**Envisioned Fossil-Based Power Plants of the Future are Highly** Complex with a Number of Processes Integrated Into a Large Hybrid System.

#### **Mitigation of Environmental Impacts of Power Generation**

CO<sub>2</sub> Capture and Sequestration is a Primary Technology Currently Under Research and Development to Reduce Environmental Impacts of Greenhouse Gas Production

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Economical / Environmentally Responsible Resource Recovery**

IEICE TRANS. ELECTRON., VOL.E83-C, NO.3 MARCH 2000

A Number of Parameters are Important to Monitor Throughout a Well-Bore to Ensure Environmentally Responsible and Economical Resource Recovery Including Pressure, Temperature, Flow, Chemistry, Seismic Activity, etc.

### Harsh Environment Sensor Material and Device R&D

	ShortTerm Focus			
	Coal Gasifiers	Combustion Turbines	Solid Oxide Fuel Cells	Advanced Boiler Systems
Temperatures	Up to 1600°C	Up to 1300°C	Up to 900°C	Up to 1000°C
Pressures	Up to 1000psi	Pressure Ratios 30:1	Atmospheric	Atmospheric
Atmosphere(s)	Highly Reducing, Erosive, Corrosive	Oxidizing	Oxid izing and Reducing	Oxidizing
Examples of Important Gas Species	H <sub>2</sub> , O <sub>2</sub> , CO, CO <sub>2</sub> , H <sub>2</sub> O, H <sub>2</sub> S, CH <sub>4</sub>	O <sub>2</sub> Gaseous Fuels (Natural Gas to High Hydrogen), CO, CO <sub>2</sub> , NO <sub>2</sub> , SO,	Hydrogen from Gaseous Fuels and Oxygen from Air	Steam, CO, CO <sub>2</sub> , NO <sub>3</sub> , SO <sub>2</sub>

Sensor Development for Embedded Sensing in Power Generation

(#>

Conditions	Downhole Drilling	Deep/Ultra-deep	Geological CO <sub>2</sub> Sequestration (Vilarrasa et al., 2013)
Depth of interest (feet)	1,500–13,500	30,000–40, 000	6,000–7,000
Temperature (K)	Up to 470	Up to 580	Up to 370
Pressure (psi)	Up to over 10,000	Up to 30,000	Up to 3,000
Typical pH	4–8	4–8	2–6

Sensor Development for Embedded Sensing in Subsurface Applications

NATIONAL ENERGY TECHNOLOGY LABORATORY

### Thin Film Functional Sensor Layers in Harsh Environment Sensing Applications

## Motivation for Looking at Optical Materials

#### Chemi-resistive materials : the fundamentals are understood

- G. Korotcenkov (2007). Materials Science and Engineering: B 139(1): 1-23
- Gas Species Interact with Adsorbed Surface Species or Alter Defect Chemistry Changing:

(1) Free Charge Carrier Concentration, (2) Mobility of Free Carriers

#### **Optical materials : fundamentals are <b>poorly understood**

- How Do Refractive Index and Optical Absorption Depend Upon Defect Chemistry or Concentration of Adsorbed Species?
- How Can Materials with Useful Responses Be Optimally Integrated into Optical Sensing Devices?
  e.g. Evanescent Wave Sensors

Silica-Based Fibers are Stable up to Temperatures Approaching 900°C

### Advanced Functional Sensor Material Project Team University Partnerships

NATIONAL ENERGY TECHNOLOGY LABORATORY

Engineering of Functional Sensing Layer Porosity to Enhance Responses for Thick Film Sensing Layers and Strategies for High Temperature Compatible Distributed Interrogation Have Been Developed.

## Collaborative Research: Virginia Polytechnic Univ.

[18], [23]

Characteristic Absorption Peaks are Observed for Different Silica-Based

Fiber Compositions, Strength Depends Upon Formation of OH-Defects and

a Reversible Temperature Dependent Behavior is Observed.

### Collaboration Products 7 – Joint Publications (U. Pitt, U. Albany, OSU) Since 2012 4 – Joint Patent Applications (U. Pitt., Stevens, OSU) 4 - Additional Joint Publications in Preparation (U. Conn., U. Pitt., VA Tech) Wiresity of Pittsburgh

The Team Also Seeks to Establish New Collaborations with Other

**NETL-Funded Projects and Others to Help Promote the Mission of the** 

Laboratory and the Crosscutting Research Program.

Estimates of Binding Energy Shifts Associated with Electronic Charge Transfer for this System Based on Metal / Semiconductor Contact Theory are of the Correct Order of Magnitude -> Mechanistic Understanding of Optical Response.

### **Sensor Materials for Power Generation**

NATIONAL ENERGY TECHNOLOGY LABORATORY

### **In-House Efforts Have Targeted Embedded Sensing**

### Example : Solid Oxide Fuel Cells Internal Gas and Temperature

**Distribution** 

Spatial Distribution in Temperature and Fuel Gas Composition

Incompatible with Traditional Sensing Technologies

1) At Limits of High Temperature Electrical Insulation

- 2) Limited Access Space
- 3) Only Single-Point, Single-Parameter Sensing

Temperature : 700-800°C Anode Stream : Fuel Gas (e.g. H<sub>2</sub>-Containing) Cathode Stream : Air or O<sub>2</sub>

Stable Sensors Capable of Embedding in Harsh Environments Would Enable Unprecedented Access to New Process Information.

**Key Thrusts:** 

(1) Stable Sensing Devices, (2) Compatible with Distributed Interrogation

## **Sensing Materials Classes Investigated**

#### Binary Semiconductor Metal Oxides: SnO<sub>2</sub>, TiO<sub>2</sub>, ZnO

- → High Temperature Stable Variants Show Weak Optical Responses
- $\rightarrow$  Link Between Resistive Changes and Optical are Weak
- → Temperature Dependent Band-Gap Useful for Temperature Sensing

#### Au-Nanoparticle Incorporated Oxides: Au-TiO<sub>2</sub>, Au-SiO<sub>2</sub>

- → Shifts of the Au LSPR Absorption Peak (Reducing vs. Oxidizing)
- → Damping and Shifting of the Au LSPR Absorption Peak (Temperature)
- → Multi-Parameter Monitoring Possible (Gas and Temperature)

#### Doped Semiconductor Metal Oxides: AI-Doped ZnO, Nb-Doped TiO<sub>2</sub>

- $\rightarrow$  Enhanced Optical Responses Due to Free Carrier Contribution
- → Enhanced Chemical Sensitivity of Band-Edge Due to Burstein-Moss Shift

#### Perovskite Based Oxides: SrTiO<sub>3</sub>, La-Doped SrTiO<sub>3</sub>

→ Stable Under SOFC Operational Conditions, Response up to 100% H<sub>2</sub> NATIONAL ENERGY TECHNOLOGY LABORATORY

### **Example Sensing Material Class #1:**

## Plasmonic Au-Nanoparticle Incorporated Oxides (e.g. Au / SiO<sub>2</sub>)

NATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

**(#**>

### **Demonstration of Fabricated Prototype Sensor**

Sensor Elements Have Been Fabricated Based upon the Au / SiO<sub>2</sub> System to Explore High Temp. Plasmonic Sensing Exploiting Au LSPR Absorption Modifications.

ATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

**(#**>

Optical Fiber Stability at Such Extreme Temperatures is a Concern, Particularly in H<sub>2</sub> Containing Atmospheres. This is Why the VA Tech. Effort Plays a Critical Role in the Program.

ATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

(#)

### **Fabricated Sensor Results : Testing in SOFC**

**(#**)

We Have Successfully Demonstrated Embedded Temperature and H<sub>2</sub> Responses in an Operational SOFC Although More Work is Required to Better Understand Stability at Visible Wavelengths.

NATIONAL ENERGY TECHNOLOGY LABORATORY

### **Long-Term Exposure Testing of Sensor Materials**

Reactive Evaporation of Noble Metals Such as Ag, Pd, and Au is Increasingly Being Observed at High Temperatures Depending Upon the Specific Gas Atmosphere in Question. Exploration of Alternative Materials Systems is Needed...

ATIONAL ENERGY TECHNOLOGY LABORATORY

### **Example Sensing Material Class #2:**

# High Electronic Conductivity Metal Oxides (e.g. Al-Doped ZnO and La-Doped SrTiO<sub>3</sub>)

NATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

**(**#>

## Fabricated Sensors Based on Al-Doped ZnO

#### Attractive High Temperature and Broadband Near-IR Sensing Responses Observed for AI-Doped ZnO Thin Films.

Fabricated Sensors Show Promising Results in Near-IR and UV / Visible Wavelength Ranges Due to Free Carrier / "Burstein-Moss" Effects.

NATIONAL ENERGY TECHNOLOGY LABORATORY

### **Sensor Materials for Subsurface Applications**

(#>)

NATIONAL ENERGY TECHNOLOGY LABORATORY

### **Downhole pH and Chemical Sensing Applications**

#### Pressure, Temperature, and Flow Sensors are Commercially Available

Importance of Downhole pH Sensors:

- Oil & gas production
- Corrosion and Scaling : Functions of Brine Chemistry & Well-Bore Conditions
  - pH is Single Most Important Chemical Parameter Predicting Corrosion and Scaling
  - Scaling Removal for a Single Well Can Be as Large as \$2.5million<sup>1</sup>
- pH Helps to Characterize Formation, e.g. Transition Zones
- pH Can Be an Indicator of Chemical Composition *in* Some Down Hole Environments

```
pH=pK_1+Log([CO_2]=0.0449\alpha P_{CO2})/0.0449\alpha P_{CO2})
```

Apparent AcidTotal Conc. Of<br/>ConstantCO2<br/>ConstantBunsen Abs.ConstantCarbonatesPressure (bar)Coeff.and Free CO2Coeff.Coeff.

#### Commercial Distributed Temperature and Pressure Sensors Exist. (Schlumberger, Haliburton, Baker Hughes, and Others)

Chemical Sensing Technologies are Relatively Under-Developed Despite The Importance and Potential Economic / Environmental Impact

#### **Traditional Optical Based pH Sensing**

Indicator	LowpH color	Transition pH range	High pH color

Crosscutting Review Workshop, April 30, 2015

IAL ENERGY TECHNOLOGY LABORATORY

### **Temperature Instability of Optical-Based pH Sensors**

#### Traditional Optical-Based pH Indicators Have Inherent Temperature Limitations that Create a Challenge for the Most Aggressive Conditions.

Sensing Material	Thermal Stability	Chemical Stability	pH Responsive Range	Reported Research
Dye	low (up to ~ 100 °C)	low – moderate	0-14	very well studied and have been investigated for down-hole sensing
pH responsive polymer	moderate (a few hundred °C possible)	moderate – high	2 – 13	some reports and not aware of down-hole sensing application
Au nanoparticles	high (up to 1000 °C)	high	2 – 12*	a few reports on using pH sensitive molecules/polymer to enable optical response from Au
Oxides	high (up to 1000 °C or more)	high	?	?

How Can we Exploit Optical Properties of Inherently Stable Materials for the Purpose of Optical pH Sensing in Extreme Temperature Applications?

NATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

#### **Nanocomposite Metal-Nanoparticle Incorporated Silica Based Sensing Layers** 140 TEOS 120 Transmission (%) Au-Nanoparticles 100 80 Pd 60 600 700 500 800 Wavelength (nm) Au/TEOS $TEOS + HAuCl_4 (PdCl_2)$ **Optical Fiber** Coating Light Detector Source 200 °C ~ 600 °C Solution

Incorporation of Metal Nanoparticles Into an Organic or Inorganic Matrix Provides a Unique Optical Absorption Feature Characteristic of the Nanoparticles in Question.

IATIONAL ENERGY TECHNOLOGY LABORATORY

### Nanocomposite Metal-Nanoparticle Incorporated Silica Based Sensing Layers

#### **Au-Nanoparticles**

Higher pH Solutions "Amplify" the Inherent Absorption Associated with the Plasmonic Au-Nanoparticles.

A Strong Shift in the Au LSPR Absorption Peak Wavelength Cannot Be Resolved, Suggests it is Not a Pure LSPR Shift Due to Refractive Index.

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### Nanocomposite Metal-Nanoparticle Incorporated Silica Based **Sensing Layers Au-Nanoparticles** 120 120 3.93 7.04 Water 3.93 Transmission at 525 nm (%) 3.67 Transmission at 600 nm (%) 6.91 pH 2.65 6.95 6.91 6.95 7.04 7.09 Water 7.09 100 -.81 pH 2.65 7.81 100 9.23 9.60 9.23 80 9.60 60 80 10.88 10.96 10.88 10.96 11.38 40 11.38 60 10000 12000 14000 10000 12000 14000 Elapsed Time (s) Elapsed Time (s)

The Optical Absorption Response Appears Rapid, Robust, and Reversible as pH is Varied from Acidic to Basic.

What is the Mechanism Responsible for the Optical pH Response?

NATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

**(#**>

### Characteristic "pH Dependence" of Optical Sensing Responses Regardless of "Indicator"

Even Organic, Non-pH Sensitive Organic Dyes Show a Similar Qualitative Response as Au and Pd!

Could Refractive Index Impacts on Waveguiding Conditions Be Responsible for the Observed Responses?

Correlation of Response with Surface Charge Density of Silica Suggests Surfaces are Playing a Critical Role.

NATIONAL ENERGY TECHNOLOGY LABORATORY

# Surface Charging + Electrochemical Double Layer Formation

Surface Charging Behavior

is "Tunable"

**‹#**>

Adsorption of Cations Near the Charged Silica Surface

One Can Hypothesize that the Surface Layer Refractive Index Has a Monotonic (Linear?) Dependence on Surface Charge Density.

For "Porous" Layers This May Translate into a "Bulk" Index Modification.

J. Rayss, G. Sudolski, Sens. Actuators B 87, 397 (2002).

Suggested "Increase in Electron Density" Increases Silica Refractive Index

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### Waveguide Modeling of a Au / TEOS Sensing Layer

1  $\mu$ m sensing layer, varying pH (left) and normalized transmission change and effective silica index vs. pH (right)

Linearity between the transmission and effective refractive index of the matrix layer is consistent with experimental results.

ATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Elevated Temperature Measurements : Au / TEOS Sensor**

As temperature is increased up to 80°C for fixed pH, a unique temperature dependence of the Au / TEOS sensor is observed.

We currently believe that the observed dependence is related to a relatively large temperature dependence of optical constants of water.

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Elevated Temperature Waveguide Modeling : Au / TEOS**

High pressure testing has only recently been initiated. Early results do not show a strong pressure dependence of transmission at fixed pH.

The sensing response also appears to be qualitatively the same as for ambient pressure applications. Work is on-going to better quantify the pressure impacts on pH sensing response in these materials.

#### **Overall Summary and Future pH Sensing Work**

Robust Optical pH Response in Several Materials Described Current Information Suggests Silica Refractive Index is the Likely Mechanism → pH Dependent Surface Charging Plays an Important Role

Testing high temperature/pressure performance, development of calibration strategy, and new materials/functionalization for enhanced performance

Crosscutting Review Workshop, April 30, 2015

#### Expansion of Subsurface Sensing Activity Moving Forward

Expanding pH Sensing Activities to Higher Pressure and Temperature Environments, and Exploring New Functional Sensing Materials

Expanding Beyond pH to Other Chemical Parameters of Direct Relevance:

1)  $CO_2$  Measurement ( $CO_2$  Migration in Geological Formations)

2) CH<sub>4</sub> Measurement (Wellbore Monitoring, Leak Detection)

Conditions	Downhole Drilling	Deep/Ultra-deep	Geological CO <sub>2</sub> Sequestration (Vilarrasa et al., 2013)
Depth of interest (feet)	1,500–13,500	30,000–40, 000	6,000–7,000
Temperature (K)	Up to 470	Up to 580	Up to 370
Pressure (psi)	Up to over 10,000	Up to 30,000	Up to 3,000
Typical pH	4–8	4–8	2–6

Sensor Development for Embedded Sensing in Subsurface Applications

NATIONAL ENERGY TECHNOLOGY LABORATORY

### Opportunities to Collaborate with the In-House Sensor Material and Device R&D Team

NATIONAL ENERGY TECHNOLOGY LABORATORY

Crosscutting Review Workshop, April 30, 2015

**(#**)

#### Licensing Opportunities for In-House Sensor Related Patents

#### **Novel Classes of Sensing Materials**

Sensor Material Approaches for Harsh Environment Sensing

Novel Sensor Applications in a Solid Oxide Fuel Cell Environment

A significant patent portfolio has been established by the in-house research team and collaborators, licensing and technology development partnership opportunities exist.

We are Seeking to Build Stronger Industrial Collaborations and Relationships.

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Sensors Testing Opportunity at NETL**

NETL currently has two (2) facilities available to support sensors testing.

#### High-Pressure Combustion Facility (Aerothermal Rig)

- Simulates hot gas path of a turbine
- Natural gas or hydrogen fuel
- Capable of 2 lb/s air flow @ 10atm
- Temperature: up to 1300°C
- Optically-accessible combustor and test sections

NETL is currently <u>identifying more facilities</u> and working to streamline internal approval process.

- A 300kW solid oxide fuel cell gas turbine (SOFC-GT) power plant simulator
- 120 kW Garrett Series 85 APU with single-shaft turbine, 2-stage radial compressor, and gear driven generator
- 100+ process variables measured including rotational speed (1,200Hz; 40,500 rpm), air/fuel flow, temperature (turbine: 637°C; SOFC: 1133°C), pressure (up to 260kPa), etc.

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Opportunities for Collaborative Technology Development w/ NETL**

NETL has a number of well equipped laboratories for in-house sensor and sensor material research and development activities.

High temperature reaction chambers with automated gas flows and temperature control.

- H<sub>2</sub>, CH<sub>4</sub>, CO, CO<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub>
- 2 Ambient pressure reactors, up to 1000°C
- 1 Pressurized reactor, up to 900psi, 850°C
- Electrical and optical access for various instrumentation, probes, and devices

Intermediate temperature and elevated pressure reaction chambers with automated gas /fluid flows.

- CH<sub>4</sub>, CO<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub>
- 1 Intermediate pressure reactor, up to 3500psi and 150 or 350°C (depending on vessel)
- 1 High pressure reactor, up to 10000psi and 350°C (in construction)
- Probe access

NETL also has significant expertise and facilities for materials development and characterization, applied spectroscopy for sensing and diagnostics, and sensor device fabrication.

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Conclusions and Summaries**

NATIONAL ENERGY TECHNOLOGY LABORATORY

- Needs Exist for Harsh Environment Sensors
  - Power Generation Applications (Combustion, SOFCs, Turbines)
  - Subsurface Environments (CO<sub>2</sub> Sequestration, Unconventional Oil & Gas)
- Advanced Materials Enable Harsh Environment Compatible Sensors
  - Particular Focus / Needs for Optical Materials
  - Electrical, Electrochemical, and Even Magnetic Materials are Also of Interest
- Power Generation Sensors
  - Early Focus on SOFC Applications as a Demonstration Platform
  - Planned Expansion to Other Power Generation Technologies
- Subsurface Environment Sensors
  - Early Focus on pH (Corrosion, Scaling, Key Parameter for Geochemistry)
  - Planned Expansion to CO<sub>2</sub>, CH<sub>4</sub>, Elevated Temperatures, Elevated Pressures
- Opportunity Exist for Collaborative Technology Development
  - Licensing of Developed IP
  - Collaborative Research Activities and Joint Proposals
  - Sensor Demonstration and Testing at Pilot Scale Facilities

NATIONAL ENERGY TECHNOLOGY LABORATORY

#### **Acknowledgements and Funding Sources**

- Sydni Credle, Barbara Carney, Jessica Mullen, Robie Lewis, Steven Seachman, Susan Maley, Robert Romanosky (the Crosscutting Research Program Management Team)
  - Direct Funding Support Through the Crosscutting Research Program
  - Opportunities to Integrate and Collaborate with the Crosscutting Program
- Alexandra Hakala, Christina Lopano, Angela Goodman, Kirk Gerdes, Shiwoo Lee
  - Direct Funding Support Through Unconventional Oil & Gas and CO<sub>2</sub> Storage Programs
  - Collaborations and Demonstrations in Realistic Environments (e.g. SOFC)
- Michael Carpenter, Kevin Chen, Gary Pickrell, Anbo Wang, Puxian Gao, Junhang Dong, Henry Du, Alan Wang, and Chih-Hung Chang (and their teams)
  - Collaborations on NETL-Funded Extramural Programs
  - Development of New Future R&D Concepts and Joint Proposal Activities
  - Collaborative Joint Mentoring of Students

Come Speak to Me About Potential Collaborations with the NETL In-House Research Team to Promote the Crosscutting Research Program and the NETL Mission.
