

Electrochemical Membranes for CO<sub>2</sub> Capture and Power Generation Hossein Ghezel-Ayagh

> 2015 NETL CO<sub>2</sub> Capture Technology Meeting June 23, 2015 Pittsburgh, PA

Ultra-Clean | Efficient | Reliable Power

### **DE-FE0007634 Project Outline**

#### **Overall Project Objectives:**

- □ Demonstrate ability of FCE's electrochemical membrane (ECM)-based system to separate ≥ 90% of CO<sub>2</sub> from a simulated PC flue-gas stream suitable for sequestration or beneficial use
- □ Demonstrate that ECM system is an economical alternative for postcombustion CO₂ capture in PC-based power plants, and that it meets DOE objectives for incremental cost of electricity (COE)

#### **Project Participants:**

FuelCell Energy, Inc. (FCE)  FuelCell Energy  Ultra-Clean, Efficient, Reliable Power	System design, TEA, Gap analysis, ECM fabrication, and bench-scale testing of an 11.7 m <sup>2</sup> area ECM system for CO <sub>2</sub> capture.				
Pacific Northwest National Laboratory (PNNL)  Pacific Northwest NATIONAL LABORATORY	Test effects of flue gas contaminants on ECM.				
AECOM Technical Services (formerly URS Corporation)	Review ECM-based system design, equipment and plant costing, and flue gas clean-up system design.				

## Project Tasks, Schedule and Funding

	2012				2013				2014				2015			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Task 1 Project Management												l I	l I			
Task 2 Technical and Economic Feasibility Study (T&EFS)																
T&EFS Updates												 	 			
Task 3 Technology Gap Identification																
Task 3.1 Contaminant Evaluation																
Task 3.2 Membrane Testing																
Task 3.3 BOP Equipment Update											).					
Task 4 EH&S Review																A)
Task 5 Bench-Scale Testing																,

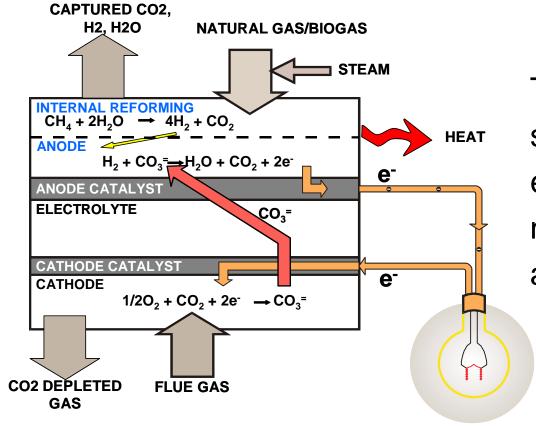

Project Funding								
DOE Share	FCE Cost Share	Project Total						
\$3,034,106	\$758,527	\$3,792,633						

## **Project Milestones**

Budget Period	Task	Milestone Description	Planned End Date	Actual End Date	Status
1	2.1	Demonstrate the potential of the ECM-based system to achieve 90% carbon capture from the Reference PC Plant, based on results of a system study	5/30/12	3/31/12	8
1	2.2	Demonstrate potential to achieve incremental COE of <35%	5/30/12	5/30/12	8
2	3.2	Verify that ECM CO <sub>2</sub> flux can meet the target identified in the Technical and Economic Feasibility Study	7/31/13	12/31/12	8
2	3.2	Demonstrate >50% NO <sub>x</sub> Destruction Capability of ECM	12/13/13	6/30/12	8
2	3.1	Verify that ECM contaminant tolerances can be met by cost-effective flue gas pretreatment technologies	12/23/13	9/30/13	Ø
3	5.4	Verify CO <sub>2</sub> Flux at 100 cc/m <sup>2</sup> /s	9/31/14	7/30/14	Ø
3	5.4	Complete 9 Months of Endurance testing with degradation in Carbon Capture Efficiency based on the value identified in the Technical and Economic Feasibility Study	6/19/15	5/31/15	8
3	5.4	Demonstrate 3 deep Thermal Cycles between ambient and operating temperatures with <2% Degradation in Carbon Capture Efficiency	8/16/15		

# Electrochemical Membrane (ECM) Technology

The driving force for CO<sub>2</sub> separation is electrochemical potential, not pressure differential across the membrane

Net Results ⇒

- Simultaneous Power Production and CO<sub>2</sub> Separation from Flue Gas of an Existing Facility
- Excess Process Water Byproduct
- Complete Selectivity towards CO<sub>2</sub> as Compared to N<sub>2</sub>

#### Solutions that Create Value

#### Modular and Scalable Global Solution

**ECM Assembly** 

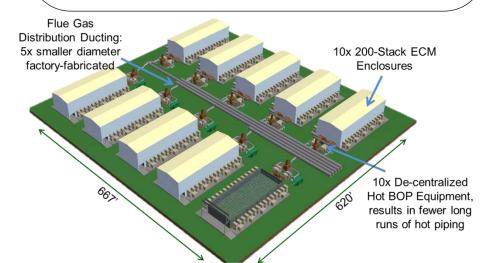

**ECM Stack** 

**Four-Stack Module** 

- Ease of scale-up and transport
- Suitable for incremental phased applications to almost any type of CO<sub>2</sub>-emitting plant
- Proven technology based on FCE's commercial Direct FuelCell<sup>®</sup> for power generation applications

421MWe CEPACS Plant for >90% Carbon Capture from 550MWe PC Plant

**MW-Class Module** 

2-Module plant

10-Module Plant

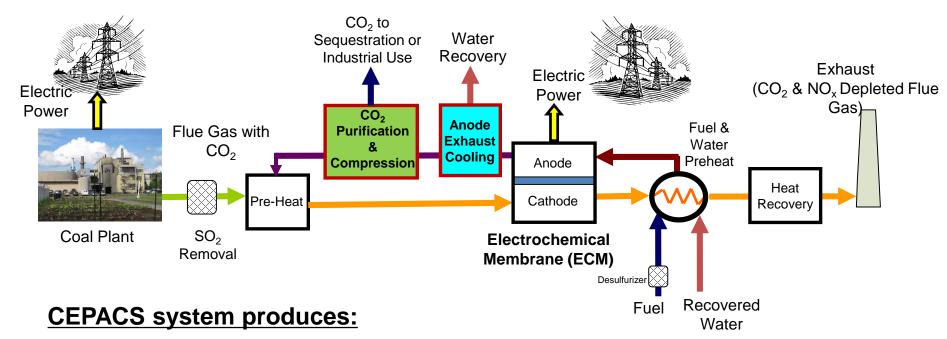

## Techno-Economic Analysis

## CEPACS System Simplified Block Flow Diagram

## <u>Combined Electric Power and Carbon-dioxide Separation (CEPACS)</u> System Concept Implementation for 550 MW Reference PC Plant\*

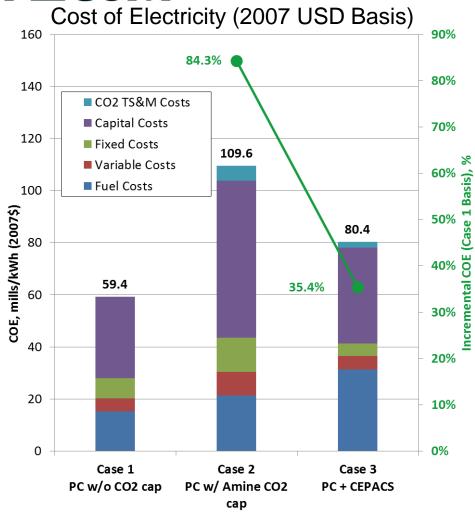

- Supercritical CO<sub>2</sub> (90% CO<sub>2</sub> capture from PC Plant)
- Excess Process Water
- Additional 421 MW of clean AC power @ 42.4% Efficiency (based on LHV NG)

<sup>\*</sup> Cost and Performance Baseline for Fossil Energy Plants, Volume 1: Bituminous Coal and Natural Gas to Electricity, Revision 2, DOE/NETL-2010/1397, November 2010.

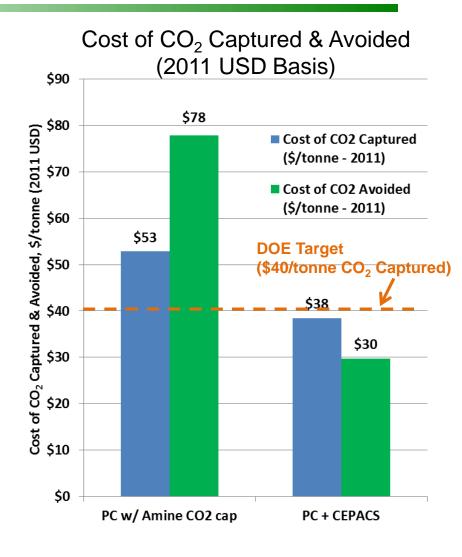

#### Techno-Economic Analysis Results

CEPACS System can meet DOE Target of <\$40/tonne CO<sub>2</sub> captured (2011 USD)

## ECM Testing Results

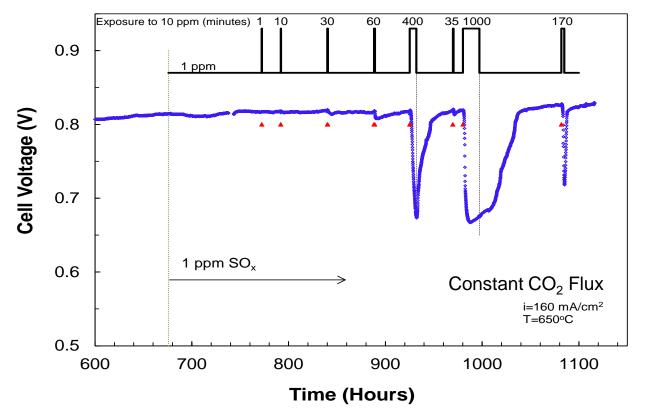

- ECM Tolerance to Flue Gas Contaminants
- Bench-scale (11.7m²) ECM System

## ECM Flue Gas Contaminant Tolerance: SO<sub>2</sub>

To simulate flue gas cleanup system upsets, ECM response to spikes of SO<sub>2</sub> concentrations was studied:

- ECM performance is stable using a polishing equipment which reduces upstream
   SO<sub>2</sub> concentration in the flue gas (cathode gas) to <1 ppm</li>
- Performance loss was fully recoverable after exposing ECM to 10 ppm transients
   SO<sub>2</sub> of varying lengths with recovery time proportional to length of transient

## ECM Flue Gas Contaminants Tolerance: Summary

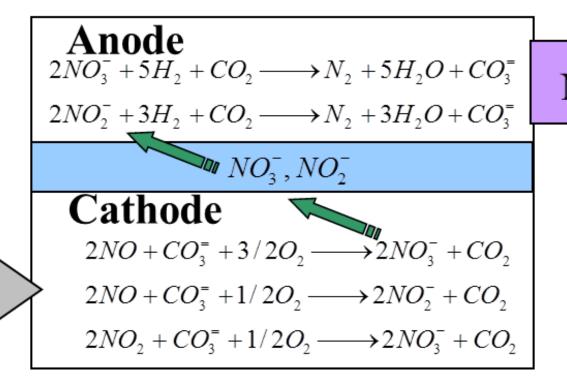

Flue Gas Contaminant	Concentra Cathode In After Poli FGD, Estim AECC	let Gas shing ated by	Tested by PNNL,		Notes
SO <sub>2</sub>	0.18	ppmv	1	ppmv	Performance losses due to short-term $SO_2$ exposure up to 40ppm were fully reversible
Se	0.30	ppbv	10	ppbv	No apparent degradation over 860 hours.
Hg	0.08	ppbv	250	ppbv	Expected form is predominantly elemental Hg. No apparent degradation over 1100 hours.
нсі	12.7	ppbv	200	ppbv	No apparent degradation over 900 hours.

 Based on PNNL testing and AECOM performance estimates, a polishing wet-FGD scrubber is designed to sufficiently clean flue gas for ECM operation

 $NO_{x}$ 

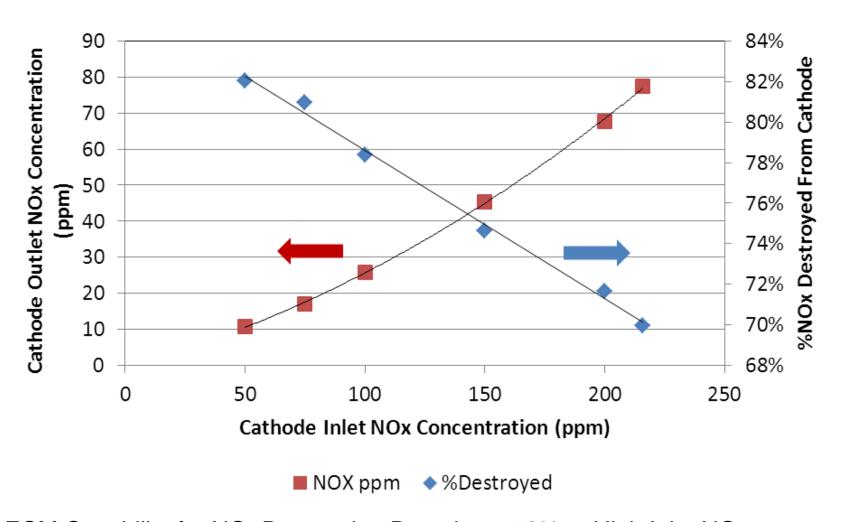

### ECM NO<sub>x</sub> Removal Mechanism

- Based on FCE's prior experience:
  - ECM materials are not expected to be degraded by NOx in flue gas
  - CEPACS system offers co-benefit of NOx reduction

Reaction Mechanism by which NOx is removed from the Flue Gas (cathode-side), transferred to the anode-side along with CO<sub>2</sub>, and subsequently destroyed

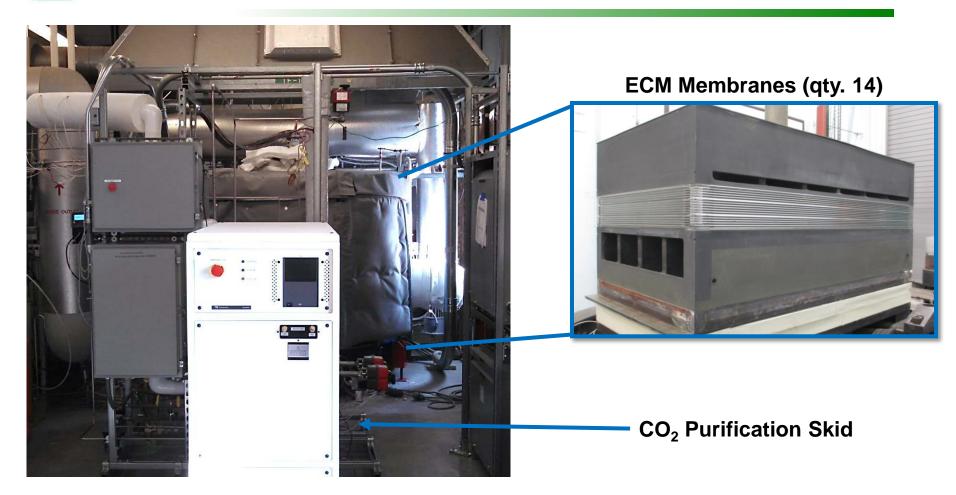

### ECM NO<sub>x</sub> Removal Capabilities

ECM Capability for NO<sub>x</sub> Destruction Remains > 70% at High Inlet NO<sub>x</sub>
 Concentration (200 ppm) During Carbon Capture under System Conditions

#### Bench-Scale Demonstration System

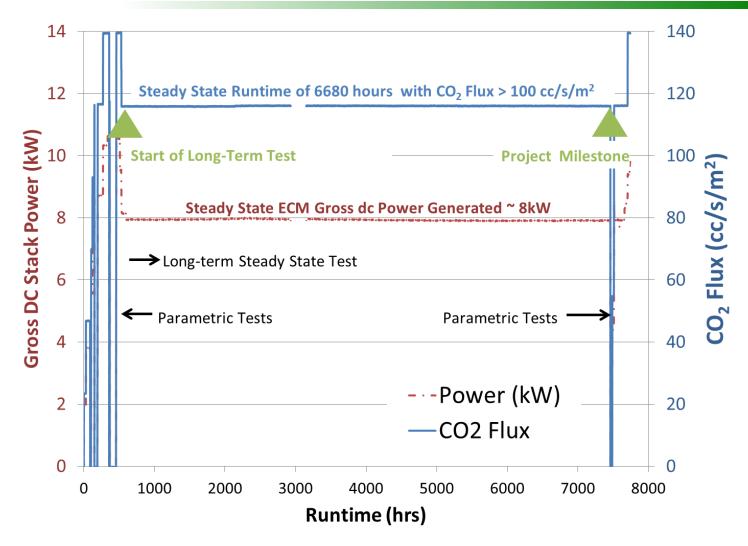

#### **CEPACS** Demonstration System:

- Designed for 100 tons/year liquid CO<sub>2</sub> product
- Capable of >10 kW peak power production

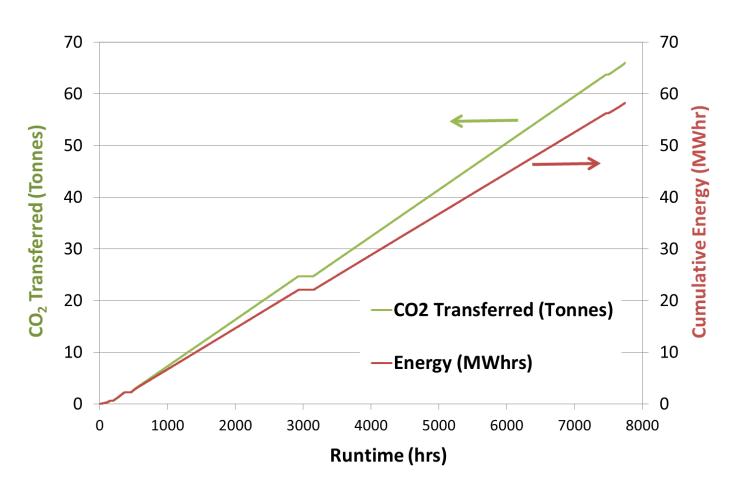

#### **Bench-Scale Demonstration Results**

Bench-scale CEPACS test results verified CO<sub>2</sub> flux greater than 15% over targeted milestone value (>100 cc/s/m<sup>2</sup>) and stable operation for >9 months

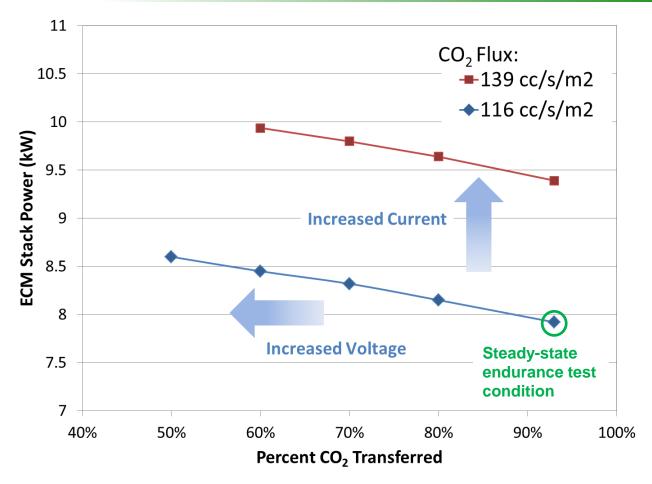

#### Bench-Scale Demonstration Results

Bench-scale ECM separated 66 Tonnes CO<sub>2</sub> from simulated PC plant flue gas, generating 58 gross megawatt-hours of electricity.

# Bench-Scale Demonstration Results: Parametric Testing

- ECM is capable of operating at higher CO<sub>2</sub> flux (>20% improvement)
   than baseline conditions, with proportional increase in power generation
- ECM power output (and efficiency) increases slightly as CO<sub>2</sub> capture % decreases

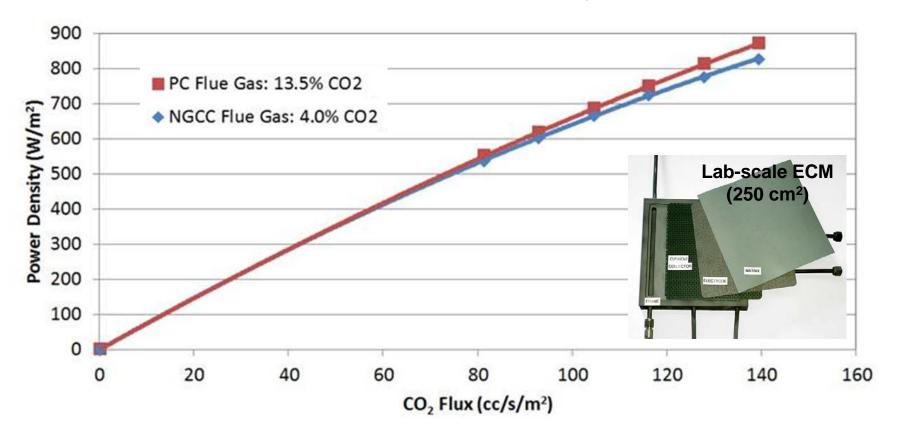

## **Other Applications**

## ECM Performance: Effect of Flue Gas Composition

#### ECM cell performance data for NGCC and PC plant flue gases at 93% carbon capture:

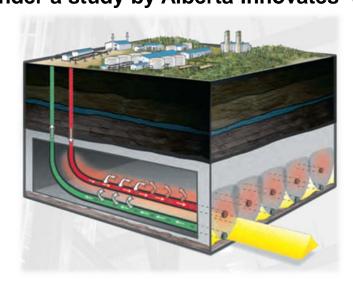

- High cell power densities at high CO<sub>2</sub> flux is observed in ECM tests
- ECM is capable of operating on flue gases with a wide range of CO<sub>2</sub> partial pressure
  - Pulverized coal-fueled boilers
  - Natural gas-fueled boilers
  - Natural gas turbine and combined cycle plants

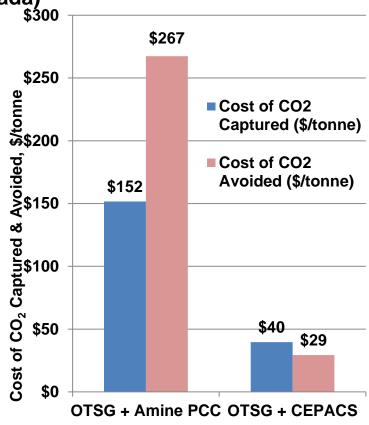

# Case Study: ECM for CO<sub>2</sub> Capture from SAGD Bitumen Extraction

Jacobs Consultancy developed an independent analysis\* of a CEPACS system for 90% CO<sub>2</sub> capture applied to a 33,000 BOPD Steam Assisted Gravity Drainage (SAGD) facility under a study by Alberta Innovates (Alberta, Canada)

#### CEPACS system:

- Captures 90% of CO<sub>2</sub> from SAGD NG-fired Once Through Steam Generator (OTSG)
- Produces 62 MWe net, enough to cover all SAGD power requirements and export 48 MWe
- Reduces SAGD facility makeup water requirements by 44% (compared to without CCS)

#### Accomplishments and Summary

- ➤ The Technical and Economic Feasibility Study (T&EFS) of a CEPACS system to separate 90% of CO₂ from the flue gas of a Reference Plant (550 MW PC) has verified:
  - ECM increases output and efficiency compared to base plant without CO<sub>2</sub> capture
  - Incremental cost of electricity (COE) of 35% and cost of CO<sub>2</sub> captured of \$38/tonne CO<sub>2</sub> (2011 USD)
  - Excess water available for export
- ECM laboratory tests verified:
  - ECM is stable in the presence of S, Se, Cl, and Hg levels expected from a wet-FGD polisher
  - Capability to destroy 70-80% of NO<sub>x</sub> from flue gases
  - Capability to separate CO<sub>2</sub> from flue gasses with low (<4%) CO<sub>2</sub> concentration

Fuel Cell Manufacturing Facility, Torrington, CT

- The Technology Gap analysis indicated that available commercial equipment can be used in CEPACS system with no R&D needed for BOP
- ECM is suitable for a wide range of carbon capture applications: Enhanced oil recovery, SAGD Oil Sands, coal and natural gas power plants, and industrial sites (cement factory & refineries)
- Completed steady state bench-scale tests of a bench-scale ECM stack achieving a stable CO<sub>2</sub> separation flux greater than the targeted 100 cc/s/m<sup>2</sup> while generating ~ 8 kW of gross power

# ECM Carbon Capture from Coal Plants supported by DOE/NETL (Award Number: DE-FE0007634)

Guidance from NETL team: José Figueroa, Lynn Brickett, John Litynski, and others at NETL/DOE
