

# PLAINS CO<sub>2</sub> REDUCTION PARTNERSHIP: BELL CREEK FIELD PROJECT

DE-FC26-05NT42592

Mastering the Subsurface Through Technology Innovation & Collaboration:  
Carbon Storage & Oil & Natural Gas Technologies Review Meeting

August 18, 2016

Charles Gorecki, Director of Subsurface R&D  
Energy & Environmental Research Center

Critical Challenges. **Practical Solutions.**

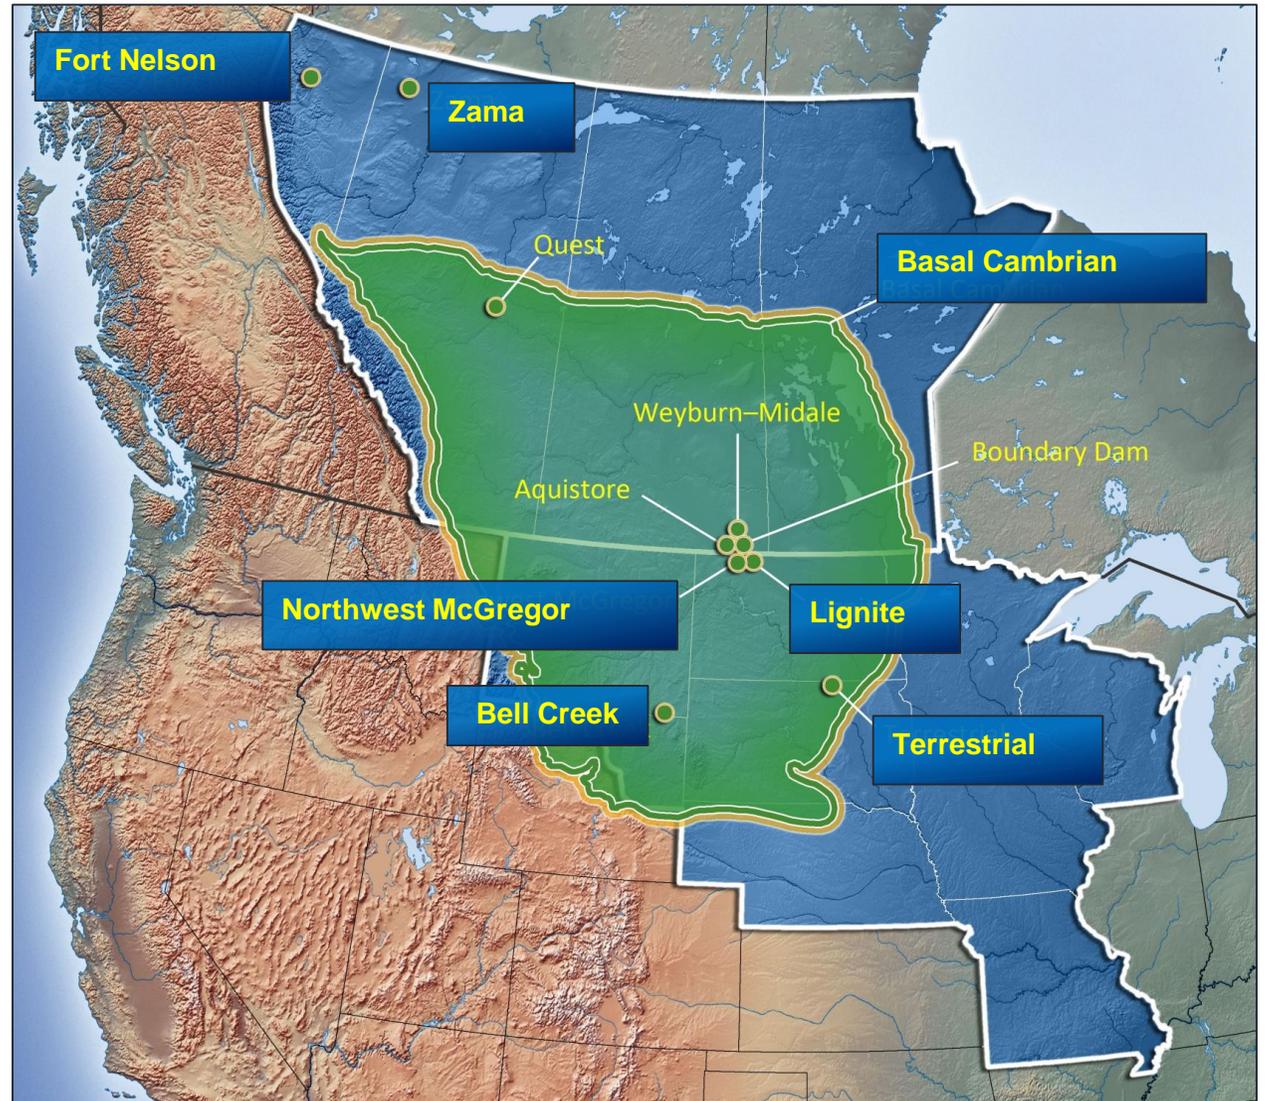

# PRESENTATION OUTLINE

- PCOR Partnership
- Enhanced oil recovery and associated CO<sub>2</sub> storage
- Bell Creek project
- Aquistore project
- Outreach activities
- Best practices manuals
- Summary

# PCOR PARTNERSHIP

- Region includes:
  - Nine states
  - Four Canadian provinces
  - 1,382,089 mi<sup>2</sup>
- Two active demonstration projects:
  - Bell Creek project
  - Aquistore project
- More than 100 partners

# PCOR PARTNERSHIP

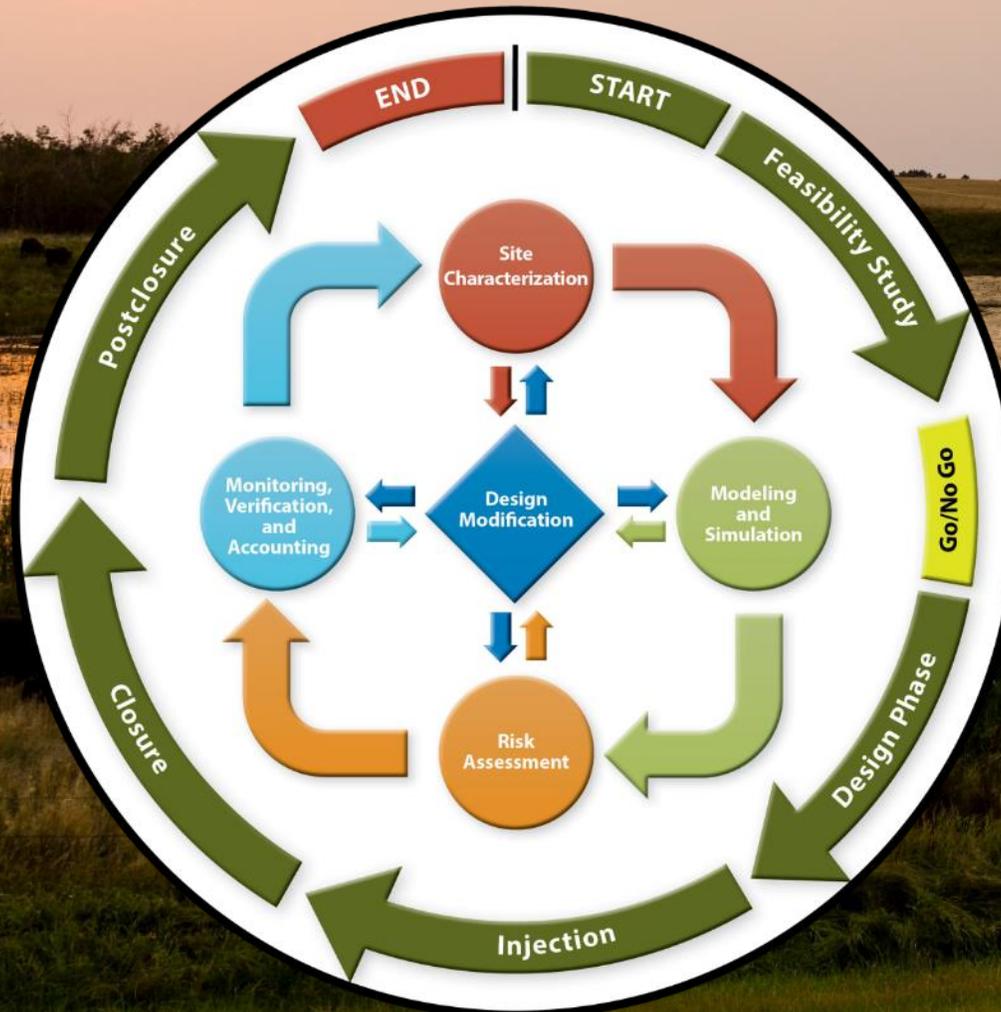

<b>PCOR Partnership 2003 – Present</b>															

# PCOR PARTNERSHIP

<b>PCOR Partnership 2003 – Present</b>															

# PCOR PARTNERSHIP'S INTEGRATED ADAPTIVE MANAGEMENT APPROACH

- Focused on site characterization, modeling and simulation, and risk assessment to guide monitoring, verification, and accounting (MVA) strategy.

# PCOR PARTNERSHIP OBJECTIVES

- Safely and permanently achieve CO<sub>2</sub> storage on a commercial scale in conjunction with enhanced oil recovery (EOR).
- Demonstrate that oil-bearing formations are viable sinks with significant storage capacity to help meet near-term CO<sub>2</sub> storage objectives.
- Establish MVA methods to safely and effectively monitor CO<sub>2</sub> storage.
- Use commercial oil/gas practices as the backbone of the MVA strategy, and augment with additional cost-effective techniques.
- Estimate the CO<sub>2</sub> storage resource potential in saline formations and hydrocarbon reservoirs in the PCOR Partnership Region.
- Serve as a knowledge hub to support in the future deployment of CCUS projects in the region. “Regional Vision”

# CO<sub>2</sub> EOR

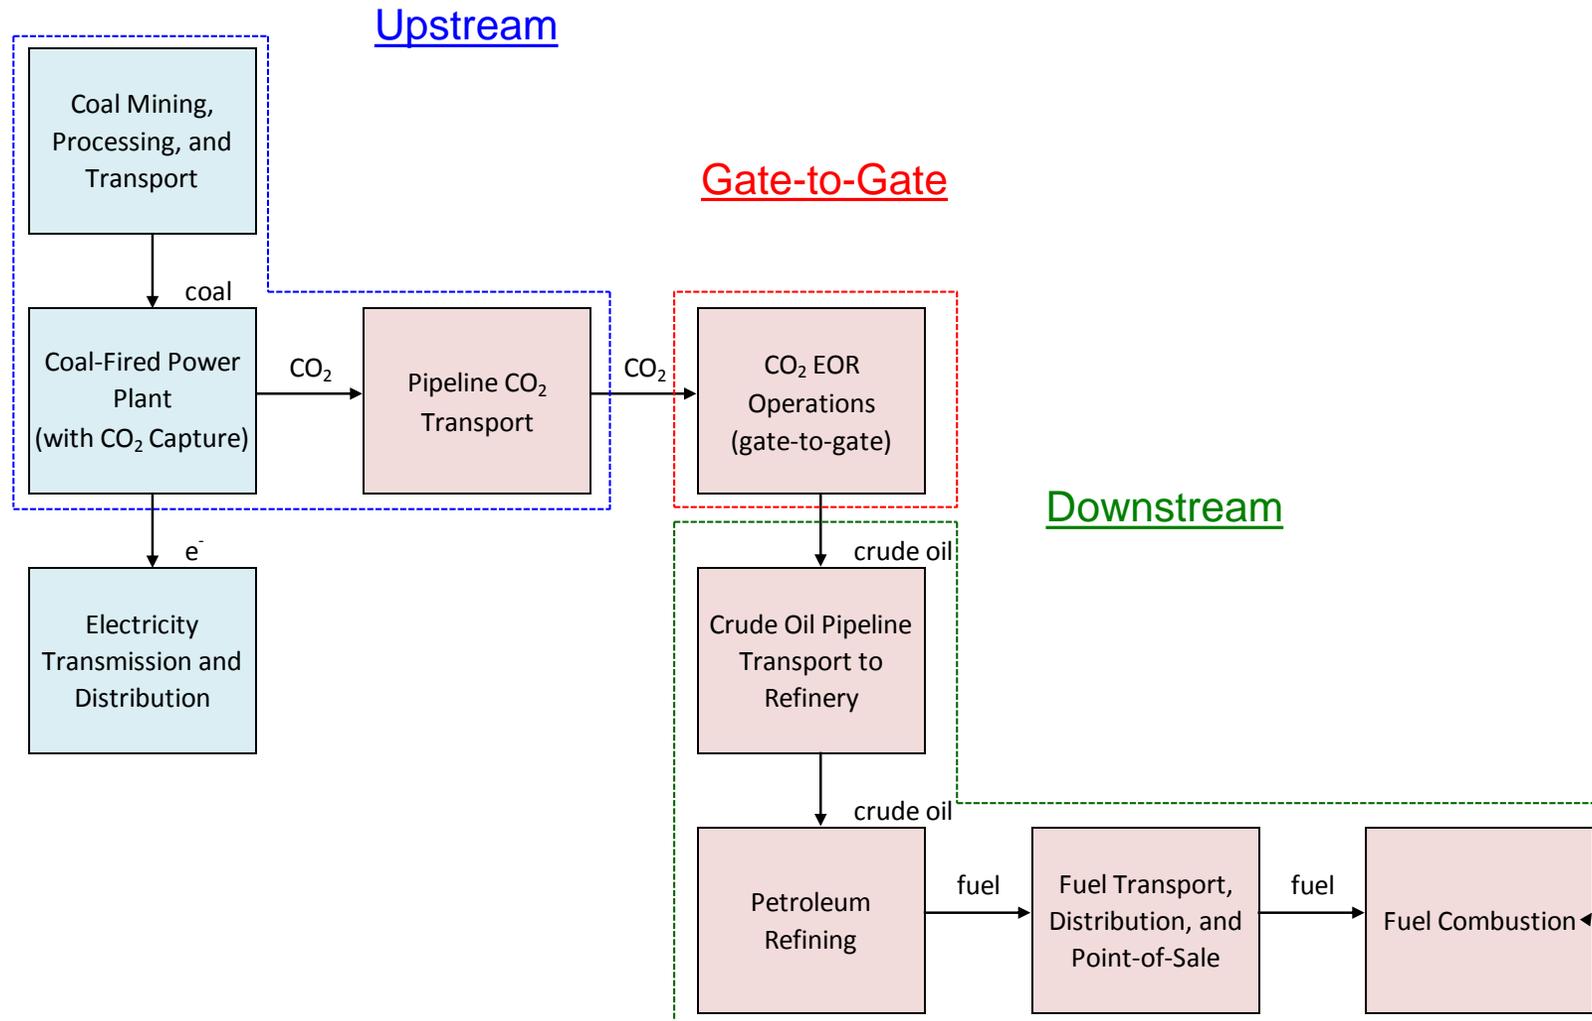

- **A great near-term storage option:**
- Over 40 years of handling and injecting large volumes of CO<sub>2</sub>.
- Much of the infrastructure already in place.
- Storage cost can be offset by income from EOR.

## “Greener” than conventionally produced oil:

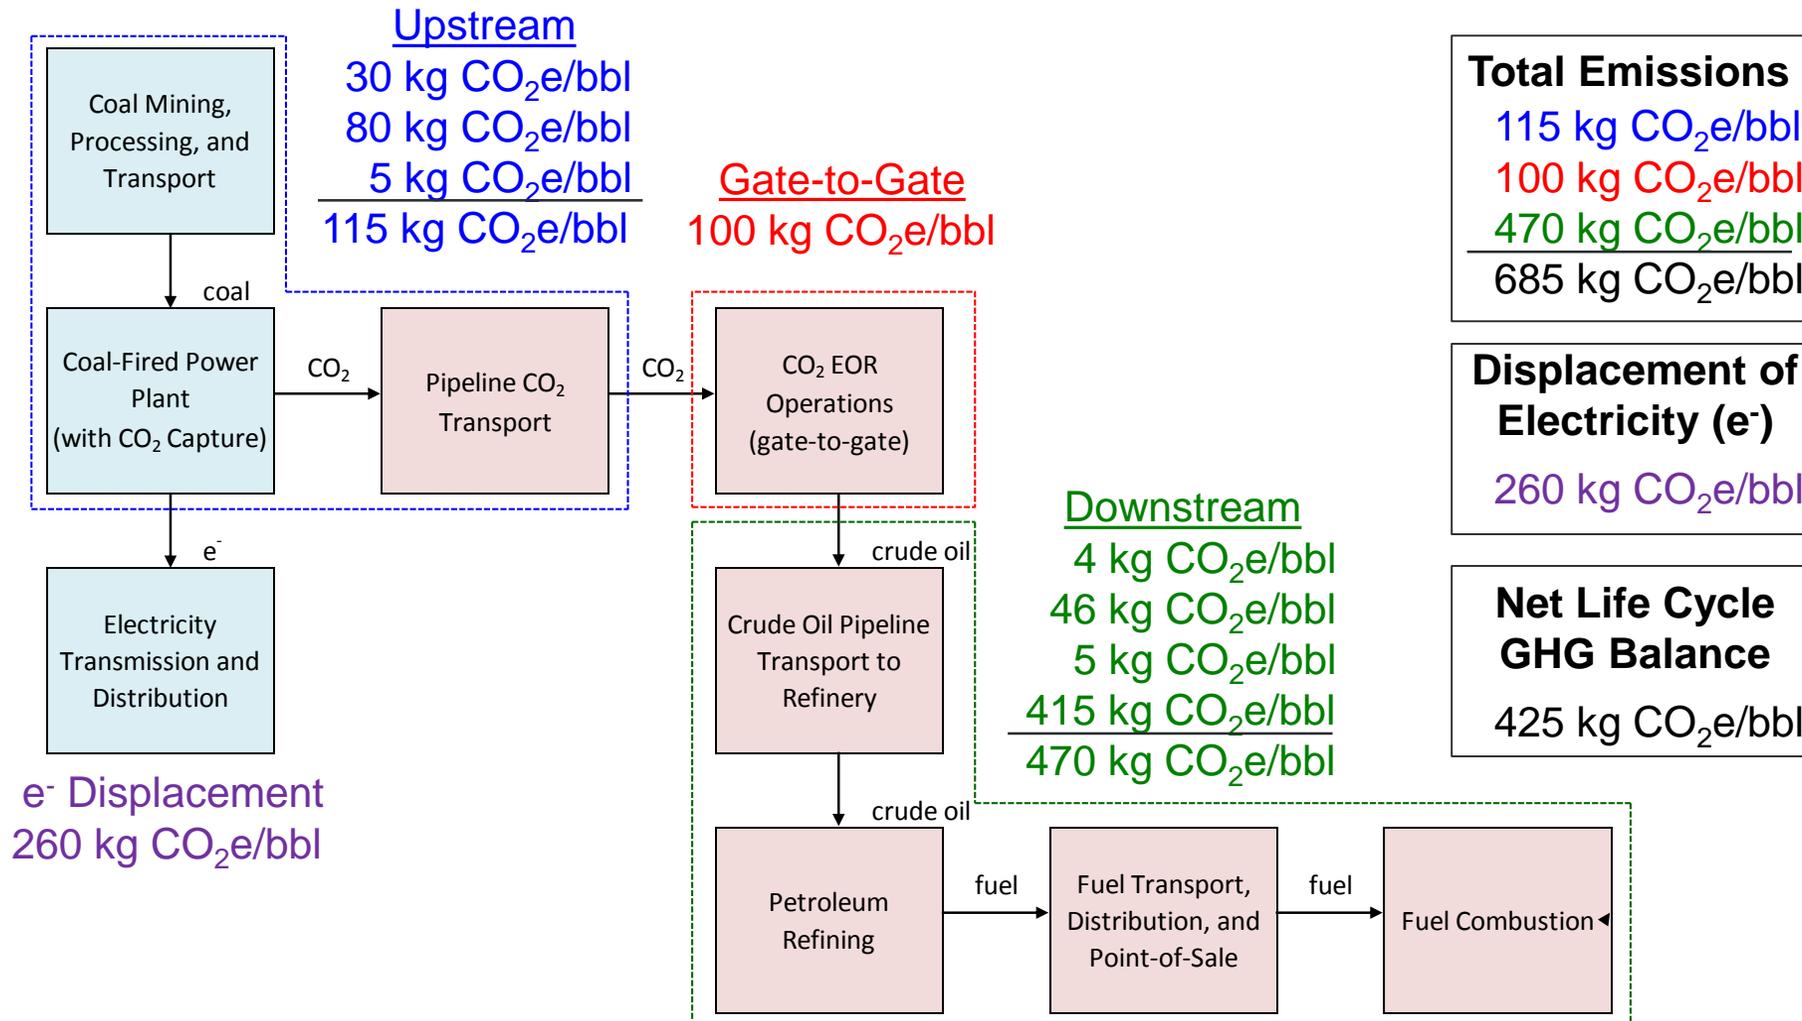

- Existing EOR operations are already storing CO<sub>2</sub>.
- Nearly every tonne of CO<sub>2</sub> purchased is eventually stored.

### CO<sub>2</sub> EOR LCA Model

The PCOR Partnership performed a life cycle analysis (LCA) to estimate the greenhouse gas emissions associated with oil produced via CO<sub>2</sub> EOR, including comparing the results to conventional oil. The results were published in the *International Journal of Greenhouse Gas Control*.

A spreadsheet-based model developed through this work allows users to input their own site-specific values for conducting the analysis.

Download the model

**Article Title:** *How Green Is My Oil? A Detailed Look at Greenhouse Gas Accounting for CO<sub>2</sub> Enhanced Oil Recovery (CO<sub>2</sub> EOR) Sites*

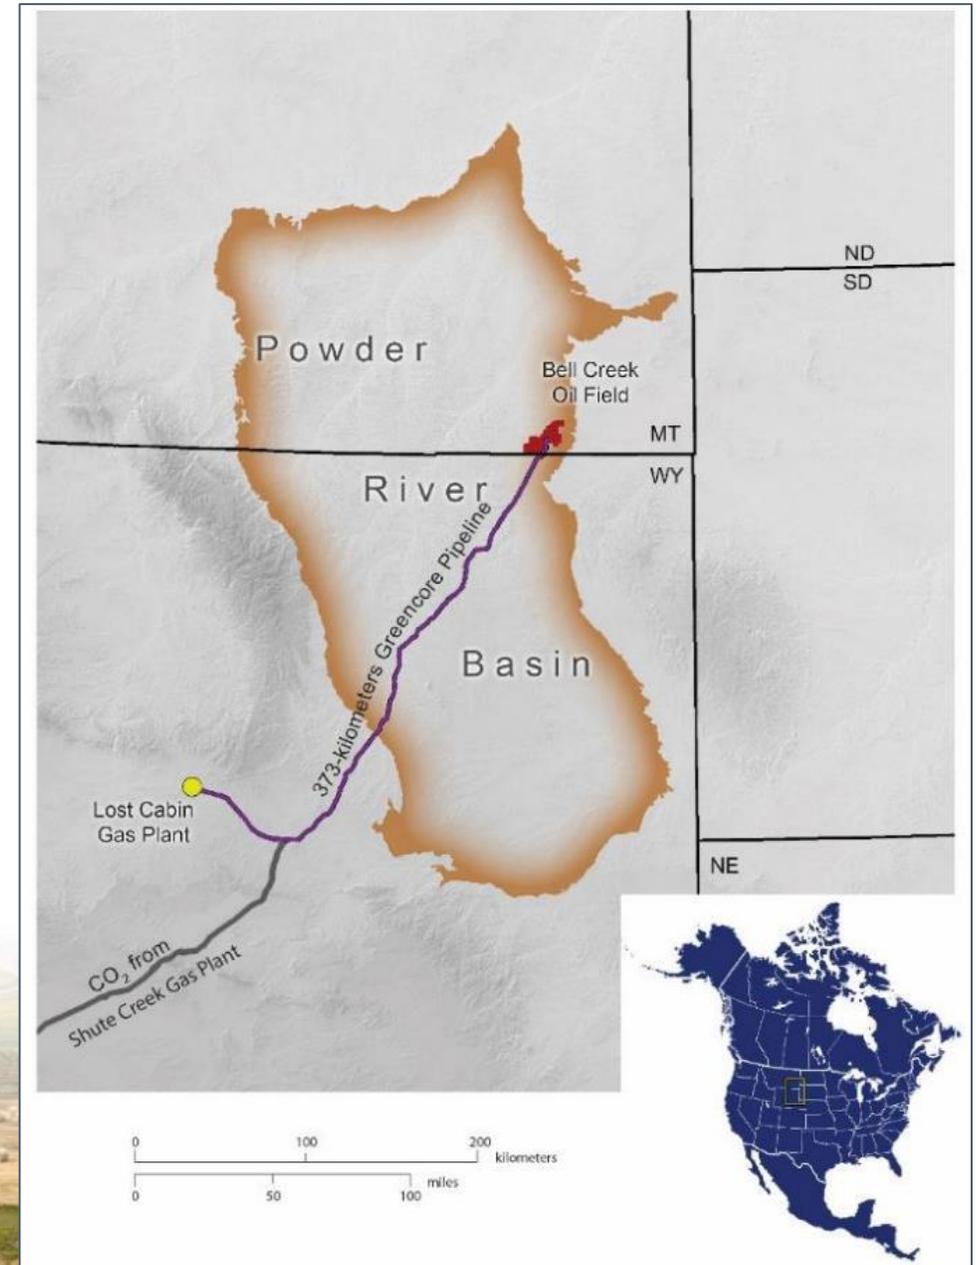

**Abstract:** This study presents the results of a detailed life cycle analysis of greenhouse gas (GHG) emissions associated with carbon dioxide enhanced oil recovery (CO<sub>2</sub> EOR) where the CO<sub>2</sub> is sourced from a coal-fired power plant. This work builds upon previous investigations and integrates new information to provide more plausible ranges for CO<sub>2</sub> storage in the reservoir during CO<sub>2</sub> EOR. The system model includes three segments: upstream, gate-to-gate, and downstream processes. Our base case model using Ryan-Holmes gas separation technology for the CO<sub>2</sub> EOR site determined the emissions from upstream, gate-to-gate, and downstream processes to be 117, 98, and 470 kg CO<sub>2</sub>e/bbl (CO<sub>2</sub> equivalents per barrel of incremental oil produced), respectively, for total emissions of 685 kg CO<sub>2</sub>e/bbl. However, these emissions are offset by CO<sub>2</sub> storage in the reservoir and the resulting displacement credit of U.S. grid electricity, which results in a net life cycle emission factor of 438 kg CO<sub>2</sub>e/bbl. Therefore, CO<sub>2</sub> EOR produces oil with a lower emission factor than conventional oil (~500 kg CO<sub>2</sub>e/bbl). Optimization scenarios are presented that define a performance envelope based on the CO<sub>2</sub> capture rate and net CO<sub>2</sub> utilization and suggest that lower emission factors below 300 kg CO<sub>2</sub>e/bbl are achievable. Based on these results, CO<sub>2</sub> EOR where the CO<sub>2</sub> is sourced from a coal-fired power plant provides one potential means for addressing the energy demand–climate change conundrum, by simultaneously producing electricity and oil to meet growing energy demand and reducing GHG emissions to abate global warming.

# BELL CREEK PROJECT OVERVIEW

- Operated by Denbury Onshore LLC.
- CO<sub>2</sub> is sourced from ConocoPhillips' Lost Cabin natural gas-processing plant and Exxon's Shute Creek gas-processing plant.
- The EERC, through the PCOR Partnership, is studying CO<sub>2</sub> storage associated with the commercial CO<sub>2</sub> EOR project.

# BELL CREEK FIELD

- Phased development.
- Primary production and waterflooding produced ~37.5% original oil in place (OOIP)
- CO<sub>2</sub> EOR is under way in Phases 1–5.

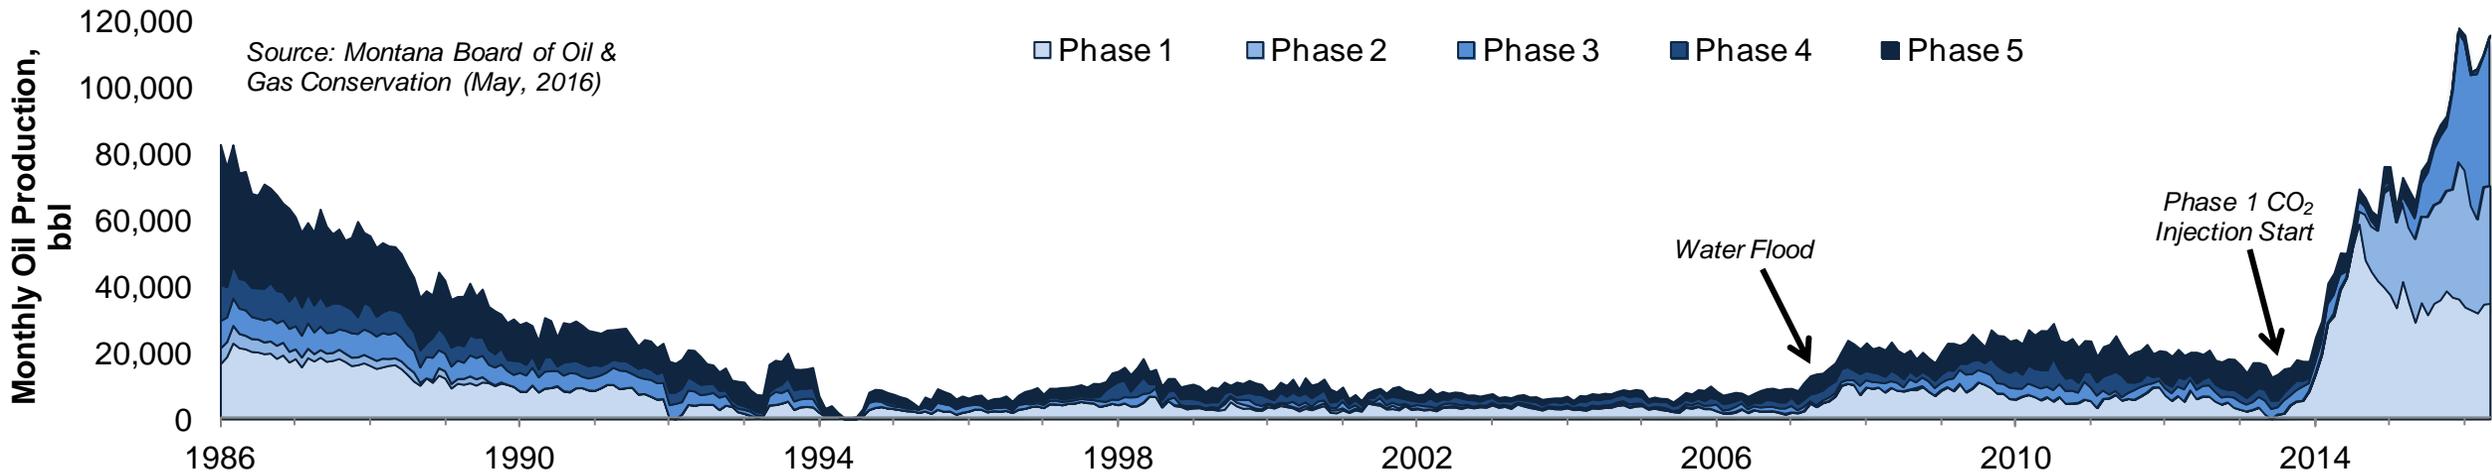

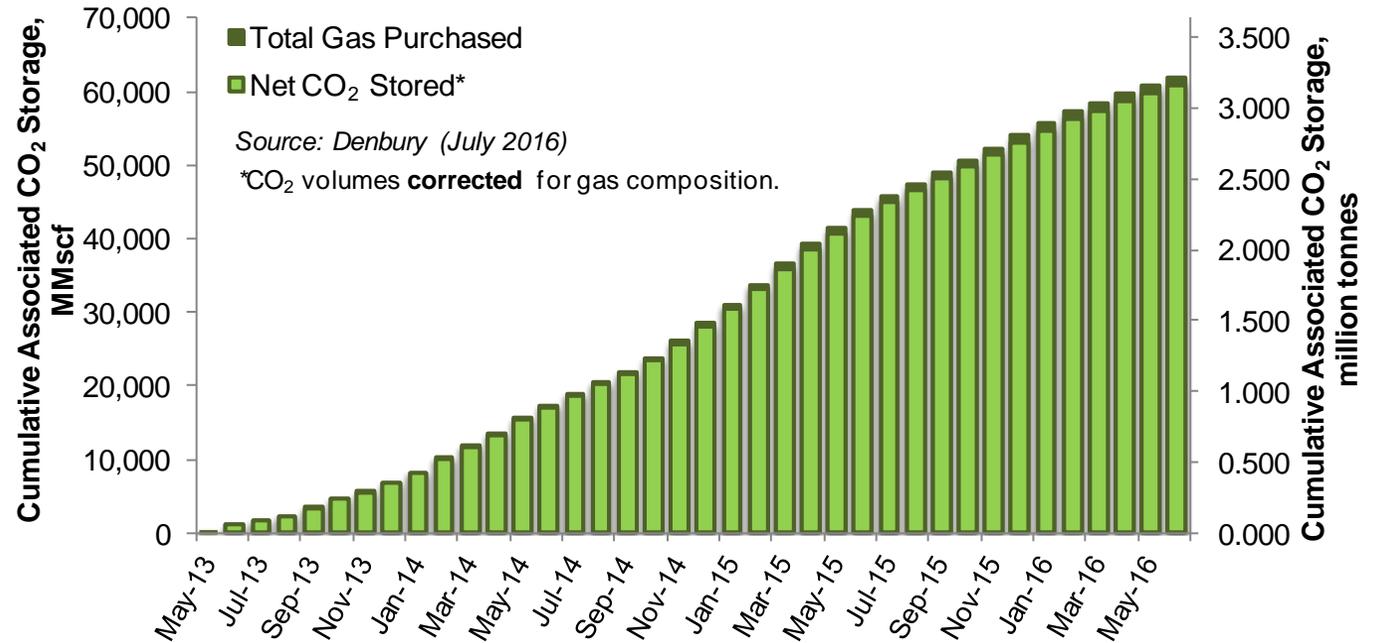

- An estimated 40–50 million incremental bbl of oil will be recovered.
- An estimated 12.7 million tonnes of CO<sub>2</sub> will be stored.

# CO<sub>2</sub> INJECTION

## As of June 2016

- Oil Produced: ~2.5 million barrels  
(source: Montana Board of Oil and Gas Database)
- CO<sub>2</sub> stored: ~3.2 million tonnes  
(source: Denbury)

# BELL CREEK – SITE CHARACTERIZATION

## Properties:

- Cretaceous Muddy Sandstone Formation
- Nearshore marine/strand plain (barrier bars)
- Approximately 1311–1371-m (4300–4500-ft) depth
- Overlain by more than 914 m (3000 ft) of siltstones and shales
- Average thickness 9–14 m (30–45 ft)
- Average porosity range
  - 25%–35%
- Average permeability range
  - 150–1175 mD

Age Units		Seals, Sinks, and USDW*	Powder River Basin	
Cenozoic	Quaternary	USDW

# MODEL REFINEMENT

## Version 1 (2009–2012)

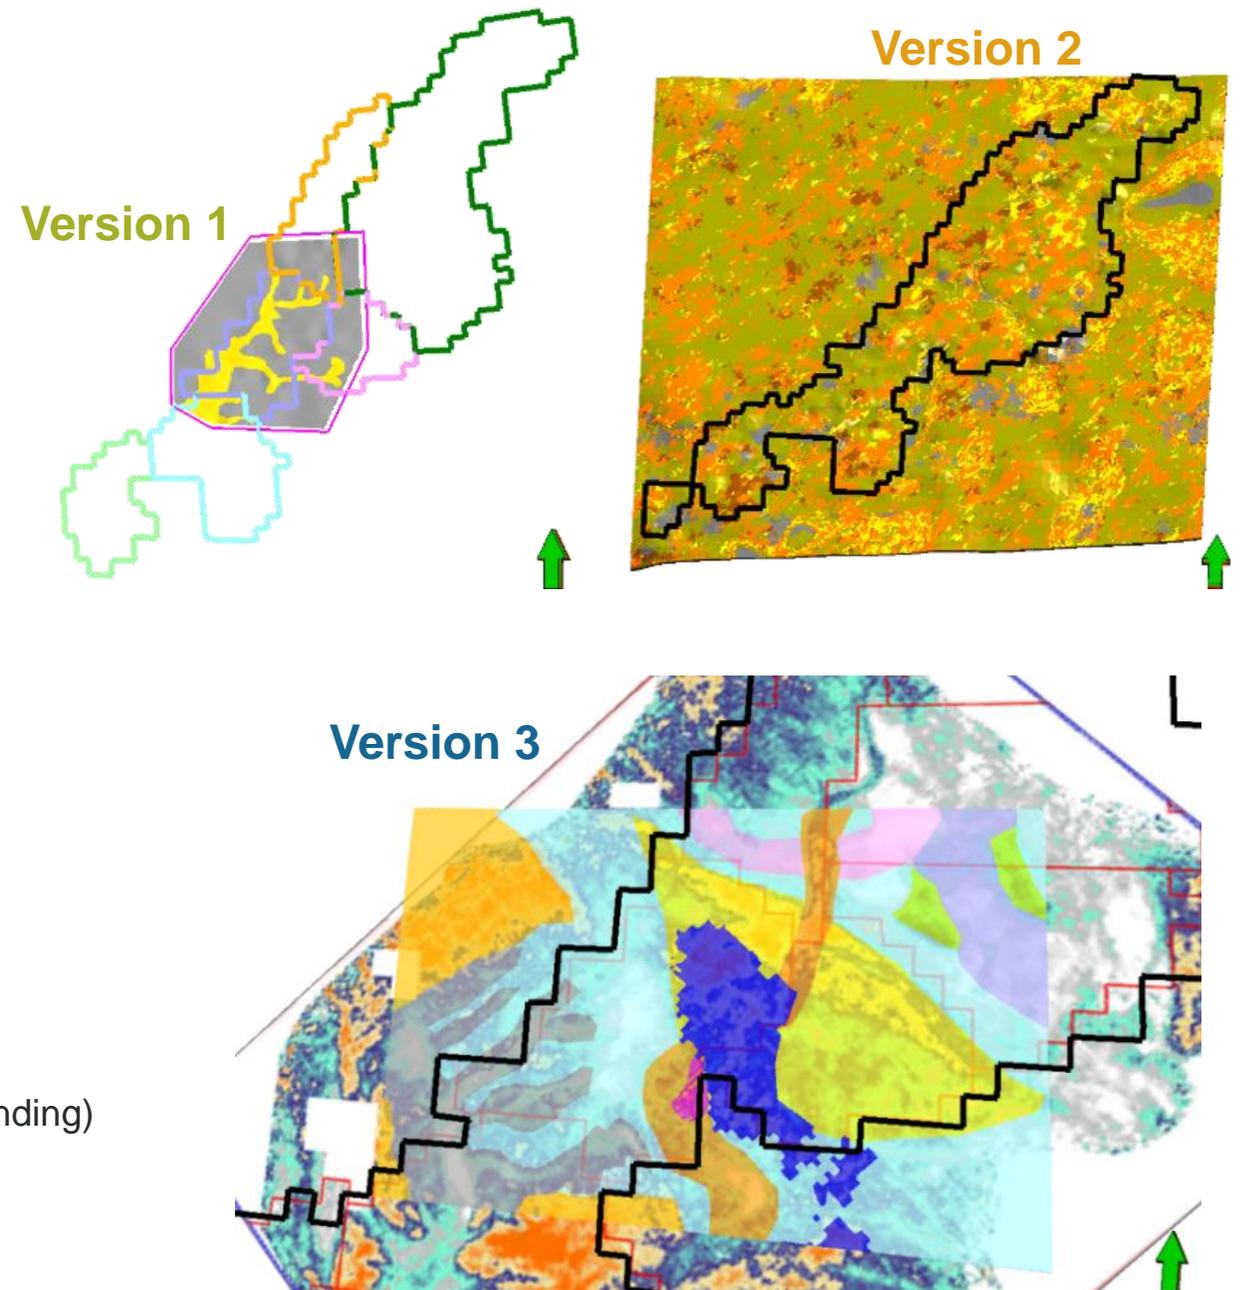

- Phase 1 geomodel
- Simulation model
  - Phase 1 history-matched (pre-CO<sub>2</sub>) and performance forecasts

## Version 2 (2012–2015)

- Full-field geomodel
  - Electrofacies
- Phases 1 and 2 history-matched and performance forecasts

## Version 3 (under development)

- Geobody interpretations and facies model
  - Trained with seismic data, logs, and core
  - Multiple-point statistics to populate facies with realistic heterogeneity
- Phases 1–4 history-matched and performance forecasts (pending)

# SIMULATION MODELS – COMBINED

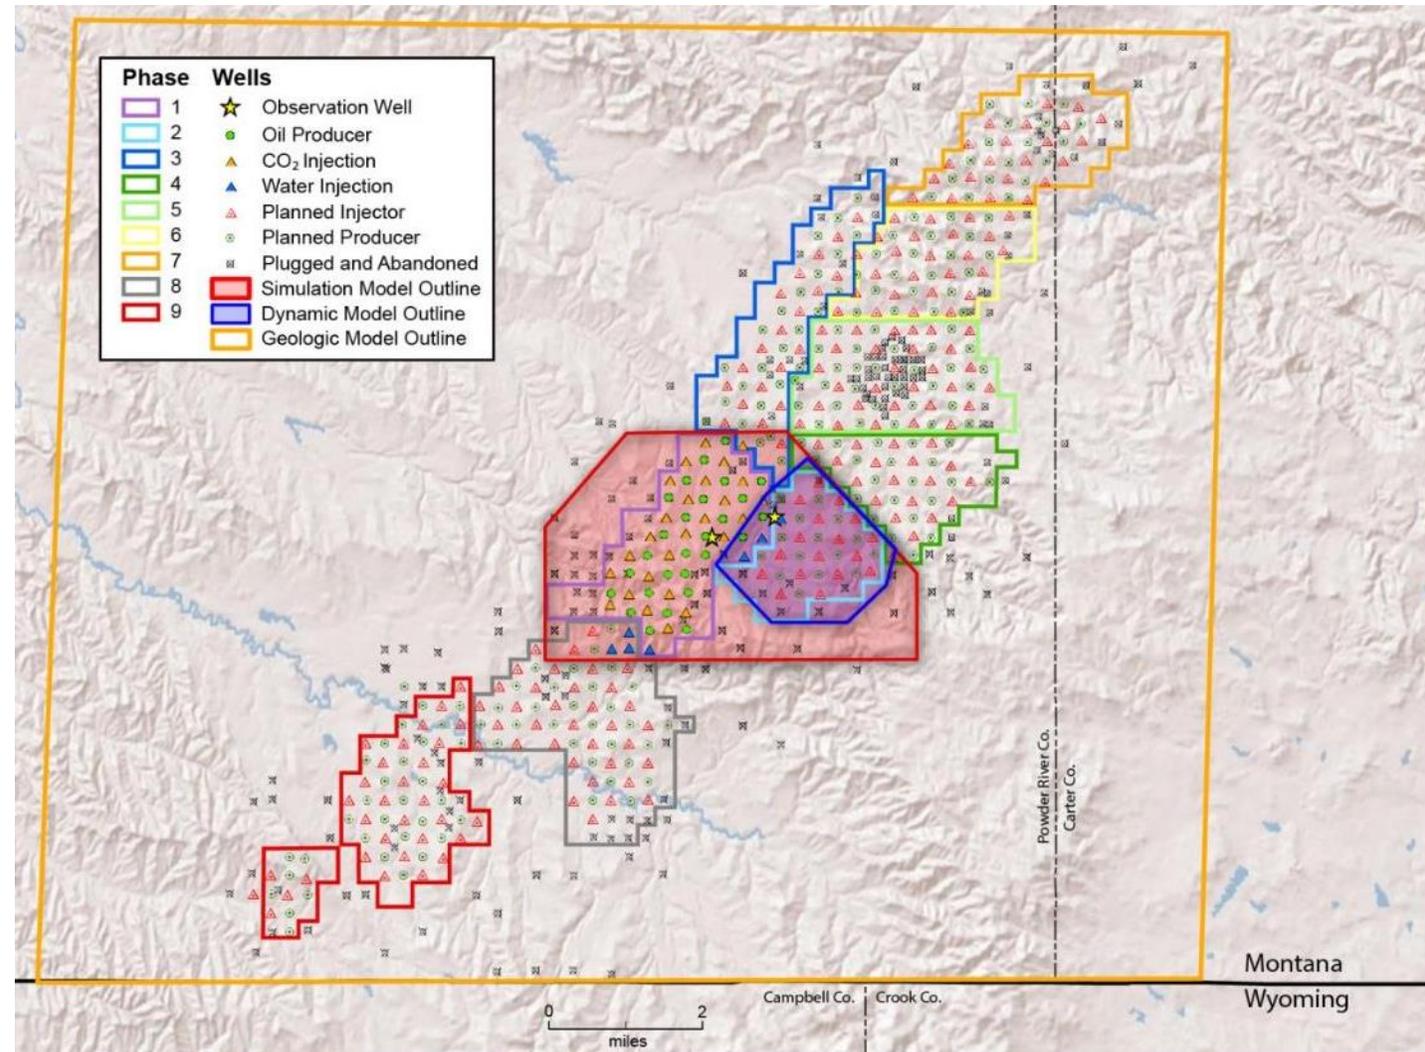

## Challenge

- Phase 1 and 2 models assumed no flow between phases.
- Material balance in Phase 2 showed injection water flowing from Phase 2 to Phase 1.
- Time-lapse seismic data showed possible fluid connection between them.

## Response

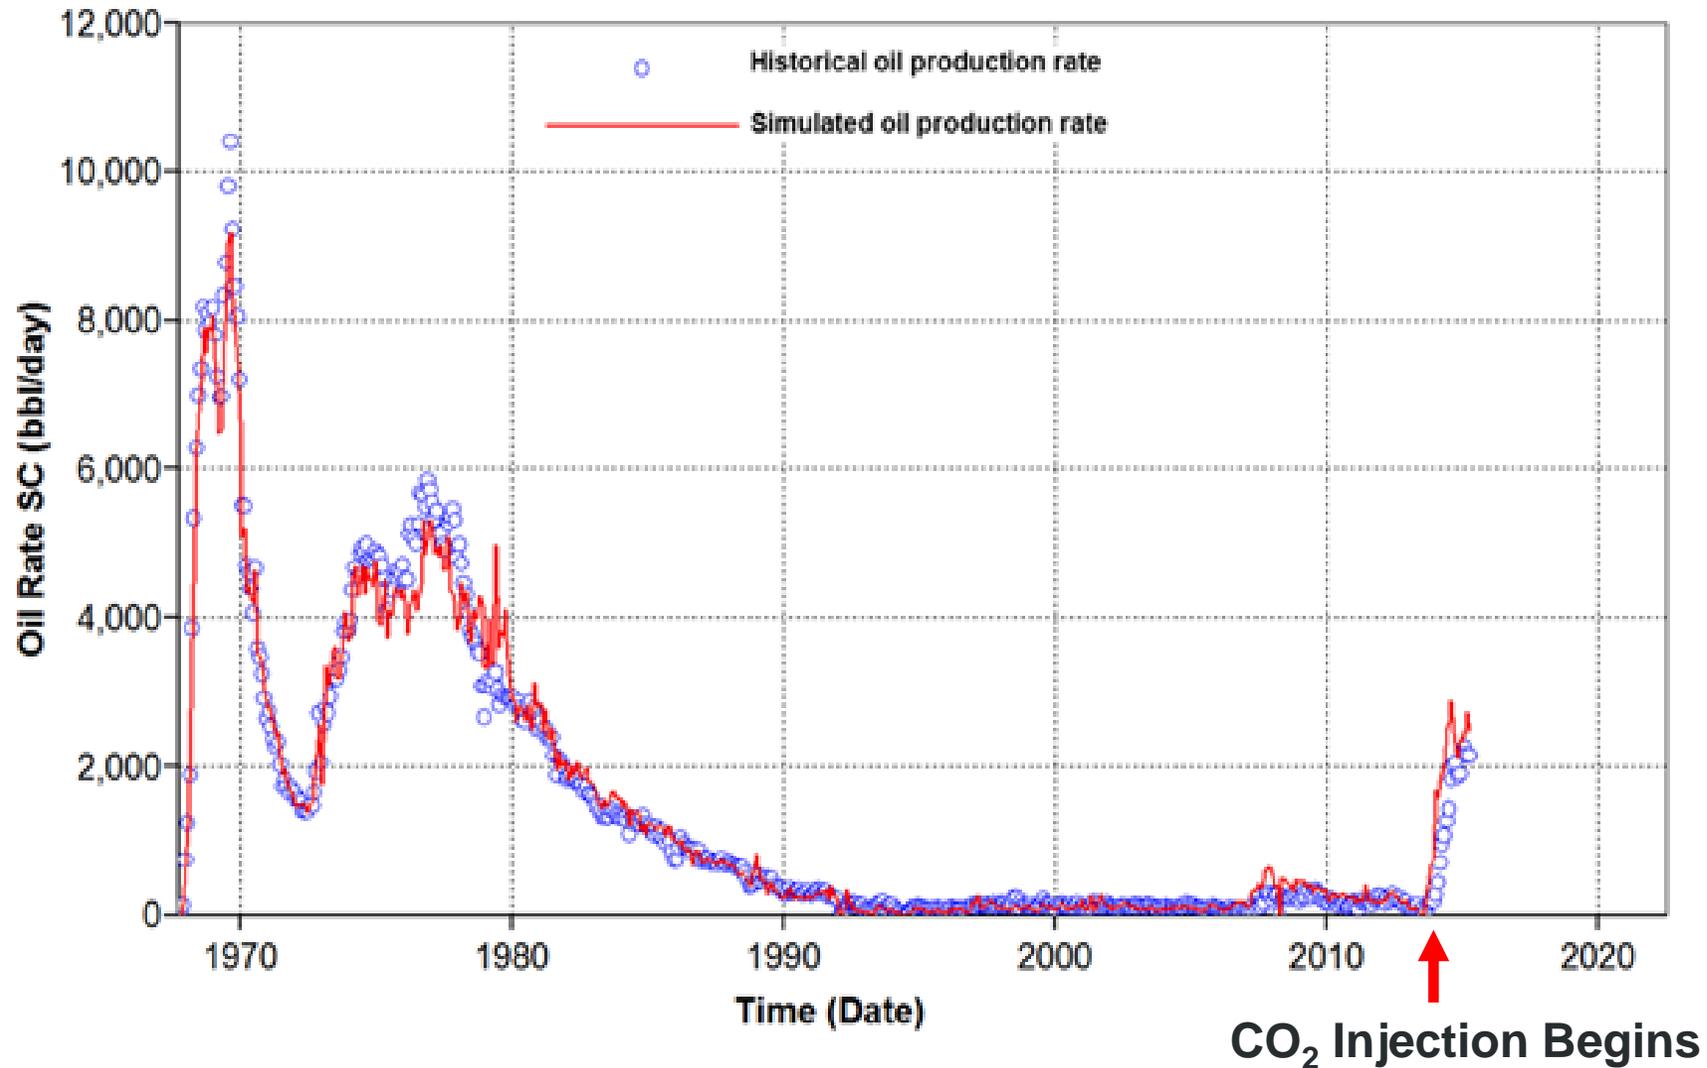

A combined model including Phases 1 and 2 was created.

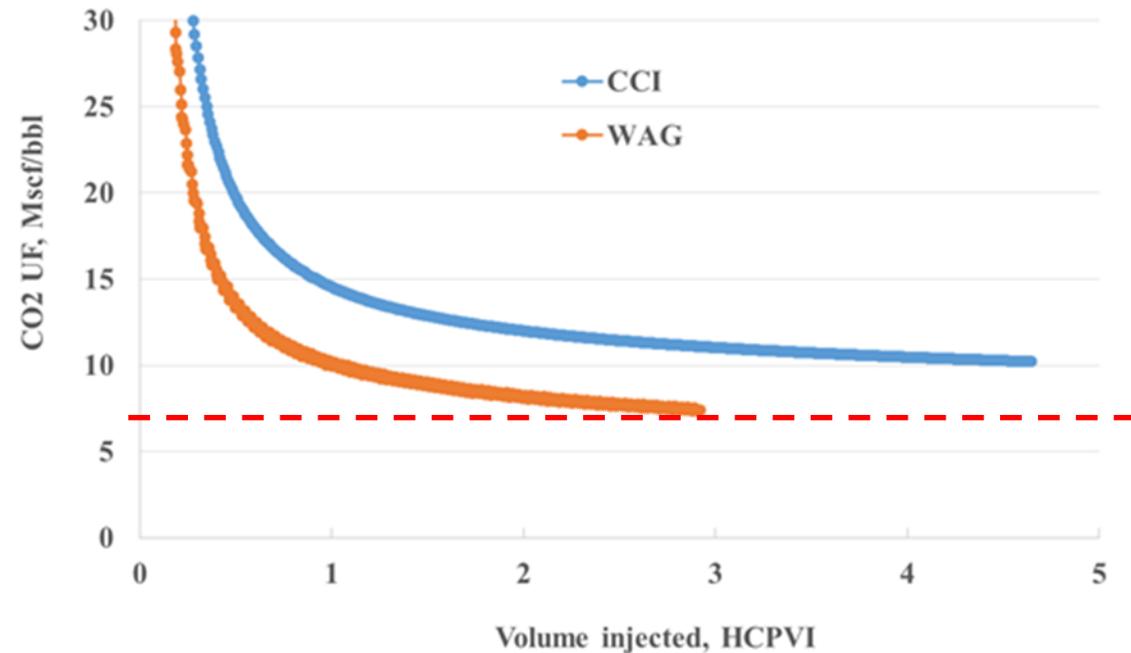

# HISTORY MATCH RESULTS

# CO<sub>2</sub> UTILIZATION FACTOR

- CO<sub>2</sub> utilization factor (amount of CO<sub>2</sub> needed to produce 1 bbl of oil):
  - Water alternating gas (WAG): 10 mscf/bbl after 1 HCPVI, 7 mscf/bbl after 3 HCPVI
  - Continuous CO<sub>2</sub> injection (CCI): >10 mscf/bbl even after 4 HCPVI

**Conclusion:** WAG requires less CO<sub>2</sub> than CCI to produce the same amount of oil. In agreement with other CO<sub>2</sub> EOR projects.\*

# WHAT ARE THE EFFECTS OF SMALL AMOUNT OF CH<sub>4</sub> (1%~4%) IN THE PRODUCED CO<sub>2</sub>?

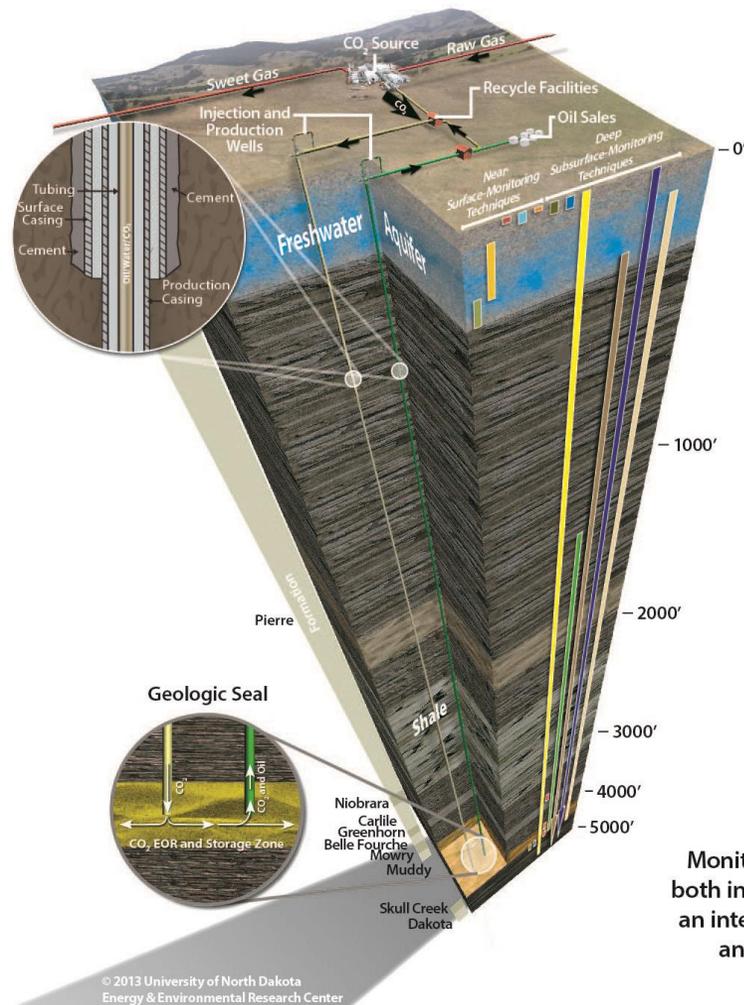

Vanishing interfacial tension (VIT) methods were used to measure minimum miscibility pressure (MMP) as CH<sub>4</sub> mole percentage increases from 0 to 100% in the solvent phase (T = 42°C).

Miscible flooding is still reachable when CH<sub>4</sub> is less than 36% and reservoir pressure is above 2500 psi.

Hawthorne, S.B., Miller, D.J., Jin, L., and Gorecki, C.D., 2016, Rapid and simple capillary-rise/vanishing interfacial tension method to determine crude oil minimum miscibility pressure—pure and mixed CO<sub>2</sub>, methane, and ethane: Energy & Fuels, <http://pubs.acs.org/doi/abs/10.1021/acs.energyfuels.6b01151>.

# AQUISTORE PROJECT

- Injection of CO<sub>2</sub> from the Boundary Dam Power Station in southeastern Saskatchewan began in April 2015.
- Most CO<sub>2</sub> captured at Boundary Dam is used for EOR; Aquistore serves as buffer storage for excess CO<sub>2</sub>.
- PCOR Partnership activities include:
  - Core analysis.
  - Static and dynamic modeling.
  - Public outreach.
  - Participation in Aquistore Science and Engineering Research Council (SERC).

# AQUISTORE INJECTION

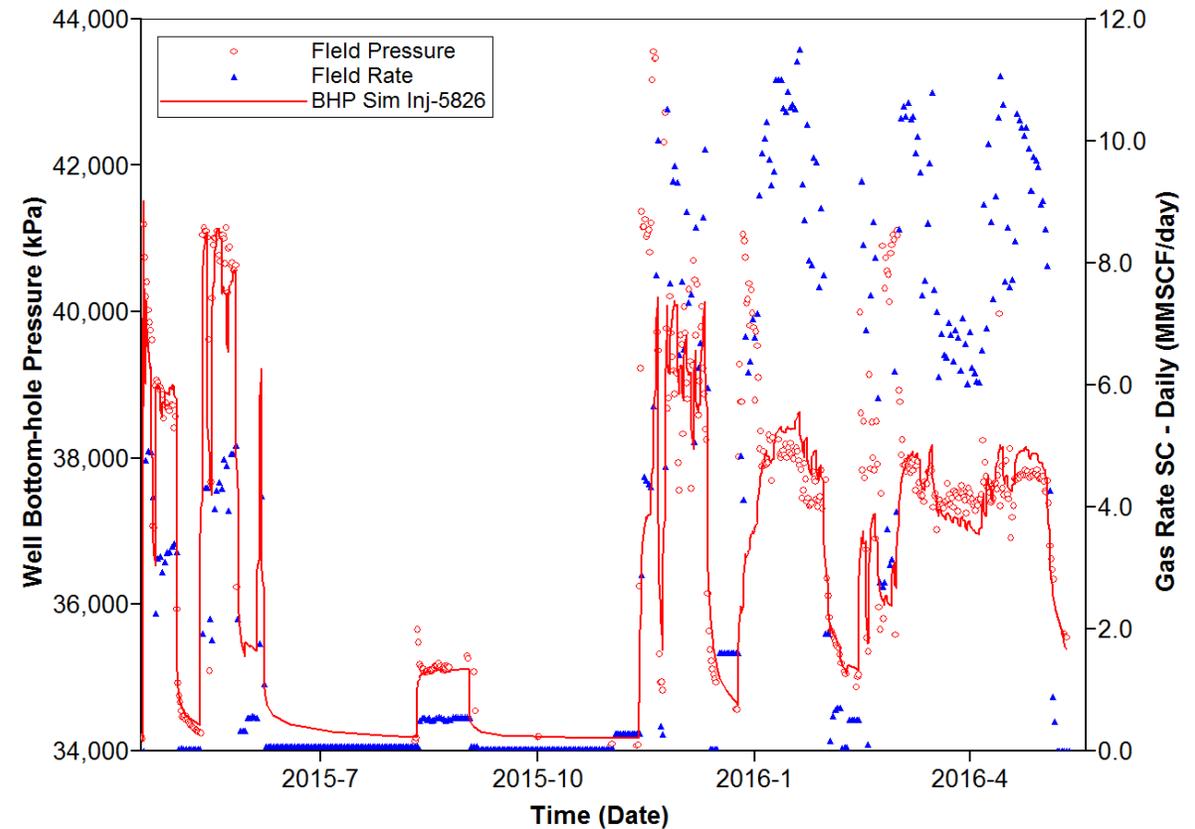

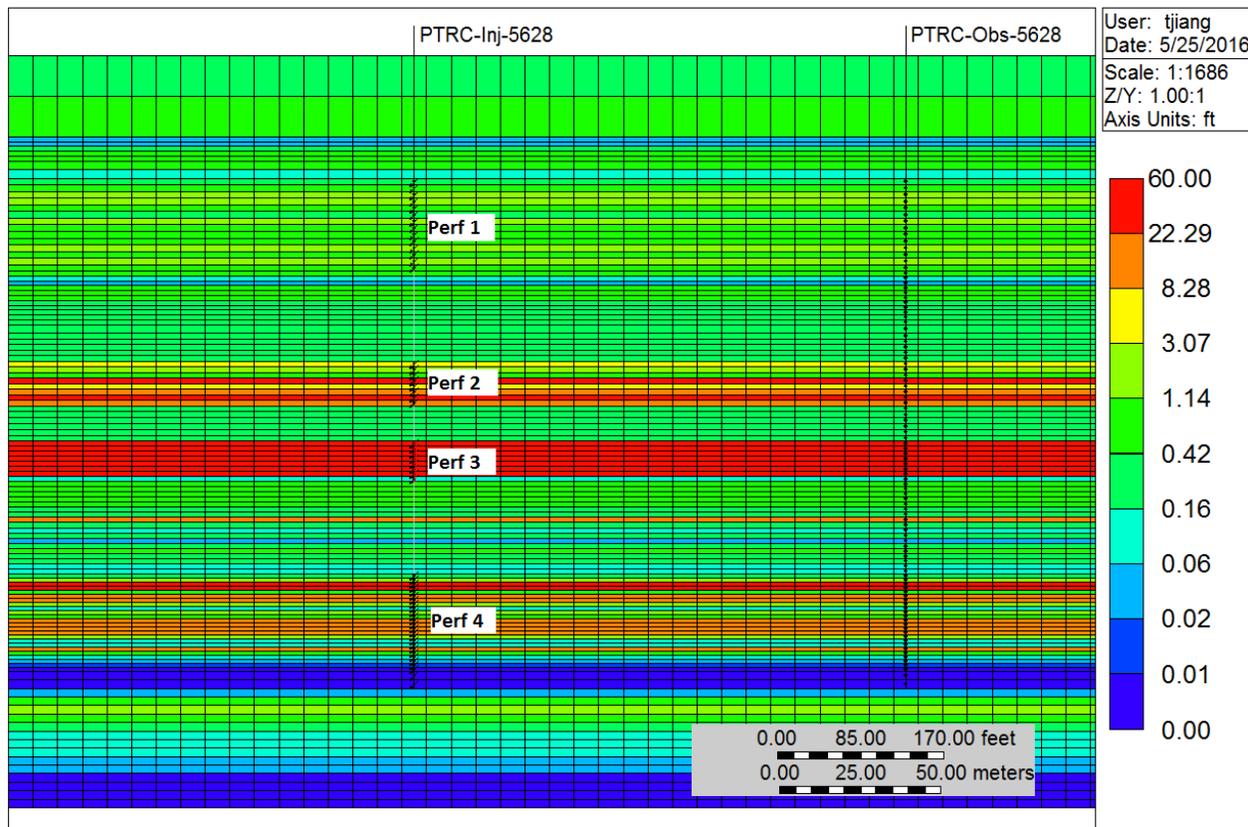

- Target saline formations:
  - Deadwood and Black Island Formations ~3200 m (10,500 ft) deep, >50 m (>150 ft) thick.
- ~75,000 tonnes of CO<sub>2</sub> injected (August 4, 2016)
- Injection rate of 350–550 tonnes/day

# HISTORY MATCH

- Injection data are being used to history-match in near-real time.
- MVA field activities are being used to validate the models.

Permeability I (md) 2015-04-16 | layer: 44

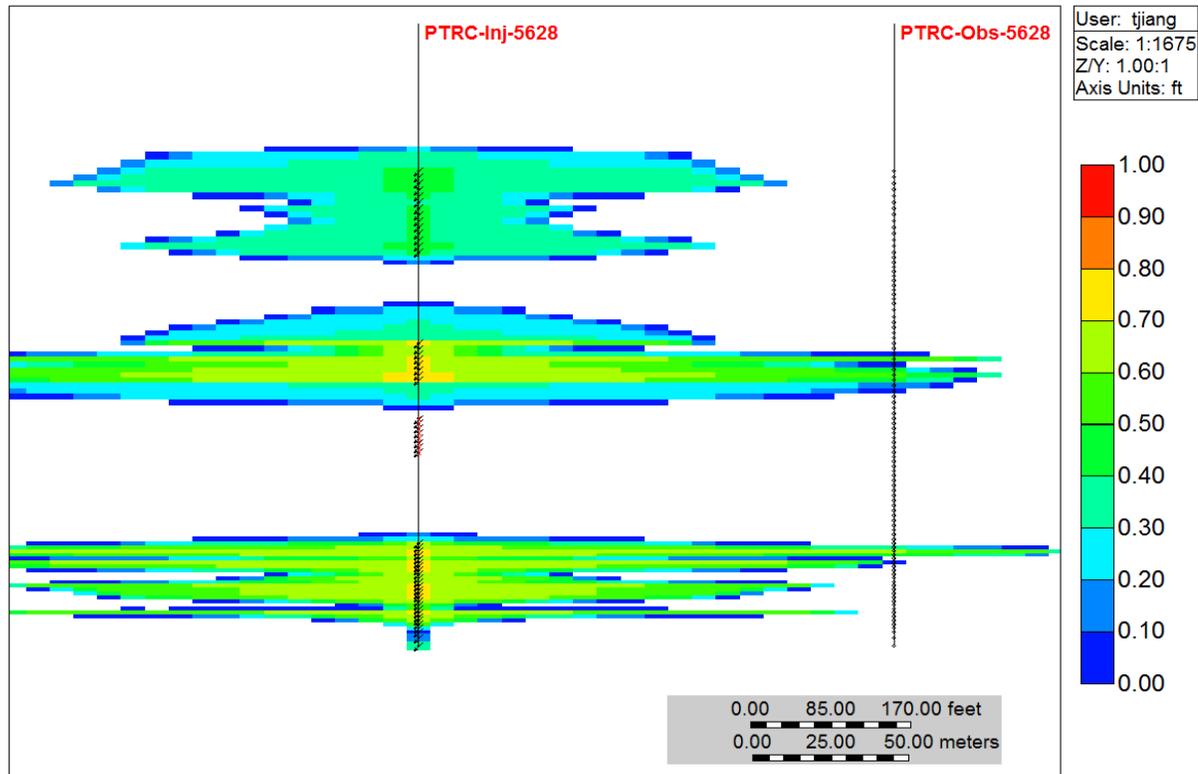

# AQUISTORE

May 2016:

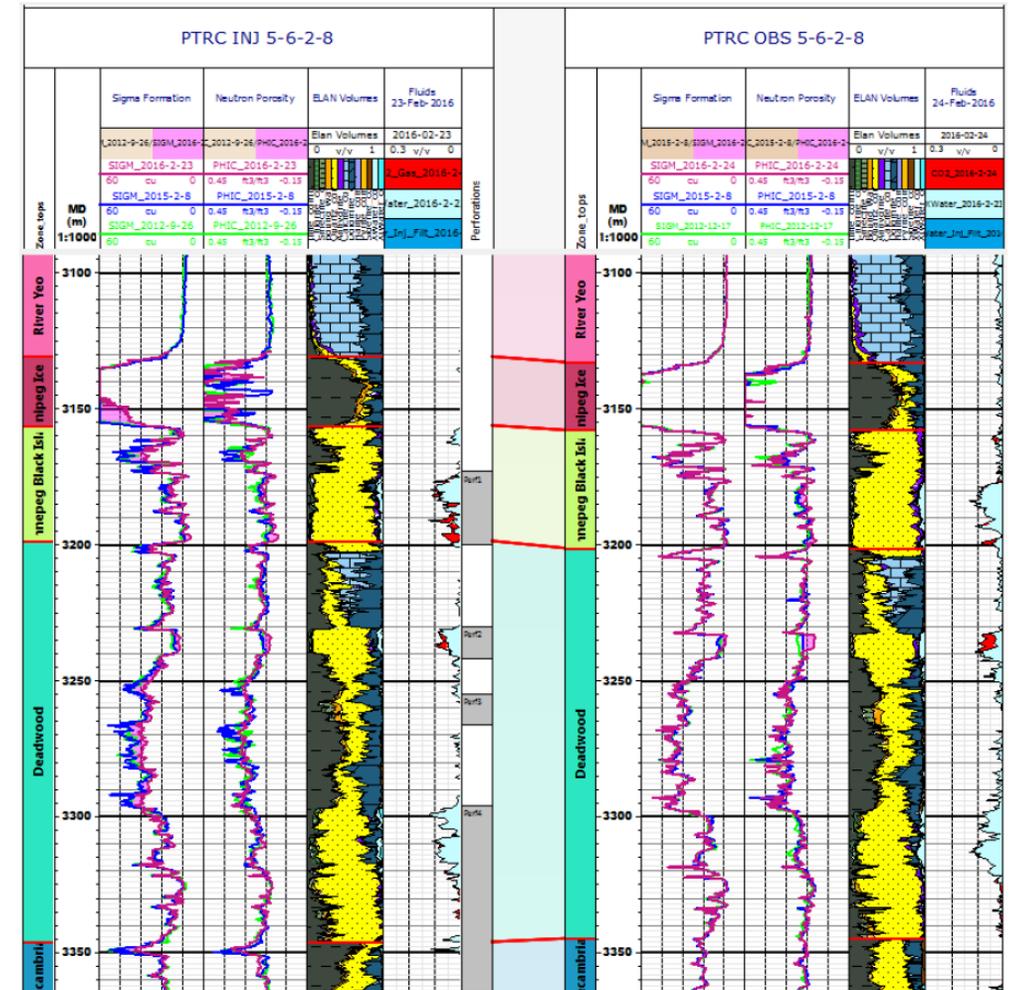

- CO<sub>2</sub> plume prediction: Plume reached the observation well (~68,000 tonnes cumulative injection).

Gas Saturation 2016-05-11 | layer: 44

February 2016:

- CO<sub>2</sub> breakthrough was observed in second perforation interval at observation well.

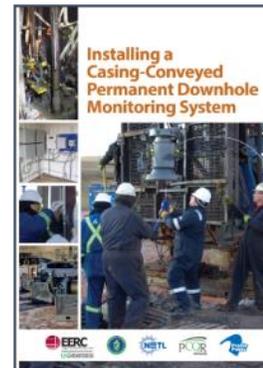

RST interpretation, Schlumberger

**Introduction**

The overall goal of carbon capture and storage (CCS) is to inject greenhouse gases (CO<sub>2</sub>) that have been captured from a point source, such as a power plant, into a deep underground storage formation and ensure that it remains there. Maintaining the quality of the CO<sub>2</sub> inside the storage formation is a key concern. This fact sheet identifies the keys to successfully protect water resources during CCS and reviews the existing regulatory framework set up for that purpose.

**CCS and CO<sub>2</sub> Containment**

The commercial geologic injection of fluids has been done only in the United States for decades and currently occurs under the Underground Injection Control Program, which is regulated by state and federal regulatory agencies. Each day, large amounts of fluids are injected for waste disposal, enhanced oil recovery (EOR), and liquid hydrocarbon and natural gas storage (Table 1). The subsurface systems encountered during CCS (Figure 1) are similar to those encountered during the deep injection activities described in Table 1.

**Keys to Successful Protection of Water Resources**

The keys to water resource protection during CCS include detailed site characterization, thorough construction and operation protocols, and comprehensive monitoring and

**Table 1. Injection Well Types in the United States<sup>1</sup>**

Well Type/Class	Number of Wells	Comment
Oil and Gas-Related Injection Wells (Class 2)	~10000	Over 2 billion gallons of water injected daily. 40% associated with EOR to enable oil production. Includes Brine Disposal and the Injection of CO <sub>2</sub> and Other Fluids to EOR.
Natural Gas Storage	486 active storage facilities in the United States	5000 to 700000 bbl of natural gas per acre-foot.
Liquid Hydrocarbon Storage (Class 3)	100	Part of U.S. Strategic Petroleum Reserve.
Wastewater Disposal (Class 4) (as Defined by RCSP) <sup>2</sup>	100	Generally located at industrial facilities.
Nonhazardous Industrial/Waste Disposal (Class 5)	260	Currently operated in Texas, primarily Texas, Wyoming, Illinois, and Oklahoma.
Municipal Wastewater Disposal (Class 6)	160	Primarily in Florida, large diameter and generally 600 ft.

**Figure 1. A subsurface view of CO<sub>2</sub> injection into deep storage reservoirs. CO<sub>2</sub> injection and storage.**

Figure 1 shows a cross-section of the subsurface. It illustrates the injection well, the CO<sub>2</sub> plume, and the storage formation. Labels include 'Freshwater aquifer', 'Additional layer of production zone', and 'Impermeable cap rock'.

# BEST PRACTICES MANUALS

- Participated in updating several DOE best practices manuals (BPMs)
  - Site characterization
  - Risk assessment/simulation
  - MVA
  - Operations
  - Outreach
- PCOR Partnership BPMs (in development)
  - Adaptive management approach
  - Site characterization
  - MVA
  - Risk assessment
  - Modeling and simulation

# SUMMARY

- **CO<sub>2</sub> EOR produces oil while also storing CO<sub>2</sub>. Nearly all the CO<sub>2</sub> purchased for EOR is eventually stored.**
- **CO<sub>2</sub> storage associated with commercial CO<sub>2</sub> EOR is being investigated at the Bell Creek project. Over 3.2 million metric tons of associated CO<sub>2</sub> storage as of June 2016.**
- **CO<sub>2</sub> is being injected into a saline formation at Aquistore as buffer storage for CO<sub>2</sub> produced from a coal-fired electricity-generating facility.**
- **Characterization activities indicate the PCOR Partnership region has incredible potential for CO<sub>2</sub> storage in saline formations and through CO<sub>2</sub> EOR.**
- **Outreach activities and complementary projects continue to support the PCOR Partnership Program.**

# BENEFIT TO THE PROGRAM

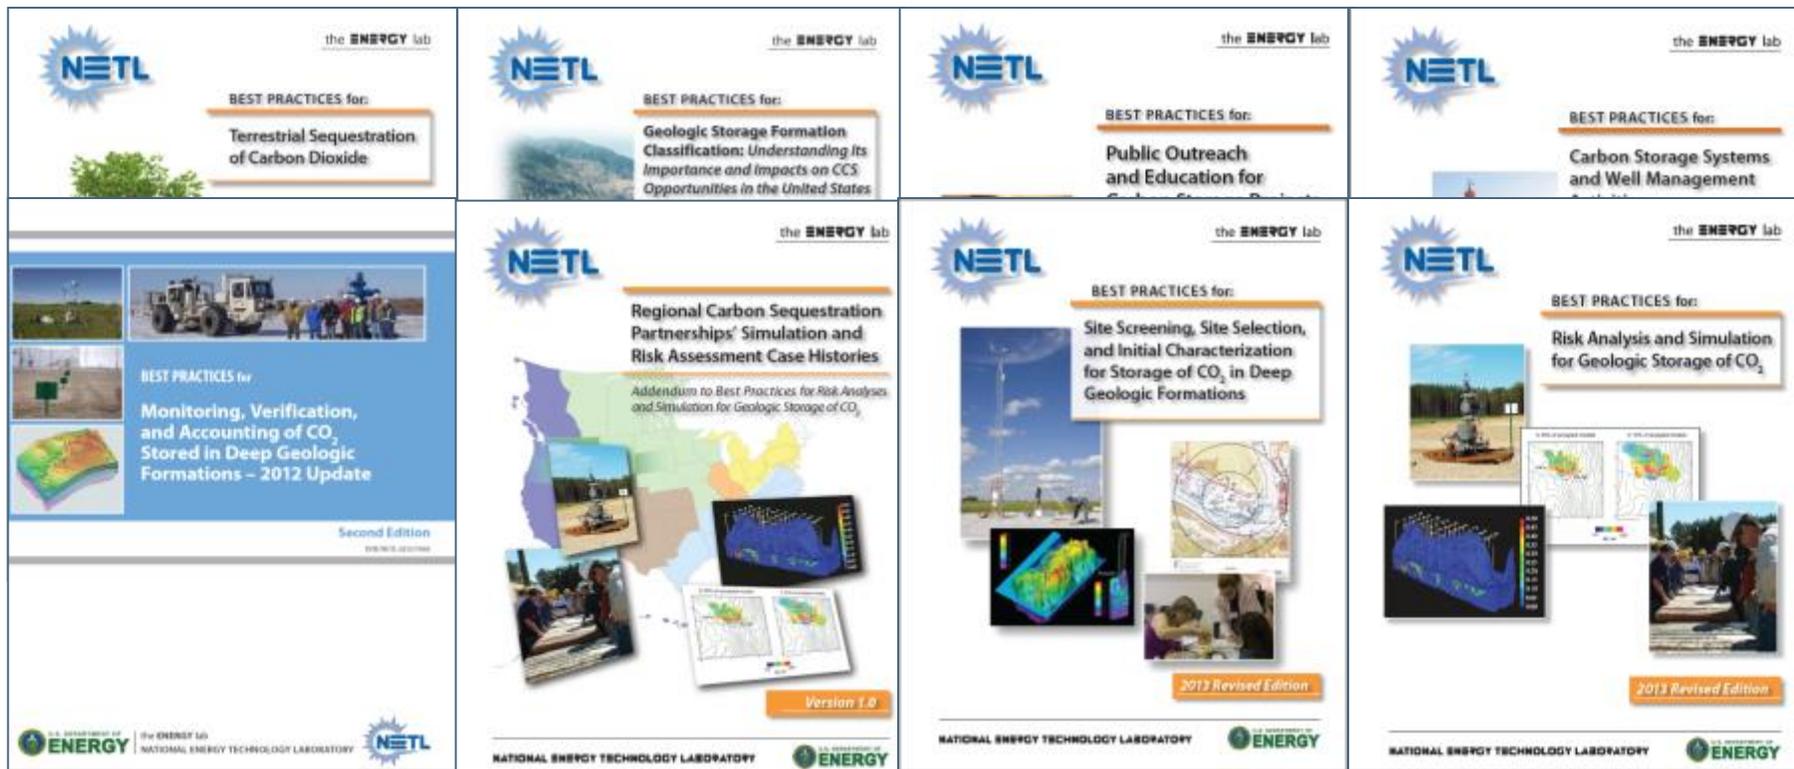

- Develop technologies that will support the industry's ability to predict carbon dioxide (CO<sub>2</sub>) storage capacity in geologic formations to within  $\pm 30\%$ :
  - *Conducting pilot tests and demonstration projects in hydrocarbon reservoirs, saline formations, and coal seams to study sweep and storage efficiency in each project.*
  - *Evaluating multiple oil fields, saline formations, and coal seams in the Plains CO<sub>2</sub> Reduction (PCOR) Partnership region, and estimating volumetric and dynamic storage resource through characterization and simulation.*
  - *Sharing lessons learned from our projects, with the other partnerships and participating in all Regional Carbon Sequestration Partnership (RCSP) Storage Capacity working groups.*
  - *Conducting complementary projects that utilize the lessons learned from PCOR Partnership projects to improve the methodologies used to estimate CO<sub>2</sub> storage resource in saline formations and hydrocarbon reservoirs.*
    - *Joint IEA Greenhouse Gas R&D Programme (IEAGHG) and U.S. Department of Energy (DOE) project – Development of Storage Coefficients for Carbon Dioxide Storage in Deep Saline Formations, Report No. 2009/13 (completed 2009)*
    - *DOE project – Optimizing and Quantifying CO<sub>2</sub> Storage Capacity/Resource in Saline Formations and Hydrocarbon Reservoirs (active 2012–2015)*
    - *Joint IEAGHG and DOE project – CO<sub>2</sub> Storage Efficiency in Deep Saline Formations (active 2013–2014)*

# BENEFIT TO THE PROGRAM (con't)

- Develop technologies to improve reservoir storage efficiency while ensuring containment effectiveness:
  - *Testing new techniques or combining techniques to better account for injected CO<sub>2</sub> in the demonstration tests.*
  - *Evaluating different injection strategies through simulation and field activities to determine the optimal strategies for both improving storage efficiency and hydrocarbon recovery, with commercial partner Denbury Onshore LLC (Denbury) providing all resources for CO<sub>2</sub> injection.*
- Develop and validate technologies to ensure 99% storage permanence:
  - *Developing and implementing an adaptive management approach to project management that integrates site characterization, modeling, risk assessment, and monitoring, verification, and accounting (MVA) throughout a project's life.*
  - *Evaluating the existing technologies used to monitor, verify, and account for the injected CO<sub>2</sub> to determine detection limits and the ability to meet the RCSP Program goals.*
  - *Testing new techniques or combining techniques to better account for injected CO<sub>2</sub> in the demonstration tests.*

# BENEFIT TO THE PROGRAM (con't)

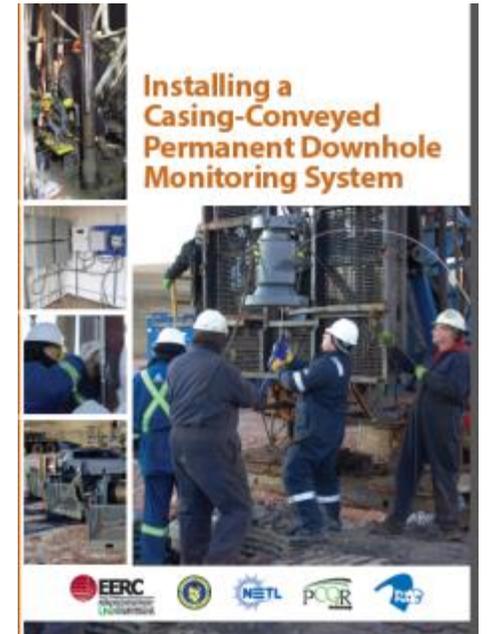

- Develop best practices manuals (BPMs) for MVA and assessment; site screening, selection, and initial characterization; public outreach; well management activities; and risk analysis and simulation:
  - *Contributed technical expertise and lessons learned in the development of all the RCSP BPMs created to date.*

# BENEFIT TO THE PROGRAM (con't)

- *The PCOR Partnership will develop several BPMs throughout the course of the program, including the following:*
  - ◆ *Bell Creek Test Site – Site Characterization (9/30/2014)*
  - ◆ *Bell Creek Test Site – Simulation (8/31/2016)*
  - ◆ *Bell Creek Test Site – Monitoring for CO<sub>2</sub> Storage and CO<sub>2</sub> Enhanced Oil Recovery (EOR) (9/30/2017)*
  - ◆ *Fort Nelson Test Site – Feasibility Study (6/30/2014)*
  - ◆ *The Nexus of Water and Carbon Sequestration Activities (11/30/2016)*
  - ◆ *Permitting (9/30/2017)*
- *Developed a videographic BPM entitled “Installing a Casing-Conveyed Permanent Downhole Monitoring (PDM) System” (draft under review).*

# SYNERGY OPPORTUNITIES

- Knowledge sharing, especially lessons learned, will help guide the creation of best practices for deploying commercial-scale CCS.
