttings, soil or a material approved by the Pollution Abatement Department.
(4) If the standard method is inadequate to stop artesian flow, alternate remedies must be employed to do so.
(5) All holes shall be properly completed or plugged to protect groundwater.

[**SOURCE:** Added in Rule Making 97000002, eff 7-1-97]

PART 3. STORAGE AND DISPOSAL OF FLUIDS

165:10-7-15. Drilling or seismic activity near superfund sites or hazardous waste facilities

Any drilling or seismic activity related to oil or gas exploration or production shall be prohibited within 500 feet of the boundary of any superfund site pursuant to the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), 42 U.S.C. Sections 9601, et. seq., or active hazardous waste treatment, storage, or disposal facility. A current listing of all superfund sites and active hazardous waste facilities is available from the Manager of Pollution Abatement. Seismic work, monitoring wells, or recovery wells necessary for identification, monitoring, or remediation of the superfund site or hazardous waste facility shall be exempt from this Section. Any request for exception to this Section shall comport with the requirements generally for filing of applications under the Commission's Rules of Practice (see 165:5-7-1); in addition, notice shall be given to the Oklahoma State Department of Health, 1000 Northeast Tenth Street, Oklahoma City, Oklahoma 73152.

165:10-7-16. Use of noncommercial pits

(a) **Scope.** This Section shall cover the permitting, construction, operation, and closure requirements for any noncommercial pit. A noncommercial pit is an earthen pit which is located either on-site or off-site and is used for the handling, storage, or disposal of drilling fluids and/or other deleterious substances produced, obtained, or used in connection with the drilling and/or operation of a well or wells, and is operated by the generator of the waste. This does not cover disposal well pits. (See 165:10-7-20 and 165:10-9-3.)
(b) **Liner requirements.**
(1) **Reserve/circulation and/or completion/fracture/workover pits.**
(A) To assist in determining the construction requirements for a particular proposed reserve/circulation pit, either on-site or an off-site, the operator of the pit shall indicate on Form 1000 the type of mud system(s) to be used, the maximum and average anticipated chloride concentration of the mud (based on drilling records in the area), whether or not pit fluids will be segregated, and shall furnish other information required by this Section or requested by the Commission's Technical Department.
(B) The Commission's Technical Department shall evaluate the site based upon Oklahoma Geological Survey maps and other pertinent information and shall assign one of the following categories to any proposed reserve/circulation pit, designating same on Form 1000 and indicating whether or not a liner is required:
(i) **Category 1A - Geomembrane liner.**
(I) **Water based drilling fluid containment and/or water-based completion/fracture/workover fluid containment located over a alluvial deposit or in a near surface static water level environment.** Any pit used to contain water-based drilling fluids, cuttings and/or completion/ fracture/ workover fluids located in alluvial deposit area or an area where the static water table is

within 10 feet of the surface shall utilize a geomembrane liner for all drilling fluids and cuttings and/or completion/ fracture/ workover fluids.

(II) **Water-based drilling fluid containment and/or water-based completion/fracture/workover fluid containment located within a wellhead protection area.** Any pit used to contain water-based drilling fluids, cuttings and/or completion/fracture/workover fluids located within a wellhead protection area (WPA) as identified by the Wellhead Protection Program (42 U.S.C. Section 300h-7, Safe Drinking Water Act), or within one mile of an active municipal water well for which the WPA has not been delineated, shall be required to have a geomembrane liner.

(ii) **Category 1B - Soil liner or geomembrane liner.**

(I) **Water-based drilling fluid containment and/or water-based completion/fracture/workover fluid containment located over a terrace deposit.** Any pit used to contain water-based drilling fluids, cuttings and/or completion/ fracture/ workover fluids located over a terrace deposit shall be required to have either a soil liner or a geomembrane liner.

(II) **Water-based drilling fluid containment and/or water-based completion/fracture/workover fluid containment located over a bedrock aquifier or Hydrologically Sensitive Area(HSA).** Any pit used to contain water-based drilling fluids, cuttings and/or completion/ fracture/workover fluids located over any bedrock aquifer or HSA and is used to contain water-based drilling fluids and/or cuttings and/or completion/fracture/workover fluids with chlorides in excess 5,000 mg/l shall be required to have a soil liner or a geomembrane liner. A separate unlined pit may be used to contain fluids and/or cuttings with a chloride content of less than of 5,000 mg/l.

(iii) **Category 2 - Water-based/other situations.** Any pit which is used to contain water-based drilling fluids, cuttings and/or completion/fracture/workover fluids with a set of conditions different from Categories 1A and 1B shall not be required to be lined.

(iv) **Category 3 - Oil-based.** Any pit used to contain oil-based drilling fluids, cuttings and/or completion/fracture/workover fluids shall be required to have a geomembrane liner.

(v) **Category 4 - Air-based.** Any pit used to contain the cuttings from an air-based system shall not be required to be lined.

(2) **Other type pits.**

(A) Any basic sediment pit shall be required to have a geomembrane liner.

(B) Any emergency pit shall not be required to be lined.

(C) Any flare pit shall not be required to be lined.

(D) Any recycling/reuse pit, spill containment pit, or remediation pit shall conform to the same criteria for determining liner requirements for reserve/circulation and/or completion/fracture/workover pits, pursuant to (b)(1) of this Section.

(3) **Converted pits.** Any pit that is to be converted from one use to another, e.g., reserve pit to completion or fracture pit, shall have the more stringent liner requirements, pursuant to (c)(6) and (c)(7) of this Section.

(4) **Offsite pits.** Any offsite pit shall conform to the liner requirements in this Section and will require a permit. The operator of the proposed pit shall submit Form 1014 in duplicate to the appropriate District Office for review and approval. No offsite reserve pit may be permitted or constructed at a spacing closer than one pit per governmental quarter quarter section and a distance less than 600 feet from any other pit. Any offsite reserve pit may be reclassified or considered as a commercial pit, pursuant to 165:10-9-1, if it is constructed or used at a spacing closer than one reserve pit per governmental quarter quarter section. Closure of any offsite reserve pit shall not warrant the permitting of another offsite reserve pit within the same governmental quarter quarter section. For use of a pit without a permit, the pit operator may be fined up to $1,000.00.

(5) **Variances.** Any variance from the liner requirements of this Section may be granted by the Manager of the Technical Department after receipt of a written request and supporting documentation required by the Department.

(c) **Construction requirements.**

(1) **Field or area rules.** Any noncommercial pit which is to be constructed or used in an area covered by a field or area rule shall be subject to the more stringent requirements of either this Section or the field or area rule.

(2) **Stockpiling of topsoil.** Prior to constructing any noncommercial pit, except an emergency pit, all top soil within the top twelve inches shall be stripped and stockpiled for use as the final cover of fill at the time of closure. The top soil may be stockpiled in the berms, provided it is not mixed with other materials and can be readily distinguishable from other materials at the time of closure.

(3) **Exclusion of runoff water.** Any noncommercial pit shall be constructed and maintained so that runoff water from outside the location is not allowed to enter it.

(4) **Flood protection.** Any noncommercial pit which is constructed in any area subject to frequent flooding according to the Soil Conservation Service County Soil Survey shall have berms substantial enough to prevent overtopping or washing out.

(5) **Constructing on fill.** Any noncommercial pit which requires a liner and is constructed on fill shall be constructed so that the maximum level of the solid contents will be maintained at least three feet below the natural ground level.

(6) **Soil liners.**

(A) Soil materials used or to be used in a soil liner shall undergo permeability testing either before or after construction, unless exempt pursuant to (B) of this paragraph.

(i) Pre-construction permeability testing shall consist of laboratory permeability tests on at least two specimens of representative soil liner materials compacted in the laboratory to approximately 90 percent of the material's Standard Proctor Density (ASTM D-698).

(ii) Post-construction permeability testing shall consist of at least two laboratory permeability tests on undisturbed samples of the completed soil liner or one field permeability test on the completed soil liner. Particular emphasis shall be placed on selecting the location(s) for permeability tests or test samples where nonuniformity in soil texture or color can be observed.

(iii) Laboratory permeability test procedures must conform to one of the methods described for fine-grained soils in the Corps of Engineers Manual EM-1110-2-1906 Appendix VII. In no case shall the pressure differential across the specimen exceed five feet of water per inch of specimen length. Field permeability tests shall be conducted only by the double ring infiltrometer method as described in ASTM D-3385. Permeability tests may be discontinued prior to flow stabilization upon satisfactory evidence that the permeability rate is less than 1.0×10^{-6} cm/sec.

(iv) If permeability testing shows that addition of bentonite or other approved material is needed to assist the native soils in meeting the permeability standard, it shall be applied at a minimum rate specified by the testing or engineering firm. Any bentonite used for liner material shall not have been previously used in drilling muds.

(B) Permeability testing requirements for soil materials may be exempt if laboratory testing of a minimum of two representative samples of the soil materials found throughout the entire depth of the proposed excavation indicates that the plasticity index is greater than 16 (ASTM D-4318) and that the amount passing the No. 200 U.S. standards sieve is greater than 60 percent (ASTM D-1140).

(C) Any soil liner shall be constructed by disturbing the soil to the depth of the bottom of the liner, applying fresh water as necessary to the soil materials to achieve a moisture content wet of optimum, then recompacting it with heavy construction equipment, such as a footed roller, until the required density is achieved, pursuant to (H) of this paragraph.

(D) Any soil liner shall cover the bottom and interior sides of the pit entirely.

(E) Any soil liner shall be installed on a slope no steeper than 3:1 (horizontal to vertical).

(F) Any soil liner shall have a minimum thickness of six inches (after compaction), and shall have a maximum coefficient of permeability of 1.0 x 10^{-6} cm/sec, unless it conforms to (G) of this paragraph.

(G) A soil liner may have a coefficient of permeability greater than 1.0 x 10^{-6} cm/sec if it is greater in thickness and constructed in accordance with the following:

(i) A minimum twelve inch compacted soil liner shall have a maximum coefficient of permeability of 2.0 x 10^{-6} cm/sec.

(ii) A minimum 18 inch compacted soil liner shall have a maximum coefficient of permeability of 3.0 x 10^{-6} cm/sec.

(iii) A compacted soil liner may not be constructed thicker than 18 inches for the purpose of meeting a coefficient of permeability greater than 3.0 x 10^{-6} cm/sec.

(iv) Any soil liner with a minimum twelve inch or 18 inch thickness shall be constructed in maximum lifts of six inches (after compaction). Each lift shall be scarified before placement of the next lift and shall conform to (H) of this paragraph.

(H) Any soil liner shall be field tested for compaction, unless a post-construction permeability test is performed, pursuant to (A)(ii) of this paragraph.

(i) A minimum of six compaction tests shall be performed on any soil liner; a minimum of four widely spaced tests in the bottom of the pit and two tests on different slopes of the pit are required, unless otherwise directed by a Field Operations representative. Particular emphasis shall be placed on selecting locations for compaction tests where nonuniformity in soil texture or color can be observed.

(ii) Compaction tests shall be conducted in accordance with ASTM methods D-2922 or D-1556.

(iii) The soil materials of any liner shall be compacted to at least 90 percent of the Standard Proctor Density (ASTM D-698).

(7) **Geomembrane liners.**

(A) Any geomembrane liner that is installed in a reserve/circulation pit, spill prevention pit, or remediation pit, completion/fracture/workover pit, basic sediment pit, or recycling/reuse pit shall have a minimum thickness of 20-mil.

(B) Any geomembrane liner used in a noncommercial pit shall be chemically compatible with the type of substances to be contained and shall have ultraviolet light protection.

(C) Any geomembrane liner shall be placed over a specially prepared, smooth, compacted surface void of sharp changes in elevation, rocks, clods, organic debris, or other objects.

(D) Any geomembrane liner shall be continuous, although it may include seams, and shall cover the bottom and interior sides of the pit entirely. The edges shall be securely placed in a minimum twelve inch deep anchor trench around the perimeter of the pit.

(8) **Certification of liner.** The operator of any noncommercial pit that is constructed with a soil or geomembrane liner shall secure an affidavit signed by the installer, certifying that the liner meets minimum requirements and was installed in accordance with Commission rules. It shall be the operator's responsibility to maintain the affidavit and all supporting documentation pertaining to the liner (e.g., permeability and compaction test results, bentonite receipts, and geomembrane liner specifications from the manufacturer), and shall make them available at all times for review by any representative of the Conservation Division.

(d) **Operation and maintenance requirements.**

(1) **Freeboard.** The fluid level of any noncommercial pit shall be maintained at all times at least 24 inches below the lowest elevation on the top of the berm.
(2) **Reserve/circulation pits.** The operator of any reserve/circulation pit shall limit its contents to the fluids and cuttings from a single well.
(3) **Off-site reserve pits.** A waterproof sign shall be posted within 25 feet of any off-site reserve pit and shall bear the name of the operator, legal description to the quarter quarter quarter section, permit number, and emergency telephone number.
(4) **Recycling/reuse pits.**
(A) Any pit permitted for drilling mud recycling or reuse may contain the fluids and cuttings from multiple wells, provided that those wells are operated by the pit operator.
(B) A waterproof sign shall be posted within 25 feet of any recycling/reuse pit and shall bear the name of the operator, legal description to the quarter quarter quarter section, permit number, and emergency telephone number.
(5) **Prevention of pollution.**
(A) All noncommercial pits shall be constructed, used, operated, and maintained at all times so as to prevent pollution. In the event of a nonpermitted discharge from a noncommercial pit, sufficient measures shall be taken by the operator to stop or control the loss of contents, and reporting procedures pursuant to 165:10-7-5(c) shall be followed. Any materials lost from a pit shall be cleaned up as directed by any Field Operations representative. For a willful non-permitted discharge from a noncommercial pit, the operator may be fined up to $2,000.00.
(B) The protection of migratory birds shall be the responsibility of the operator. Therefore, the Conservation Division recommends that to prevent the loss of birds, oil be removed or the surface area covered by the oil be protected from access to birds. [See Advisory Notice 165:10-7-3(c)].

(e) **Closure requirements.**
(1) **Designation of disposal method.** The operator of any reserve/circulation pit shall indicate the proposed method of disposal of drilling fluids and/or cuttings on Form 1000 as required by 165:10-3-1(f). Options shall be limited to the following, unless written approval is granted by a Field Operations representative:
(A) Evaporation/dewatering and backfilling.
(B) Chemical solidification of pit contents.
(C) Annular injection (requires permit).
(D) Land application (requires permit).
(E) Disposal in permitted commercial pit.
(F) Disposal at permitted commercial soil farming facility.
(G) Disposal at permitted recycling/reuse facility.
(2) **Trenching.**
(A) Before trenching, stirring or otherwise disturbing the bottom of any noncommercial pit, the pit shall be completely dewatered.
(B) Trenching, stirring, or other similar practice shall be prohibited for any lined pit.
(3) **Lined pits.**
(A) When closing any noncommercial pit with a soil or geomembrane liner, extreme care shall be taken to preserve the integrity of the liner.
(B) For any lined reserve/circulation pit, completion/fracture/workover pit, recycling/reuse pit, or basic sediment pit, all free liquids shall be removed or chemically solidified with nonhazardous material.
(C) For any lined oil-based reserve/circulation pit, all cuttings remaining in the pit shall be chemically solidified with nonhazardous material.
(D) Soil cover, pursuant to (5) of this subsection, shall follow.
(4) **Soil cover.** Closure procedures for any noncommercial pit shall include a minimum of three feet of soil cover over any remaining pit contents, with all stockpiled topsoil being applied last. The materials shall be mounded or sloped to encourage runoff. A variance from this provision may be granted by a Field Operations District Office for justifiable cause. A

written request and supporting documentation is required. The Field Operations office shall respond in writing within five working days either approving or disapproving the request.

(5) **Erosion control.** Any noncommercial pit shall be closed in such a manner that any future erosion will not cause the discharge of the pit contents. This may require vegetative cover and/or a diversion terrace(s).

(6) **Notification to District Office.** The operator of any noncommercial pit shall notify the appropriate Field Inspector or District Office at least 48 hours prior to commencing closure, and for reserve/circulation pits shall advise if the disposal method is different from that indicated on Form 1000. The operator shall also notify the Field Inspector or District Office within 48 hours after reclamation of the site has been completed.

(7) **Time limits.** Any noncommercial pit shall be closed within the time limits set forth in this paragraph. Any extension of time for pit closure must be requested by the operator, who shall file an application pursuant to OAC 165:5-7-33. A legal change of operator of any noncommercial pit shall not extend the time limit for closure. If a noncommercial pit is converted from one type of use to another, the last use shall determine the time limit for closure.

(A) Any Category 1A, 1B or ~~3~~ 2 reserve/circulation pit, either on-site or off-site, shall be closed within twelve months after drilling operations cease.

(B) Any Category 3 reserve/circulation pit, either on-site or off-site shall be closed within six months after drilling operations cease.

(C) Any Category 4 pit shall have closure procedures commenced within 30 days and completed within 90 days after drilling operations cease.

(D) **Completion/fracture/workover pits.**

(i) Any reserve/circulation pit converted to a completion/fracture/workover pit shall be closed within six (6) months after drilling operations cease. Upon request by the operator, a six (6) month extension shall be granted by the Conservation Division, after review by a field inspector to confirm the pit is in compliance with 165:10-7-16 (c) and (d)requirements.

(ii) Any completion/fracture/workover pit not converted from a reserve/circulation pit shall be closed within 60 days after completion, fracture, or workover operations cease.

(E) Any emergency pit shall be emptied of its contents as soon as possible and closed within 60 days after the emergency situation ceases to exist.

(F) Any flare pit shall be closed within 30 days of abandonment of a lease.

(G) Any spill containment pit shall be closed within 30 days of abandonment of a lease.

(H) Any basic sediment pit shall be closed within 60 days after use of the pit ceases.

(I) Any recycling/reuse pit shall be closed within twelve months after operations cease.

(J) Any remediation pit shall be closed immediately after receipt of all contaminated materials.

(8) For failure to comply with any closure requirement, the operator may be fined up to $1,000.00.

(9) **Waiver of closure requirements.** Exemption from closure and transfer of responsibility for any noncommercial pit to the surface owner or other party shall be requested by filing an application pursuant to OAC 165:5-7-34. No approval shall be granted unless the analyses of the fluids show that the following ranges or concentrations are not exceeded:

(A) pH - 6.0-9.5 s.u.
(B) Chlorides - 3500 mg/l
(C) Total Dissolved Solids (TDS) - 7000 mg/l
(D) Chromium (Total) - 10 mg/l
(E) Arsenic - 20 mg/l

[**Source:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 12 Ok Reg 2017, eff 7-1-95; Amended in Rule Making 980000035, eff 7-1-99]

165:10-7-17. Surface discharge of fluids

(a) **Scope.** This Section shall cover the surface discharge of hydrostatic test water, storm water from diked areas, and produced water from tanks or other containment vessels.

(b) **Discharge of hydrostatic test water.**

(1) Hydrostatic test water used in the testing of new pipeline segments, new casing, new tubing, new tanks and new vessels, may be discharged as necessary without a permit, notification to the Commission, or adherence to any other provisions of this Section, provided the following conditions are met:

(A) **Low chlorides.** Chloride concentration does not exceed 1000 mg/l.

(B) **Sheen.** There shall be no visible sheen or discoloration as a result of testing; however, certain dyes used to establish mechanical integrity may be approved.

(C) **Notice to District Office.** Any discharges exceeding 1,000 barrels shall require notification to the appropriate District Office.

(2) Hydrostatic test water used in the testing of existing tanks, vessel lines and transmission pipelines may be discharged upon notification to the Oklahoma Corporation Commission appropriate District Office on Form 1014HD provided that the following conditions are met:

(A) **Oil and grease.** The oil and grease content of the discharge water shall not exceed 15 mg/l.

(B) **Sheen.** There shall be no visible sheen or discoloration as a result of testing; however, certain dyes used to establish mechanical integrity may be approved.

(C) **Total Suspended Solids (TSS).** The TSS shall not exceed 45 mg/l.

(D) **pH.** The pH shall not be less than 6.5 nor exceed 9 s.u.

(E) **Foreign material.** The discharge must be free from foreign material such as welding scrap tank sediments or sand blasting waste material.

(F) **Soil erosion.** Standard soil erosion prevention procedures shall be required.

(3) Hydrostatic test water that meets the requirements listed in (b) (2) of this Section may be discharged in volumes less than 15 bbls without filing Form 1014HD.

(4) Hydrostatic test water that will be discharged to land and not directly into waters of the state and which may exceed the discharge parameters specified in (b) (2), shall be discharged only upon submission and approval by the Pollution Abatement Department of a plan for one-time discharge.

(5) Hydrostatic test water not covered under (b)(1) from transmission lines and tanks that contain waste products that are listed as hazardous waste under the Resource Conservation and Recovery Act and have not been cleaned or pigged must meet the following discharge requirements in addition to (b)(2) of this Section:

(A) The following parameters may not be exceeded: Benzene, .028 MG/L; toluene, .3 MG/L; phenol, .250 MG/L.

(B) EPA analytical method 8020 shall be used unless approved by the Manager of Pollution Abatement.

(c) **Discharge of storm water.** Storm water accumulations in any diked area built for the containment of tank battery spills may be discharged as necessary without a permit, notification to the Commission, or adherence to any other provisions of this Section, provided the following conditions are met:

(1) **No hydrocarbons.** A visual inspection of the storm water is made and there is no sheen or other visible evidence of hydrocarbons being present.

(2) **Low chlorides.** Chloride concentration does not exceed 1000 mg/l.

(3) **Conditions recorded.** The operator records the conditions required by (1) and (2) in this subsection for each discharge, maintains those records for a period of three (3) years, and makes them available upon request to any representative of the Field Operations Department.

(d) **Discharge of produced water.**

(1) **Site restrictions.** Discharge of produced water shall only occur on land having an Exchangeable Sodium Percentage (ESP) no greater than 15, pursuant to

(f)(3) of this Section, and all of the following characteristics as determined by the appropriate Soil Conservation District or by a qualified soils expert:

(A) A maximum slope of five percent.

(B) Depth to bedrock at least 20 inches.

(C) Slight salinity (defined as electrical conductivity less than 4,000 micromhos/cm) in the topsoil or upper six inches of the soil.

(D) A water table deeper than six feet from the soil surface, except a perched water table.

(E) A minimum distance of 100 feet from any stream designated by Oklahoma Water Quality Standards (available for viewing at the Commission's Oklahoma City Office and District Offices) or any fresh water pond, lake, or wetland (designated by the National Wetlands Inventory Map Series, prepared by the U.S. Fish and Wildlife Service and available for viewing at the Commission's Oklahoma City Office).

(2) **Water quality limitations.** A surface discharge permit shall not be issued if the produced water to be discharged exceeds either of the following concentrations:

(A) Total Dissolved Solids (TDS) - 5000 mg/l.

(B) Oil and Grease - 1000 mg/l.

(e) **Sampling requirements.**

(1) **Contact with District Office.** The appropriate District Office shall be contacted at least two working days prior to sampling to allow a Commission representative an opportunity to witness the sampling of the receiving soil and produced water to be discharged. A variance from this provision may be granted by a Field Operations office for justifiable cause. A written request and supporting documentation shall be required. The Field Operations office shall respond in writing within five working days after receipt, either approving or disapproving the request.

(2) **Produced water.** Produced water to be discharged shall be sampled using the following procedure, unless exempt pursuant to (f)(4) of this Section.

(A) Prior to sampling, fresh water shall not be added to any tank or other containment vessel for dilution or any other purpose.

(B) A sample of the produced water to be discharged shall be taken from the bottom of the tank or other containment vessel. A minimum two quart sample shall be placed into a foil or teflon covered, glass container. The container shall be filled completely to exclude air and delivered to the laboratory within seven days. No samples shall be altered in any way.

(C) Another sample of the produced water to be discharged (approximately one pint) shall be properly labeled and delivered or otherwise provided to a Field Operations office or Field Inspector, unless exempt by the District Manager.

(3) **Receiving soil.** Soil samples shall be taken from the proposed discharge area and analyzed, unless exempt pursuant to (f)(4) of this Section. A minimum of 20 representative surface core samples (0-6 inches) must be taken from each sample area, combined and thoroughly mixed, then a minimum one pint composite sample taken and placed in a clean container for delivery to the lab. No sample area shall exceed 40 acres.

(f) **Analysis requirements.**

(1) **Certified laboratory.** The samples of soil and produced water shall be analyzed by a laboratory operated by the State of Oklahoma or certified by the Oklahoma Water Resources Board, unless exempt pursuant to (4) of this subsection.

(2) **Parameters for produced water.** Parameters for analysis of the produced water shall include, but not be limited to, Total Dissolved Solids (TDS) and Oil and Grease.

(3) **Parameters for soil.** Parameters for analysis of the receiving soil shall include, but not be limited to, Electrical Conductivity or Total Soluble Salts (TSS) and Exchangeable Sodium Percentage (ESP).

(4) **Exemptions.** A Field Operations office may exempt the analysis of produced water if an analysis of the produced water from a well located within one mile and producing from the same formation has been previously submitted. Analysis of the receiving soil may be exempt if an analysis of the same soil type(s) within one mile of the proposed discharge site has been previously submitted.

(g) **Application for permit.**

(1) **Permit required.** No person shall discharge produced water from a tank or other containment vessel without applying for and obtaining a permit issued under this subsection. An operator discharging produced water without a permit shall be fined $1,000.00.

(2) **Who may apply.** Only the operator of the well associated with the tank or other containment vessel, the contents of which are sought to be discharged, may apply for a surface discharge permit.

(3) **Required form and attachments.** Each application for surface discharge of produced water shall be submitted to a Field Operations office on Form 1014D in quadruplicate. The forms shall be properly completed and signed. Attached to at least one of the forms shall be the following:

(A) A copy of written notice to the surface owner that the applicant intends to discharge produced water as per 165:10-7-17 to a specific portion of real property as designated by legal description.

(B) If the operator has an agent, a contractual agreement between the parties or an affidavit designating the contractor or agent.

(C) A well prepared map or diagram, drawn to scale, showing the proposed and potential discharge areas.

(D) Site suitability report, pursuant to (d)(1) of this Section, provided by a qualified soils expert (include qualifications).

(E) Analysis of produced water, unless exempt pursuant to (f)(4) of this Section.

(F) Soil analysis, unless exempt pursuant to (f)(4) of this Section.

(G) Other information as required by this Section or requested by a Field Operations office.

(4) **Review period.** The Field Operations office shall review the application, either approve or disapprove it, and return a copy of Form 1014D within five working days of submission of all required or requested information. If approved, a permit number shall be assigned to Form 1014D; if disapproved, the reason(s) shall be given. The applicant may make application for a hearing if it is not approved.

(h) **Maximum application rate.**

(1) **Soil loading standards.** The maximum application rate shall be calculated by the Field Operations office using the following soil loading standards. (Soil loading standards are based upon standards set forth in "Diagnosis and Improvement of Saline and Alkaline Soils," U.S. Agriculture Handbook 60. Pub. U.S. Salinity Laboratory, Riverdale, California, 1954. "Critical Concentrations for Irrigation Water Supplies," Water Quality Criteria, 1972 Ecological Research Series, EPA R2-73033, March, 1973).

(A) Total Soluble Salts - 6,000 lbs/acre (less TSS in soil).

(B) Oil and Grease - 500 lbs/acre.

(2) **Determination of most limiting parameter.** The maximum application rate shall be restricted by the most limiting parameter. It may require more than one application to achieve the maximum application rate while avoiding runoff. The Field Operations office shall indicate on the permit what the maximum application rate shall be after making the following calculations:

PROCEDURE FOR CALCULATING APPLICATION RATE OF TOTAL SOLUBLE SALTS (TSS)

______ppm TSS in soil[1] X 2 = ______lbs/ac TSS in soil

6000 lbs/ac TSS - ______ lbs/ac TSS in soil = Maximum TSS (lbs/ac) to be applied

Maximum TSS (lbs/ac) ______ ÷ (______ ppm TSS in water[1] X .000001) = Maximum lbs/ac of water to be applied ______

Maximum lbs/ac ______ ÷ ______lbs/bbl[2] = Maximum bbls/ac ______

PROCEDURE FOR CALCULATING APPLICATION RATE OF OIL AND GREASE

500 lbs/ac ÷ (______ppm in water X .000001) = Maximum lbs/ac of water to be applied ______

Maximum lbs/ac ______ ÷ ______ lbs/bbl[2] = Maximum bbls/ac ______

[1]Electrical Conductivity (EC expressed in micromhos/cm) may be used to estimate TSS: EC x 0.64 = ppm TSS.
[2]Based on documented weight of composite sample.

(i) **Conditions of permit.** Any discharge of produced water that is done under this Section shall be subject to the following conditions or stipulations of the permit.

(1) **Presence of representative.** A representative of the operator shall be on the discharge site at all times that water is being applied. A variance from this provision may be granted by a Field Operations office for justifiable cause. A written request and supporting documentation shall be required. The Field Operations office shall respond in writing within five working days after receipt, either approving or disapproving the request.

(2) **Weather restrictions.** Surface discharge shall not be done:

(A) During precipitation events or when precipitation is imminent.

(B) When the soil moisture content is at a level such that the soil would not readily take the addition of water.

(C) When the ground is frozen.

(D) By spray irrigation when the wind velocity is such that even distribution of water cannot be accomplished or the buffer zones, pursuant to (3) of this subsection, cannot be maintained.

(3) **Buffer zones.** Surface discharge shall not be done within the following buffer zones:

(A) Fifty feet of a property line boundary.

(B) Fifty feet of any stream not designated by Oklahoma Water Quality Standards.

(C) Three hundred feet of any actively-producing water well used for domestic or irrigation purposes.

(D) Eight hundred feet of any actively-producing water well used for municipal purposes.

(4) **Application rate.** The maximum application rate of produced water stipulated by the permit shall not be exceeded. Application of produced water outside the approved plot shall be prohibited. Accurate records shall be kept as to the quantities discharged and the dates of each discharge.

(5) **Discharge method.** Discharge of produced water shall be uniform over the approved discharge plot and shall be made by spray irrigation or other method approved by the Commission prior to use. The flood irrigation method shall be limited to those fields that normally are irrigated in that manner.

(6) **Runoff or ponding prohibited.** No runoff or ponding of discharged water shall be allowed during application.

(7) **Annual report.** An annual report shall be submitted by February 1 of each year and shall be made on Form 1014P. Attached to the annual report shall be current (within three months) analyses of the produced water and soil from the discharge plot, pursuant to (8) of this subsection.

(8) **Additional testing.** The produced water and soil shall be sampled and analyzed, pursuant to (e)(1) through (e)(3) and (f)(1) through (f)(3) of this Section, on an annual basis just prior to filing of the annual report. When a soil analysis indicates that 75 percent of the maximum application rate of TSS or Oil and Grease [(h) of this Section] has been applied or when the ESP exceeds 11, sampling shall be done quarterly or semiannually as determined by the Field Operations office.

(9) **Expiration of permit.** The permit shall expire by its own terms when testing, pursuant to (8) of this subsection, indicates that the concentration of TDS or Oil and Grease in the water exceeds the limitations of (d)(2) of this Section, or more than 98 percent of the maximum application rate of TSS or Oil and Grease [(h) of this Section] has been applied or the ESP exceeds 15.

(10) **Violations.** If the applicant violates the conditions of the permit or this Section, the surface discharge shall be discontinued and the Field Operations office shall be contacted immediately. The Field Operations office may revoke the permit and/or require the operator to do remedial work. If the permit is not revoked, surface discharge may resume with Field Operations' approval. If the permit is revoked, the operator may make application for a hearing to reinstate it.

[SOURCE: Amended at 9 Ok Reg 2295, eff 6-25-92; amended at 13 Ok Reg 2381, eff 7-1-96; Amended in Rule Making 97000002, eff 7-1-97]

165:10-7-18. Discharge to surface waters

Discharge of deleterious substances to streams or other surface waters is prohibited except by order of the Commission; unless permitted by a valid National Pollutant Discharge Elimination System (NPDES) Permit issued by U.S. EPA.

165:10-7-19. One-time land application of water-based fluids from earthen pits and tanks

(a) **Authority for land application.** No person shall land apply fluids except as provided by 165:10-9-2, 165:10-7-17, or this Section. Any operator failing to obtain a permit shall be fined $2,000.

(b) **Scope.** This Section shall cover the land application of water-based drilling fluids and cuttings from earthen pits, tanks, or other containment structures; however, this Section shall not be exclusive of other authorities for land application listed in (a) of this Section. Any land application made under this Section shall be done on a one-time basis from a single well to land that has not been previously permitted and used for this practice or similar practices.

(c) **Site suitability restrictions.** Land application shall only occur on land having all of the following characteristics below, as field verified by a soil scientist or other qualified person pre-approved by the Commission. Any variance from site suitability restrictions must be approved by the Oil and Gas Conservation Division (see (f)(2)(C) of this Section).

(1) **Maximum slope.**

(A) Five percent for all application methods except spray irrigation;

(B) Eight percent for the spray irrigation method.

(2) **Depth to bedrock.** Depth to bedrock must be at least 20 inches.

(3) **Soil texture.** A soil profile (as defined by USDA soil surveys) containing at least twelve inches (may be cumulative) of one of the following soil textures between the surface and the water table, unless a documented impeding layer of shale is present: loam, silt loam, silt, sandy clay loam, silty clay loam, clay loam, sandy clay, silty clay, or clay.

(4) **Salinity.** Slight salinity [defined as Electrical Conductivity (EC) less than 4,000 micromhos/cm] in the topsoil, or upper six inches of the soil, and a calculated Exchangeable Sodium Percentage (ESP) less than 10.0.

(5) **Depth to water table.** No evidence of a seasonal water table within six (6) feet of the soil surface as verified by field observation and published data.

(6) **Distance from water bodies.** A minimum distance of 100 feet from the land application site boundary to any perennial stream and 50 feet to any intermittent stream shown on the appropriate United States Geological Survey (U.S.G.S.) topographic map (available for viewing at the Commission's Oklahoma City Office and District Offices) and a minimum of 100 feet to any freshwater pond, lake, or wetland. [Designated by the National Wetlands Inventory Map Series, prepared by the U.S. Fish and Wildlife Service, available for viewing at the Commission's Oklahoma City Office (also, see (h)(6) of this Section)].

(7) **Site specific concerns.** Void of slick spots within or adjacent to the land application area, where subsurface lateral movement of water is unlikely, or areas void of concentrated surface flow such as gullies or waterways.

(d) **Sampling requirements.**

(1) **Notice to Field Inspector.** The appropriate Field Inspector shall be contacted at least two working days prior to sampling of the receiving soil and sampling of the drilling fluids and/or cuttings to be land applied from an earthen pit. This is to allow a Commission representative an opportunity to be present.

(2) **Receiving soil.** Sampling of the receiving soil shall be performed by, or under the supervision of, a soil scientist or other qualified person pre-approved by the Commission. Soil samples shall be taken from the proposed application area and analyzed. A minimum of four representative core samples from the surface (0-6 inches) and subsurface (14-20 inches) must be taken from each ten acres, or part thereof. Each group of surface core samples representative of a ten-acre area (or less) shall be combined and thoroughly mixed. A minimum one-pint composite sample shall be taken and placed in a clean container for delivery to the laboratory. Alternatively, soil samples may be composited by the laboratory. All subsurface samples shall be handled in the same manner.

(3) **Drilling fluids and/or cuttings.**

(A) **Earthen pits.** Drilling fluids and/or cuttings to be land applied shall be sampled using the following procedure:

(i) Prior to sampling, fresh water (except natural precipitation) shall not be added to any pit for dilution or any other purpose.

(ii) A minimum of four samples, each from different quadrants of the pit and representative of the materials to be land applied, must be taken if the volume to be land applied is 25,000 bbls. or less. If more than 25,000 bbls. are to be land applied, a minimum of four quadrant samples plus one sample for each 5,000 bbls. over 25,000 bbls. will be required. The samples shall be combined and thoroughly mixed, then a minimum two quart composite sample placed into a foil or teflon covered glass container. The container shall be filled completely to exclude air and delivered to the laboratory within seven days. No samples shall be altered in any way.

(iii) After samples have been taken for analysis from a pit, the operator shall not allow the addition of fluids or other materials, except natural precipitation or fresh water to decrease the viscosity of the fluid.

(B) **Tanks.** Sampling of the drilling fluids and/or cuttings shall occur after the application has been approved. A minimum of one representative sample must be taken from each tank or other containment structure, the contents of which are to be land applied.

(e) **Analysis requirements.**

(1) **Testing.**

(A) The composite sample(s) of soil shall be tested by a laboratory proficient in testing soils. Either a 1:1 extract or saturated paste extract shall be used for sample preparation.

(B) Methods of analysis.

(i) **Earthen pits.** The composite sample(s) of drilling fluids and/or cuttings shall be analyzed by a laboratory operated by the State of Oklahoma or certified by the Oklahoma Department of Environmental Quality.

(ii) **Tanks.** Samples of the drilling fluids and/or cuttings may be tested on-site. A filter press shall be used for preparation of samples. Tests must be performed by a person who is knowledgeable and experienced in the chemical testing of fluids. Acceptable on-site testing protocol may be obtained from a Field Operations office.

(2) **Parameters for receiving soil.** Parameters for analysis of the receiving soil shall include at a minimum EC and ESP.

(3) **Parameters for drilling fluids and/or cuttings.**

(A) **Earthen pits.** Parameters for analysis of the drilling fluids and/or cuttings shall include at a minimum EC and Oil and Grease (O&G). Dry Weight shall also be determined if a significant amount of solids will be land applied.

(B) **Tanks.** EC shall be a required parameter for analysis of drilling fluids and/or cuttings. Dry weight shall also be determined if a significant amount of solids will be land applied.

(f) **Application for permit.**

(1) **Who may apply.** Only the operator of a well or the operator's designated agent may apply for a land application permit under this Section, except that a commercial pit operator may also apply in case of emergency or for the purpose of facilitating repair or closure.

(2) **Required form and attachments.** Each application for land application of drilling fluids and/or cuttings shall be submitted to a Field Operations office on Form 1014S. An original and three copies shall be required. Attached to at least one of the copies shall be the following:

(A) Written permission from the surface owner to allow the applicant to land apply drilling fluids and/or cuttings. For purposes of obtaining such consent, the applicant shall use Form 1014L.

(B) A topographic map and the most recent aerial photograph (minimum scale 1:660) with the proposed and potential land application areas delineated as well as the location of cultural features such as buildings, water wells, etc. Both the topographic map and aerial photograph must show all areas within 1,320 feet of the boundary of the land application area.

(C) A site suitability report, pursuant to subsections (c) and (h)(6) of this Section, based on an on-site investigation and signed by a soil scientist or other qualified person. The report shall include detailed information concerning the site and shall discuss how all site characteristics were determined. Any requests for a variance to site suitability restrictions must be accompanied by a written justification that has been developed or approved by a soil scientist or other qualified person. The justification shall provide explanation as to safeguards which will assure that conditions of the permit will be met and there will be no adverse impacts from the land application.

(D) Analysis of drilling fluids and/or cuttings (for earthen pits only).

(E) Analyses of soil samples.

(F) Loading calculations.

(G) Copies of all chains-of-custody related to sampling.

(H) Manufacturer, model number, and specifications of testing equipment to be used (for tanks only).

(I) If there is an agent, a notarized affidavit designating same, signed by the operator.

(J) Other information as required by this Section or requested by a Field Operations office.

(3) **Review period.** The Field Operations office shall review the application, either approve or disapprove it, and return a copy of Form 1014S within five working days of submission of all required or requested information. If approved, a permit number shall be assigned to Form 1014S; if disapproved, the reason(s) shall be given. The applicant may make application for a hearing if it is not approved.

(g) **Calculating maximum application rate.**

(1) **Earthen pits.**

(A) The maximum application rate shall be calculated by the applicant or the applicant's designated agent based on the analyses of the pit materials and the soil of the application area. The averaging of TDS values of soil sampling areas shall not be permitted. If the entire application area is larger than ten acres, requiring separate soil sampling areas, the applicant or the applicant's designated agent shall use the highest soil TDS value of any sampling area in calculating the maximum application rate for the entire application area, and shall also calculate the maximum application rate of each ten acre (or less) application area using the respective TDS values of each soil sampling area. The applicant or the applicant's designated agent shall decide which of the two loading rates to use and notify the District Office when notification of commencement of land application is given, pursuant to (h)(1) of this Section.

(B) Soil loading formulas contained in Appendix I shall be used.

(C) The maximum application rate shall be restricted by the most limiting parameter. The Field Operations office shall indicate on the permit the maximum application rate and the minimum acreage that must be used.

(2) **Tanks.**

(A) The applicant shall calculate the maximum application rate based on the analysis of each tank or other containment vessel to be land applied and the soil of the application area. The averaging of TDS values of soil sampling areas shall not be permitted. If the entire application area is larger than ten acres, requiring separate soil sampling areas, the applicant shall have the option of using the highest soil TDS value of any sampling area in calculating the maximum application rate for the entire application area, or calculating the maximum application rate of each ten-acre (or less) application area using the respective TDS value of each soil sampling area.

(B) Soil loading formulas contained in Appendix I shall be used.

(C) Based on the maximum application rate, the applicant or its designated agent shall determine where the fluids will be applied and supervise the land application process.

(h) **Conditions of permit.** Any land application which is performed under this Section shall be subject to the following conditions or stipulations of the permit:

(1) **Notice to Field Inspector.** The applicant shall notify the appropriate Field Inspector at least 24 hours prior to the commencement of land application to allow a Commission representative an opportunity to be present.

(2) **Compliance agreement.** Any person responsible for supervision of land application shall have signed a compliance agreement with the Commission.

(3) **Presence of representative.** A representative of the applicant shall be on the land application site at all times during which fluids and/or cuttings are being applied. The representative shall be an employee of the applicant, designated agent, contractor, or other person pre-approved by the Commission.

(4) **Materials to be land applied.** Land application shall be limited to water-based drilling fluids and/or cuttings.

(5) **Weather restrictions.** Land application, including incorporation, shall not be done:

(A) During precipitation events or when precipitation is imminent.

(B) When the soil moisture content is at a level such that the soil cannot readily take the addition of drilling fluids.

(C) When the ground is frozen.

(D) By spray irrigation when the wind velocity is such that even distribution of materials cannot be accomplished or the buffer zones, pursuant to (6) of this subsection, cannot be maintained.

(6) **Buffer zones.** Land application shall not be done within the following buffer zones, as identified in the site suitability report:

(A) Fifty feet of a property line boundary.

(B) Three hundred feet of any actively producing water well used for domestic or irrigation purposes.

(C) One-quarter (1/4) mile of any actively producing water well used for municipal purposes.

(7) **Land application rate.** The maximum calculated application rate of drilling fluids and/or cuttings shall not be exceeded. It may require more than one pass to achieve the maximum application rate while avoiding runoff or ponding, pursuant to (9) of this subsection. Application of drilling fluids and/or cuttings outside the approved plot shall be prohibited.

(8) **Land application method.**

(A) Application of drilling fluids and/or cuttings shall be uniform over the approved land application plot, shall not be applied at a rate to cause permanent vegetation damage, and shall be made by a method approved by the Commission prior to use. The flood irrigation method shall be limited to those fields that normally are irrigated in that manner.

(B) For earthen pits, if more than 500 lbs/acre of Oil and Grease or 50,000 lbs/acre of Dry Weight materials are applied, the materials shall be incorporated into the soil by use of the injection method, or by disking or use of some other method approved by the Commission prior to use within 15 days after application.

(9) **Runoff or ponding prohibited.** No runoff of land applied materials shall be allowed during application. Ponding is prohibited, except where the flood irrigation method is approved. In order to comply with this rule, some applications will require the use of more than the minimum calculated acreage and/or a drying period between applications.
(10) **Vegetative cover.** If the vegetative cover is destroyed or significantly damaged by disking, injection, or other practice associated with land application, a bona fide effort shall be made to restore or reestablish the vegetative cover within 180 days after the land application is completed. Additional efforts shall be made until the vegetative cover is fully restored or reestablished.
(11) **Time period.**
(A) **Earthen pits.** Land application shall be completed within 90 days from the date of the permit. At the end of the 90 day period, the permit shall expire by its own terms. To renew the permit, the applicant shall resample the fluids and/or cuttings to be land applied, submit a new analysis, and receive a notification of renewal from a Field Operations office.
(B) **Tanks.** Land application shall be completed within 180 days after drilling ceases.
(12) **Post-application report.** A post-application report shall be submitted by the operator or the operator's agent to the Manager of Field Operations within 30 days of the completion of land application. The report shall give specific details of the land application, including test results of materials applied and loading rate calculations (for tanks only), volumes of materials applied, and an aerial photograph (minimum scale 1:660) delineating the actual area where materials were applied. The report shall contain a statement certifying that the land application was done in accordance with the approved permit.
(13) **Violations.** If the applicant violates the conditions of the permit or this Section, the land application shall be discontinued and the Field Operations office shall be contacted immediately. The Field Operations office may revoke the permit and/or require the operator to do remedial work. If the permit is not revoked, land application may resume with Field Operations' approval. If the permit is revoked,` the operator may make application for a hearing to reinstate it.
(14) **Requirements to close pit.** Neither filing an application nor receiving a permit under this Section shall extend the time limit for closing a reserve pit pursuant to 165:10-7-16, or a commercial pit pursuant to 165:10-9-1.
(i) **Variances.** A variance from the time provisions of (d)(1), (h)(1), (h)(8)(B) or (h)(10) of this Section may be granted by a Field Operations office for justifiable cause. A written request and supporting documentation shall be required. The Field Operations office shall respond in writing within five working days after receipt, either approving or disapproving the request.

[**SOURCE:** Amended in Rule Making 97000002, eff 7-1-97]

165:10-7-20. Noncommercial disposal or enhanced recovery well pits used for temporary storage of saltwater
(a) **Scope.** This Section shall apply to any production operation_where a pit is used for temporary storage of saltwater, except (c)(7) of this Section, which shall apply to any noncommercial well, regardless of whether or not a pit is used.
(b) **Construction requirements.**
(1) **Splash pad/apron.** A splash pad/apron shall be constructed at the unloading area of any noncommercial disposal well or enhanced recovery pit to the design and dimensions necessary to contain and direct all materials unloaded into the pit, unless the pit is of such design that discharge directly into it presents no spill potential.
(2) **Pit specifications.** Except as provided by (4)(A) of this subsection, any noncommercial disposal or enhanced recovery well pit shall be constructed of concrete or steel or be lined with a geomembrane liner according to the following:

(A) Concrete pits must be steel reinforced and have a minimum wall thickness of six inches.
(B) Steel pits must have a minimum wall thickness of three-sixteenths (3/16) inch. A previously used steel pit may be installed, provided it is free of corrosion or other damage.
(C) Geomembrane liners must:
(i) Have a minimum thickness of 30 mils, be chemically compatible with the type of wastes to be contained, and have ultraviolet light protection.
(ii) Be placed over a specially prepared, smooth, compacted surface void of sharp changes in elevation, rocks, clods, organic debris, or other objects.
(iii) Be continuous (may include seams) and cover the bottom and interior sides of the pit entirely. The edges must be securely placed in a minimum twelve inch deep anchor trench around the perimeter of the pit.

(3) **Certification of liner.** The operator of any saltwater storage pit that is constructed with a geomembrane liner shall secure an affidavit signed by the installer, certifying that the liner meets minimum requirements and was installed in accordance with Commission rules. It shall be the operator's responsibility to maintain the affidavit and all supporting documentation pertaining to the liner, such as geomembrane liner specifications from the manufacturer, etc., and shall make them available to a representative of the Conservation Division upon request.

(4) **Monitoring of site.**
(A) If not constructed according to one of the three methods in (2) of this subsection, any noncommercial disposal or enhanced recovery well pit shall be required to have a leachate detection system or at least one monitor well, unless it can be shown that the pit is not located over a hydrologically sensitive area, i.e., a principal bedrock aquifer, the recharge or potential recharge area of a principal bedrock aquifer, or an unconsolidated alluvium or terrace deposit, according to the Oklahoma Geological Survey "Maps Showing Principal Groundwater Resources and Recharge Areas in Oklahoma" (available for viewing at the Commission's Oklahoma City Office or District Offices). The District Manager may require more than one monitor well if he has reason to believe one would not be sufficient to adequately monitor the site.
(B) Any monitor well shall be installed within 100 feet of the pit. An existing nearby water well may be used as a monitor well upon written approval by the District Manager or Manager of Field Operations.
(C) Any new monitor well shall be drilled through the first aquifer encountered, but need not extend below 100 feet if no aquifer is encountered, and shall be completed by a licensed monitor well driller. If documentation can be submitted prior to drilling to show that no water will be encountered within 100 feet, the District Manager may allow the monitor well(s) to be drilled to a lesser depth or eliminated.
(D) Any new monitor well shall have:
(i) A minimum two inch diameter PVC casing with a sealing cap on the bottom.
(ii) Casing consisting of a slotted liner in the saturated zone, or bottom ten feet if none is encountered, and be gravel packed or sand packed as appropriate to the installation.
(iii) Bentonite placed in the annular space of the well above the slotted liner for an interval of at least two feet to form an adequate seal.
(iv) Well cuttings returned to the annular space above the bentonite seal for well stability.
(v) A minimum of two of the top six feet of annular space around the casing filled with cement.
(vi) A minimum three inch thick concrete apron placed at the surface to a minimum two foot radius from the casing.
(vii) A removable and lockable cap placed on top of the casing. The cap must remain locked at all times, except when a well is being sampled.

(E) Within 30 days of installation, construction details for any leachate detection system or specific completion information for any monitor well and a diagram of the location of any monitor well in relation to the pit shall be submitted to the Manager of Field Operations.

(c) **Operation and maintenance requirements.**

(1) **Fencing.** All noncommercial disposal or enhanced recovery well surface facilities that have a pit shall be completely enclosed by a minimum four strand barbed wire fence or equivalent protection as approved by the District Manager. Said fence shall be constructed in such a manner as to prevent livestock from entering the pit area.

(2) **Site maintenance.** The normal access surface of any well site that has a pit, including the access road(s), shall be maintained in a condition that will safely and easily allow access.

(3) **Exclusion of runoff water.** No pit shall be allowed to receive runoff water.

(4) **Freeboard.** The fluid level in any concrete or steel noncommercial disposal or enhanced recovery well pit shall be maintained at all times at least six inches below the top of the pit wall. Any geomembrane lined pit shall have a minimum of 18 inches of freeboard at all times.

(5) **Temporary storage only.** No pit shall be used as permanent storage for salt water.

(6) **Sampling of monitor wells or leachate detection systems.**

(A) Sampling of monitor wells and leachate detection systems shall occur once every six months, during the months of January and July.

(B) The appropriate District Manager shall be notified at least 24 hours in advance of sampling to allow a Commission representative an opportunity to witness the sampling.

(C) Samples shall be collected, preserved, and handled by the operator according to EPA approved standards (RCRA Groundwater Monitoring Technical Enforcement Guidance Document, EPA, OSWER-9950.1, September, 1986, pp. 99-107) and analyzed for pH, chlorides (Cl^-) and total dissolved solids (TDS) by a laboratory certified or operated by the State of Oklahoma. Analysis of additional parameters may be required as determined by the District Manager or Manager of Field Operations. A copy of each analysis and a statement as to the depth to groundwater encountered in each well, or an affidavit that no water was encountered, shall be forwarded to the Manager of Field Operations, within 30 days of sampling.

(7) **Prevention of pollution.** All noncommercial disposal or enhanced recovery wells shall be maintained at all times so as to prevent pollution. In the event of a nonpermitted discharge from surface facilities, sufficient measures shall be taken immediately to stop, contain, and control the loss of materials. Reporting of said discharge shall be in compliance with 165:10-7-5(c). Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division of the Commission.

(8) **Oil film.** The operator of a saltwater pit shall be responsible for the protection of migratory birds. Therefore, the Conservation Division recommends that to prevent the loss of birds due to oil films, all open top tanks and pits containing fluid be kept free of oil films or sludge or be protected from access to birds. [See Advisory Notice 165:10-7-3(c)]

(d) **Closure requirements.**

(1) **Time limit.** Within 180 days of the cessation of operations, all associated pits shall be emptied of all contents, and either removed or filled with soil. All monitor wells shall be plugged with bentonite or cement, unless exempt in writing by the District Manager or Manager of Field Operations. The site shall be revegetated within one (1) year.

(2) **Burial.** If any concrete, steel, geomembrane, or other materials associated with the site are to be left on-site, they shall be buried under a minimum soil cover of three feet, pursuant to 165:10-3-17.

(e) **Prospective application to existing facilities.** All provisions of this Section, except those in (b)(2) and (b)(3), shall apply to all existing pits within the scope of this Section which are, or have been, in operation prior to the effective date of this Section. Operators shall have one (1) year from the effective date of this Section in which to bring their facilities into compliance with the applicable provisions of this Section. Failure to comply with any applicable provision may result in revocation of the authority to operate.

(f) **Variances.**

(1) A variance from the time requirements of (c)(6), (d)(1), or (e) of this Section may be granted by the District Manager or Manager of Field Operations for justifiable cause. A written request and justifiable explanation is required. The District Manager or Manager of Field Operations shall respond in writing within five working days, either approving or disapproving the request.

(2) Any variance from the liner requirements as required under (b)(2) of this Section may be granted by the manager of Field Operations after receipt of a written request and supporting documentation required by the department.

[**SOURCE:** Amended in Rule Making 980000034, eff 7-1-99]

165:10-7-21. Refining and processing of oil and gas

(a) All deleterious substances obtained or used in the processing and refining of oil and gas shall be disposed of in a manner that will prevent the pollution of fresh water.

(b) Chemicals, gasolines, oil, and other deleterious substances shall be stored, where necessary, in tanks or containers of a material and of a construction and in a manner that will prevent the escaping, seepage, or draining of such liquids into any fresh water.

165:10-7-22. Permits for County Commissioners to apply waste oil, waste oil residue, or crude oil contaminated soil to roads

(a) **Prohibition against application of waste oil, waste oil residue, or crude oil contaminated soil without permit.** This Section prohibits any Board of County Commissioners from applying waste oil, waste oil residue, or crude oil contaminated soil to a street or road without a permit.

(b) **Permit by District Office.** A District Manager for the Conservation Division may issue to a Board of County Commissioners for a county within the district a permit to apply waste oil, waste oil residue, or crude oil contaminated soil to a street or road within the county.

(c) **Permit requirements.**

(1) **Use of Form 1014W.** The application and permit to apply waste oil, waste oil residue, or crude oil contaminated soil shall be made on Form 1014W.

(2) **Telephone permits.** In case of emergency, a District Manager may issue a permit by telephone. If an applicant obtains a permit by telephone, then the applicant shall file Form 1014W and attachment within five working days after receipt of the permit by telephone.

(3) **Conditions for permit.**

(A) Waste oil, waste oil residue, and contaminated soils applied under this Section shall consist of crude oil and materials produced with crude oil only and shall not contain any refined oils such as motor oils, lubricants, compressor oils or hydraulic fluids.

(B) If required by the District Manager, a hydrocarbon analysis shall be submitted with Form 1014W. The analysis shall be performed by a state-certified laboratory in accordance with OCC-approved methods.

(C) Waste oil, waste oil residue, and crude oil contaminated soil shall be applied in such a manner that pollution of surface or subsurface waters will not likely occur and public and private property adjoining the street or road will be protected.

(D) During operations for road oiling, all necessary signs, lights, and other safety and warning devices shall be used to alert road users to

conditions. A sign shall be posted with the contractor or authority's name and phone number to contact in case of emergency.
(E) Following completion of the project there shall be a uniform soil/oil base (all liquid worked in), with no visible free-standing oil.
(F) Proper care shall be taken to avoid runoff of oil or water into borrow ditches or adjacent areas.
(G) No road oiling shall be conducted:
(i) When the temperature is less than 45° F.
(ii) In any area where water collects and stands.
(iii) Where soil moisture content or road conditions such as soil type, tight soil conditions, packed soil conditions, or grade limits prevent rapid absorption of the oil.

(d) **Notice to District Office.** The Board of County Commissioners receiving the permit shall notify the District Office at least two days prior to commencement of road oiling under a permit.
(e) **Site inspection.** At his discretion, a District Manager may request a Field Inspector of the Conservation Division or an Enforcement Officer of the Transportation Division to inspect the site at any time during the road oiling operation to ensure compliance with this Section.
(f) **Duration of permit.** The permit shall state the duration of the permit, and it shall also state that if the application fails to comply with either the terms of the permit or the terms of this Section, then the permit shall terminate automatically.
(g) **Disapproval or cancellation of permits.**
(1) If a District Manager receives a complaint about a road oiling permit, he shall cause an investigation of the complaint to be made as soon as practicable. During the investigation, the District Manager may direct the applicant to cease road oiling under a permit. If necessary, the District Manager may verbally revoke the permit.
(2) If a District Manager disapproves an application or cancels a permit, the applicant may apply to the Commission for an order under OAC 165:5-7-41.

[**Source:** Amended at 12 Ok Reg 2017, eff 7-1-95]

165:10-7-23. Disposal of waste oil

(a) All waste oil and waste oil residue shall be disposed of in one of the following ways:
(1) Transfer or sale to a reclaimer or transporter.
(2) Transfer or sale to County Commissioners.
(3) Administrative approval from the Conservation Division.

(b) All operators or owners of pits, tanks, commercial disposal operations, or reclaimers shall maintain books and records describing the disposition of all waste oil or waste oil residue. A copy of the run or load ticket will satisfy this requirement if the information required in (c) of this Section is contained therein.
(c) The following information shall be contained in said books and records and subject to audit and inspection by representatives of the Commission for a minimum period of three years:
(1) The amount of waste oil or waste oil residue removed.
(2) The location of the waste oil or waste oil residue prior to disposal.
(3) The destination of waste oil or waste oil residue as reported by transporter.
(4) The name of the transporter of waste oil or waste oil residue.

165:10-7-24. Waste management practices reference chart

(a) **Scope.** This Section provides reference guidelines for the disposal of wastes under the jurisdiction of the Commission which are generated by oil and gas operators and pipeline companies. Hazardous waste as defined at 40 CFR 261.3 is regulated by the Oklahoma Department of Environmental Quality.

(b) **Waste materials and disposal options.** Consistent with EPA's policy on source reduction, recycling, treatment and proper disposal, operators shall use waste management practices as listed in (c) of this Section which describes the various management practices for the following waste materials. For any of the following waste materials where option (16) of subsection (c) is listed, option (16) shall be considered before any other option.

(1) Produced water: Options 1, 7 & 9
(2) Weighted water: Options 1 & 7
(3) Used treatment fluids and other flowback wastes: Options 1, 2, 5 & 7
(4) Water based mud: Options 1, 2, 5, 6, 7, 8 & 19
(5) Water based mud cuttings: Options 1, 2, 3, 4, 5, 6, 7, 8, 12 & 19
(6) Oil based mud: Options 1, 2, 3, 5, 7 & 22
(7) Oil based mud cuttings: Options 1, 2, 3, 4, 5, 7, 8, 12 & 14
(8) Crude oil: Options 1, 4, 12, 13 & 14
(9) Used motor, gear, lube, compressor and hydraulic oils: Options 1, 15 & 16
(10) Used solvents: Options 1, 15 & 16
(11) Oily debris: Options 1, 3, 13 & 20
(12) Filter media and backwash: Options 1, 3, 7, 15, 16 & 20
(13) Glycol, amine, and caustic wash: Options 1 & 7
(14) Iron sponge: Options 3 & 20
(15) Molecular sieve: Options 3 & 20
(16) Produced sand/sediment: Options 3, 7, 8, 17 & 20
(17) Tight emulsions: Options 1, 4, 8, 12, 14 & 17
(18) Unused treatment chemicals: Options 1, 15 & 16
(19) Tank bottoms from E&P: Options 1, 3, 4, 7, 8, 10, 12, 14 & 17
(20) Paraffin: Options 1, 3, 4, 12, 14, 15, 16 & 20
(21) Asbestos insulation: Options 3 & 15
(22) Non-asbestos insulation: Options 3, 15 & 20
(23) Used batteries: Options 1, 3, 15 & 16
(24) Oils containing PCBs: Option 11
(25) Oils not containing PCBs: Options 1, 15 & 16
(26) Empty oil and chemical drums: Options 1, 3 & 15
(27) Salt contaminated soils: Options 5, 6, 8 & 17
(28) Crude oil contaminated soils: Options 1, 3, 4, 8, 10, 12, 14, 17 & 22
(29) Pit sludges from wellsites, disposal well pits and gathering systems: Options 1, 3, 4, 7, 8, 12, 17 & 20
(30) Gathering line pigging wastes: Options 1, 3, 7 & 20
(31) Gas plant sweetening wastes: Options 1, 3, 7 & 20
(32) Gas plant dehydration wastes: Options 1, 3 & 7
(33) Cooling tower blowdown from gas plants: Options 7 & 15
(34) Wastes from subsurface natural gas storage: Options 1, 3, 7 & 20
(35) Wastes other than refined product removed from produced water and other well fluids prior to injection or disposal: Options 1, 7, 8, 17 & 20
(36) Gases removed from the production stream: Options 1, 7, 13 & 18
(37) Waste crude oil and light hydrocarbons (gas condensate) in reserve pits, other impoundments or tankage at wellsites: Options 1, 7, 8, 13 & 17
(38) Contaminated ground water (except refined products): Options 1, 7, 21 & 22
(39) Pipeline sludge and other deposits removed from pipe or equipment on E&P gathering systems: Options 1, 3, 7, 8, 10, 17 & 20
(40) Residues and truckwash from inside the tank of trucks used to transport saltwater, drilling mud or spent completion fluids: Options 1, 3, 7 & 20
(41) Sewage and wastes from portable toilets: Option 15
(42) Crude pipeline pigging wastes, contaminated soil and residue from transmission and trunk lines: Options 1, 3, 4, 8, 12, 15, 16, 17 & 22
(43) Water or soil contaminated by refined product from E&P operations: Options 1, 16, 21 & 22
(44) Rigwash and supply water: Options 1, 5, 7 & 8
(45) Storm water and hydrostatic test water from E&P operations: Options 1, 7, 9 & 22
(46) Spent filters: Options 1 & 3
(47) Trash and debris: Options 15 & 20
(48) Refined petroleum product releases: Options 1, 3, 8, 13, 16, 17 & 22

(49) Refined petroleum product pigging wastes: Options 1, 3, 8, 15, 16, 17 & 22
(50) Water or soil contaminated by refined products from pipelines: Options 1, 16, 21 & 22
(51) Hydrostatic test water from pipelines: Options 1, 9, 16 & 22
(52) Tank bottoms from crude pipeline facilities: Options 1, 3, 4, 8, 10, 12, 14, 16, 17 & 22
(53) Tank bottoms from refined product pipeline facilities: Options 1, 3, 14, 15, 16, 17 & 22

(c) **Disposal options and rule reference guide.** The following waste disposal options are referenced in (b) of this Section:
(1) Reclaim and/or recycle.
(2) Burial (in accordance with 165:10-7-16).
(3) Landfills regulated by the Oklahoma Department of Environmental Quality.
(4) Road applications by County Commissioners (in accordance with 165:10-7-22 and 165:10-7-28).
(5) Noncommercial pits (in accordance with 165:10-7-16).
(6) Commercial mud disposal pits (in accordance with 165:10-9-1).
(7) Underground injection (in accordance with 165:10-5-1 through 165:10-5-14).
(8) Land application (in accordance with 165:10-7-19 and 165:10-7-26).
(9) Discharge (in accordance with 165:10-7-17).
(10) Reclaim and/or recycle (in accordance with 165:10-7-23).
(11) In accordance with EPA; Code of Federal Regulations (CFR), Title 40, Part 761.60 through 761.79.
(12) Application to lease roads, well locations, and production sites (in accordance with 165:10-7-27 and 165:10-7-29).
(13) Open burning in accordance with Oklahoma Department of Environmental Quality regulations.
(14) Disposal of waste oil as specified in 165:10-7-23.
(15) Disposal in accordance with Oklahoma Department of Environmental Quality regulations.
(16) If the waste is determined to be a hazardous waste under the Federal Resource Conservation and Recovery Act (RCRA), disposal will be determined by the Oklahoma Department of Environmental Quality; if a non-hazardous waste, Option 17 may be used or other disposal option as approved by the Commission.
(17) On-site or in-situ bioremediation/remediation.
(18) Flaring or venting (in accordance with 165:10-3-15).
(19) Commercial soil farming (in accordance with 165:10-9-2).
(20) Burial as approved by the Commission.
(21) Surface discharge as approved by the Commission.
(22) Land application as approved by the Commission.

[**Source:** Amended at 12 Ok Reg 2039, eff 7-1-95; Amended in Rule Making 97000002, eff 7-1-97; Amended in Rule Making 200200017, eff 7-1-02]

165:10-7-25. One-time land application of water-based fluids from tanks or other containment vessels [REVOKED]

[SOURCE: Amended at 9 Ok Reg 2295, eff 6-25-92; Revoked in Rule Making 97000002, eff 7-1-97]

165:10-7-26. One-time land application of contaminated soils and petroleum hydrocarbon based drill cuttings

(a) **Authority for land application.** No person shall land apply soils or drill cuttings contaminated by salt or petroleum hydrocarbons except as provided by this Section. Any operator failing to obtain a permit shall be fined $2,000.00.

(b) **Scope.** This Section shall cover the land application of soils and drill cuttings contaminated by salt and/or petroleum hydrocarbons. Petroleum hydrocarbon-contaminated soils land applied under this Section shall meet the

RCRA criteria for exempt or non-exempt/nonhazardous waste. [Reference 40 CFR Subtitle C and EPA publication EPA530-K-95-003 "Crude Oil and Natural Gas Exploration and Production Wastes: Exemption from RCRA Subtitle C Regulation]. Hazardous waste as defined at 40 CFR 261.3 is regulated by the Oklahoma Department of Environmental Quality. Any land application made under this Section shall be done on a one-time basis to land that has not been previously used for this practice or similar practices.

(c) **Receiving site suitability restrictions.** Land application shall only occur on land having all of the characteristics below, as field verified by a soil scientist or other qualified person pre-approved by the Commission~~:~~. Any variance from site suitability restrictions must be approved by the Oil and Gas Conservation Division (see (g)(2)(C) of this Section).

(1) **Maximum slope.** A maximum slope of five percent for all application methods.

(2) **Depth to bedrock.** Depth to bedrock will be at least 40 inches if crude oil contaminated soils or petroleum hydrocarbon-based drill cuttings are to be applied; 20 inches if salt contaminated soils are to be applied.

(3) **Soil texture.** A soil profile (as defined by USDA soil surveys) containing at least twelve inches (may be cumulative) of one of the following soil textures between the surface and the water table, unless a documented impeding layer of shale is present: loam, silt loam, silt, sandy clay loam, silty clay loam, clay loam, sandy clay, silty clay, or clay.

(4) **Salinity.** Slight salinity [defined as Electrical Conductivity (EC) less than 4,000 micromhos/cm] in the topsoil, or upper six inches of the soil, and a calculated Exchangeable Sodium Percentage (ESP) less than 10.0.

(5) **Depth to water table.** No evidence of a seasonal water table within six (6) feet of the soil surface as verified by field observation and published data.

(6) **Distance from water bodies.** A minimum distance of 100 feet from the land application site boundary to any perennial stream and 50 feet to any intermittent stream found on the appropriate United States Geological Survey (U.S.G.S.) topographic map (available for viewing at the Commission's Oklahoma City Office and District Offices); and a minimum of 100 feet to any freshwater pond, lake, or wetland designated by the National Wetlands Inventory Map Series, prepared by the U.S. Fish and Wildlife Service (available for viewing at the Commission's Oklahoma City Office). Also, see (h)(6) of this Section.

(7) **Site specific concerns.** Void of slick spots within or adjacent to the land application area, where subsurface lateral movement of water is unlikely, or areas void of concentrated surface flow such as gullies or waterways.

(d) **Sampling requirements.**

(1) **Notice to Field Inspector.** The appropriate Field Inspectors shall be contacted at least two working days prior to sampling of the receiving soil and materials to be land applied. This is to allow a Commission representative an opportunity to be present.

(2) **Receiving soil.** Sampling of the receiving soil shall be performed by, or under the supervision of, a soil scientist or other qualified person pre-approved by the Commission. Soil samples shall be taken from the proposed application area and analyzed. A minimum of four representative surface core samples from the surface (0-6 inches) and subsurface (14-20 inches) must be taken from each ten acres, or part thereof. Each group of surface core samples representative of a ten-acre area (or less) shall be combined and thoroughly mixed. A minimum one pint composite sample shall be taken and placed in a clean container for delivery to the laboratory. Alternatively, soil samples may be composited by the laboratory. All subsurface samples shall be handled in the same manner.

(3) **Materials to be land applied.** Representative samples of the materials to be land applied shall be taken, composited into a minimum one-pint sample, and placed in a clean container for delivery to the laboratory. Alternatively, materials to be land applied may be composited by the laboratory.

(e) **Analysis requirements.**

(1) **Salt contaminated soils or drill cuttings.** Analysis requirements will be dependent upon the loading method that is chosen. For most applications, loading based on Total Dissolved Solids (TDS) will be most appropriate. However, applicants proposing to land apply on a site in western Oklahoma, where the soils commonly contain moderate to high levels of gypsum, may benefit from using the loading formula based on Chlorides (Cl).

(A) Samples of soil and materials to be land applied shall be tested by a laboratory proficient in testing soils. Either a 1:1 extract or saturated paste extract shall be used for sample preparation for TDS or Cl loading. A saturated paste moisture equivalent is necessary where the saturated paste sample preparation method is used.

(B) Parameters for analysis of the receiving soil shall include at a minimum EC, TDS, and ESP for TDS loading. For Chloride loading, parameters shall include Chlorides (dry weight basis) and ESP.

(C) Parameters for analysis of soils or drill cuttings contaminated by salt shall include at a minimum EC for TDS loading and both EC and Cl for Chloride loading.

(2) **Soils and drill cuttings contaminated by petroleum hydrocarbons.**

(A) Samples of soil and materials to be land applied shall be tested by a laboratory proficient in testing soils.

(B) Parameters for analysis of the receiving soil shall include at a minimum EC and ESP.

(C) Parameters for analysis of soils or drill cuttings contaminated by petroleum hydrocarbons shall include at a minimum a test of the appropriate carbon range(s), which is determined by the nature of the waste material. These include Gasoline Range Organics (GRO) - C6 to C10 (EPA test method 8015/8020 M), Diesel Range Organics (DRO) - C10 to C28 (extractable procedure), and Oil and Grease - C20 to C50+ (EPA test method 1664).

(f) **Application rates.**

(1) **Calculations.** The maximum application rate for TDS (or Cl) and GRO, DRO, or O & G shall be calculated by the applicant based upon the analyses of the materials to be land applied and the soil of the application area. For salt contaminated soils or drill cuttings, if the application area encompasses more than one soil sampling area, the rate shall be calculated in one of two ways, depending on how the application will be made. The applicant may either calculate the maximum application rate for the entire application area based upon the highest soil TDS (or Cl) value of any sampling area (averaging not allowed), or calculate it for each ten acre (or less) application area using the respective soil TDS (or Cl) values of each sampling area.

(2) **Soil loading formulas.** The maximum application rate for any application area shall be restricted by the most limiting parameter. To determine this, the soil loading formulas in Appendix I of this Chapter shall be used as applicable.

(3) **Variances.** In special situations, a request for a variance relating to soil loading of petroleum hydrocarbons may be administratively approved by the Manager of Field Operations. The applicant shall submit a written request explaining the circumstances or conditions which warrant a variance and shall also submit a management plan for reducing the petroleum hydrocarbon content in the soil to two percent or less.

(g) **Application for permit.**

(1) **Who may apply.** Only the operator responsible for generating the waste to be land applied or the operator's designated agent may apply for a land application permit, except that the Oklahoma Energy Resources Board or its designated contractor may make application to land apply materials for which there is no responsible party.

(2) **Required form and attachments.** Each application for land application of soils contaminated by salt and/or crude oil or petroleum hydrocarbon-containing deleterious substances shall be submitted to a Field Operations office on Form 1014S. An original and three copies shall be required. Attached to at least one of the copies shall be the following:

(A) Written permission from the surface owner to allow the applicant to land apply, incorporate, and fertilize materials. For purposes of obtaining such consent, the applicant shall use Form 1014L.
(B) A topographic map and the most recent aerial photograph (minimum scale 1:660) with the proposed and potential land application areas delineated as well as the location of cultural features such as buildings, water wells, etc. Both the topographic map and aerial photograph must show all areas within 1320 feet of the boundary of the land application area.
(C) Receiving site suitability report, pursuant to subsections (c) and (h)(6) of this Section, based on an on-site investigation and signed by a soil scientist or other qualified person. The report shall include detailed information concerning the site and shall discuss how all site characteristics were determined. Any requests for a variance to site suitability restrictions must be accompanied by a written justification that has been developed or approved by a soil scientist or other qualified person. The justification shall provide explanation as to safeguards which will assure that conditions of the permit will be met and there will be no adverse impacts from the land application.
(D) Analyses of receiving soil samples.
(E) Analyses of contaminated soil or petroleum hydrocarbon-based drill cuttings.
(F) For contaminated soils, an investigation report and diagram, drawn to scale, detailing the areal extent and depth of the contamination; and sampling procedures which were used to assure that representative samples were taken.
(G) Loading calculations.
(H) Copies of all chains-of-custody related to sampling.
(I) If there is an agent, a notarized affidavit designating same, signed by the operator.
(J) Other information as required by this Section or requested by a Field Operations office.

(3) **Review period.** The Field Operations office shall review the application, either approve or disapprove it, and return a copy of Form 1014S within five working days of submission of all required or requested information. If approved, a permit number shall be assigned to Form 1014S; if disapproved, the reason(s) shall be given. The applicant may make application for a hearing if it is not approved.

(h) **Conditions of permit.** Any land application which is performed under this Section shall be subject to the following conditions or stipulations of the permit:

(1) **Notice to Field Inspector.** The applicant shall notify the appropriate Field Inspector at least 24 hours prior to the commencement of land application to allow a Commission representative an opportunity to be present.
(2) **Compliance agreement.** Any person responsible for supervision of land application shall have signed a compliance agreement with the Commission.
(3) **Presence of representative.** A representative of the applicant shall be on the land application site at all times during which materials are being applied. The representative shall be an employee of the applicant, designated agent, contractor, or other person pre-approved by the Commission.
(4) **Materials to be land applied.** Land application under this Section shall be limited to soils and drill cuttings contaminated by salt and/or petroleum hydrocarbons. Petroleum hydrocarbon-contaminated soils or drill cuttings land applied under this Section shall meet the RCRA criteria for exempt or non-exempt/nonhazardous waste. Hazardous waste as defined at 40 CFR 261.3 is regulated by the Oklahoma Department of Environmental Quality.
(5) **Weather restrictions.** Land application, including incorporation, shall not be done:

(A) During precipitation events or when precipitation is imminent.
(B) When the soil moisture content is at a level such that the soil cannot readily take the addition of materials.
(C) When the ground is frozen.

(6) **Buffer zones.** Land application shall not be done within the following buffer zones, as identified in the site suitability report:
(A) Fifty feet of a property line boundary.
(B) Three hundred feet of any actively producing water well used for domestic or irrigation purposes.
(C) One-quarter (1/4) mile of any actively producing water well used for municipal purposes.
(7) **Land application rate.** The maximum calculated application rate of materials shall not be exceeded. Under no circumstances shall land applied materials exceed a two inch depth. Furthermore, no runoff or ponding of land applied materials shall be allowed. It may require more than one pass or lift to achieve the maximum application rate while avoiding runoff or ponding.
(8) **Land application method.** Application of materials shall be uniform over the approved land application area, and shall be made by a method approved by the Commission prior to use. Land applied materials shall be incorporated into the soil by disking or chiseling during or immediately after application to a minimum depth of two times the depth of ~~a~~ applied materials; however, if any contaminated sandy soil~~s~~ is applied to any clayey soil, incorporation shall be to a minimum depth of four times the depth of the applied materials.
(9) **Fertilizer.** For any land application involving petroleum hydrocarbon-contaminated soils and/or drill cuttings, fertilizer shall be applied at an appropriate rate as indicated by soil testing for available N-P-K to adjust the average carbon-nitrogen ratio in order to enhance biodegradation of the petroleum hydrocarbons and assist in reestablishing vegetation. In the absence of soil testing, Nitrogen, Phosphorus, and Potassium shall be applied at a rate of 160-40-40 lbs. per acre (actual N-P-K).
(10) **Vegetative cover.** A bona fide effort shall be made to restore or reestablish the vegetative cover within 180 days after the land application is completed. Additional efforts shall be made until the vegetative cover is fully restored or reestablished.
(11) **Time period.** Land application shall be completed within 30 days of the anticipated completion date shown on the approved application form.
(12) **Post-application report.** A post-application report shall be submitted by the operator or the operator's agent to the Manager of Field Operations within 30 days of the completion of land application. The report shall give specific details of the land application, including volumes of materials applied and an aerial photograph (minimum scale 1:660) delineating the actual area where materials were applied. The report shall contain a statement certifying that the land application was done in accordance with the approved permit.
(13) **Violations.** If the applicant violates the conditions of the permit or this Section, the land application shall be discontinued and the Field Operations office shall be contacted immediately. The Field Operations office may revoke the permit and/or require the operator to do remedial work. If the permit is not revoked, land application may resume with Field Operations' approval. If the permit is revoked, the operator may make application for a hearing to reinstate it.

(i) **Variances.** A variance from the time provisions of (d)(1), (h)(1), (h)(10) or (h)(11) of this Section may be granted by a Field Operations office for justifiable cause. A written request and supporting documentation shall be required. The Field Operations office shall respond in writing within five working days after receipt, either approving or disapproving the request.

[**Source:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 12 Ok Reg 2039, eff 7-1-95; Amended in Rule Making 97000002, eff 7-1-97]

165:10-7-27. Application of waste oil, waste oil residue, or crude oil contaminated soil by oil and gas operators and pipeline companies

(a) **Scope.** This Section shall cover the application of waste oil, waste oil residue, or crude oil contaminated soil by oil and gas operators and pipeline companies to lease roads, pipeline service and tank farm roads, well locations,

and production sites. Hazardous waste as defined at 40 CFR 261.3 is regulated by the Oklahoma Department of Environmental Quality.
(b) **Permit by District Office.** A District Manager for the Conservation Division may issue to an oil or gas operator or pipeline company within the District a permit for road application of waste oil, waste oil residue, or crude oil contaminated soil to lease roads, pipeline service and tank farm roads, well locations, and production sites within the District. This subsection prohibits any operator from applying waste oil, waste oil residue, or crude oil contaminated soil without a permit. Any operator or pipeline company violating this subsection shall be fined $2,000.00.
(c) **Permit requirements.**
(1) **Use of Form 1014X.** The application to apply waste oil, waste oil residue, or crude oil contaminated soil shall be made on Form 1014X. The original and one copy are required.
(2) **Landowner permission.** Attached to the application shall be a copy of written permission by the surface owner to allow the operator or pipeline company to apply waste oil, waste oil residue, or crude oil contaminated soil as per this Section to a specific portion of real property as designated by legal description. For purposes of obtaining such consent, the applicant shall use Form 1014L.
(3) **Telephone permits.** In case of an emergency, a District Manager may issue a permit by telephone. If an operator or pipeline company obtains a permit by telephone, the operator or pipeline company shall file Form 1014X and attachments within five working days after receipt of the permit by telephone.
(4) **Conditions for permits.**
(A) Waste oil, waste oil residue, and contaminated soils applied under this Section shall consist of crude oil and materials produced with crude oil only. Hazardous waste as defined at 40 CFR 261.3 is regulated by the Oklahoma Department of Environmental Quality.
(B) If required by the District Manager, a hydrocarbon analysis shall be submitted with Form 1014X. The analysis shall be performed by a state-certified laboratory in accordance with OCC-approved methods.
(C) Waste oil, waste oil residue, and crude oil contaminated soil shall be applied in such a manner that pollution of surface or subsurface waters will not likely occur and public and private property adjoining the application area will be protected.
(D) During application, any necessary signs, lights and other safety and warning devices shall be used as traffic requires to alert users to conditions. A sign shall be posted with the contractor's or operator's name and phone number to contact in case of an emergency.
(E) No application shall be conducted:
(i) When the temperature is less than 45° F.
(ii) In any area where water collects and stands.
(iii) Where conditions such as grade, soil moisture content, soil type, tight soil conditions, or packed soil conditions cause runoff or prevent rapid absorption of the oil.
(F) Following completion of the project, there shall be a uniform soil/oil base (all liquids worked in), with no visible free-standing oil.
(G) Proper care shall be taken to avoid runoff of oil into borrow ditches or adjacent areas.
(d) **Notice to Field Inspector.** The operator or pipeline company receiving the permit shall notify the appropriate Field Inspector at least two days prior to commencement of application.
(e) **Site inspection.** At his discretion, a District Manager may request a Field Inspector of the Conservation Division or an Enforcement Officer of the Transportation Division to inspect the site at any time during the application operation to ensure compliance with this Section.
(f) **Duration of permit.** The permit shall state the duration of the permit, not to exceed 60 days. If a complaint is received or the operator or pipeline company fails to comply with either the terms of the permit or this Section, the District Manager may direct the operator or pipeline company to cease application until the problem is resolved. If necessary, the District Manager may verbally revoke the permit and/or require the operator or pipeline company to perform remedial work.

If a District Manager disapproves an application or cancels a permit, then the applicant may apply to the Commission for an order under 165:5-7-41.

[**Source:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended at 12 Ok Reg 2017, eff 7-1-95; Amended in Rule Making 97000002, eff 7-1-97]

165:10-7-28. Application of freshwater drill cuttings by County Commissioners

(a) **Scope.** This Section shall cover the one-time application of freshwater drill cuttings by a Board of County Commissioners to a street or road.

(b) **Permits by District Office.** A District Manager for the Conservation Division may issue to any Board of County Commissioners within the District a permit for road application of freshwater drill cuttings to a street or road within the county. This Section prohibits any Board of County Commissioners from applying freshwater drill cuttings without a permit.

(c) **Site restrictions.** Application of freshwater drill cuttings shall only occur on sites having an:

(1) Electrical Conductivity (EC) no greater than 6,000 micromhos/cm; and

(2) Exchangeable Sodium Percentage (ESP) less than 15.0.

(d) **Sampling requirements.**

(1) The appropriate Field Inspector shall be contacted at least two working days prior to sampling to allow a Commission representative an opportunity to witness the sampling of the receiving soil and freshwater drill cuttings to be applied.

(2) The receiving soil shall be sampled using the following procedure:

(A) A minimum of five samples shall be taken for each one-half (1/2) mile section of road (or borrow ditch) and composited into one sample for analysis.

(B) Sampling shall be to a minimum depth of six inches.

(3) The freshwater cuttings shall be sampled by taking a minimum of one representative sample for every five cubic yards of freshwater cuttings to be applied and composited into one quart sample for analysis.

(e) **Analysis requirements.**

(1) The composite samples of soil and drill cuttings shall be analyzed by a laboratory which tests soils.

(2) The parameters for the receiving soil shall include ESP and either EC or Total Dissolved Solids (TDS).

(3) The parameters for the drill cuttings shall include TDS.

(f) **Maximum application rate.**

(1) The maximum application rate shall be calculated by the Board of County Commissioners using the following formula:

PROCEDURE FOR CALCULATING APPLICATION RATE OF TOTAL DISSOLVED SOLIDS (TDS)

______ ppm TDS in receiving soil x 2 = ______ lbs/ac TDS in receiving soil.

10,000 lbs/ac TDS - _______ lbs/ac TDS in receiving soil = Maximum TDS (lbs/ac) to be applied _________.

Maximum TDS (lbs/ac) to be applied ________ ÷ (_______ ppm TDS in cuttings x .000001) = Maximum lbs/ac of cuttings to be applied _______.

Actual weight of drill cuttings ________ lbs/cu ft x 27 = ________ lbs/cu yd.

Maximum lbs/ac to be applied _______ ÷ _______ lbs/cu yd = ________ cu yds/ac to be applied.

Total volume _______ cu yds ÷ _______ cu yds/ac = Minimum acres required ________.

(2) Calculations shall be submitted with the application.

(g) **Permit requirements.**

(1) **Use of Form 1014W.** The application to apply freshwater drill cuttings shall be made on Form 1014W. The original and one copy are required.
(2) **Telephone permits.** In case of an emergency, a District Manager may issue a permit by telephone. If any Board of County Commissioners obtains a permit by telephone, the applicant shall file Form 1014W within five working days after receipt of the permit by telephone.
(3) **Conditions for permits.**
(A) The method to be used for application of freshwater drill cuttings shall not pollute surface or subsurface waters and shall protect public and private property adjoining the application area.
(B) During application, any necessary signs, lights and other safety and warning devices shall be used to alert users to conditions. A sign shall be posted with the contractor's or authority's name to contact in case of an emergency.
(C) All free liquids shall be removed before cuttings are applied.
(D) Following completion of the project, there shall be a uniform soil/cuttings base.
(h) **Notice to Field Inspector.** The Board of County Commissioners receiving the permit shall notify the appropriate Field Inspector at least two days prior to commencement of the application.
(i) **Site inspection.** At his discretion, a District Manager may request a Field Inspector of the Conservation Division or an Enforcement Officer of the Transportation Division to inspect the site at any time during the application operation to ensure compliance with this Section.
(j) **Duration of permit.** The permit shall state the duration of the permit, not to exceed 60 days. If a complaint is received or the Board of County Commissioners fails to comply with either the terms of the permit or this Section, the District Manager may direct the Board of County Commissioners to cease application until the problem is resolved. If necessary, the District Manager may verbally revoke the permit and/or require the Board of County Commissioners to perform remedial work. If a District Manager disapproves an application or cancels a permit, then the applicant may apply to the Commission for an order under 165:5-7-41.

165:10-7-29. Application of freshwater drill cuttings by oil and gas operators
(a) **Scope.** This Section shall cover the one-time application of freshwater drill cuttings by oil and gas operators to private access areas, well locations, and production sites.
(b) **Permits by District Office.** A District Manager for the Conservation Division may issue to an operator within the District a permit for application of freshwater drill cuttings to private access areas, well locations, and production sites within the District. This Section prohibits any operator from applying freshwater drill cuttings without a permit. Any operator violating this subsection shall be fined $2,000.00.
(c) **Site restrictions.** Application of freshwater drill cuttings shall only occur on sites having an:
(1) Electrical Conductivity (EC) no greater than 6,000 micromhos/cm; and
(2) Exchangeable Sodium Percentage (ESP) less than 15.0.
(d) **Sampling requirements.**
(1) The appropriate Field Inspector shall be contacted at least two working days prior to sampling to allow a Commission representative an opportunity to witness the sampling of the receiving soil and freshwater drill cuttings to be applied.
(2) The receiving soil shall be sampled using the following procedure:
(A) A minimum of five samples shall be taken for each one-half (1/2) mile section of road (or borrow ditch), well location, or production facility and composited into one sample for analysis.
(B) Sampling shall be to a minimum depth of six inches.
(3) The freshwater cuttings shall be sampled by taking a minimum of one representative sample for every five cubic yards of freshwater cuttings to be applied and composited into one quart sample for analysis.

(e) **Analysis requirements.**
(1) The composite samples of soil and drill cuttings shall be analyzed by a laboratory which tests soils.
(2) The parameters for the receiving soil shall include ESP and either EC or Total Dissolved Solids (TDS).
(3) The parameters for the drill cuttings shall include TDS.
(f) **Maximum application rate.**
(1) The maximum application rate shall be calculated by the operator using the following formula:

PROCEDURE FOR CALCULATING APPLICATION RATE OF TOTAL DISSOLVED SOLIDS (TDS)

_______ ppm TDS in receiving soil x 2 = ________ lbs/ac TDS in receiving soil.

10,000 lbs/ac TDS - ______ lbs/ac TDS in receiving soil = Maximum TDS (lbs/ac) to be applied _______.

Maximum TDS (lbs/ac) to be applied _______ ÷ (_______ ppm TDS in cuttings x .000001) = Maximum lbs/ac of cuttings to be applied _______.

Actual weight of drill cuttings _______ lbs/cu ft x 27 = _______ lbs/cu yd.

Maximum lbs/ac to be applied _______ ÷ _______ lbs/cu yd = _______ cu yds/ac to be applied.

Total volume _______ cu yds ÷ _______ cu yds/ac = Minimum acres required _______.

(2) Calculations shall be submitted with the application.
(g) **Permit requirements.**
(1) **Use of Form 1014X.** The application to apply freshwater drill cuttings shall be made on Form 1014X. The original and one copy are required.
(2) **Landowner permission.** Attached to the application shall be a copy of written permission by the surface owner to allow the operator to apply freshwater drill cuttings as per this Section to a specific portion of real property as designated by legal description.
(3) **Telephone permits.** In case of an emergency, a District Manager may issue a permit by telephone. If an operator obtains a permit by telephone, the applicant shall file Form 1014X within five working days after receipt of the permit by telephone.
(4) **Conditions for permits.**
(A) The method to be used for application of freshwater drill cuttings shall not pollute surface or subsurface waters and shall protect public and private property adjoining the application area.
(B) During application, any necessary signs, lights, and other safety and warning devices shall be used as traffic requires to alert users to conditions. A sign shall be posted with the contractor's or operator's name to contact in case of an emergency.
(C) All free liquids shall be removed before cuttings are applied.
(D) Following completion of the project, there shall be a uniform soil/cuttings base.
(h) **Notice to Field Inspector.** The operator receiving the permit shall notify the appropriate Field Inspector at least two days prior to commencement of the application.
(i) **Site inspection.** At his discretion, a District Manager may request a Field Inspector of the Conservation Division or an Enforcement Officer of the Transportation Division to inspect the site at any time during the application operation to ensure compliance with this Section.
(j) **Duration of permit.** The permit shall state the duration of the permit, not to exceed 60 days. If a complaint is received or the operator fails to comply with either the terms of the permit or this Section, the District Manager may direct the operator to cease application until the problem is resolved. If necessary, the District Manager may verbally revoke the permit

and/or require the operator to perform remedial work. If a District Manager disapproves an application or cancels a permit, then the applicant may apply to the Commission for an order under 165:5-7-41.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92]

165:10-7-30. Enhanced recovery project surface facilities [REVOKED]

[**SOURCE:** Added at 9 Ok Reg 2337, eff 6-25-92; Revoked in Rule Making 980000034, eff 7-1-99]

165:10-7-31. Seismic and stratigraphic operations

(a) **Scope.**

(1) This Section shall cover the permitting, bonding, and plugging requirements for seismic exploration activities and stratigraphic test holes. Check-shots and vertical seismic profiles or other downhole wellbore seismic operations are excluded from this Section.

(2) For the purposes of this Section, seismic operation shall mean the drilling of seismic shot holes and use of surface energy sources such as weight drop equipment, thumpers, hydro pulses and vibrators. This definition does not include surveying of the seismic area or the activity of conducting private negotiations between parties.

(3) For the purposes of this Section, technical information and data shall be defined as pre-plats as referenced in (b)(2)(B) and post-plats as referenced in subsection(e).

(b) **Seismic and stratigraphic test permitting.**

(1) Before commencing any seismic or stratigraphic test hole operations in the State of Oklahoma, those companies who actually do the work in the field, hereinafter referred to as the applicant, shall:

(A) Be duly registered with the Commission, including provision of a permanent address.

(B) Post a financial surety guarantee with the Commission.

(C) Provide to the Commission the name and business or field address of the contractor responsible for the operations being conducted.

(D) Notify all surface owners of property where seismic or stratigraphic test operations will occur at least fifteen (15) days prior to commencement of operations. It shall be sufficient notice pursuant to this Section when notice is given to the current surface owner(s) as shown by the records of the applicable county treasurer's office. If the applicant has obtained from the surface owner specific written permission to conduct such operations prior to commencement of operations, such action shall be considered sufficient notification for the purposes of this Section and the 15 day notice requirement shall not be required. Notification by U.S. mail shall be sufficient for the purposes of this Section, provided the notice is postmarked at least fifteen (15) days prior to commencement of any seismic or stratigraphic test operations.

(E) The notice shall include a copy of the oil or gas lease or seismic permit or other legal instrument of similar nature authorizing the use of the surface for seismic or stratigraphic test hole operation(s) and shall contain the following information:

(i) Name of the company for whom the applicant is conducting the seismic or stratigraphic test operation(s) and

(ii) Anticipated date of commencement of operation(s).

(F) Applicants must obtain a permit from the Conservation Division for each seismic or stratigraphic test operation.

(2) The applicant shall make application on the Commission's Form 1000S.

(A) The permit shall be valid for only one operation as approved on Form 1000S.

(B) A pre-plat of the operation area shall be attached to the application showing the location of the operation area delineated to the nearest section.

(C) Post a performance bond in the amount of $50,000, or other form of surety in an amount as approved by the Conservation Division. The performance bond may be filed for each operation, or may be filed on an annual basis to cover all operations that may be undertaken during the year. If the performance bond is filed for a single operation, the amount may be approved by the Conservation Division for less than $50,000 or in another form of financial surety guarantee, depending on the nature of the seismic or stratigraphic operation involved, the number of shot holes or surface energy source points, the cost of the operation and the size of the applicant's business. The form of surety shall not include letters of credit or financial statements. Such bond(s) or other surety may be released upon request made no sooner than thirty (30) days subsequent to the completion of the applicant's operation(s), which have been permitted under such bond(s) or other surety, upon satisfactory inspection or review by Conservation Division personnel.

(D) The permit shall expire twelve (12) months from the issue date, unless operations are commenced.

(E) The Conservation Division shall approve or deny the application within thirty (30) days of receipt of the application. The Conservation Division may act upon an application or amended application on an expedited basis.

(F) During any activity subject to this subsection, the applicant shall maintain at the site a copy of the approved permit, Form 1000S, for inspection.

(G) All technical information, excluding the Form 1000S, but including any plats, relative to the permitted operation shall remain confidential or the Conservation Division shall destroy the records. The plats and any other technical data submitted, shall be filed in the Technical Services Department of the Conservation Division. Upon request of the Manager of Field Operations, the technical data may be reviewed by Field Operations to ensure compliance with Commission rules.

(3) Unless the applicant can demonstrate to the Conservation Division's District Office that another method will provide sufficient protection to groundwater supplies and long term land stability, the following guidelines shall be observed:

(A) Standard plugging method. All holes shall be filled to within four feet from the surface with bentonite, native cuttings, or an appropriate substitute. The remainder of the shot hole shall be filled and tamped with native cuttings or soil.

(B) Special methods. In areas where the standard plugging method has been shown to be inadequate for the prevention of groundwater contamination, the Conservation Division may designate the area as a special problem area. In such event, the Conservation Division will provide to the best of its ability, a clear geographical description of such area and the recommended, or required, hole plugging methods. Should the applicant encounter conditions such that the standard method appears inadequate for the prevention of groundwater contamination, the applicant shall inform the Conservation Division.

(i) Artesian flow. If the standard method is inadequate to stop artesian flow, alternate remedies must be employed to do so.

(ii) Water well conversion. Applicants are prohibited from allowing the conversion of seismic shot holes or stratigraphic test holes to water wells.

(iii) Groundwater protection. Alternative plugging procedures and materials may be utilized when the applicant has demonstrated to the Conservation Division's satisfaction that the alternatives will protect usable quality water.

(iv) Timeliness. All seismic shot holes or stratigraphic test holes shall be plugged as soon as possible and shall not remain unplugged for a period of more than 30 days after the drilling of the hole.

(c) No seismic shot hole blasting shall be conducted within two hundred (200) feet of any habitable dwelling, building, or water well without written permission from the owner of the property or within 500 feet of any superfund site or hazardous waste facility.
(d) Any person, firm, corporation or entity which conducts any seismic or stratigraphic test hole operations without a permit as provided in this Section, or in any other manner violates the rules of the Commission governing such operation shall be subject to a penalty up to One Thousand Dollars ($1,000.00) per violation per day after completion of the informal complaints procedure provided in OAC 165:10-7-7 and notice and hearing pursuant to the Commission's contempt proceedings.
(e) Within 30 days after completing a seismic or stratigraphic test hole operation, the applicant receiving the permit shall submit a copy of the approved Form 1000S certifying the plugging of all seismic shot holes or stratigraphic test holes in compliance with Section (b)(3)(A) or Section (b)(3)(B) above. In addition to the Form 1000S, a post-plat or acceptable form of survey showing the actual location of all seismic shot holes or all stratigraphic test holes shall be included.
(f) **Complaints.** A complaint alleging violations of this Section may be filed with the Commission against any person, firm or corporation conducting seismic and stratigraphic operation(s). The Commission may determine if and when a complaint has been adequately resolved, pursuant to the informal complaints process of OAC 165:10-7-7, and, if an environmental complaint, pursuant to the citizen complaint procedure of OAC 165:5-1-25.

[**SOURCE:** Added in Rule making 980000034, eff 7-1-99]

165:10-7-32. Application to reclaim and/or recycle produced water for surface activities related to drilling, completion, workover, and production operations from oil and gas wells

(a) **Authority to reclaim and/or recycle produced water.** No person shall use produced water for any other purpose except as provided by this section. Any operator failing to obtain a permit may be fined up to $500.00.
(b) **Scope.** This Section shall cover the reclaiming and/or recycling of produced water from oil and gas wells for a single well location for the purpose of water supply for surface activities used for a specific permitted use. This does not include the use of produced water for down- hole operations referred to as weighted water under OAC 165:10-7-24(b)(2).
(c) **Quality of produced water.** For the purposes of this rule shall be limited to Total Dissolved Solids (TDS) content not to exceed 5,000 mg/l and oil and grease content not to exceed 1,000 mg/l.
(d) **Storage of produced water.** If the produced water is stored in tanks, the tanks shall be legibly marked "recycle" water.
(e) **Log of load tickets.** The operator shall maintain copies of the load tickets from wells that the produced water was obtained. Such copies shall be made available to the OCC Inspector upon request.
(f) **Notification to OCC District Office.** The Operator shall orally notify the District Office when produced water is to be initially hauled to the permitted facility.
(g) **Application for permit.**
  (1) The operator of the well must apply for the permit for the reclamation of produced water.
  (2) Required Application. Each application for the reclaiming and/or recycling of produced water shall be submitted to the Field Operations District office on Form 1014D.
  (3) A copy of written notice to the surface owner that the applicant intends to use produced water as per 165:10-7-32 to a specific portion of their real property as designated by legal description. For purposes of notice, a written waiver from the surface owner may also be submitted.

[**SOURCE:** Added in Rule making 200300001, eff 7-1-03]

SUBCHAPTER 8. COMMERCIAL RECYCLING
PART 1. HYDROCARBON RECYCLING/RECLAIMING FACILITIES

Section

PART 3. DRILLING WASTE RECYCLING/RECLAIMING FACILITIES

[**Authority:** 52 O.S. Sections 139 and 141 (Supp. 1993)]

[**Source:** Codified 7-11-94]

[BLANK PAGE]

PART 1. HYDROCARBON RECYCLING/RECLAIMING FACILITIES

165:10-8-1. Scope

This Part shall cover the permitting, construction, operation, and closure requirements for any recycling/reclaiming facility.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-2. Definitions

The following words and terms, when used in this Subchapter, shall have the following meaning, unless the context clearly indicates otherwise:

"Tank bottom hydrocarbon recycling/reclaiming facility" means a recycling/reclaiming operation at a tank bottom reclaiming facility which is authorized by the Commission to recycle and/or reclaim marketable crude oil or condensate produced or used in the exploration or production of oil and gas. The facility shall comply with OAC 710:45-15-3.

"Hydrocarbon recycling/reclaiming facility at a saltwater disposal site" means a recycling/reclaiming operation at a Class II saltwater disposal site which is authorized by the commission to recycle and/or reclaim marketable crude oil or condensate produced or used in the exploration or production of oil and gas. The facility shall comply with OAC 710:45-15-3.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-3. Permit required

(a) **Who may apply.** The applicant for a recycling/reclaiming facility shall be the owner and/or lease holder of the site.
(b) **Compliance with Part.** Before issuance of a permit, the applicant shall comply with this Part and if pits are to be used for storage, the applicant shall comply with 165:10-9-1, except at Class II saltwater disposals.
(c) **OCC Form 1020A.** Application shall be filed on OCC Form 1020A.
(d) **An Oklahoma Tax Commission Reclaimer License.** The applicant shall have obtained a reclaimer license number under OAC 710:45-15-2. This number will be used by the Corporation Commission for its permit number.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-4. Application requirements

(a) **Permit required.** No recycling/reclaiming facility shall be constructed, enlarged, or used without approval on Form 1020A.
(b) **Site limitations.** Recycling/reclaiming facilities shall not be restricted by site limitations unless pits are to be used.
  (1) Tank bottom hydrocarbon recycling/reclaiming facilities with pits that are to be used for storage in the operation shall comply with OAC 165:10-9-1.
  (2) Hydrocarbon recycling/reclaiming facilities at a saltwater disposal site with pits that are used for unloading saltwater shall comply with OAC 165:10-9-3.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-5. Surety requirements for reclaimers

(a) **Agreement to close.** Any operator of a recycling/reclaiming facility shall file with the Oil and Gas Conservation Division an agreement to properly close and reclaim the site in accordance with approved closure and reclamation procedures upon termination of recycling/reclaiming operations. The agreement shall be on forms available from the Conservation Division and shall be accompanied by surety. The agreement shall provide that if the Commission finds that the operator has failed or refused to close the facility or take remedial action as required by law and the rules of the Commission, the surety shall pay to the Commission the full amount of the operator's obligation up to the limit of the surety.

(b) **New facilities.** Category A (165:10-1-11) or Category B (165:10-1-13) surety shall be required for coverage of the closure costs, including well pluggings and general site restoration. These costs shall be calculated upon the projected costs of closure for the facility, based on estimated costs of earth work, remediation, revegetation, plugging, etc. Such information shall be provided by the applicant and reviewed, adjusted and ordered by the Commission.

(c) **Existing facilities.** For facilities in operation prior to the effective date of this Part, the Commission can require, by order, the establishment of an escrow account to cover the costs of closure, by using a per barrel fee to be deposited into the account. Any interest the account earns until the total amount is collected shall be reinvested in the account. Any interest accrued after the account balance is full shall be returned to the operator.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-6. Design and construction requirements

(a) **Spill prevention.** Each facility shall be designed and constructed utilizing good engineering practices. Design and construction standards shall be determined on a case-by-case basis by the Commission. Each such facility shall be designed and constructed to prevent escape of deleterious substances.

(b) **Unloading pits or sumps.** All unloading areas at tank bottom hydrocarbon recycling/reclaiming facilities that use a pit to receive fluids and skimming pits shall be approved on OCC Form 1014.

(c) **Required exhibits.** Complete construction plans, drawings, and written specifications for the proposed facility shall be submitted to the Manager of Pollution Abatement for review and approval. Design and construction standards shall be determined on a case-by-case basis by the Commission. Applicants shall consult with the Commission prior to the construction of the proposed facility. The Commission may apply existing technological standards and/or establish new standards, as it deems appropriate to the proposed site and activities. All plans, drawings, and specifications shall be prepared by or under the supervision of a qualified expert.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-7. Operation and maintenance requirements

(a) **Fencing.** All recycling/reclaiming facilities shall be completely enclosed by a fence at least four feet in height. No livestock shall be allowed inside the fence. Final construction is subject to approval by the Manager of Pollution Abatement.

(b) **Sign.** A waterproof sign bearing the name of the operator, legal description, permit number, and emergency phone number shall be posted within 25 feet of the entrance gate to the facility and shall be readily visible.

(c) **Site security.** Receiving of any recycling/reclaiming material shall occur only when there is an attendant on duty. All sites shall be secured by a locked gate when an attendant is not on duty. A key or combination to the lock shall be provided to the appropriate Field Inspector for the purpose of carrying out inspections.

(d) **Acceptable materials.** Operators of a recycling/reclaiming facility shall only receive substances as defined in 165:10-1-2 "Deleterious substances."
(e) **Oil film.** OPERATORS TAKE NOTE: Federal statutes, such as the Bald Eagle Protection Act (16 U.S.C. Sections 668-668d), the Migratory Bird Treaty Act (16 U.S.C. Sections 703-711), the Endangered Species Act (16 U.S.C. Sections 1531-1542), and the Lacey Act Amendments of 1981 (16 U.S.C. Sections 3371-3378), dictate substantial fines and penalties for persons who allow birds of certain species to become fatally injured due to incidental contact with oil or oil by-products. These fines may be levied upon persons allowing such fatalities to occur, whether accidental or not. Misdemeanor and felony convictions may include imprisonment. Information on affected bird species, regulations under these Acts, and measures which can be taken to prevent such occurrences, such as the netting or covering of open-topped tanks and pits which contain oil or oil by-products, can be obtained from the U.S. Fish and Wildlife Service Office in Oklahoma City or the nearest Oklahoma Department of Wildlife Office.
(f) **Aesthetics.**
(1) All surface trash, debris, junk and scrap or discarded material connected with the operations of the facility shall be removed from the premises. With written permission from the surface owner, the operator may, without applying for an exception to 165:10-3-17(b), bury all nonhazardous material at a minimum depth of three feet; cement bases are included.
(2) The District Office or field inspector may issue a Form 1085 for any alleged violation of this subsection. If the operator fails to conduct cleanup as directed, the Commission may fine the operator $500.00 for a first offense. For a subsequent offense, the fine shall be $1,000.00, and the facility shall be shut down until completion for cleanup operations.
(g) **Structural integrity.** All recycling/reclaiming facilities shall be used, operated, and maintained at all times so as to prevent the escape of their contents. Any condition that threatens the structural stability of any diked portion or the storage facility shall be repaired in a timely manner.
(h) **Prevention of pollution.** All recycling/reclaiming facilities shall be used, operated, and maintained at all times so as to prevent pollution. In the event any non permitted discharge occurs, sufficient measures shall be taken to stop or control the loss of materials, and reporting procedures in accordance with 165:10-7-5(c) shall be followed. Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division.
(i) **Fines.** For a willful non-permitted discharge from the facility, the operator shall be fined $5,000.00.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-8. Reporting
(a) **Annual report on Form 1014A.** The operator of any recycling/reclaiming facility shall submit an annual report on Form 1014A to the Manager of Pollution Abatement, by February 1 of each year. In lieu of Commission Form 1014A, operators may submit Oklahoma Tax Commission Form 323A for the twelve calendar months of the previous year by February 1st.
(b) **Daily log for tank bottom at a hydrocarbon recycling/reclaiming facility.** The operator shall maintain a daily log and at a minimum shall include the date, volume, source (generator) and type of material. In addition, copies of any chemical analysis of materials or material safety data sheets shall be maintained.
(c) **Daily load tickets for hydrocarbon recycling/reclaiming facilities at salt water disposal facilities.** The operator shall keep the load tickets for saltwater and other deleterious substances received at the saltwater disposal facilities for a minimum of three years at the operator's office.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 200000002, eff 7-1-00]

165:10-8-9. Closure requirements

(a) **Notification.** The Manager of Pollution Abatement Department shall be notified in writing whenever a recycling/reclaiming facility shall be closed, or portions thereof, or becomes inactive unless it is shut down by the Commission.

(b) **Closed facility.** A recycling/reclaiming facility may be considered closed or inactive if the operator closes the facility, the operator is unable to furnish documentation to show that there has been receipt of deleterious substances during the last twelve months, the facility has been shut down by the Commission, or authority to operate has lapsed or is vacated by Commission order.

(c) **Closure plan.** An approved closure plan shall be submitted to the Pollution Abatement Department. Estimate of cost of closure shall be made part of the plan.

(d) **Monitor wells.** Monitor wells, if required, shall be plugged with bentonite or cement, upon approval in writing by the Manager of Pollution Abatement.

(e) **Pits.** When closing any pit with a geomembrane liner, extreme care shall be taken to preserve the integrity of the liner. All free liquids and sediments shall be removed.

(f) **Burial.** If any concrete, steel, geomembrane, or other materials associated with the site are to be left on-site, they shall be buried under a minimum soil cover of three (3) feet, pursuant to 165:10-3-7.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-10. Additional requirements

The requirements set forth in this Part are minimum requirements. Additional requirements may be made upon a showing of good cause.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-11. Variances

Except as otherwise provided in this Subchapter, variances from provisions of this Part may be granted by the Manager of Pollution Abatement or by order after application, notice, and hearing.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

PART 3. DRILLING WASTE RECYCLING/RECLAIMING FACILITIES

165:10-8-25. Scope

This Part shall cover the permitting, construction, operation, and closure requirements for any drilling waste recycling/reclaiming facility.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-26. Definitions

The following words and terms, when used in this Subchapter, shall have the following meaning, unless the context clearly indicates otherwise:

"Drilling waste recycling/reclaiming facility" means a recycling/reclaiming operation which is authorized by the Commission to recycle and/or reclaim drilling waste produced or used in the exploration or production of oil and gas into a marketable product for resale which has undergone at least one treatment process and is to be used for something other than drilling or plugging mud.

This definition does not?include the reuse of drilling mud used in drilling or plugging operations.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-27. Pit requirements
(a) **Who may apply.** The applicant for a drilling waste recycling/reclaiming facility shall be the owner and/or lease holder of the site.
(b) **Compliance with Part.** Before issuance of a permit, the applicant shall comply with this Part and if pits are to be used for storage, the applicant shall also comply with 165:10-9-1.
(c) **OCC Form 1020A.** Application shall be filed on OCC Form 1020A.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-28. Application requirements
(a) **Permit required.** No drilling waste recycling/reclaiming facility shall be constructed, enlarged, reconstructed, or used without approval on Form 1020A.
(b) **Site limitations.** Drilling waste recycling/reclaiming facilities shall not be restricted by site limitations unless pits are to be used. If pits are to be used for storage in the operation, the applicant shall also comply with 165:10-9-1.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-29. Surety requirements for reclaimers
(a) **Agreement to close.** Any operator of a drilling waste recycling/reclaiming facility shall file with the Oil and Gas Conservation Division an agreement to properly close and reclaim the site in accordance with approved closure and reclamation procedures upon termination of drilling waste recycling/reclaiming operations. The agreement shall be on forms available from the Conservation Division and shall be accompanied by surety. The agreement shall provide that if the Commission finds that the operator has failed or refused to close the facility or take remedial action as required by law and the rules of the Commission, the surety shall pay to the Commission the full amount of the operator's obligation up to the limit of the surety.
(b) **New facilities.** For new facilities, a Category A (165:10-1- 11) or Category B (165:10-1-13) surety shall be required for coverage of the closure costs, including well pluggings and general site restoration. These costs shall be calculated upon the projected costs of closure for the facility, based on estimated costs of earth work, remediation, revegetation, plugging, etc. Such information shall be provided by the applicant and reviewed, adjusted if necessary, and ordered by the Commission.
(c) **Existing facilities.** For facilities in operation prior to the effective date of this Section, the Commission can require, by order, the establishment of an escrow account to cover the costs of closure, by using a per barrel fee to be deposited into the account. Any interest the account earns until the total amount is collected shall be reinvested in the account. Any interest accrued after the account balance is full shall be returned to the operator.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-30. Design and construction requirements
(a) **Spill prevention.** Each facility shall be designed and constructed utilizing good engineering practices. Design and construction standards shall

be determined on a case-by-case basis by the Commission. Each facility shall be designed and constructed to prevent escape of deleterious substances.
(b) **Unloading pits or sumps.** All unloading areas that use a pit to receive fluids and skimming pits shall be approved on OCC Form 1014.
(c) **Required exhibits.** Complete construction plans, drawings, and written specifications for the proposed facility shall be submitted to the Manager of Pollution Abatement for review and approval. Design and construction standards shall be determined on a case-by-case basis by the Commission. Applicants shall consult with the Commission prior to construction of the proposed facility. The Commission may apply existing technological standards and/or establish new standards, as it deems appropriate to the proposed site and activities. All plans, drawings, and specifications shall be prepared by or under the supervision of a qualified expert.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-31. Operation and maintenance requirements
(a) **Fencing.** The drilling waste recycling/reclaiming facility shall be completely enclosed by a fence at least four feet in height. No livestock shall be allowed inside the fenced area. Final construction is subject to approval by the Manager of Pollution Abatement.
(b) **Sign.** A waterproof sign bearing the name of the operator, legal description, permit number, and emergency phone number shall be posted within 25 feet of the entrance gate to the facility and shall be readily visible.
(c) **Site security.** Receiving of any drilling waste recycling/reclaiming material shall occur only when there is an attendant on duty. All sites shall be secured by a locked gate when an attendant is not on duty. A key or combination to the lock shall be provided to the appropriate Field Inspector for the purpose of carrying out inspections.
(d) **Acceptable materials.**
(1) Operators of a drilling waste recycling/reclaiming facility shall only receive substances as defined in 165:10- 1-2 "Deleterious Substances."
(2) Water based mud shall be stored separately from oil based mud.
(e) **Open pits.** Any open recycling pit or tank shall be covered to prevent access to birds.
(f) **Aesthetics.**
(1) All surface trash, debris, junk and scrap or discarded material connected with the operations of the facility shall be removed from the premises. With written permission from the surface owner, the operator may, without applying for an exception to 165:10-3-17(b), bury all nonhazardous material at a minimum depth of three feet; cement bases are included.
(2) The District Office or field inspector may issue a Form 1036 for any alleged violation of this subsection. If the operator fails to conduct cleanup as directed, the Commission may fine the operator $500.00 for a first offense. For a subsequent offense, the fine shall be $1,000.00, and the facility shall be shut down until completion for cleanup operations.
(g) **Structural integrity.** All drilling waste recycling/reclaiming facilities shall be used, operated, and maintained at all times so as to prevent the escape of their contents. Any condition that threatens the structural stability of any diked portion or the storage facility shall be repaired in a timely manner.
(h) **Prevention of pollution.** All drilling waste recycling/reclaiming facilities shall be used, operated, and maintained at all times so as to prevent pollution. In the event any non permitted discharge occurs, sufficient measures shall be taken to stop or control the loss of materials, and reporting procedures in accordance with 165:10-7-5(c) shall be followed. Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division.
(i) **Fines.** For a willful non-permitted discharge from the facility, the operator shall be fined $5,000.00.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-32. Reporting

(a) **Annual report on Form 1014A.** The operator of any drilling waste recycling/reclaiming facility shall submit an annual report on Form 1014A to the Manager of Pollution Abatement, by February 1 of each year.
(b) **Daily log.** The operator shall maintain a daily log that at a minimum shall contain the date, volume, source (generator) and type of material and in addition copies of any chemical analysis or materials or D.O.T. material safety data sheets.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-33. Closure requirements

(a) **Notification.** The Manager of Pollution Abatement Department shall be notified in writing whenever a drilling waste recycling/reclaiming facility shall be closed, or portions thereof, or becomes inactive unless it is shut down by the Commission.
(b) **Closed facility.** A drilling waste recycling/reclaiming facility may be considered closed or inactive if the operator closes the facility, the operator is unable to furnish documentation to show that there has been receipt of deleterious substances during the last twelve months, the facility has been shut down by the Commission, or authority to operate has lapsed or is vacated by Commission order.
(c) **Closure plan.** An approved closure plan shall be submitted to the Pollution Abatement Department. Estimate of cost of closure shall be made part of the plan.
(d) **Monitor wells.** Monitor wells, if required, shall be plugged with bentonite or cement, upon approval in writing by the Manager of Pollution Abatement.
(e) **Pits.** When closing any pit with a geomembrane liner, extreme care shall be taken to preserve the integrity of the liner. All free liquids and sediments shall be removed.
(f) **Burial.** If any concrete, steel, geomembrane, or other materials associated with the site are to be left on-site, they shall be buried under a minimum soil cover of three (3) feet, pursuant to 165:10-3-7.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-34. Additional requirements

The requirements set forth in this Part are minimum requirements. Additional requirements may be made upon a showing of good cause.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

165:10-8-35. Variances

Except as otherwise provided in this Subchapter, variances from provisions of this Part may be granted by the Manager of Pollution Abatement or by order after application, notice, and hearing.

[**Source:** Added at 11 Ok Reg 3691, eff 7-11-94]

[BLANK PAGE]

SUBCHAPTER 9. COMMERCIAL DISPOSAL FACILITIES

Section

[BLANK PAGE]

165:10-9-1. Use of commercial pits

(a) **Scope.** This Section shall cover the permitting, construction, operation, and closure requirements for any commercial pit. A commercial pit is a disposal facility which is authorized by Commission order and used for the disposal, storage, and handling of deleterious substances or soils contaminated by deleterious substances produced, obtained, or used in connection with drilling and/or production operations. This does not cover disposal well pits. (See 165:10-9-3 and 165:10-7-20.)

(b) **Application requirements.**

(1) **Who may apply.** The applicant for a commercial pit shall be the owner of the land (or person having a written firm option to purchase the land at the time the application is filed) on which the proposed pit is to be located: if leased, both the owner and lessee shall be joint applicants.

(2) **Compliance with rules.** Before issuance of an order, the applicant shall comply with Commission Rules of Practice 165:5-7-1, 165:5-7-35, 165:5-3-1, and this Section.

(3) **Exhibits.** Two complete sets of all exhibits which shall be relied upon by the applicant shall be submitted to the Pollution Abatement Department of the Commission, pursuant to 165:5-7-35. Those exhibits shall include, but are not limited, to the following:

(A) A lithologic log of test borings, identifying the subsurface materials encountered and the depth at which groundwater was encountered pursuant to (c)(2)(D) of this Section.

(B) Results of permeability tests of the proposed liner materials, pursuant to (e)(7) of this Section.

(C) A topographic map of the commercial pit site.

(D) The appropriate Soil Conservation Service (SCS) soil survey aerial photo and legend.

(E) A detailed drawing of the site, with complete construction plans drawn to scale by or under the supervision of a registered professional engineer.

(F) A plan for closure of the pit(s) which shall provide for a minimum three feet of soil cover and shall specifically state how all aspects of closure shall be accomplished, including volume and fate of liquids and solids, earthwork to close the pit(s) (including placement of stockpiled topsoil), and revegetation of the site.

(G) An itemization of projected hauling, closure, reclamation, maintenance, and monitoring costs.

(H) A plan for post-closure maintenance and monitoring which shall address maintenance of the site as well as monitoring and plugging of wells. Exemption from the plugging of monitor wells may be obtained upon written request and approval of the Manager of Pollution Abatement.

(I) A plan for operation which shall address the method(s) by which excess water will be disposed.

(c) **Restrictions.**

(1) **Order required.** No commercial earthen pit shall be constructed, enlarged, reconstructed, or used without a Commission order.

(2) **Site limitations.**

(A) No commercial earthen pit shall be constructed or used unless an investigation of the soils, topography, geology, and hydrology conclusively shows that storage of water-based drilling fluids and/or cuttings at the site will not be harmful to groundwater, surface water, soils, plants, or animals in the surrounding area. No abandoned mine, strip pit, quarry, canyon, or streambed shall be used for disposal of oilfield wastes, nor shall a pit be constructed or used in such a setting.

(B) No commercial pit shall be constructed or used on any site that is located within a 100-year flood plain.

(C) No commercial pit shall be constructed or used within a wellhead protection area (WPA) as identified by the Wellhead Protection Program (42 USC Section 300h-7, Safe Drinking Water Act), or within one mile of an active municipal water well for which the WPA has not been delineated.

(D) No commercial pit shall be constructed unless it can be shown that there will be a minimum of 25 feet between the bottom of the pit and the groundwater level of the first aquifer. To ascertain this and to demonstrate the subsurface profile of the site, a minimum of three test borings (the exact number of locations to be determined by the Pollution Abatement Department) shall be drilled to a minimum depth of 25 feet below the proposed bottom of the pit and into the first aquifer encountered. Test borings need not extend deeper than 50 feet below the bottom of the pit if an aquifer has not been encountered before that depth. All boreholes converted to monitor wells shall conform to (e)(15) of this Section. All boreholes not converted to monitor wells shall be plugged from top to bottom with bentonite, cement, and/or other method approved by the Pollution Abatement Department within 30 days of drilling completion.

(E) After July 1, 1992, no commercial pit shall be constructed or used within the following distances from the city limits of an incorporated municipality unless previously authorized by Commission order:

(i) Three miles if population is 20,000 or less.

(ii) Five miles if population is greater than 20,000.

(3) **Means of water disposal.** No commercial pit shall be constructed or used unless the operator can show that there will be an ongoing means of disposal of excess water pursuant to (b)(3)(I) of this Section.

(d) **Surety requirements.**

(1) **Agreement with Commission.** Any operator of a commercial pit shall file with the Manager of Document Handling for the Conservation Division an agreement to properly close and reclaim the site in accordance with approved closure and reclamation procedures upon termination of disposal operations due to abandonment, shutdown, full pits, or other reason. The agreement shall be on forms available from the Conservation Division and shall be accompanied by surety. The agreement shall provide that if the Commission finds that the operator has failed or refused to close the pits or take remedial action as required by law and the rules of the Commission, the surety shall pay to the Commission the full amount of the operator's obligation up to the limit of the surety.

(2) **Surety amount and type.** The Commission shall establish the amount of security in the order for the authority to construct, enlarge, or operate a commercial pit. The amount of security shall be based on factors such as dimensions of the pit and costs of hauling, closure, reclamation, and monitoring. The amount may be subject to change for good cause. Upon approved closure of a pit, the Manager of Pollution Abatement may administratively reduce the surety requirement to an amount which would cover the cost of monitoring the site and plugging the monitor wells. Security shall be maintained for as long as monitoring is required. The type of security shall be a corporate surety bond, certificate of deposit, irrevocable letter of credit, or other type of security approved for the pit by order of the Commission. Any type of surety that expires shall be renewed prior to 30 days before the expiration date. All joint escrow accounts shall be made current every 30 days.

(3) **Posting surety before permit is issued.** An operator shall post surety with the Commission before a construction permit is issued, pursuant to (e)(1) of this Section.

(e) **Construction requirements.**

(1) **Permit required.** Prior to constructing any pit, a commercial pit operator shall obtain a permit from the Manager of Pollution Abatement. Application shall be made on Form 1014N. For use of a commercial pit without a permit, the pit operator shall be fined $5,000.00.

(2) **Runoff water prohibited.** No runoff water from surrounding land surfaces shall be allowed to enter a pit.

(3) **Stockpiling of topsoil.** Prior to constructing a pit, all topsoil within the top twelve inches of soil on the site shall be stockpiled for use as the final cover at the time of closure. The topsoil may be stockpiled in the outside slopes of the berms, provided it is not used for structural purposes and can be readily distinguishable from other soil materials at the

time of closure. In cases where topsoil is stockpiled in the berms, it shall be shown in the as-built drawings pursuant to (e)(16) of this Section.

(4) **Monitoring by engineer.** A registered professional engineer or an engineer-in-training working under the supervision of a registered professional engineer (RPE) shall monitor the construction of any commercial pit to assure that approved design specifications and Commission rules are adhered to. A minimum of three on-site visits to the site shall be made; one pre-construction, one during construction, and one post-construction. At least the post-construction on-site visit shall be made by the RPE.

(5) **Maximum fluid depth.** Any pit shall be constructed to contain a maximum fluid or sediment depth of seven feet, with a minimum freeboard of three feet.

(6) **Maximum dimensions.** Any pit shall not be constructed to dimensions greater than that approved in the order. Furthermore, the maximum width of a pit or pit cell shall not exceed 175 feet if closure must be accomplished from one side or two adjacent sides; 350 feet if closure can be accomplished from at least two opposite sides or three adjacent sides. Pit dimensions shall be measured at the maximum allowable fluid level.

(7) **Soil liners.**

(A) Soil materials to be used in a soil liner shall undergo permeability testing before construction. Pre-construction permeability testing shall consist of laboratory permeability tests on at least two specimens of representative soil liner materials compacted in the laboratory to approximately 95 percent of the material's Standard Proctor Density (ASTM D-698).

(B) Laboratory permeability test procedures must conform to one of the methods described for fine-grained soils in the Corps of Engineers Manual EM-1110-2-1906 Appendix VII. In no case shall the pressure differential across the specimen exceed five feet of water per inch of specimen length.

(C) If permeability testing shows that addition of bentonite or other approved material is needed to assist the native soils in meeting the permeability standard, it shall be applied at a minimum rate specified by the testing or engineering firm. Any bentonite used for liner material shall not have been previously used in drilling muds.

(D) Any soil liner shall be constructed by disturbing the soil to the depth of the bottom of the liner, applying fresh water as necessary to the soil materials to achieve a moisture content wet of optimum, then recompacting it with heavy construction equipment, such as a footed roller, until the required density is achieved, pursuant to (H) of this paragraph. The liner shall be constructed in maximum six inch lifts (after compaction), with each lift being scarified before placement of the next lift.

(E) Any soil liner shall cover the bottom and interior sides of the pit entirely.

(F) Any soil liner shall be installed on a slope no steeper than 3:1 (horizontal to vertical).

(G) Any soil liner shall have a minimum thickness of 18 inches (after compaction) and shall have a maximum coefficient of permeability of 1.0×10^{-7} cm/sec.

(H) Any soil liner shall be field tested for compaction, unless a post-construction permeability test is performed pursuant to (I) of this paragraph.

(i) A minimum of six compaction tests shall be performed on any soil liner; a minimum of four widely spaced tests in the bottom of the pit and two tests on different slopes of the pit are required, unless otherwise directed by a Conservation Division representative. Particular emphasis shall be placed on selecting locations for compaction tests where nonuniformity in soil texture or color can be observed.

(ii) Compaction tests shall be conducted in accordance with ASTM methods D-2922 or D-1556.

(iii) The soil materials of any liner shall be compacted to at least 95 percent of the Standard Proctor Density.

(I) Post-construction permeability testing shall consist of at least two laboratory permeability tests on undisturbed samples of the completed soil liner.

(i) Particular emphasis shall be placed on selecting the location(s) for permeability tests or test samples where nonuniformity in soil texture or color can be observed.

(ii) Field permeability tests shall be conducted only by the double ring infiltrometer method as described in ASTM D-3385. Permeability tests may be discontinued prior to flow stabilization upon satisfactory evidence that the permeability rate is less than 1.0×10^{-7} cm/sec.

(8) **Geomembrane liners.**

(A) Any geomembrane liner that is installed in a commercial pit shall have a minimum thickness of 30 mil.

(B) Any geomembrane liner used in a commercial pit shall be chemically compatible with the type of substances to be contained and shall have ultraviolet light protection.

(C) Any geomembrane liner shall be placed over a specially prepared, smooth, compacted surface void of sharp changes in elevation, rocks, clods, organic debris, or other objects.

(D) Any geomembrane liner shall be continuous, although it may include seams, and shall cover the bottom and interior sides of the pit entirely. The edges shall be securely placed in a minimum twelve inch deep anchor trench around the perimeter of the pit.

(9) **Width of the crown.** The crown (top) of any berm shall be a of minimum eight feet in width.

(10) **Slopes.** The inside slope of any exterior berm (having fluid on one side) shall not be steeper than 3:1 (horizontal to vertical) and the outside slope 2.5:1. The slopes of any interior berm (having fluid on both sides) shall not be steeper than 3:1.

(11) **Earthwork compaction.** All earthwork, except as noted in (7)(H)(iii) of this subsection, shall be compacted to achieve a minimum 90% Standard Proctor Density and shall be applied in lifts where some method of bonding is achieved between lifts, with each lift not to exceed eight inches prior to compaction.

(12) **Pipe installation.** Any pipe, tinhorn, culvert, or conduit in the berm between two adjoining pits shall be placed so that there is a minimum of 36 inches between the top of the pipe, tinhorn, culvert, or conduit and the lowest point in the top of the berm separating the pits.

(13) **Splash pad.** All pits which receive fluids directly from a vacuum truck shall have a splash pad at the point where fluids are received unless a waiver is obtained from the Manager of Pollution Abatement by showing that erosion of the liner will not occur. The pad must be constructed of materials and to the dimensions necessary to effectively prevent the liner from eroding.

(14) **Fluid level marker.** A minimum of one stationary fluid level marker shall be erected in each pit or cell. The marker shall be erected in a location within the pit or cell where it can be easily observed. The marker shall be of such design that the maximum fluid level at any time may be clearly identified. The marker shall be mounted on a suitable post set in concrete or other method approved by the Manager of Pollution Abatement. That portion of the post hole which lies in the soil liner zone shall be backfilled with bentonite pellets. Details of the proposed marker installation shall be approved by the Manager of Pollution Abatement prior to installation. Markers shall be installed under the supervision of a registered professional engineer, licensed land surveyor, or other person approved by the Manager of Pollution Abatement prior to installation.

(15) **Monitor wells.** All commercial pits shall have a minimum of three monitor wells; one upgradient and two downgradient. The exact number and location of wells shall be approved by the Pollution Abatement Department prior to installation. No monitor well shall be installed more than 250 feet from a commercial pit, nor shall any existing water well be used as a monitor well unless approved by the Manager of Pollution Abatement. Monitor wells installed prior to the effective date of this Section may be accepted

by the Manager of Pollution Abatement if it can be shown that they adequately monitor a site. All new monitor wells shall be drilled through the first aquifer encountered, but need not extend more than 50 feet below the bottom of a pit if no aquifer is encountered, and shall be completed by a licensed monitor well driller. If documentation can be submitted prior to drilling to show that no water will be encountered within 50 feet below the bottom of the pit, the Manager of Pollution Abatement may require that monitor wells be drilled to a lesser depth. All new monitor wells shall meet the following requirements:

(A) A minimum two inch diameter PVC casing shall be used with a sealing cap on the bottom.

(B) The casing shall consist of a slotted liner in the saturated zone, or bottom ten feet if none is encountered, and shall be gravel-packed or sand-packed as appropriate to the installation.

(C) Bentonite shall be placed in the annular space of the well above the slotted liner for an interval of at least two feet to form an adequate seal.

(D) Uncontaminated well cuttings may be returned to the annular space above the bentonite seal for well stability.

(E) A minimum of two of the top six feet of the annular space around the casing shall be filled with cement.

(F) A minimum three inch thick concrete apron shall be placed at the surface to a minimum two foot radius from the casing.

(G) A removable and lockable cap shall be placed on top of the casing. The cap shall remain locked at all times, except when the well is being sampled.

(H) Within 30 days of installation, specific completion information for all monitor wells shall be submitted to the Manager of Pollution Abatement.

(16) **As-built drawing.** A detailed, as-built drawing of the pit(s) and monitor wells by or under the supervision of a registered professional engineer shall be submitted to the Manager of Pollution Abatement before operation of the pit(s) commences.

(17) **Liner certification.** An affidavit signed by the person who was responsible for installing the pit liner, certifying that the liner meets minimum requirements and was installed in accordance with Commission rules, shall be submitted to the Manager of Pollution Abatement before operation of the pit commences. Supporting documentation shall also be submitted, such as post-construction permeability or compaction test results, bentonite receipts, and geomembrane liner specifications from the manufacturer.

(18) **Pit approval.** Acceptance of fluids into a pit shall not commence until a representative of the Conservation Division has inspected and approved the pit.

(19) **Hydrologically sensitive areas.** If the proposed site is known to be located over a hydrologically sensitive area (hydrologically sensitive areas and hydrologically very sensitive areas are determined by the Technical Department and based upon Oklahoma Geological Survey maps), in addition to the foregoing construction requirements, the additional requirements shall apply:

(A) The total depth of a pit shall not exceed eight feet, and the total designed fluid or sediment depth shall not exceed five feet.

(B) A soil liner having a minimum thickness of three feet and a coefficient of permeability no greater than 1.0×10^{-8} cm/sec or a minimum 60-mil geomembrane liner shall be required.

(C) The Manager of Pollution Abatement shall determine the minimum depth of all monitor wells.

(f) **Operation and maintenance requirements.**

(1) **Vegetative cover.** Vegetative cover shall be established on all areas of earthfill immediately after pit construction or during the first planting season if pit construction is completed out of season. The cover shall be sufficient to protect those areas from soil erosion and shall be maintained.

(2) **Fencing.** All commercial pits shall be completely enclosed by either a woven wire fence at least four feet in height or a woven wire fence at least

three feet in height with two strands of barbed wire. No livestock shall be allowed inside the fence.
(3) **Sign.** A waterproof sign bearing the name of the operator, legal description, most current order number, and emergency phone number shall be posted within 25 feet of the entrance gate to any commercial pit and shall be readily visible.
(4) **Site security.** Dumping into a commercial pit shall occur only when there is an attendant on duty. All sites shall be secured by a locked gate when an attendant is not on duty. A key or combination to the lock shall be provided to the appropriate Field Inspector for the purpose of carrying out inspections.
(5) **Fluid level.** Drilling fluids and/or cuttings shall not be accepted into a commercial pit unless the fluid level can be maintained at an elevation no higher than the maximum level of the fluid level marker.
(6) **Acceptable materials.**
(A) No operator of a commercial pit shall receive any substances other than water-based drilling fluids and/or cuttings or salt contaminated soils.
(B) No operator of a pit permitted prior to July 9, 1987, shall receive fluids and/or cuttings with a chloride content greater than 3500 mg/l. No operator of a pit permitted after July 9, 1987, shall receive fluids and/or cuttings with a chloride content greater than 5000 mg/l.
(C) A sample from each incoming load shall be collected, filtered using a standard API filter press, and tested for chlorides.
(D) The date, volume, source, and chloride level of each load received shall be entered into a log book. The log book shall be available for inspection by a representative of the Conservation Division of the Commission at all times. Log books shall be kept for a minimum of five years after closure is completed.
(7) **Pit contents.** No pit permitted prior to July 9, 1987, shall contain fluids and/or cuttings with a chloride content greater than 5,000 mg/l. No pit permitted after July 9, 1987, shall contain fluids and/or cuttings with a chloride content greater than 10,000 mg/l. The contents of each pit or pit cell shall be sampled and analyzed by the operator at least once every six months (during January and July) after operations commence. More frequent sampling may be required by the Manager of Pollution Abatement. The following procedures shall be used:
(A) The appropriate Field Inspector shall be notified at least 24 hours in advance of sampling to allow a Commission representative an opportunity to witness the sampling.
(B) Samples shall be collected and handled by the operator according to EPA-approved standards. (RCRA Groundwater Monitoring Technical Enforcement Guidance Document, EPA, OSWER-9950.1, September 1986, pp. 99-107.)
(C) A minimum of five samples per 50,000 bbls., or part thereof, is required for each pit or pit cell. Samples must be taken from different horizontally and vertically distributed locations in each pit or pit cell.
(D) The samples shall be combined and thoroughly mixed, then a minimum two pint composite sample taken for analysis.
(E) If requested by a representative of the Conservation Division, each composite sample shall be split and an adequate portion (approximately one pint) shall be properly labeled and delivered or otherwise provided to the appropriate District Office or Field Inspector.
(F) All samples delivered to the laboratory shall be accompanied by a chain of custody form.
(G) All composite samples must be analyzed for chlorides by a laboratory certified by the Oklahoma Water Resources Board or operated by the State of Oklahoma. Analysis of additional parameters may be required, as determined by the Manager of Pollution Abatement.
(H) A copy of each analysis shall be forwarded to the Pollution Abatement Department within 30 days of sampling.
(8) **Oil film.**

(A) No commercial pit shall contain an oil film covering more than one acre or more than ten percent of the surface area of the pit, whichever is less.

(B) The protection of migratory birds shall be the responsibility of the operator. Therefore, the Conservation Division recommends that to prevent the loss of birds, oil films be removed, or the surface area covered by the film be protected from access to birds. (See Advisory Notice in 165:10-7-3(c).)

(9) **Aesthetics.** All commercial pit sites shall be maintained so that there is no junk iron or cable, oil or chemical drums, paint cans, domestic trash, or debris on the premises.

(10) **Structural integrity.** All commercial pits shall be used, operated, and maintained at all times so as to prevent the escape of their contents. All erosion, cracking, sloughing, settling, animal burrows, or other condition that threatens the structural stability of any earthfill shall be repaired immediately upon discovery.

(11) **Monitor wells.** Sampling of monitor wells shall begin prior to accepting any drilling fluids and/or cuttings into a new facility and within 30 days of drilling completion on existing facilities, and shall be done at least once every six months (during January and July) after operations commence until three years after closure is completed. Sampling of greater frequency of duration may be required by the Manager of Pollution Abatement. The following procedures shall be used:

(A) The appropriate Field Inspector shall be notified at least 24 hours in advance of sampling to allow a Commission representative an opportunity to witness the sampling.

(B) Samples shall be collected and handled by the operator according to EPA-approved standards. (RCRA Groundwater Monitoring Technical Enforcement Guidance Document, EPA, OSWER-9950.1, September 1986, pp. 99-107.)

(C) If requested by a representative of the Conservation Division, an adequate portion of each sample (approximately one pint) shall be properly labeled and delivered or otherwise provided to the appropriate District Office or Field Inspector.

(D) All samples delivered to the laboratory shall be accompanied by a chain of custody form.

(E) All samples must be analyzed for pH and chlorides by a laboratory certified by the Oklahoma Water Resources Board or operated by the State of Oklahoma. Analysis of additional parameters may be required, as determined by the Manager of Pollution Abatement.

(F) A copy of each analysis and a statement as to the depth to groundwater encountered in each well, or an affidavit that no water was encountered, shall be forwarded to the Pollution Abatement Department within 30 days of sampling.

(12) **Prevention of pollution.** All commercial pits shall be used, operated, and maintained at all times so as to prevent pollution. In the event of a nonpermitted discharge from a commercial pit, sufficient measures shall be taken to stop or control the loss of materials, and reporting procedures in 165:10-7-5(c) shall be followed. Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division. For a willful non-permitted discharge, the pit operator shall be fined $5,000.00.

(g) **Annual report.** The operator of any commercial pit shall submit an annual report on Form 1014A to the Manager of Pollution Abatement, by February 1 of each year.

(h) **Closure requirements.**

(1) **Notification.** The Manager of Pollution Abatement shall be notified in writing whenever a commercial pit becomes inactive, is abandoned, full of sediment, or operation of the pit ceases for any reason. A commercial pit may be considered to be inactive by the Commission if:

(A) The pit has been shut down by the Commission because of a violation which results in the filing of an application for an order to vacate the operator's authority.

(B) The authority to operate has been terminated by failure to comply with (j) of this Section.
(C) The operator is unable to furnish documentation to show that there has been receipt of drilling fluids and/or cuttings into the pit during the previous twelve months.

(2) **Time limit.** Closure of all commercial pits shall be commenced within 60 days and completed within one year of cessation of pit operations, pursuant to (1) of this subsection. In cases where extenuating circumstances arise, one extension of six months may be administratively approved in writing by the Manager of Pollution Abatement. Closure shall be in accordance with an approved closure plan. A progress report shall be submitted to the Manager of Pollution Abatement, every three months (during January, April, July, and October) after cessation of pit operations until closure is completed.

(3) **Restrictive covenant.** A restrictive covenant shall be filed with the County Clerk of the county in which a commercial pit is located. The document shall accurately describe the pit location and shall specifically restrict the current or future landowners of the pit site from puncturing the final cover of the pit or otherwise disturbing the site to the extent that pollution could occur.

(4) **Penalty for failure to meet closure requirements.** An operator failing to meet the closure requirements set out in this subsection shall be fined $1,000.00.

(i) **Additional requirements.** The requirements set forth in this Section are minimum requirements. Additional requirements may be made upon a showing of good cause that an operator has a history of complaints for failure to comply with Commission rules and regulations, the site has certain limitations, or other conditions of risk exist.

(j) **Application to existing pits.** Subsections (a), (c)(1), (d), (e), (f), (g), (h), and (i) of this Section shall apply to all commercial pits permitted or ordered prior to the adoption of this Section. All pits permitted, but yet to be constructed as of the effective date of this Section, shall be subject to all of the construction requirements under (e) of this Section.

(k) **Variances.** Except as otherwise provided in this Section, variances from provisions of this Section may be granted for good cause by order after application, notice, and hearing.

[**SOURCE:** Amended at 9 Ok Reg 2295; Amended at 9 Ok Reg 2337, eff 6-25-92]

165:10-9-2. Commercial soil farming

(a) **Order and permit required.** No person shall conduct commercial soil farming without an order of the Commission and an approved permit.

(b) **Site suitability restrictions.** Commercial soil farming shall only occur on a tract of land having all of the following characteristics [paragraphs (1) through (5) shall be determined by the appropriate Soil Conservation District or a qualified soils expert]:

(1) A maximum slope of five percent.
(2) Depth to bedrock no less than 20 inches.
(3) A soil profile containing at least twelve inches of one of the following U.S.D.A. soil textures:
(A) loam
(B) silt loam
(C) silt
(D) sandy clay loam
(E) clay loam
(F) silty clay loam
(G) sandy clay
(H) silty clay or clay
(4) No flooding potential.
(5) Slight salinity (defined as electrical conductivity less than 4,000 micromhos/cm) in the topsoil or upper six inches of the soil.
(6) An Exchangeable Sodium Percentage (ESP) less than 15.

(7) A water table deeper than 25 feet from the soil surface, excluding perched water tables (submit basis for this determination).
(8) A minimum distance of 100 feet from any stream designated by Oklahoma Water Quality Standards or any fresh water pond, lake, or wetland (available for viewing at the Commission's Oklahoma City or District Offices).

(c) **Application requirements.**
(1) **Who may apply.** The applicant or joint applicant for commercial soil farming shall be the owner of the land (or person having a firm option, in writing, to purchase the land) which is to be used for soil farming.
(2) **Order required.** The Commission may issue an order upon compliance with Commission Rules of Practice 165:5-7-1, 165:5-7-35, 165:5-3-1, and this Section.
(3) **Required exhibits.** All exhibits intended to support an application shall be filed pursuant to 165:5-7-35. The exhibits shall include the following:
(A) A site suitability report, pursuant to (b) of this Section, provided by the appropriate Soil Conservation District or a qualified soils expert (include qualifications). The report must contain a U.S.D.A. Soil Survey map, or when Soil Survey map does not have adequate detail, a map prepared by a qualified soils expert. A legend and soil type description shall be attached.
(B) Plan of conservation management practices covering needs of storm water disposal and erosion control.
(C) A well-prepared map or diagram, drawn to scale, showing the size and configuration of the individual soil farming plots.
(D) A topographic map of the subject area.
(E) Initial soil analysis.
(F) A detailed discussion of the method of application and provisions for preventing runoff from the application area.

(d) **Sampling requirements.**
(1) **Contact with District Office.** The District Office shall be contacted at least two working days prior to sampling to allow a Commission representative an opportunity to witness the sampling of the receiving soil and pit(s) to be soil farmed.
(2) **Receiving soil.** Subsequent to the preparation of a conservation plan or site suitability report, soil samples shall be taken from the proposed soil farming plot and analyzed. Analysis shall be submitted pursuant to (c)(3)(E) of this Section. Soil sampling shall follow this procedure:
(A) If the site contains soil types from different parent material, separate areas shall be established for soil sampling and loading calculations.
(B) A sample area shall not exceed 40 acres.
(C) A minimum of 20 representative surface core samples (0-6 inches) and 20 representative subsurface core samples (18-30 inches) must be taken from each sample area. The samples shall be composited for analysis of a single surface core sample and a single subsurface core sample.
(3) **Pit materials.** Pit materials to be soil farmed shall be sampled using the following procedure:
(A) A minimum of five samples per 50,000 bbls., or part thereof, each representative of the materials to be soil farmed, is required for each pit or pit cell. Samples must be taken from different horizontally and vertically distributed locations in each pit or pit cell.
(B) The samples shall be combined and thoroughly mixed, then a minimum two pint composite sample shall be taken for TDS analysis, a minimum three pint composite sample taken for oil and grease analysis, and a minimum two pint composite sample taken for heavy metal analysis.
(C) If requested by a representative of the Conservation Division, each composite sample for TDS analysis shall be split and an adequate portion (approximately one pint) properly labeled and delivered or otherwise provided to the appropriate District Office or Field Inspector.
(D) After samples have been taken for analysis from a pit or pit cell which is the subject of a soil farming application, the operator shall not allow the addition of fluids or other materials, except natural precipitation or fresh water, to decrease the viscosity of the fluid.

(e) **Analysis requirements.**

(1) **Approved laboratory.** Soil and pit samples shall be analyzed by a laboratory operated by the State of Oklahoma or certified by the Oklahoma Water Resources Board.

(2) **Soil.** Parameters for analysis of soil shall include, but are not limited to pH, Total Soluble Salts (TSS) or Electrical Conductivity, and Exchangeable Sodium Percentage (ESP).

(3) **Pit contents.** Parameters for analysis of pit contents shall include, but are not limited to, the following: pH, Total Dissolved Solids (TDS), Electrical Conductivity, Arsenic, Chromium and Oil and Grease. Arsenic and Chromium may be analyzed by either Nitric Acid Extraction or Acetic Acid Extraction ("Test Methods for Evaluating Solid Waste," SW846, second edition, U.S. EPA). The analysis shall specify which method of extraction was used.

(f) **Maximum application rate.**

(1) **Loading limits.**

(A) The maximum application rate (loading limit) shall be calculated by the operator using the calculations in (g) of this Section and the following soil loading standards:

(i) Total Soluble Salts: 6,000 lbs/acre (less TSS in soil).

(ii) Arsenic: 80 lbs/acre.

(iii) Chromium: 40 lbs/acre.

(iv) Oil and Grease: 40,000 lbs/acre.

(v) Total Dry Weight: 200,000 lbs/acre.

(B) Limitations in (A) of this paragraph are based upon standards set forth in the following publications:

(i) "Diagnosis and Improvement of Saline and Alkaline Soils," U.S. Agriculture Handbook, No. 60, U.S. Salinity Laboratory, Riverdale, California, 1954

(ii) "Critical Concentrations for Irrigation Water Supplies," Water Quality Criteria, 1972 Ecological Research Series, EPA-R2-73-033, March, 1973

(iii) H.R. Moseley, "Summary and Analysis of API Onshore Drilling Mud and Produced Water Environmental Studies," American Petroleum Institute Bulletin, No. D-19, 1983

(2) **Determination of most limiting parameter.** The maximum application rate shall be restricted by the most limiting parameter. It may require more than one application to achieve the maximum application rate while avoiding runoff. The operator shall indicate on Form 1014CS the maximum application rate and the minimum acreage that will be used.

(3) **Records required.** Accurate records shall be kept for each parameter as to when, where (which application area), and how much is applied. The operator shall make such records available at all times for inspection by a representative of the Conservation Division. Additionally, an annual report shall be submitted to the Manager of Pollution Abatement, pursuant to (k) of this Section.

(4) **Additional soil sampling required.** Additional soil sampling and analysis of a plot shall be done prior to each soil farming application when records show that 60 percent of the maximum application rate in (1) of this subsection of any parameter except total weight is reached. Requirements of (d) and (e) of this Section shall be met. Soil farming shall not be permitted on a plot if the analysis indicates that more than 95 percent of the maximum application rate of any parameter has been reached or if the ESP is greater than 15.

(g) **Calculations.** The procedures described in Appendix H of this Chapter shall be used in calculating the maximum application rate.

(h) **Operation requirements.**

(1) **Surety required.**

(A) Any operator of a commercial soil farming site shall file with the Manager of Document Handling for the Conservation Division an agreement to clean up pollution, restore the site, and/or plug monitor wells, if necessary, upon termination of operations. The agreement shall be on forms available from the Conservation Division and shall be accompanied by surety. The agreement shall provide that if the Commission finds that the operator has failed or refused to comply with the rules or take remedial action as required by law and this Section, the surety shall pay to the Commission the full amount of the operator's obligation up to the limit of the surety.

(B) The Commission shall establish the amount of security in the order for the authority to operate a commercial soil farming site. The security shall be based upon $10,000 per 40 acres, or part thereof. The amount may be subject to change for good cause. The security shall be maintained for as long as monitoring is required. The type of security shall be a corporate surety bond, certificate of deposit, irrevocable letter of credit, or other type of security approved by order of the Commission. Any type of surety that expires shall be renewed prior to 30 days before the expiration date. All joint escrow accounts shall be made current every 60 days.

(2) **Sign required.** A waterproof sign bearing the name of the operator, legal description, order number, and emergency phone number shall be posted within 25 feet of the entrance to any commercial soil farming site and shall be readily visible.

(3) **Monitor wells.**

(A) Any commercial soil farming operation shall be required to have a minimum of two monitor wells, one upgradient and one downgradient, unless it can be shown that the site is not located over a hydrologically sensitive area, i.e., a principal bedrock aquifer, the recharge or potential recharge area of a principal bedrock aquifer, or an unconsolidated alluvium or terrace deposit, according to the Oklahoma Geological Survey "Maps Showing Principal Groundwater Resources and Recharge Areas in Oklahoma" (available for viewing at the Commission's Oklahoma City Office and District Offices) or other maps approved by the Commission. The exact number and location of wells shall be established by the Pollution Abatement Department.

(B) No monitor well shall be installed more than 250 feet from a commercial soil farming operation, nor shall any existing water well be used as a monitor well, unless approved by the Manager of Pollution Abatement. Monitor wells installed prior to the effective date of this Section may be accepted by the Manager of Pollution Abatement if it can be shown that they adequately monitor a site.

(C) All new monitor wells shall be drilled through the first aquifer encountered, but need not extend below 100 feet if no aquifer is encountered, and shall be completed by a licensed water well driller. If documentation can be submitted prior to drilling to show that no water will be encountered within 100 feet, then the District Manager may require that monitor wells be drilled to a lesser depth.

(D) All new monitor wells shall meet the following requirements:

(i) A minimum four inch diameter PVC casing shall be used with a sealing cap on the bottom.

(ii) The casing shall consist of a slotted liner in the saturated zone, or bottom ten feet if none is encountered, and shall be gravel-packed or sand-packed as appropriate to the installation.

(iii) Bentonite shall be placed in the annular space of the well above the slotted liner for an interval of at least two feet to form an adequate seal.

(iv) Well cuttings shall be returned to the annular space above the bentonite seal for well stability.

(v) A minimum of two of the top six feet of the annular space around the casing shall be filled with cement.

(vi) A minimum three inch thick concrete apron shall be placed at the surface to a minimum two foot radius from the casing.

(vii) A removable and lockable cap shall be placed on top of the casing. The cap shall remain locked at all times, except when the well is being sampled.

(E) Within 30 days after installation, specific completion information for all monitor wells and a diagram of their locations in relation to the soil farming site shall be submitted to the Manager of Pollution Abatement.

(4) **Sampling of monitor wells.** Sampling of monitor wells shall begin prior to the first soil farming application and shall be done once every six months (during January and July) after operations commence until one year after the last application is made, then once every year for three years according to the following:

(A) The appropriate District Manager shall be notified at least 24 hours in advance of sampling to allow a Commission representative an opportunity to witness the sampling.

(B) Samples shall be collected and handled by the operator according to EPA-approved standards ("RCRA Groundwater Monitoring Technical Enforcement Guidance Document," EPA, OSWER-9950.1, September, 1986, pp.99-107.)

(C) If requested by a representative of the Conservation Division, an adequate portion of each sample (approximately one pint) shall be properly labeled and delivered or otherwise provided to the appropriate District Office or Field Inspector.

(D) All samples must be analyzed for pH and chlorides by a laboratory certified by the Oklahoma Water Resources Board or operated by the State of Oklahoma. Analysis of additional parameters may be required, as determined by the Manager of Pollution Abatement.

(E) A copy of each analysis and a statement as to the depth to groundwater encountered in each well, or an affidavit that no water was encountered, shall be forwarded to the Pollution Abatement Department within 30 days of sampling.

(i) **Conditions of permits.** Each permit issued under this Section shall be subject to the following conditions:

(1) **Required form.** A completed Form 1014CS shall be submitted to the Manager of Pollution Abatement for approval prior to commencement of soil farming. A new Form 1014CS shall be submitted each time that soil farming is proposed to be done. Approval or disapproval shall issue on Form 1014CS within ten days of submission.

(2) **Notice to Commission.** The applicant, by agreement with the appropriate District Office, shall schedule the commencement of soil farming no less than 24 hours prior thereto, to allow a Commission representative to be present to witness the work. The applicant shall also notify the appropriate District Office of completion of each soil farming application within 24 hours. Written notice of commencement and completion shall be submitted to the Manager of Pollution Abatement within 48 hours.

(3) **Presence of representative.** A representative of the applicant shall be on the soil farming site at all times during application of the pit materials to the land.

(4) **Type muds to be soil farmed.** Commercial soil farming is limited to water-based type muds and/or cuttings. Soil farming of oil-based muds and/or cuttings shall be prohibited.

(5) **Weather restrictions.** Commercial soil farming shall not be done:

(A) During precipitation events or when precipitation is imminent.

(B) When the soil moisture content is at a level such that the soil would not readily take the addition of drilling fluids.

(C) When the ground is frozen.

(D) By spray irrigation when the wind velocity is such that even distribution of materials cannot be accomplished or the buffer zones, pursuant to (6) of this subsection, cannot be maintained.

(6) **Buffer zones:** No commercial soil farming shall be done within the following buffer zones:

(A) One hundred feet of a property line boundary.

(B) Fifty feet of any stream not designated by Oklahoma Water Quality Standards.

(C) Three hundred feet of any actively-producing water well used for domestic, irrigation or industrial purposes.

(D) One thousand three hundred feet of any actively-producing water well used for municipal purposes.

(7) **Application rate.** The maximum application rate of drilling fluids and/or cuttings stipulated by the permit shall not be exceeded. Furthermore, the minimum required acreage within the approved soil farming

plot, as designated by the permit, shall be fully utilized. Application of drilling fluids and/or cuttings outside the approved plot shall be prohibited.

(8) **Soil farming method.**

(A) Application of pit contents shall be uniform over the soil farming plot and shall be made by injection, spray irrigation, or other method approved by the Commission prior to use. The flood irrigation method shall be limited to those fields that normally are irrigated in that manner.

(B) An application of more than 50,000 lbs/acre of dry weight materials or more than 500 lbs/acre of oil and grease shall be incorporated into the soil by injection, disking, or other method approved by the Commission. If the injection method is not used, incorporation must be made within a reasonable time period after completion of application, not to exceed 14 days unless extended by the Pollution Abatement Department pursuant to a written request.

(C) When the spray irrigation method is used and solids eventually accumulate on the soil surface to a one-eighth (1/8) inch depth, then the materials shall be incorporated prior to subsequent soil farming.

(9) **Runoff or ponding prohibited.** No runoff or ponding of soil farmed materials shall be allowed during application.

(10) **Automatic termination.**

(A) If the applicant violates the order, permit, or this Section, soil farming shall be discontinued and the Pollution Abatement Department shall be contacted immediately. The Pollution Abatement Department may revoke the permit and/or require the operator to do remedial work. If the permit is not revoked, soil farming may resume with the approval of the Pollution Abatement Department.

(B) Soil farming shall be carried out within two months from the date of approval of the permit. At the end of the two month period, the permit shall expire by its own terms. The Manager of Pollution Abatement may, upon written request, separately grant up to two extensions of the permit for periods of two months each.

(11) **Prevention of pollution.** All commercial soil farming facilities shall be operated and maintained at all times so as to prevent pollution. In the event of a nonpermitted discharge from a commercial soil farming facility, sufficient measures shall be taken to stop or control the loss of materials and reporting procedures in 165:10-7-5 (c) shall be followed. Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division.

(12) **Vegetative cover.** If the vegetative cover is destroyed or significantly damaged by disking, injection, or other practice associated with soil farming, the vegetative cover shall be reestablished within one year after the last soil farming application.

(j) **Additional requirements.** The requirements set forth in this Section are minimum requirements. Additional requirements may be made upon a showing of good cause that an operator has a history of complaints for failure to comply with Commission rules, or the site has certain limitations, or other conditions of risk exist.

(k) **Annual report.** The operator of any commercial soil farming facility shall submit an annual report on Form 1014A to the Manager of Pollution Abatement by February 1 of each year.

(l) **Prospective application to existing operations.** Subsections (d), (e), (f), (g), (h), (i), (j), (k) and (m) of this Section shall apply to all commercial soil farming operations for which an order or permit was obtained prior to the adoption of this Section. All affected operators shall have their facility in compliance with all of the noted subsections by December 31, 1988. Failure to be in compliance by that date shall result in termination of the authority to operate.

(m) **Variances.** Except as provided in this Section, variances from provisions of this Section may be granted for good cause by order after application, notice, and hearing.

[**Source:** Amended at 12 Ok Reg 2017, eff 7-1-95]

165:10-9-3. Commercial disposal well surface facilities

(a) **Scope.** This Section shall apply to the surface facilities of any commercial disposal well.

(b) **Site restriction.** No commercial disposal well pit shall be constructed in any area that floods according to the Soil Conservation Service County Soil Survey (available for viewing at the Commission's Oklahoma City Office or District Offices).

(c) **Construction requirements.**

(1) **Dikes.** A dike shall be constructed and maintained around any storage tank or group of tanks. The diked area shall be capable of totally containing at least one and one-half (1 1/2) times the volume held by the largest storage tank.

(2) **Leak containment.** A means for containing leaks shall be provided at all pumps and connections.

(3) **Splash pad/apron.** A splash pad/apron shall be constructed at the unloading area of any pit to the design and dimensions necessary to contain and direct all materials unloaded into the pit. If a pit is not used, an apron shall be constructed at the unloading area to the design and dimensions necessary to direct any spills into containment.

(4) **Pit specifications.** Any commercial disposal well pit shall be constructed of concrete or steel or shall be lined with a geomembrane liner. The following specifications shall be met:

(A) Any concrete pit shall be steel-reinforced and have a minimum wall thickness of six inches.

(B) Any steel pit shall have a minimum wall thickness of three-sixteenths (3/16) inch. If a previously used steel pit is installed, it shall be free of corrosion or other damage.

(C) Any geomembrane liner shall meet these requirements:

(i) The geomembrane liner shall have a minimum thickness of 30-mils, shall be chemically compatible with the type of wastes to be contained, and shall have ultraviolet light protection.

(ii) The geomembrane liner shall be placed over a specially prepared, smooth, compacted surface void of sharp changes in elevation, rocks, clods, organic debris, or other objects.

(iii) The geomembrane liner shall be continuous (may include seams) and shall cover the bottom and interior sides of the pit entirely. The edges shall be securely placed in a minimum twelve inch deep anchor trench around the perimeter of the pit.

(5) **Certification of liner.** The operator of any commercial disposal well pit that is constructed with a geomembrane liner shall secure an affidavit signed by the installer, certifying that the liner meets minimum requirements and was installed in accordance with Commission rules. It shall be the operator's responsibility to maintain the affidavit and all supporting documentation pertaining to the liner, such as geomembrane liner specifications from the manufacturer, etc., and shall make them available to a representative of the Conservation Division upon request.

(6) **Monitor wells or leachate detection system.**

(A) Any commercial disposal well pit shall be required to have a leachate collection system or a minimum of three monitor wells, one upgradient and two downgradient.

(B) No monitor well shall be installed more than 100 feet from a commercial disposal well pit, nor shall any existing water well be used as a monitor well, unless written approval is given by the District Manager or Manager of Field Operations.

(C) All new monitor wells shall be drilled through the first aquifer encountered, but need not extend below 100 feet if no aquifer is encountered, and shall be completed by a licensed water well driller. If documentation can be submitted prior to drilling to show that no water will be encountered within 100 feet, the District Manager may require that monitor wells be drilled to a lesser depth.

(D) All new monitor wells shall meet the following requirements:

(i) A minimum four inch diameter PVC casing shall be used with a sealing cap on the bottom.
(ii) The casing shall consist of a slotted liner in the saturated zone, or bottom ten feet if none is encountered, and shall be gravel-packed or sand-packed as appropriate to the installation.
(iii) Bentonite shall be placed in the annular space of the well above the slotted liner for an interval of at least two feet to form an adequate seal.
(iv) Well cuttings shall be returned to the annular space above the bentonite seal for well stability.
(v) A minimum of two of the top six feet of annular space around the casing shall be filled with cement.
(vi) A minimum three inch thick concrete apron shall be placed at the surface to a minimum two foot radius from the casing.
(vii) A removable and lockable cap shall be placed on top of the casing. The cap shall remain locked at all times, except when a well is being sampled. A key to each well shall be made available to the appropriate District Manager or Field Inspector upon request.

(E) Within 30 days of installation, construction details for any leachate detection system or specific completion information for all monitor wells and a diagram of their locations in relation to the pit they monitor shall be submitted to the Manager of Field Operations.

(d) **Operation and maintenance requirements.**

(1) **Sign.** A waterproof sign shall be erected and maintained within 25 feet of the entrance road to any commercial disposal well, shall be readily visible, and shall contain the name of the operator, order number, legal description, and emergency phone number.

(2) **Fencing.** All commercial disposal well surface facilities that have a pit shall be completely enclosed by a minimum four strand barbed wire fence or equivalent protection using woven wire and/or barbed wire. No livestock shall be allowed inside the fence.

(3) **Site maintenance.** The normal access surface of any commercial disposal well site, including the access road(s), shall be maintained in a condition that will safely and easily accommodate a passenger car during all weather conditions.

(4) **Exclusion of runoff water.** No commercial disposal well pit shall be allowed to receive runoff water.

(5) **Freeboard.** The fluid level in any concrete or steel commercial disposal well pit shall be maintained at all times at least 6 inches below the top of the pit wall. Any geomembrane lined pit shall have a minimum of 18 inches freeboard at all times.

(6) **Temporary storage only.** No pit shall be used as permanent storage for salt water.

(7) **Sampling of monitor wells.**

(A) Sampling of monitor wells shall occur once every six months, during the months of January and July.

(B) The appropriate District Manager shall be notified at least 24 hours in advance of sampling to allow a Commission representative an opportunity to witness the sampling.

(C) Samples shall be collected, preserved, and handled by the operator according to EPA-approved standards (RCRA Groundwater Monitoring Technical Enforcement Guidance Document, EPA, OSWER-9950.1, September, 1986, pp. 99-107) and analyzed for pH, chlorides and Total Dissolved Solids (TDS) by a laboratory certified by the Oklahoma Water Resources Board or operated by the State of Oklahoma. Analysis of additional parameters may be required, as determined by the District Manager or Manager of Field Operations.

(D) If requested by the District Manager, each sample shall be split and an adequate portion (approximately one pint) properly labeled and delivered upon request or otherwise provided to the appropriate District Office or Field Inspector. A copy of each analysis and a statement as to the depth to groundwater encountered in each well, or an affidavit that no water was encountered, shall be forwarded to the Manager of Field Operations, within 30 days of sampling.

(8) **Prevention of pollution.** All commercial disposal well pits shall be used, operated, and maintained at all times so as to prevent pollution. In the event of a nonpermitted discharge from surface facilities of a commercial disposal well, sufficient measures shall be taken to stop or control the loss of materials and reporting procedures in 165:10-7-5(c) shall be followed. Any materials lost due to such discharge shall be cleaned up as directed by a representative of the Conservation Division.

(9) **Oil film.** The operator of a saltwater disposal system shall be responsible for the protection of migratory birds. Therefore, the Conservation Division recommends that to prevent the loss of birds due to oil films, all open top tanks and pits containing fluid be kept free of hydrocarbons, or be protected from access to birds. [See Advisory Notice 165:10-7-3(c).]

(e) **Closure requirements.**

(1) **Time limit.** Within 90 days of the cessation of operation of any commercial disposal well, all associated pits shall be emptied of all contents and filled with soil. All monitor wells shall be plugged with bentonite or cement, unless exempt in writing by the District Manager or Manager of Field Operations. The site shall be revegetated within 180 days.

(2) **Geomembrane-lined pits.** When closing any commercial disposal well pit with a geomembrane liner, extreme care shall be taken to preserve the integrity of the liner. All free liquids shall be removed or chemically solidified. A geomembrane cap shall be placed over the top of any remaining contents to completely encapsulate them. Any geomembrane cap shall have a minimum thickness of twelve mils and shall be chemically compatible with the type of substances to be encapsulated. Burial, pursuant to (3) of this subsection, shall follow.

(3) **Burial.** If any concrete, steel, geomembrane, or other materials associated with a commercial disposal well site are to be left on-site, they shall be buried under a minimum soil cover of three feet, pursuant to 165:10-3-17.

(f) **Prospective application to existing facilities.** All provisions of this Section except (4) and (5) of subsection (c) shall apply to all existing commercial disposal well pits which are, or have been, in operation prior to the effective date of this Section. Operators shall have 180 days from the effective date of this Section in which to bring their facilities into compliance with the applicable provisions of this Section. Failure to comply with any applicable provision may result in revocation of the authority to operate.

(g) **Variances.** A variance from the time requirements of (d)(7) or (e)(1) of this Section may be granted by the District Manager or Manager of Field Operations for justifiable cause. A written request and supporting documentation is required. The District Manager or Manager of Field?Operations shall respond in writing within five working days, either approving or disapproving the request.

[**Source:** Amended at 11 Ok Reg 3691, eff 7-11-94]

SUBCHAPTER 11. PLUGGING AND ABANDONMENT

Section

[BLANK PAGE]

165:10-11-1. License for pulling pipe and plugging wells

(a) No person shall contract to pull casing or plug oil, gas, injection, disposal, or other service wells, or contract to salvage casing therefrom, or purchase wells for the purpose of salvaging casing therefrom until a license has been secured from the Commission.

(1) The application for such license shall state:

(A) The name of the applicant.

(B) The names and addresses of all partners, chief officers, and directors.

(C) The experience of applicant.

(D) Evidence of financial responsibility of the applicant.

(E) The counties in which the applicant will operate.

(2) Notice that an application has been filed shall be published by the applicant in a newspaper of general circulation in Oklahoma County and in the county where the applicant's principal place of business is located. The applicant shall file proof of publication prior to the hearing or administrative approval. The notice shall include:

(A) The name of the applicant.

(B) Generally what operations the applicant intends to conduct for which applicant is financially responsible.

(C) The counties in which applicant will operate.

(3) If a written objection to the application is filed within 15 days after the application is published or if a hearing is required by the Commission, the application shall be set for hearing and notice thereof shall be given as the Commission shall direct. If no objection is filed and the Commission does not require a hearing, the matter shall be presented administratively to the Manager of Field Operations who shall file a report and make recommendations to the Commission.

(b) The license shall not be transferable and may at any time be revoked by the Commission upon complaint, notice, and hearing.

(c) Any person violating this Section may be fined up to $2,500.00. Any operation in violation of this Section shall be shut down pending compliance with this Section.

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Amended in Rule Making 97000002, eff 7-1-97]

165:10-11-2. Operating requirements for licensees

(a) This Section shall apply to each licensee under 165:10-11-1.

(b) If a licensee prepares the Notice of Intent to Plug (Form 1001 and/or the Plugging Report (Form 1003), then the licensee shall:

(1) Include the following on any submitted form:

(A) The name and address of the well operator if the licensee is serving as a contractor for the operator of the well.

(B) The name and address of the person or entity hiring the licensee if the licensee is serving as the contractor for any person who is not an operator of the well.

(C) That he is acting independently if the licensee either purchased the well for salvage or contracted with the landowner to plug the well in exchange for casing and/or other well equipment.

(2) Mail a copy of Form 1001 to the last known operator of the well to be plugged, as shown by the records of the Conservation Division.

(c) For purposes of this subsection, the term "plugged well" shall refer to a well for which the Conservation Division has a plugging record. A licensee shall comply with the requirements of 165:10-1-10 and 165:10-3-1 before entering a plugged well if:

(1) The licensee is not hired by the operator of the well to conduct the re-entry operation.

(2) The owner of the well is either the licensee or the surface owner of the tract on which the well was drilled.

(3) The Commission has not contracted with the licensee to replug the well.
(d) A licensee shall be responsible for the plugging of a well if:
(1) The licensee is the owner of the well or the licensee is the operator of the well.
(2) The licensee enters a well without having contracted with the operator or with a party other than the operator who has authority to authorize the licensee to enter the well on behalf of such party.
(e) Any violation of this Section will subject licensee to a fine, to suspension or revocation of licensee's license issued pursuant to 165:10-11-1, and to proceedings as authorized by statute in the district court.

[**SOURCE:** Amended in Rule Making 97000002, eff 7-1-97]

165:10-11-3. Duty to plug and abandon

(a) **Scope.** This Section applies to:
(1) Joint and several liability of the owners and operator of a well for plugging.
(2) Time periods for plugging wells:
(A) Without casing.
(B) With only surface casing and cement.
(C) With production casing.
(3) Wells exempted from plugging.
(4) Notice of Temporary Exemption from Plugging granting permission to postpone plugging of a well.
(b) **Joint and several liability of owners and operators.** Any working interest owner and operator of any oil, gas, disposal, injection, or other service well or any seismic, core, or other exploratory hole, whether cased or uncased, shall be jointly and severally liable and responsible for the plugging thereof in accordance with this Subchapter.
(c) **Time period for plugging well without casing.** Each well in which neither production casing nor surface casing has been run shall be properly plugged within 72 hours after drilling or testing is completed. However, should the lack of production and surface casing create a fire hazard or a risk of contaminating the environment or formations containing oil, gas, or known treatable water, said well shall be properly plugged within 24 hours after drilling and testing is completed. The well marker requirement described in 165:10-3-4 (e) shall be followed.
(d) **Time period for plugging well with only surface casing and cement.** Each well in which only surface casing has been run and cemented in conformance with 165:10-3-4 shall be properly plugged within 90 days after drilling or testing is completed unless the lack of production or intermediate casing creates a fire hazard or risk of contaminating the environment or formations containing oil, gas, or known treatable water, in which case or cases the well shall be plugged within 24 hours.
(e) **Time period for plugging well with production casing.** Unless exempted under provisions contained elsewhere in this Section, any well which has production casing in place shall be plugged within one year after the latter of:
(1) Cessation of drilling if the well was not completed or tested; or
(2) Cessation of the latter of completion or testing if the well has not produced; or
(3) Cessation of production.
(4) From April 1, 1998, to March 31, 1999, the time period for plugging of any producing well with production casing in place that has ceased production shall be two years. The Commission shall review the need for the continued effectiveness of this provision during the time period set forth above on a quarterly basis. This provision shall not apply to any well that poses a public health, safety or pollution threat to the environment and surface or subsurface waters of the state.
(f) **Operators failing to commence timely plugging operations.** An operator who fails to commence plugging operations as required in (c), (d), and (e) of this Section after due notice from the District Office or the appropriate field inspector may be fined up to $1,000.00.

(g) **Wells exempted from plugging**. The following wells which have production casing in place shall be exempt from (e) of this Section:

(1) Shut-in gas wells, for the purpose of this Section, shall be considered producing wells in operation.

(2) Any well for which a written order of the Commission granting a specific exception to plugging is in full force and effect.

(3) Supply wells or wells authorized by order of the Commission for injection or disposal purposes and are in compliance with the rules of the Commission.

(4) Any well for which a temporary exemption from the plugging rules has been approved.

[**SOURCE:** Amended at 9 Ok Reg 2295; Amended at 9 Ok Reg 2337, eff 6-25-92; Amended in Rule Making 97000002, eff 7-1-97; Amended in Rule Making 980000035, eff 7-1-99]

165:10-11-4. Notification and witnessing of plugging

(a) **Wells without production casing.** The Conservation Division shall be notified at least 12 hours prior to commencement of plugging operations and a plugging procedure agreed upon for any well without production casing. Each plugging operation may be witnessed by an authorized representative of the Conservation Division.

(b) **Wells with production casing.** A separate Notification of Intention to Plug (Form 1001) for each well with production casing shall be filed, in duplicate, with the Conservation Division at least five days prior to the commencement of plugging operations. The five day notice requirement may be reduced or waived:

(1) If a qualified representative of the Conservation Division is available to witness the plugging operation.

(2) At the discretion of the District Manager of the District in which the well is located or his supervisor.

(c) **Penalty.** An operator or licensed plugger plugging a well without notifying and agreeing on a plugging procedure with the District Office may be fined up to $1,000.00 and may be required by the appropriate District Manager to reenter and replug the well.

[**Source:** Amended at 11 Ok Reg 3691, eff 7-11-94; Amended in Rule Making 97000002, eff 7-1-97]

165:10-11-5. Supervision and witnessing [REVOKED]

[**SOURCE:** Amended at 9 Ok Reg 2295, eff 6-25-92; Revoked in Rule Making 97000002, eff 7-1-97]

165:10-11-6. Plugging and plugging back procedures

(a) **Scope.** This Section establishes minimum standards for plugging and plugging back wells. The standards apply to:

(1) Wells drilled for the production of oil or gas.

(2) Wells drilled or used for disposal or enhanced recovery injection.

(3) Wells used in subsurface gas storage units.

(4) Monitoring wells in enhanced recovery projects or subsurface gas storage units.

(5) Wells plugged back for:

(A) Oil or gas production.

(B) Disposal or injection.

(C) Conversion to a water well.

(6) "Rat hole" or "mouse holes" used in rotary drilling of wells.

(7) Wells used for geophysical or geological exploration.

(8) Wells used for other service operations.

(b) **Alternate plugging materials and procedures**

(1) The Manager of Field Operations, or other designated Conservation Division staff member, may approve the use of an alternate material other than cement or in combination with cement for wells listed in subsection (a), provided alternate plugging materials shall not be used to plug or plug back wells listed in subsection (a)(2), wells drilled or used for disposal or enhanced recovery injection, subsection (a)(3), wells used in subsurface gas storage units, subsection (a)(5)(B), wells plugged back for disposal or injection, and underground injection wells authorized under the Oklahoma Brine Development Act, 17 O.S. Section 500 *et seq*.

(2) The Director of Oil and Gas Conservation, in consultation with the Conservation Division's Field Operations staff and the public, shall develop specific plugging criteria for any type of alternate plugging material authorized for use instead of cement or in combination with cement. The plugging criteria for approved alternate material shall be available to the public for review and copying at the Conservation Division's offices and on the Commission's Internet website.

(3) A District Manager may approve alternate plugging procedures for the use of alternate plugging materials.

(4) A detailed description of the alternate plugging operation shall be included with the Plugging Report (Form 1003).

(5) The District Manager shall note his approval of the alternate plugging procedure on the well's Plugging Report (Form 1003).

(6) Any alternate plugging material or procedure shall conform to the minimum plugging standards relating to formations or depths set forth in the Sections below. Provided, based upon the type of alternate plugging material being utilized, the District Manager approving the alternate procedure may authorize variances to the plugging standards delineated in this Section otherwise applicable to the use of cement, where such variances are necessary to ensure an effective well plugging.

(c) **Application and cross references:**

(1) Subsection (n) of this Section provides for administrative approval of alternative plugging procedures if downhole problems in a wellbore prevent an operator from complying with the minimum standards established by this Section.

(2) Subsection (o) of this Section applies to plugging of "rat holes" and "mouse holes" used at the surface during rotary drilling.

(3) OAC 165:10-11-8 establishes additional procedures for identification and control of wellbores in which certain logging tools have been abandoned.

(4) OAC 165:10-7-31 establishes the minimum standards for plugging wellbores used in seismic exploration.

(5) Subsections (d) through (p) of this Section establish plugging and plug back standards for all other wellbores subject to this Section.

(d) **Formations to be plugged.**

(1) Except as provided in (2) of this subsection, for cased formations, if the operator plugs or plugs back a well, the operator shall plug any formation or formations in communication with a formation that:

(A) Bears H_2S;

(B) Bears oil or gas;

(C) Bears treatable water;

(D) Was used in the wellbore for injection as part of a saltwater disposal well or enhanced recovery injection well; or

(E) Is open in the wellbore below either the shoe of the casing or the base of the liner to be left in the well after plugging.

(2) Paragraph (1) of this subsection shall not apply to any formation behind the pipe left in the hole, unless a formation endangers a treatable water formation or any oil and gas bearing formation.

(e) **Mud requirements.** Before running a plug, the operator shall remove or displace all oil and saltwater in the wellbore, and the operator shall fill the wellbore with drilling mud. The minimum mud weight shall be nine pounds per gallon. The minimum viscosity for the drilling mud shall be 36 (API Full Funnel Method). If the operator removes casing from the wellbore, the operator shall keep the wellbore filled with drilling mud meeting or exceeding the weight and viscosity requirements of this subsection.

(f) **Approved cementing methods.**
(1) **Cement plugs.**
(A) To plug or plug back a well, either the tubing and pump method or the pump and plug method shall be used.
(B) Surface pumping and shut in pressures shall be of sufficient pressure to:
(i) Squeeze off perforations in the casing.
(ii) Prevent the plug from floating upward in the wellbore.
(2) **Bridge plugs.** The operator may run by the bailer method cement required in the casing above a bridge plug as provided by (g) of this Section.
(g) **Use of bridge plugs.**
(1) **Permitted use.** Except as provided in (2) of this subsection for top plugs, a bridge plug may be used to permanently plug off a formation if:
(A) The only openings from the formation into the wellbore are perforations in the casing.
(B) The annulus between the casing and the formation is filled with cement from a depth 50 feet below the base of the formation to a depth 50 feet above the top of the formation.
(C) The bridge plug is set above the top of the perforations in the cemented interval described in (B) of this paragraph.
(D) Sufficient cement is placed on top of the bridge plug to fill the casing from the top of the bridge plug to a depth ten feet above the top of the bridge plug.
(2) **Prohibited use for top plug.** A bridge plug may not be used for a top plug described in (j) of this Section.
(h) **Cement plug for uncased hole below the casing or liner.** If any production casing or liner is to be left in the wellbore, then any uncased hole below the casing or liner shall:
(1) Be filled with cement:
(A) **From** a depth which is the lesser of total depth of the well or 50 feet below the lower of shoe of the casing or base of the liner.
(B) **To** a depth of 50 feet above the lower of the casing shoe or the base of the liner; or
(2) Have a cast iron bridge plug set above the top of the liner with cement.
(i) **Intermediate cement plugs.** If a bridge plug and cement are not used, a cement plug shall be run over any other formation required to be plugged off by this Section. To plug off a formation, the wellbore shall be filled with cement from a depth at least 50 feet below the base of the formation to a depth at least 50 feet above the top of the formation.
(j) **Cement top plug.**
(1) **No treatable water exists.** If no treatable water exists, the wellbore shall be filled with cement from a depth of at least 30 feet to a depth of three feet from the surface.
