Mastering the Subsurface Through Technology, Innovation and Collaboration:

Carbon Storage and Oil and Natural Gas Technologies Review Meeting

August 16-18, 2016

Outline

1. Benefit to Program
 2. Project Overview
 3. Technical Status
 4. Accomplishments to Date
 5. Synergy Opportunities
 6. Summary
- Appendix Material

Acknowledgements

- The project was funded by the U.S. DOE / National Energy Technology Laboratory under their program on technologies to ensure permanent geologic carbon storage (Contract DE-FE0023330).
Project Manager – William O’Dowd, NETL Sequestration Division.
- Co-funding provided by Ohio Development Services Agency Agreement Ohio Coal Development Office (Grant CDO-D-14-17).
- Project team includes Neeraj Gupta, Amber Conner, Joel Main, Andrew Burchwell, Ashwin Pasumarti, Jackie Gerst, Mark Kelley, Glen Larsen, Srikanta Mishra, Nat Voorhies, and many more.

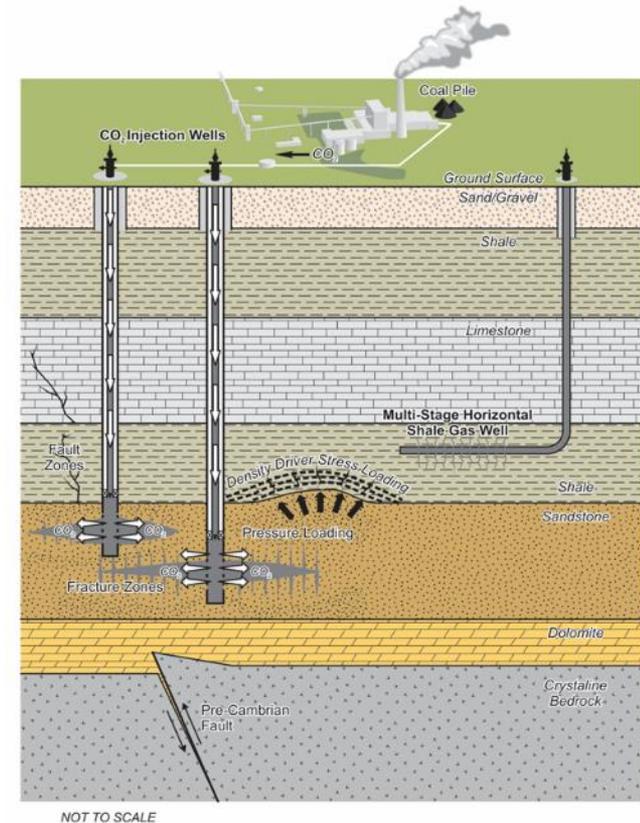

U.S. DOE/NETL

Development
Services Agency

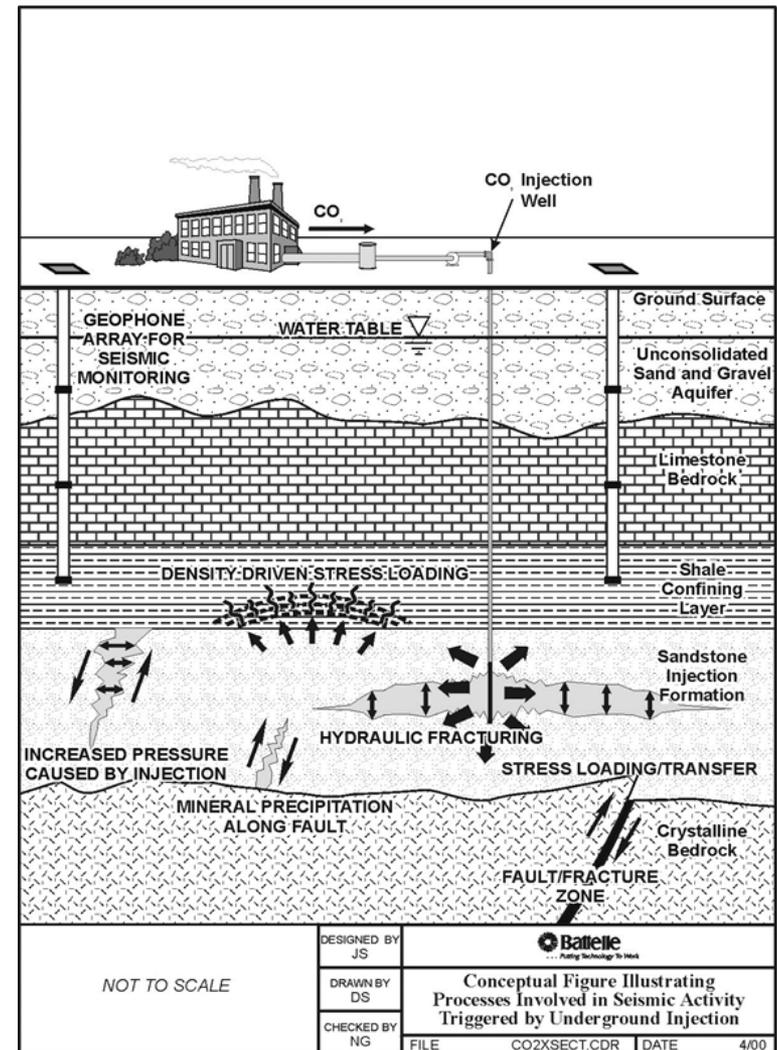

Benefit to Program

- The project addresses FOA 1037 Area of Interest 1-Geomechanical Research.
- Specifically, research impacts include:
 - characterizing the paleo-stress/strain setting in the Midwest U.S.,
 - defining geomechanical parameters,
 - evaluating the potential for (and effects of) subsurface deformation,
 - assessing CO₂ storage processes based on rock core tests and geophysical logging in the regions being considered for large-scale CO₂ storage.

Benefit to Program

- Geomechanical stability of rock formations has been identified as a major challenge to large-scale carbon capture and storage applications.
- Faults, fractures, seismic stability can affect CO₂ injection potential and storage security.

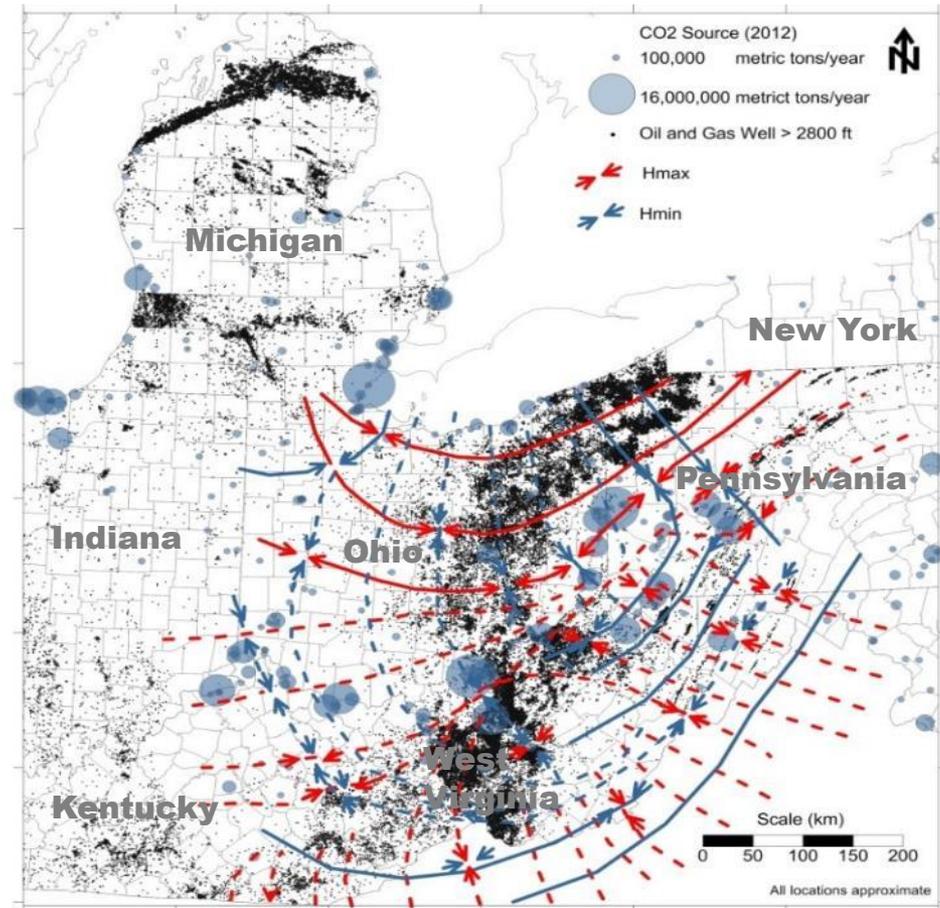

Sminchak, J.R., and Gupta, N. 2003. *Aspects of induced seismic activity and deep-well sequestration of carbon dioxide*. Environmental Geosciences, v. 10, n. 2, pp. 81-89.

Benefit to Program

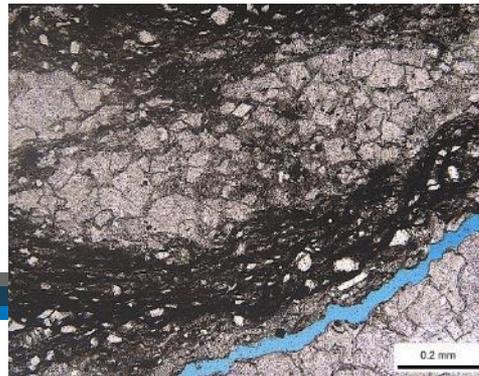

- Geomechanical processes are especially important in Appalachian Basin due to geologic structural setting and nature of deep rock formations.

Conceptual Geomechanical Stress-Strain Setting in Appalachian Basin In Relation to Large CO₂ Sources and Oil & Gas Wells

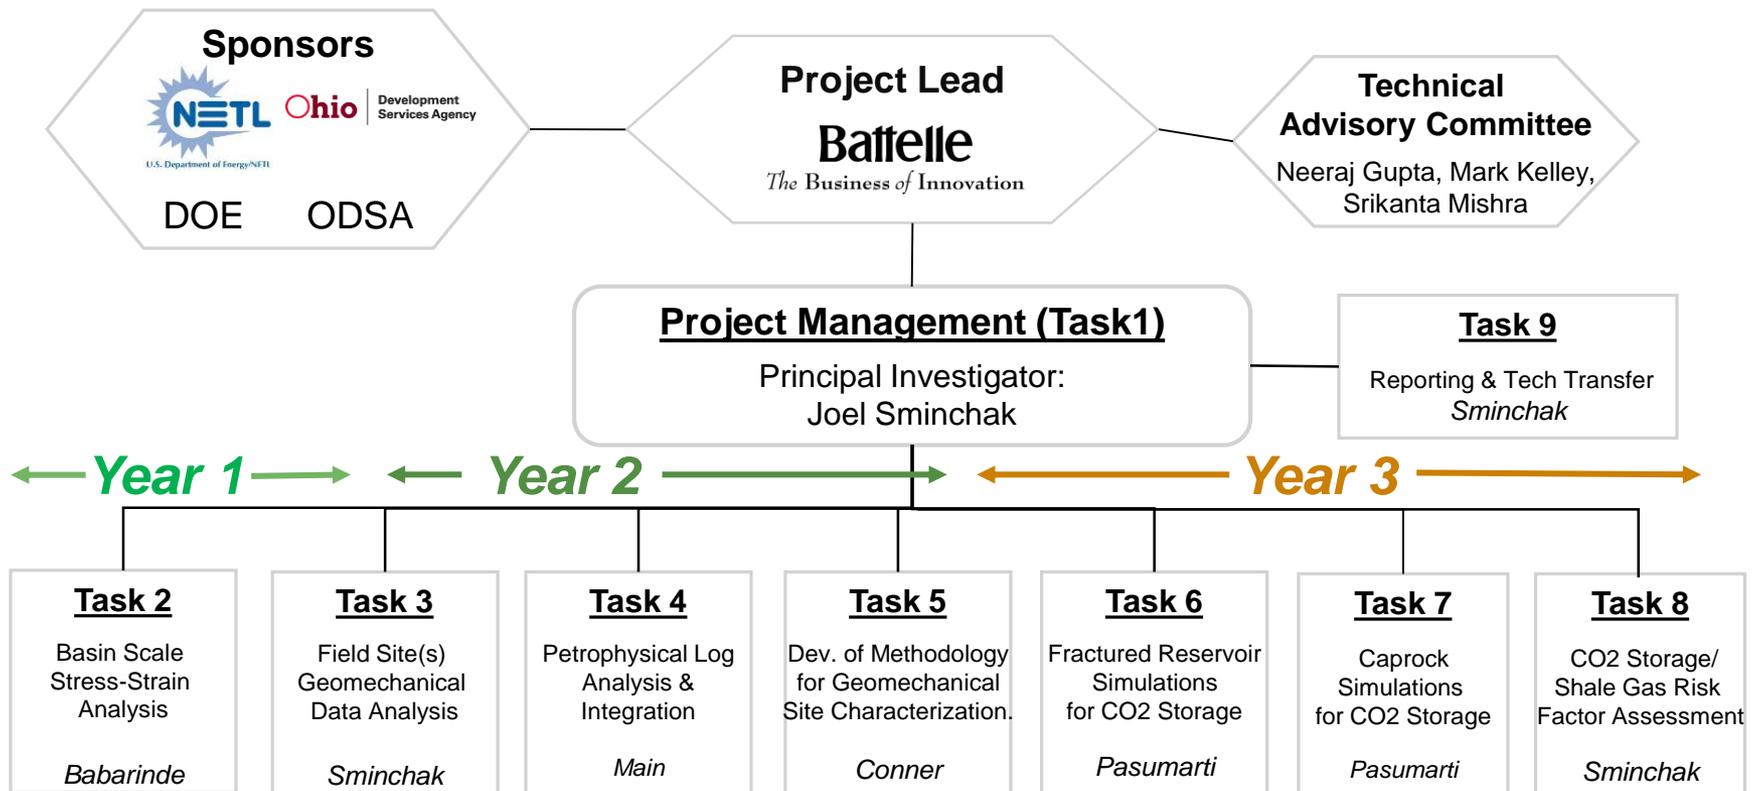

Benefit to Program

- This work was designed to perform realistic analysis of geomechanical risk factors related to CO₂ storage:
 - Which reservoir rock formations are more fractured in the region?
 - Which caprocks have larger risk factors related to fracturing?
 - What are the key methods and tools for evaluating fractured zones in deep layers?
 - How can these methods be safely and cost effectively employed?
 - How can we better understand basin-scale stress-strain regime to more accurately define stress magnitude at depth?

Project Overview

- 3 year project from October 2014-September 2017.
- Project is divided into seven main technical tasks.

Technical Status

2. Systematic assessment of the stress-strain setting for geologic formations in the Appalachian Basin,
3. Compile geomechanical parameters & data analysis,
4. Petrophysical log analysis and integration,
5. Methodology for evaluating potential geomechanical stress at CO₂ storage sites,
6. Reservoir simulations to evaluate geomechanical deformation in geologic reservoirs in the region,
7. Caprock simulations, and
8. Assessment of CO₂ storage in areas with hydraulic fracturing for shale gas development.

Year 1

Year 2

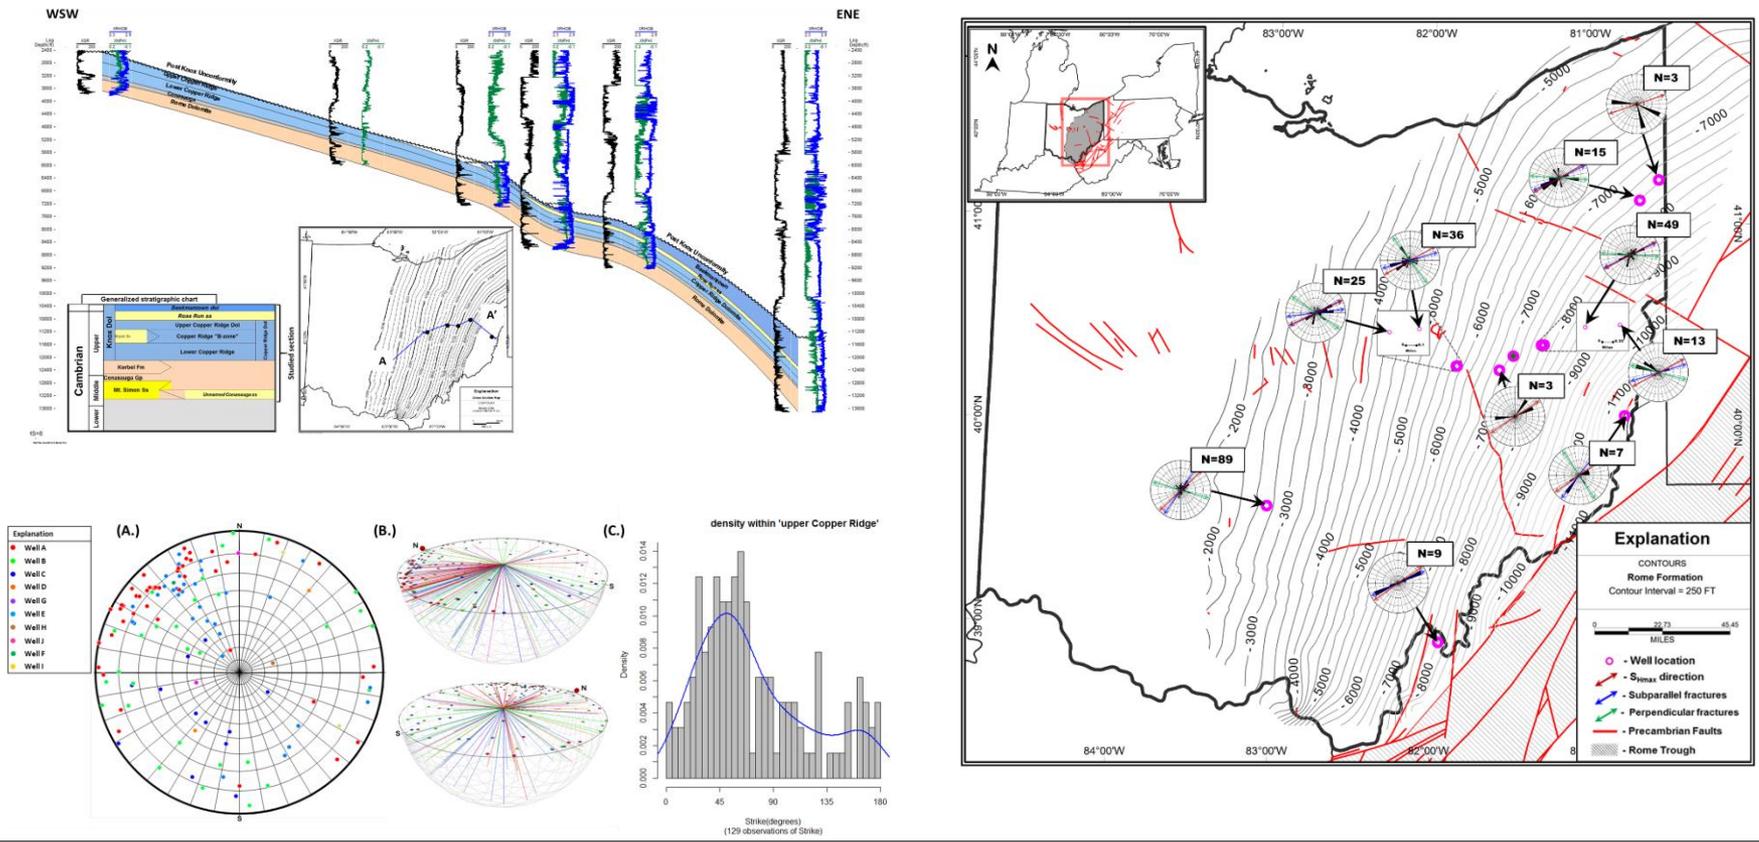

Year 3

Year 2

Accomplishments to Date

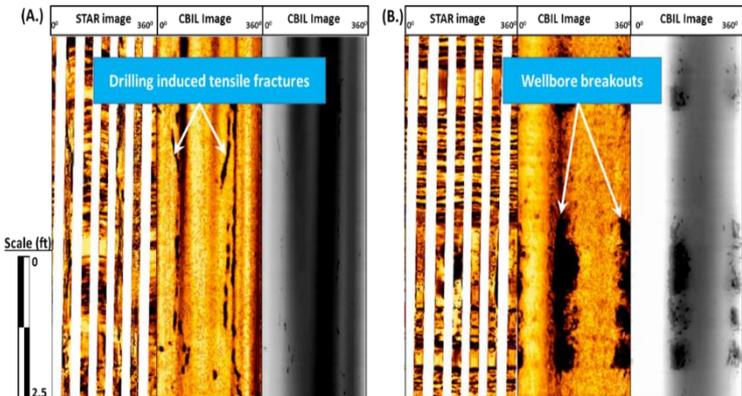

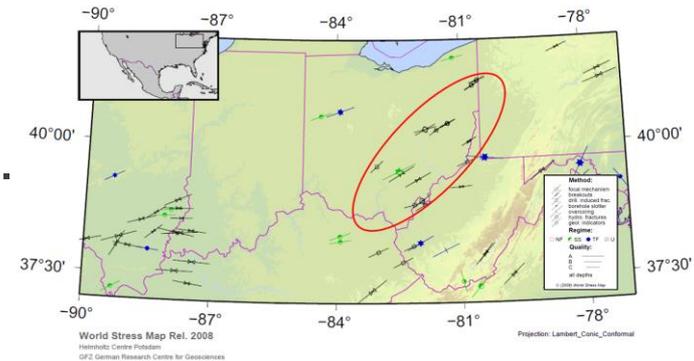

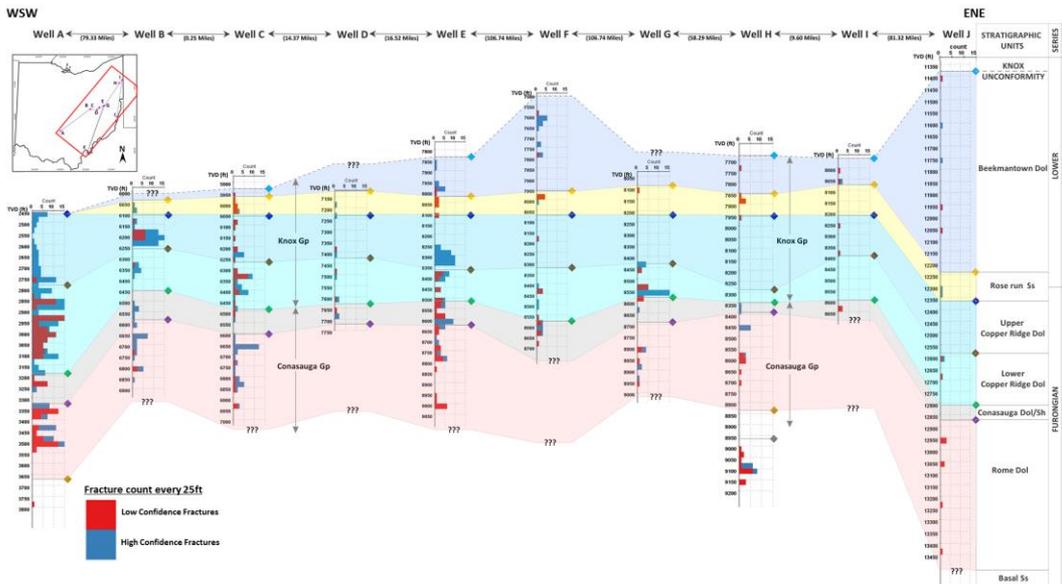

Task 2: Basin Scale Stress-Strain Analysis

- Basin Scale Stress Strain Analysis completed to describe basin evolutions, stress state, fracture density.

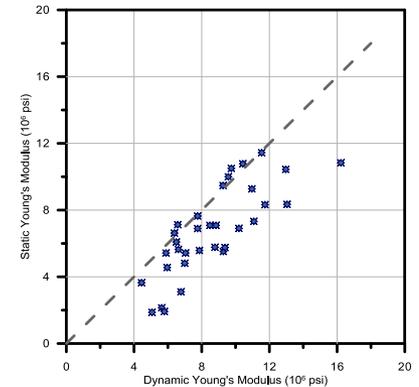

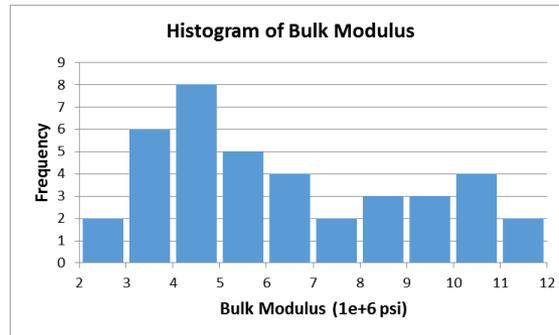

Task 2: Basin Scale Stress-Strain Analysis

- 1,760 fractures/breakouts analyzed from 10 wells' image logs, fractures interpreted for:
 - Fracture intensity variation spatially
 - predominant orientation of these fractures.

Task 2: Basin Scale Stress-Strain Analysis

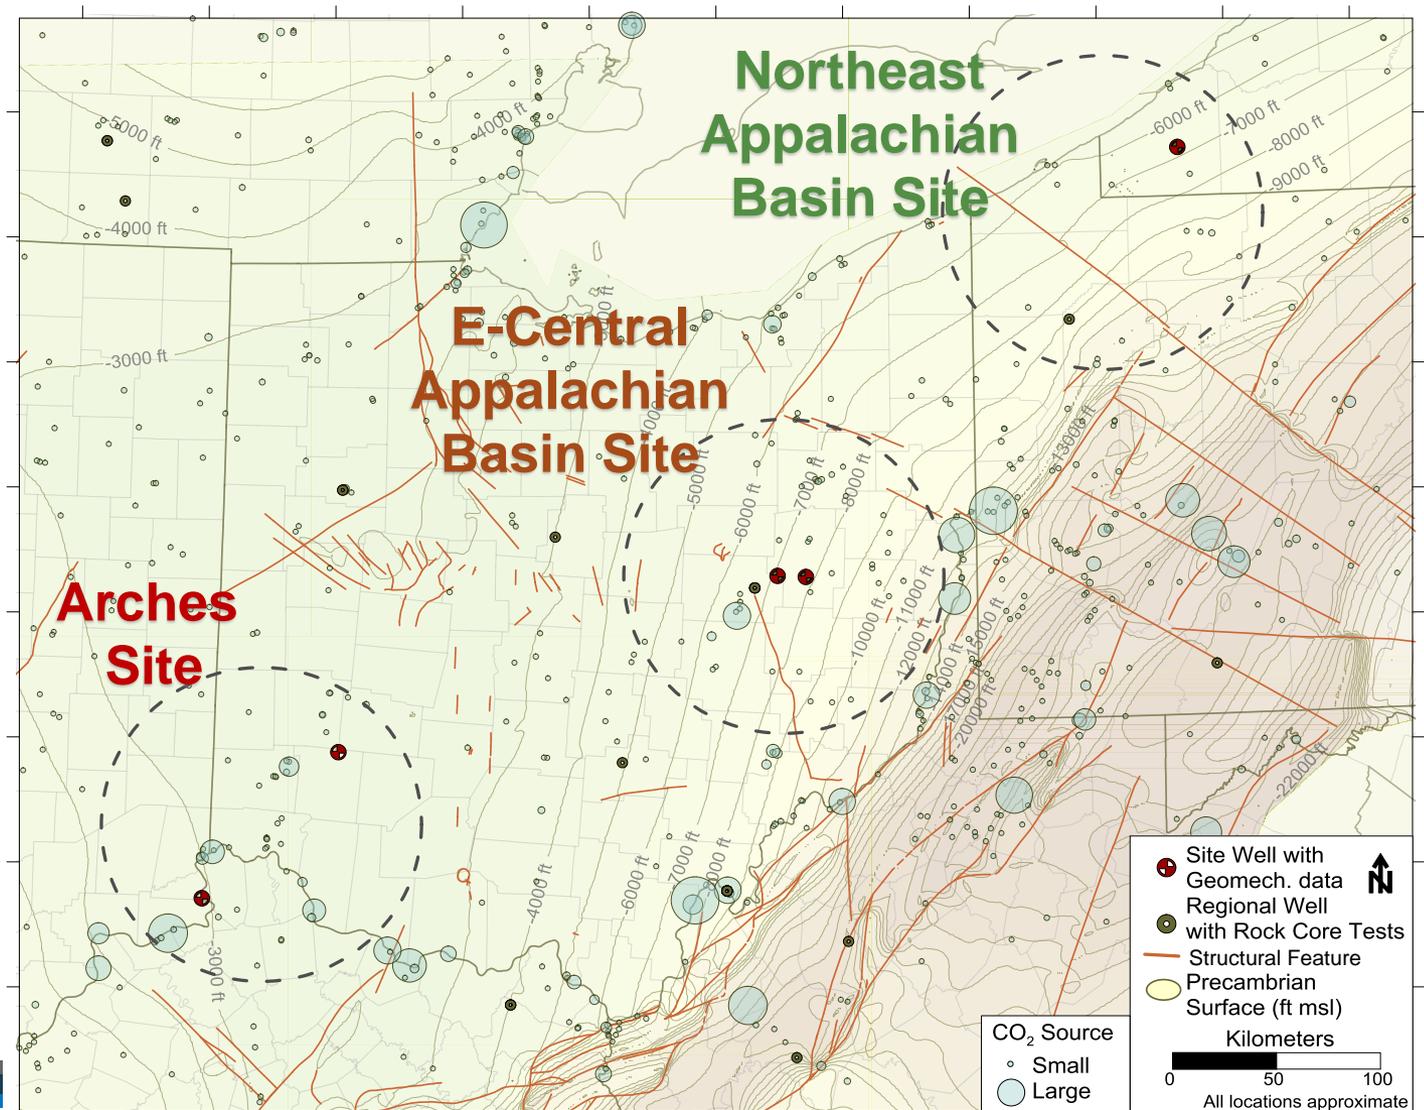

- Geomechanical test data for region was compiled and analyzed for spatial, population trends.
- Data was supplemented with tests on 8 rock core samples.

Parameter	Confining Pressure (psi)	Bulk Density (g/cc)	Compressional Velocity (ft/s)	Shear Velocity (ft/s)	Dynamic Young's Modulus (1e+6 psi)	Dynamic Poisson's Ratio	Bulk Modulus (1e+6 psi)	Shear Modulus (1e+6 psi)	Compressive Strength (psi)	Static Young's Modulus (1e+6 psi)	Static Poisson's Ratio

Task 3: Site Geomechanical Analysis

- 3 Sites identified for more detailed analysis & geomech. simulations.

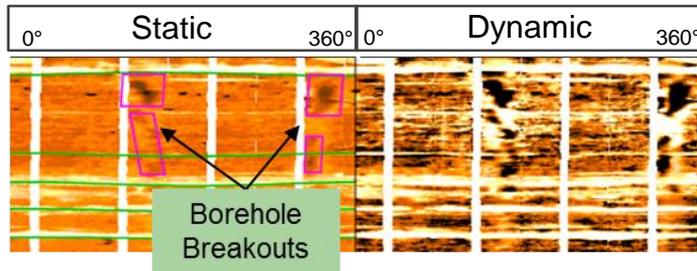

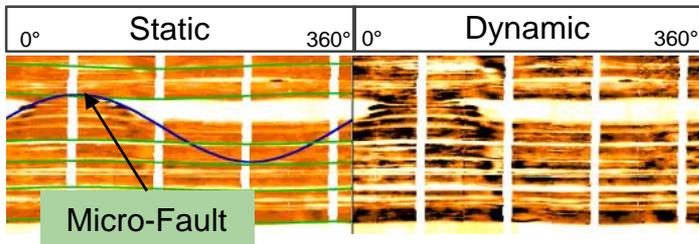

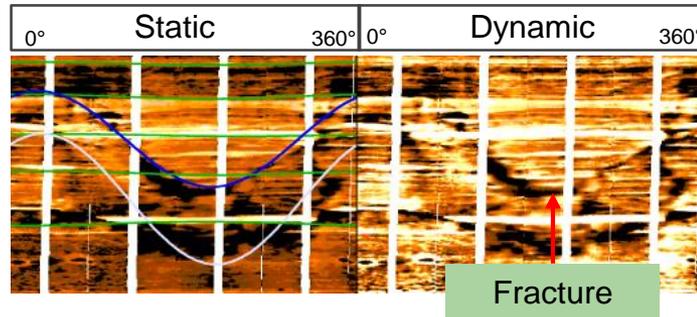

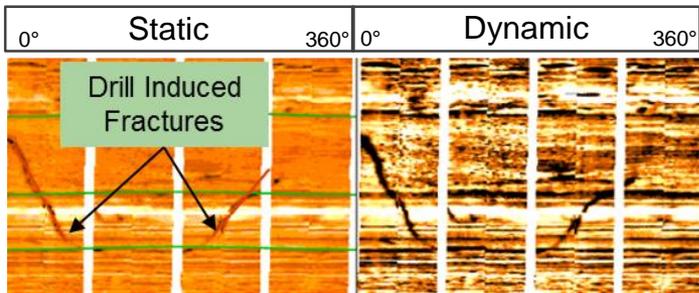

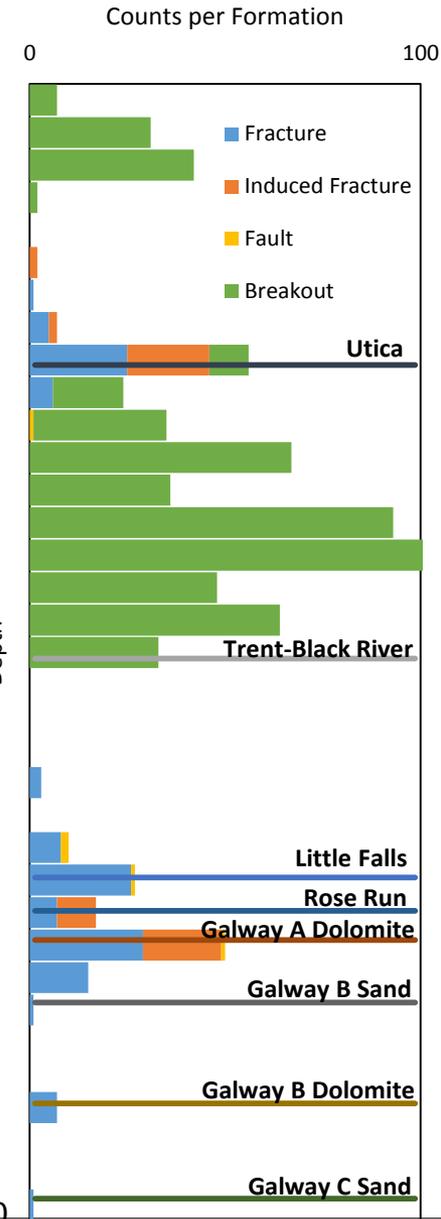

Task 3: Site Geomechanical Analysis

- >9700 ft. of image log data processed from 3 wells to identify natural fractures, breakouts, drilling induced fractures.
 - Arches Site
 - 2,650 ft. analyzed through the Rose Run, Copper Ridge, Davis Shale, Eau Claire, and Mt. Simon formations
 - East-Central Appalachian Basin Site
 - 3,600 ft. analyzed through the Queenston, Utica, Point Pleasant, Trenton, Black River, Gull River, Wells Creek, Beekmantown, Rose Run, Copper Ridge, Conasauga, Rome, and Basal Sand
 - Northeast Appalachian Basin Site
 - 3,400 ft. analyzed through the Utica, Trenton-Black River, Little Falls, Rose Run, Galway A Dolomite, Galway B Sand, Galway B Dolomite, and Galway C Sand

Task 3: Site Geomechanical Analysis

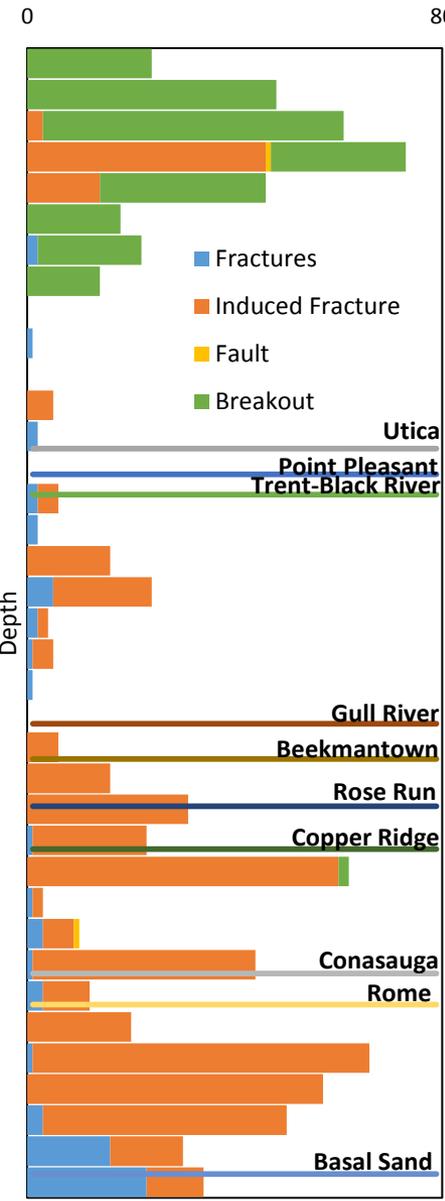

- Northeastern Appalachian Basin Site: 134 fractures, 55 induced fractures, 5 micro-faults, and 586 breakouts were interpreted on image logs.

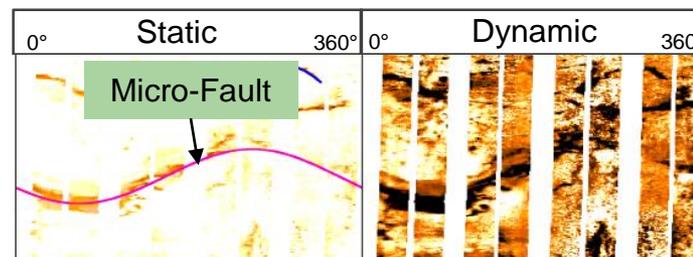

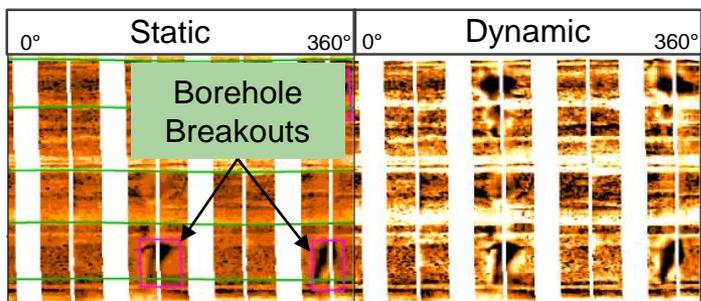

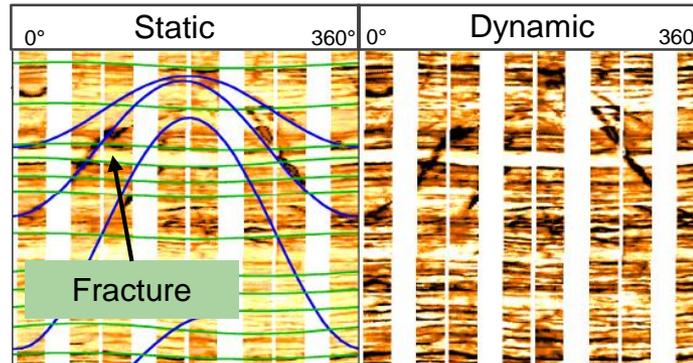

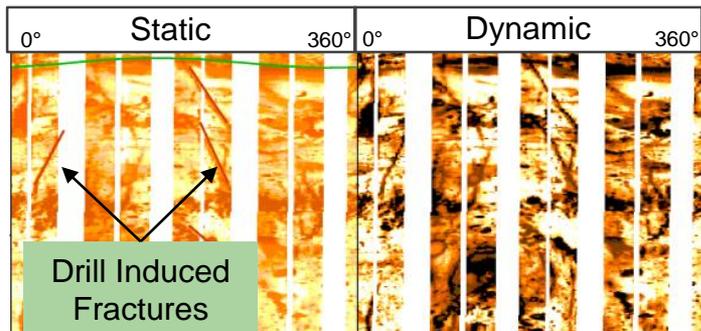

7300

Task 3: Site Geomechanical Analysis

- East-Central Basin site: 70 fractures, 522 induced fractures, 2 micro-faults, and 242 breakouts were interpreted on image logs.

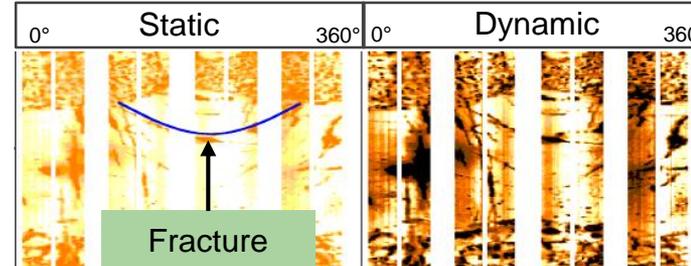

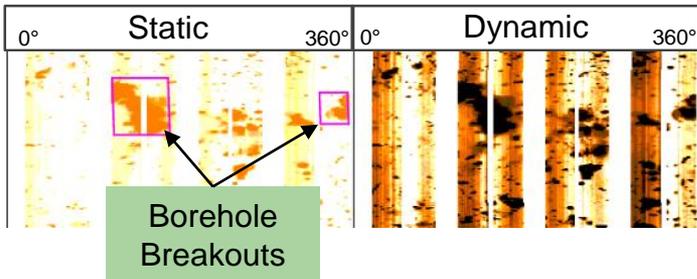

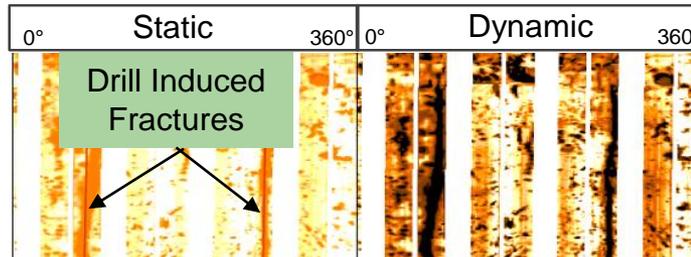

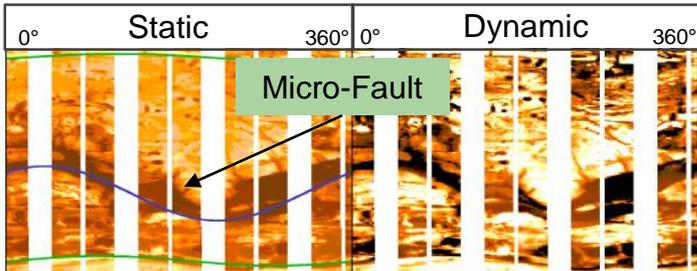

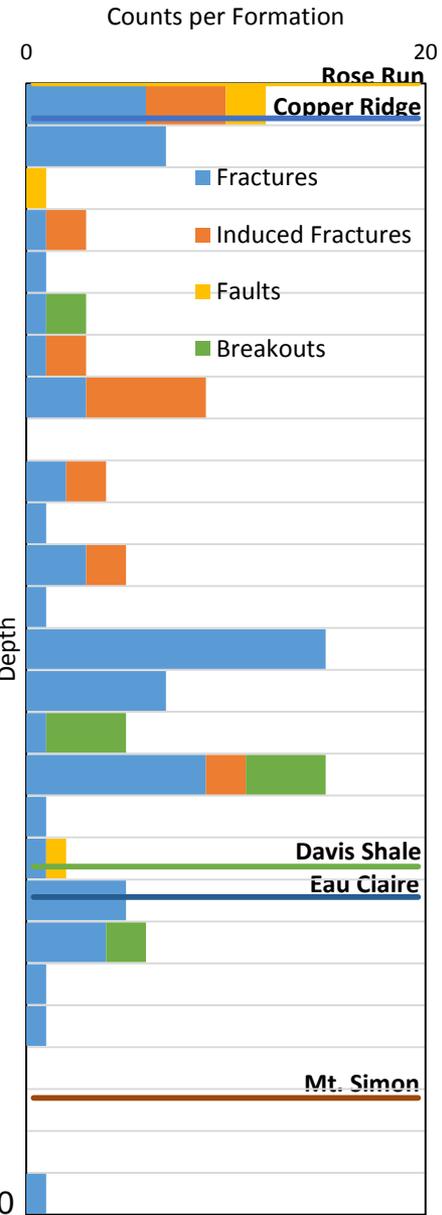

9000

Task 3: Site Geomechanical Analysis

- Arches site: 73 fractures, 20 induced fractures, 4 micro-faults, and 12 breakouts were interpreted on image logs

Task 4: Petrophysical Log Analysis & Integration

- Additional log processing was completed to derive continuous geomechanical parameters for each well using the acoustic and image logging data.

Derived Parameters

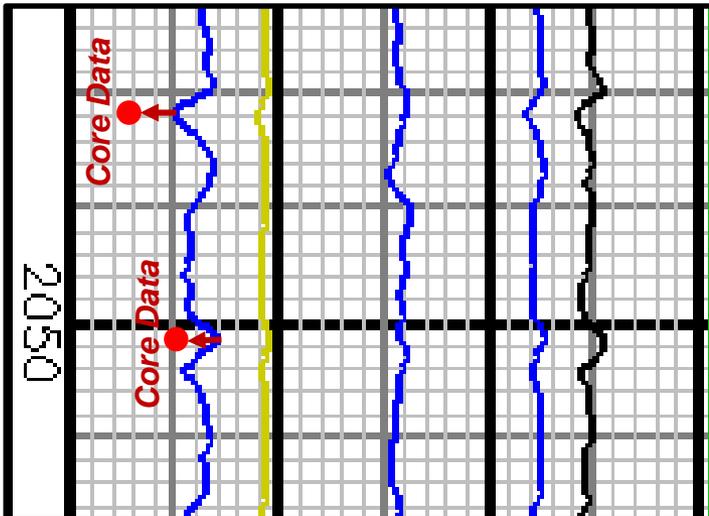

- Young's Modulus
- Poisson's Ratio
- Shear Modulus
- Bulk Modulus
- BOIT's Coefficient
- Stress Magnitudes
- Fracture Migration

Young's	Poisson's	Modulus	Unconfined Compressive Strength	Stiffness Tensor	In-Situ Stresses	Stress Profile - Gradients -	FEET	Stress Contrast	Brittleness Index	Fracture Migration

Task 4: Petrophysical Log Analysis & Integration

- Approximately 12,000 feet of geophysical log analysis of the Cambro-Ordovician rock will fill gaps on rock properties.
- Calibration to rock tests will ensure accuracy of geomechanical logs.

Curve Calibration

	Arches	E. Central App. Basin	NE App. Basin
Log Top (feet)	170	3,090	3,860
Log Bottom (feet)	3,704	8,710	7,305
Total Footage (feet)	3,543	5,620	3,445
Formations	Utica – Mount Simon	Utica- Basal Sand	Utica - Galway C Sand

Task 4: Petrophysical Log Analysis & Integration

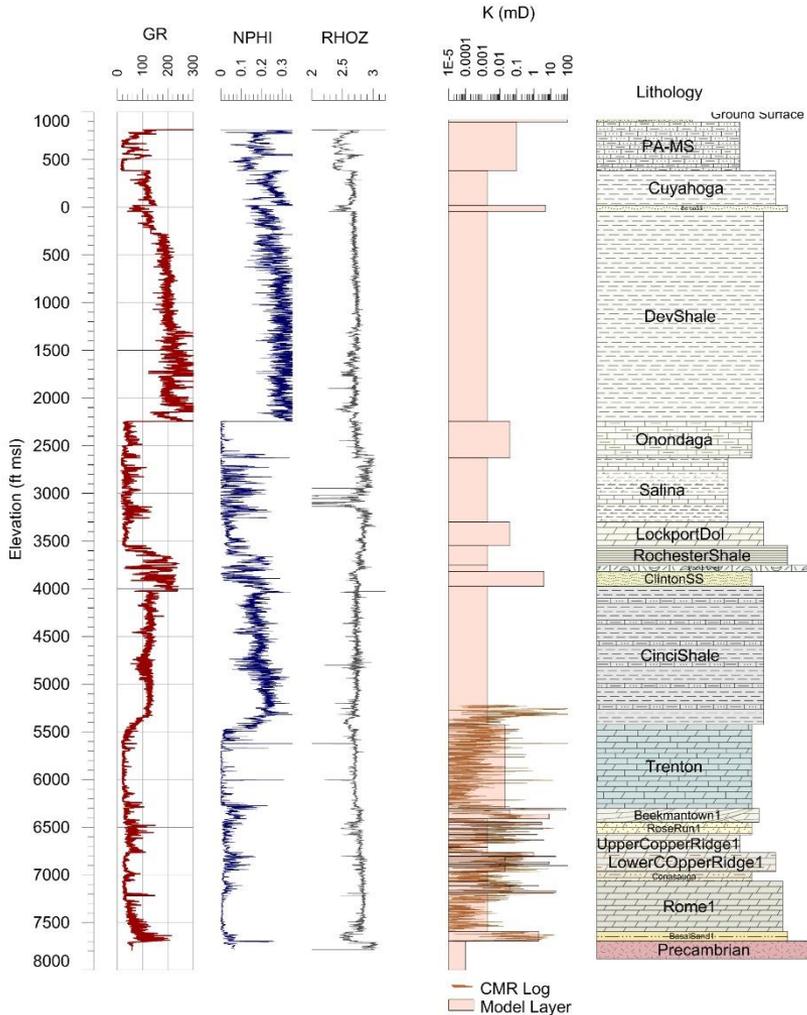

- Geologic models were built for the 3 sites based on regional well logs, structural geology, and hydraulic parameters.

Arches Site

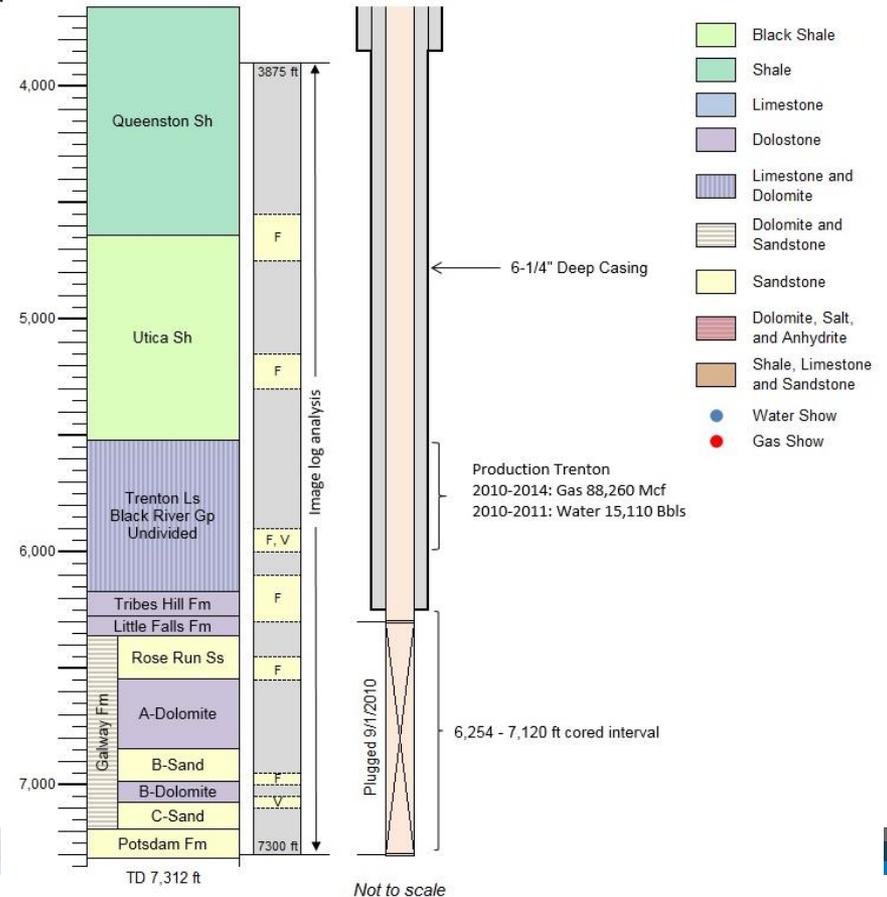

Task 4: Petrophysical Log Analysis & Integration

E-Central Appalachian Basin Site

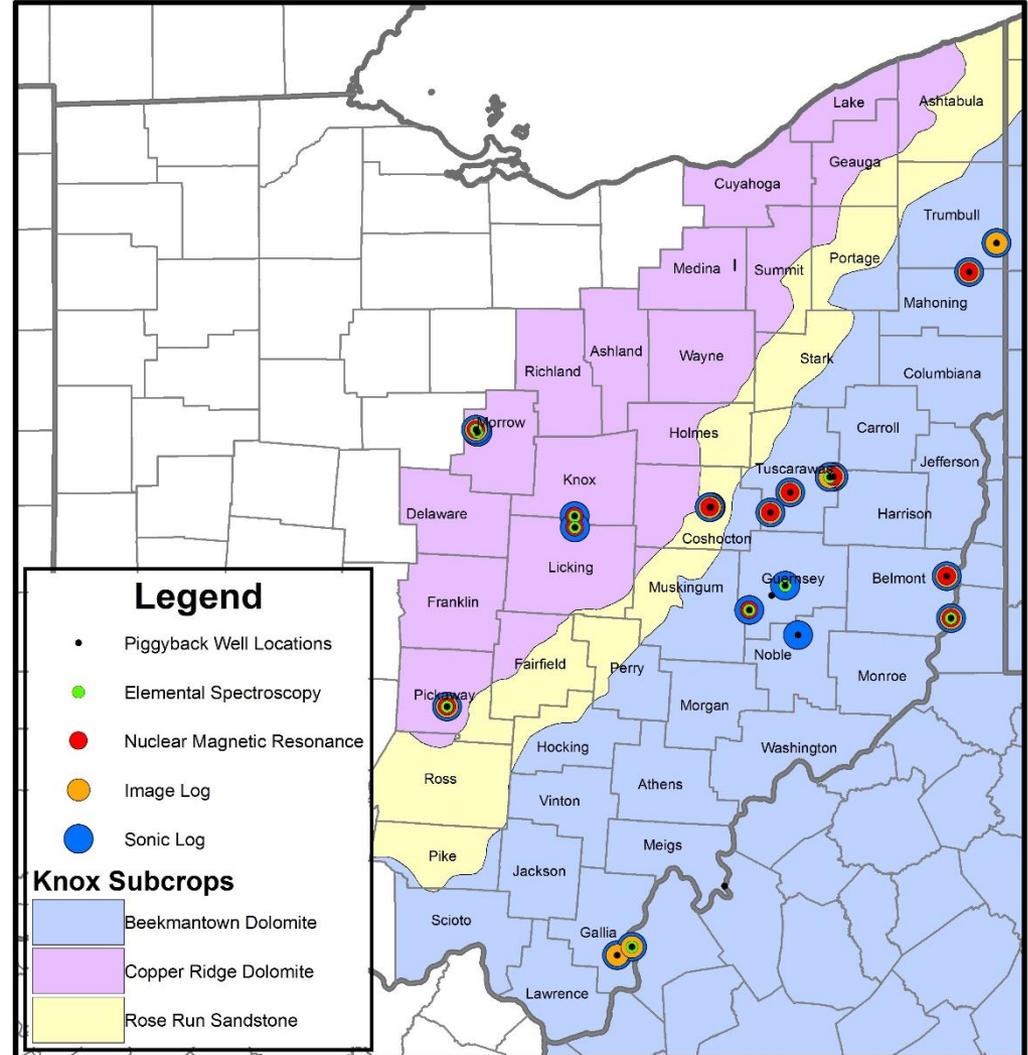

Northeast Appalachian Basin Site

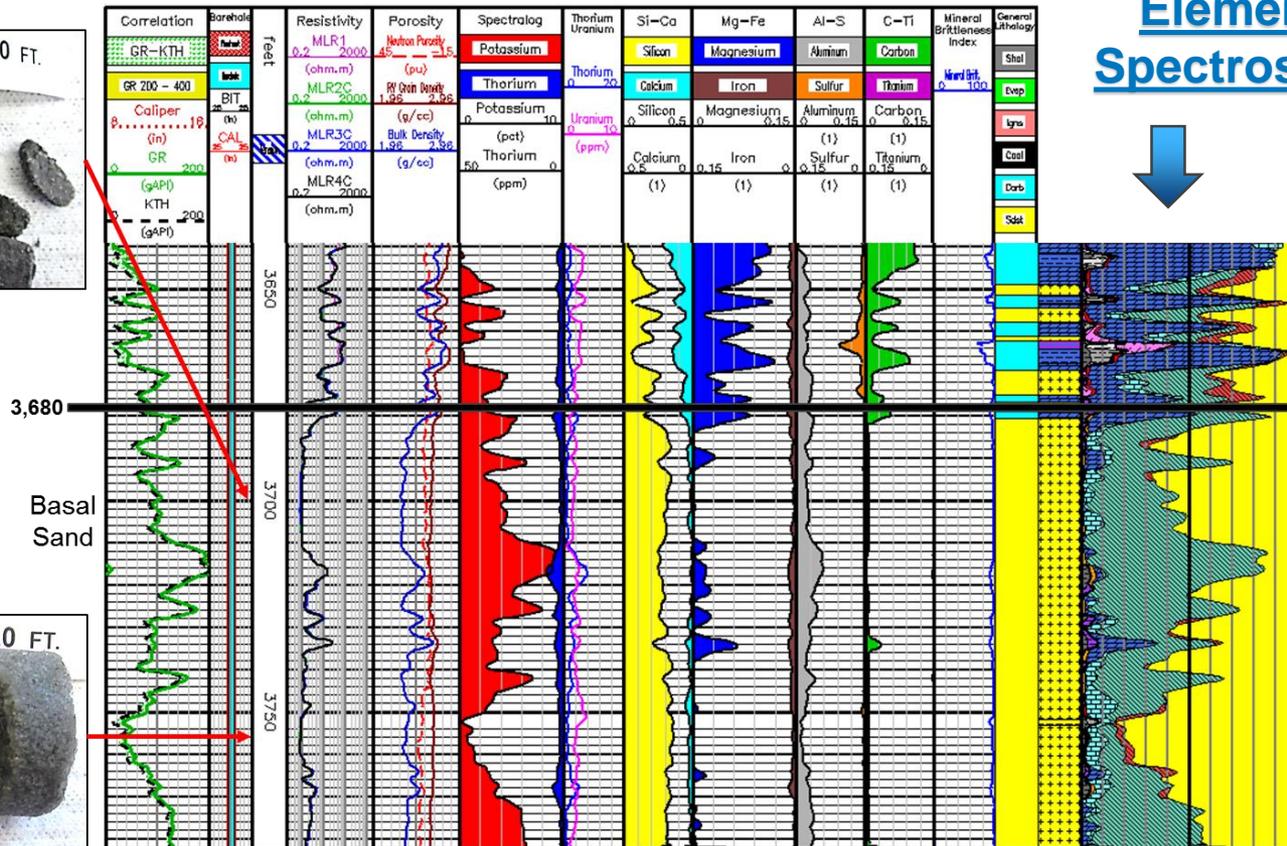

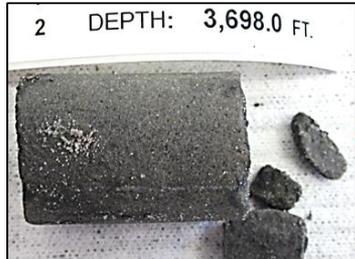

Task 4: Petrophysical Log Analysis & Integration

- Wells analyzed for elastic geomechanical properties based on geophysical logs.
- Elemental Spectroscopy logs provide a continuous estimate of mineralogy breakdown in the deep rock formations.

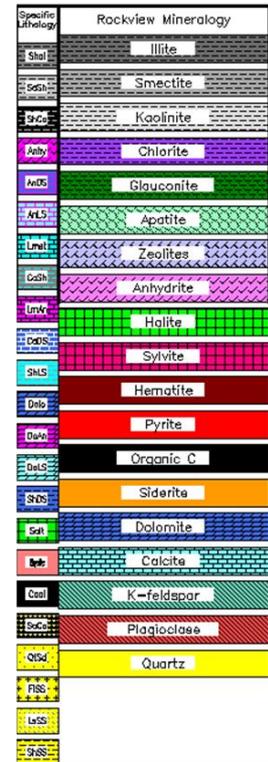

Petrophysical Log Analysis & Integration

- Elemental Spec.- Cambrian Basal Sandstone

Elemental Spectroscopy

Task 4: Petrophysical Log Analysis & Integration

- Voigt-Reuss-Hill (VRH) method was used with the fraction of minerals provided by rock view interpretation to calculate the elastic moduli at every quarter feet in the logged well.

$$M_{voigt} = \sum_{i=1}^n m_i M_i$$

$$M_{Reuss} = \sum_{i=1}^n \frac{m_i}{M_i}$$

$$M_{Hill} = \frac{M_{voigt} + M_{Reuss}}{2}$$

Fraction of minerals generated as output from the rock view interpretation includes mineral fraction for illite, smectite, kaolinite, chlorite, glauconite, apatite, zeolites, anhydrite, halite sylvite, hematite, pyrite, siderite, dolomite, calcite, k-feldspar, plagioclase and quartz.

Rock minerals	~K (GPa)	~G (GPa)	Vp (km/s)	Vs (km/s)	Poisson's ratio
Anhydrite	66.5	34	6.15	3.4	0.285
Apatite	83.9	60.7	-	-	-
Calcite	76.8	32	6.63	3.43	0.317
Dolomite	94.9	45	7.38	3.95	0.295
Aragonite	47	39	5.8	3.6	0.187
Halite	25.2	15.3	4.6	2.65	0.252
Hematite	100.2	95.2	-	-	-
Clay minerals	41	17	4.9	2.5	0.324
Clay	12	6	-	-	-
Na-Feldspar	55	28	5.9	3.3	0.272
K- Feldspar	48	24	5.6	3.05	0.289
Plagioclase	75.6	25.6	-	-	-
Pyrite	158	149	8.4	5.45	0.137
Quartz	36.6	45	6.03	4.12	0.064
Siderite	123.7	51	-	-	-

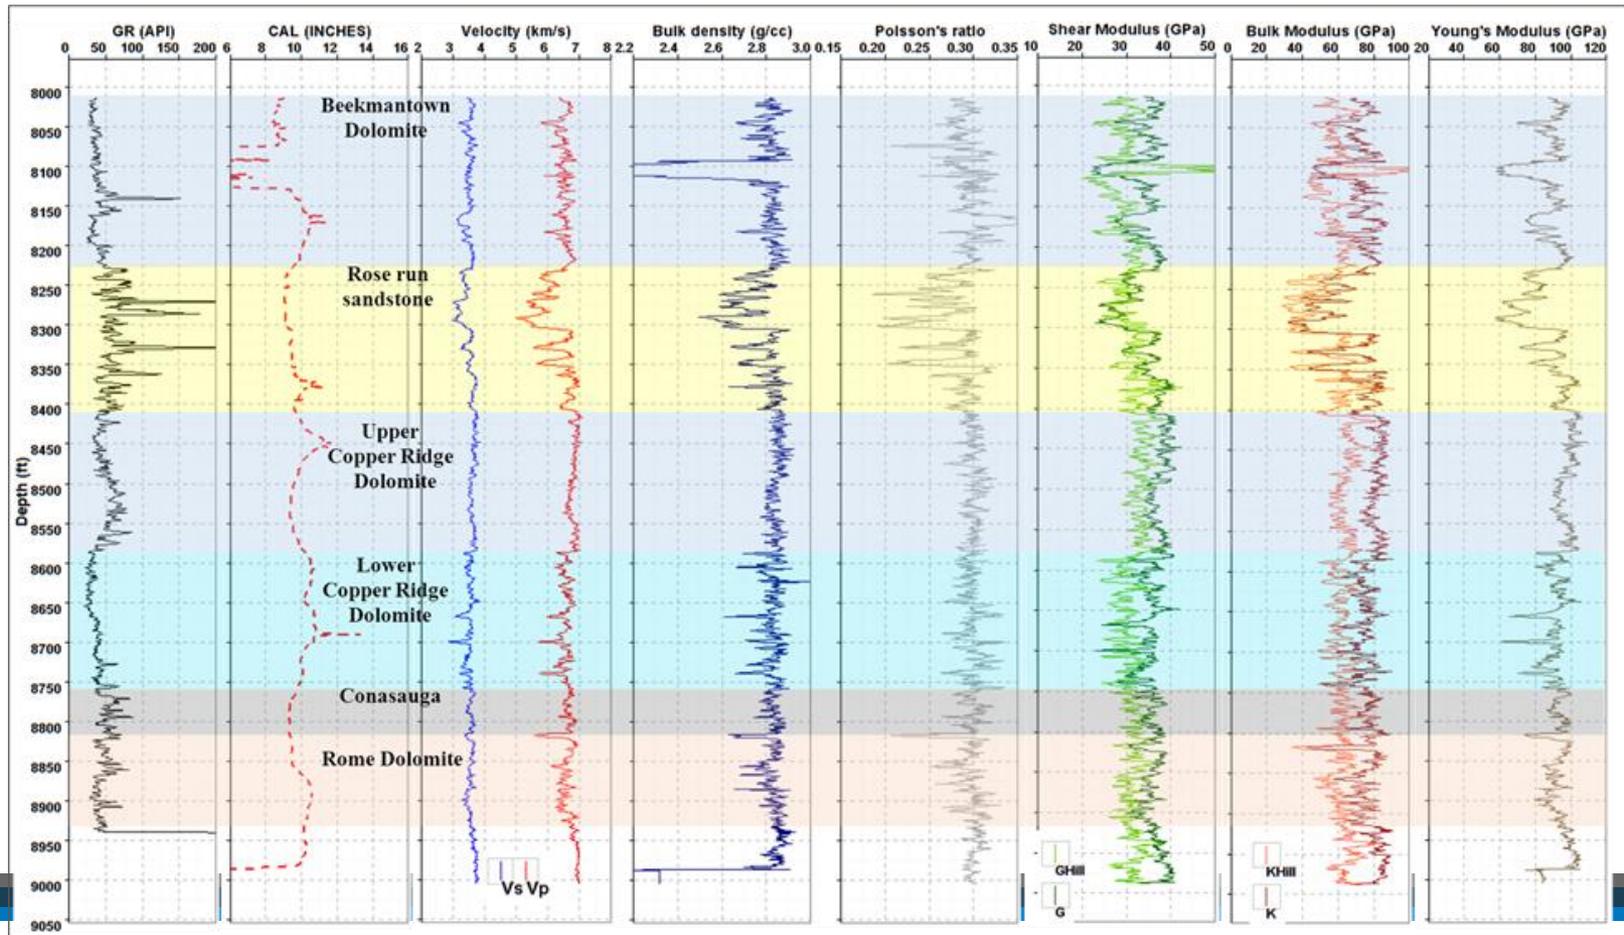

***Variable, K-Bulk modulus, G-Shear modulus, Gigapascals (GPa).

Compiled from Carmichael, 1989 and Simmons and Wang, 1971.

Task 4: Petrophysical Log Analysis & Integration

- Calculated geomechanical parameters compared with sonic derived parameters.

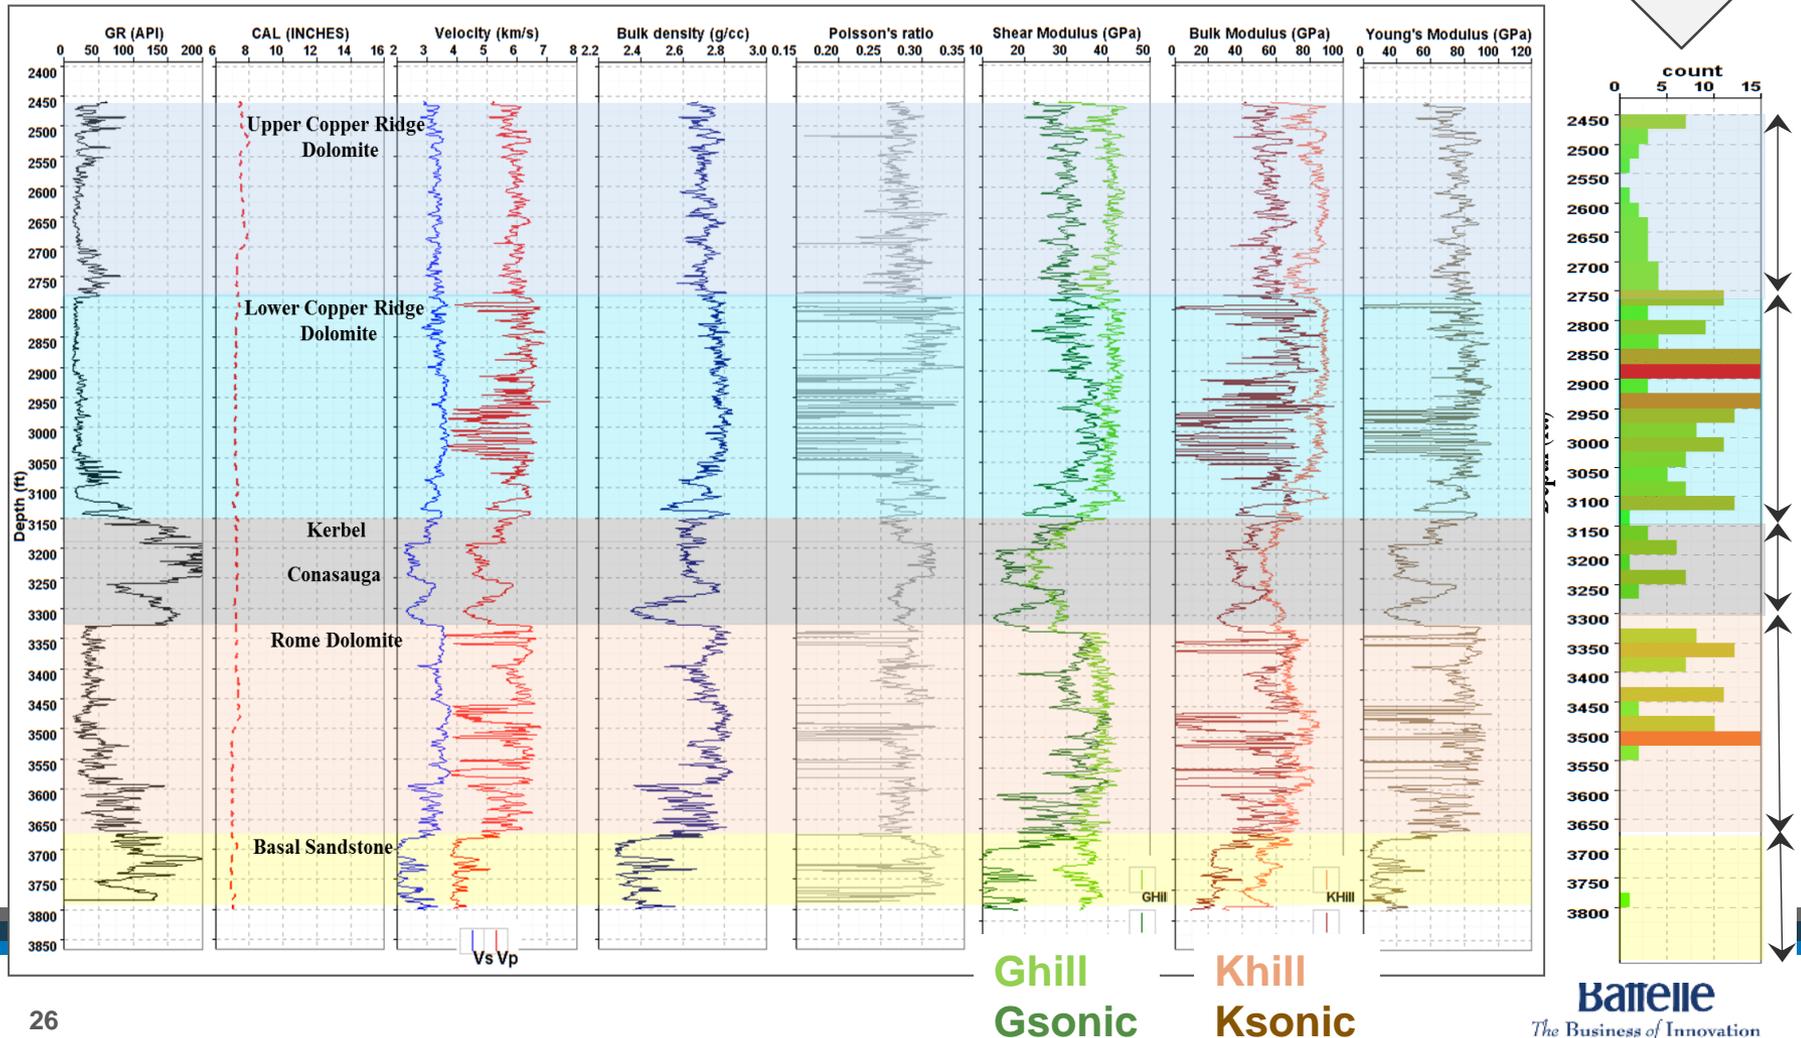

Ghill Khill
Gsonic Ksonic

Task 4: Petrophysical Log Analysis & Integration

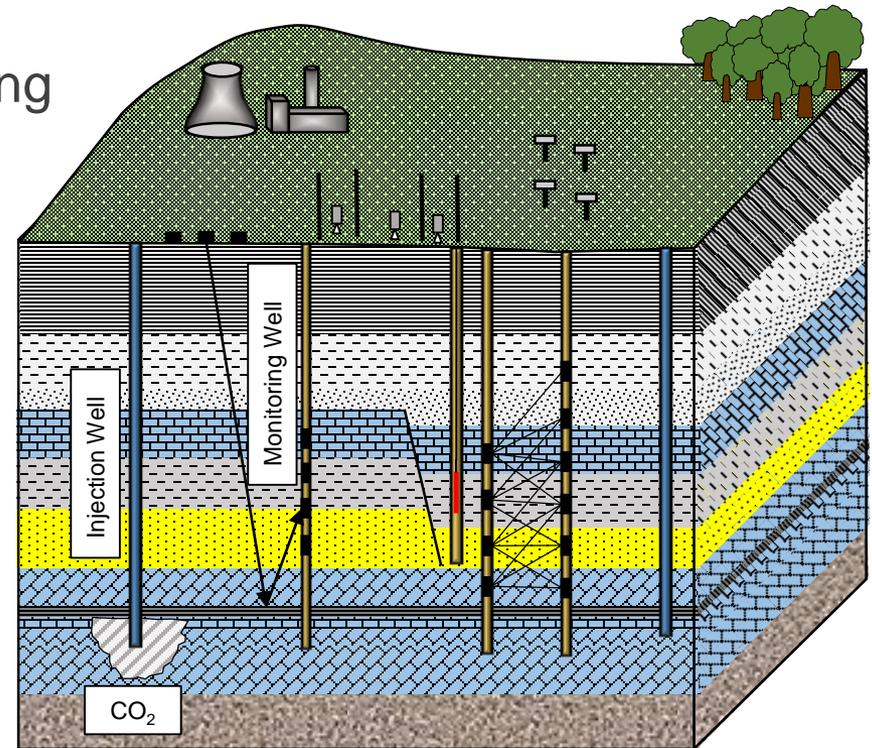

- Results compared with image log analysis.

Derived Geomechanical Parameters

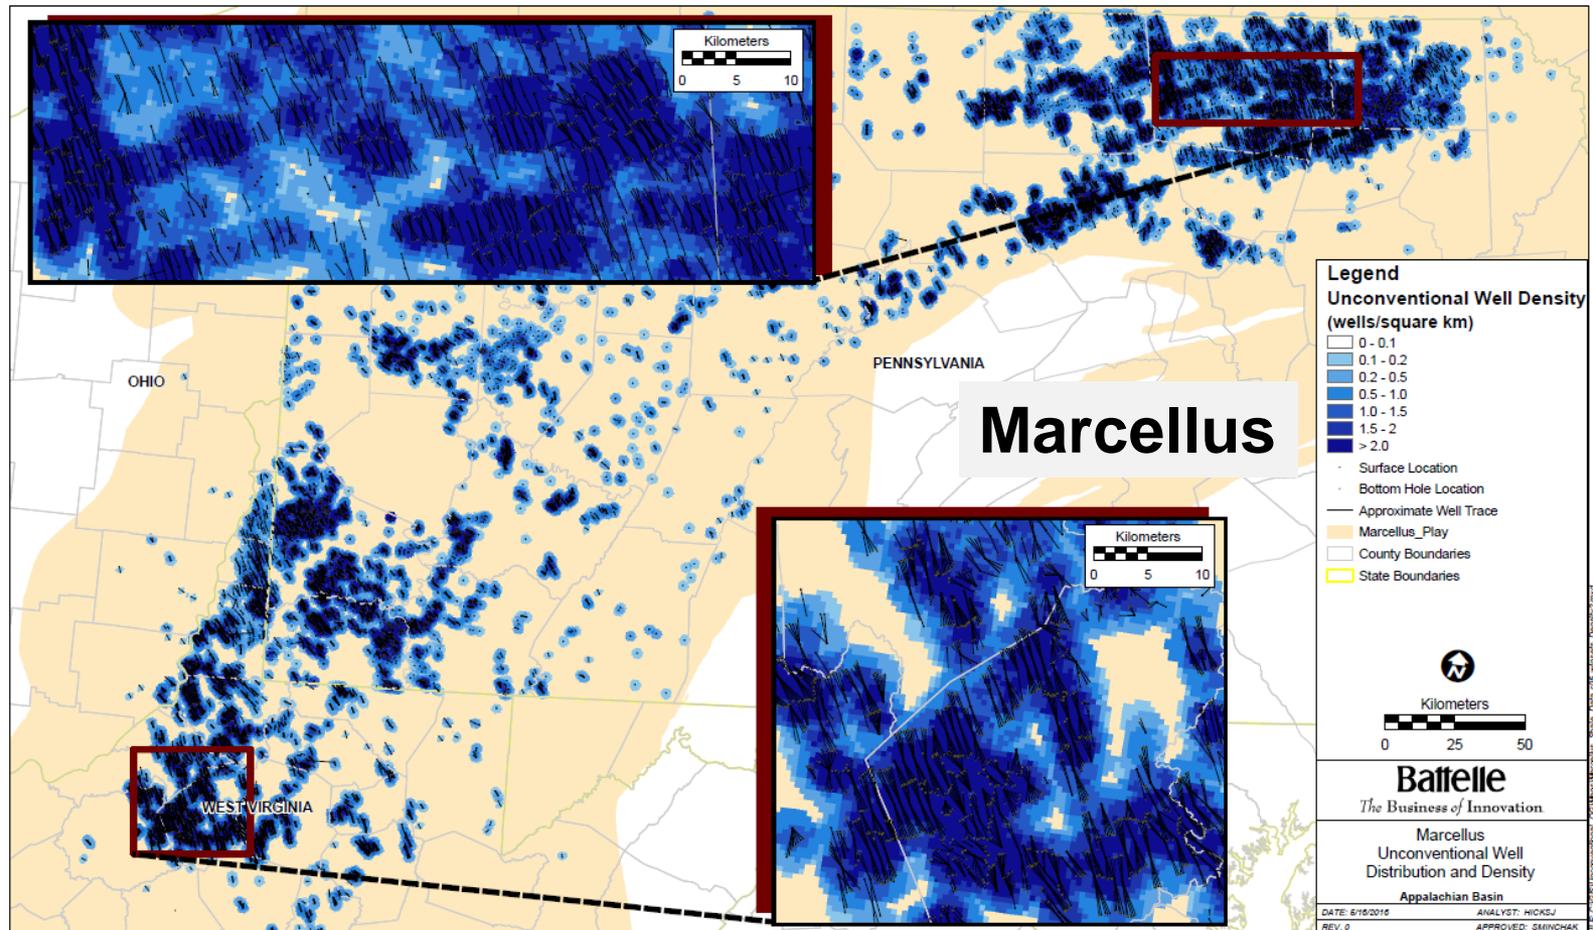

Task 5: Development of Methodology for Geomechanical Site Characterization

- Guidance developed for sites with geomechanical concerns in the following areas:
 - Geophysical Logging
 - Geomechanical Rock Core Testing
 - Injection Testing
 - Geomechanical Monitoring

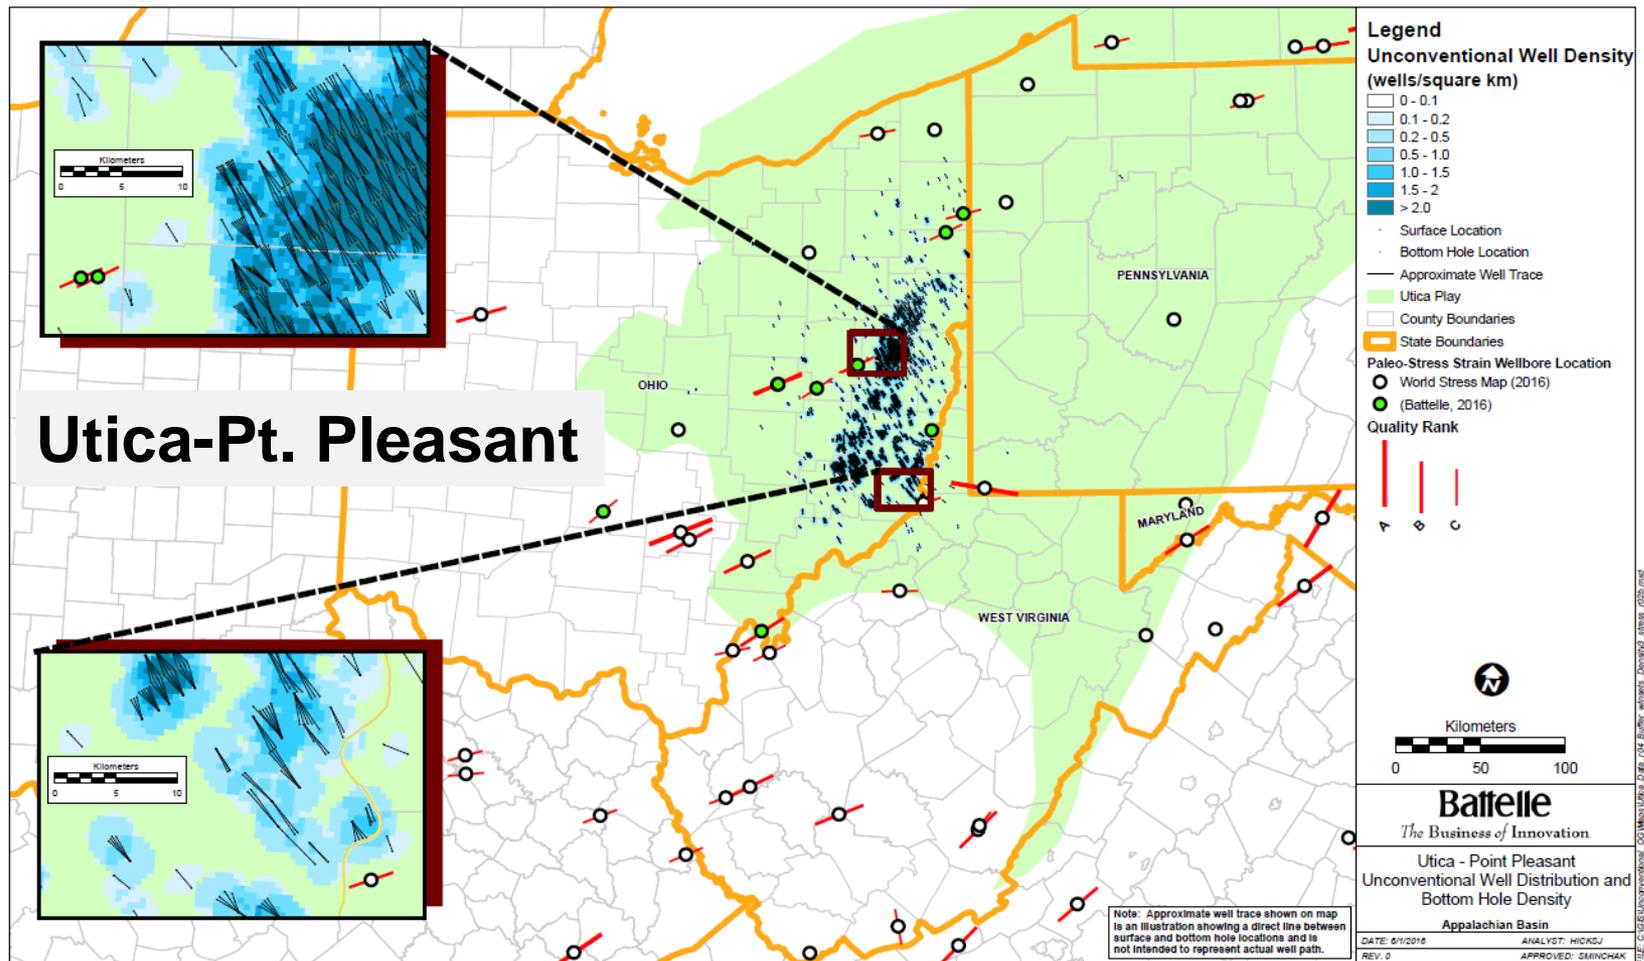

Task 8: CO₂ Storage/Shale Gas Risk Factor Assessment

- More than 13,000 horizontal shale gas wells were mapped to determine their impact on CO₂ storage zones.

Task 8: CO₂ Storage/Shale Gas Risk Factor Assessment

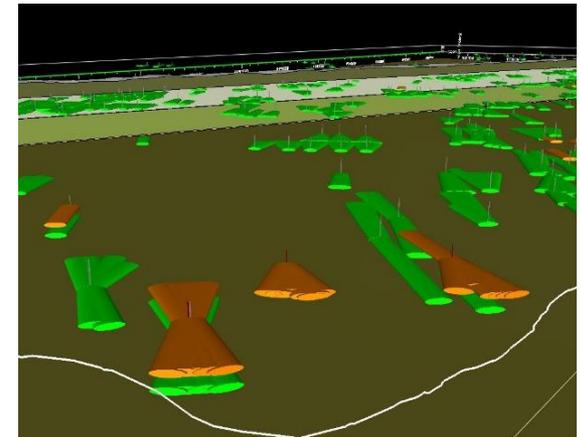

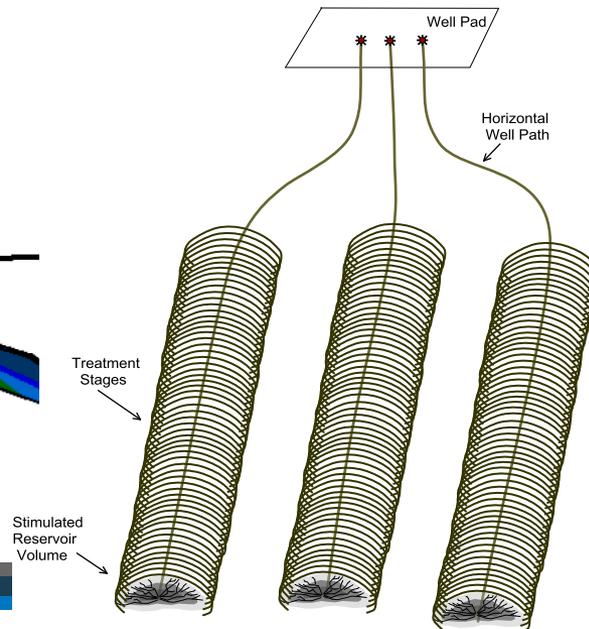

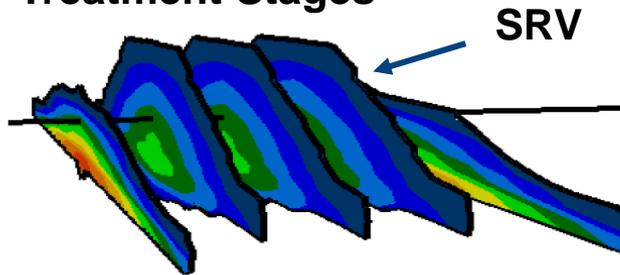

- More than 13,000 horizontal shale gas wells were mapped to determine their impact on CO₂ storage zones.

Task 8: CO₂ Storage/Shale Gas Risk Factors

- Stimulated reservoir volume extends from well along multiple treatment stages. Many (50-75) stages may form a sort of “fracture tunnel” in the subsurface.
- While large areas are covered by horizontal shale gas SRVs, they are mostly limited to discrete, vertical shale intervals, which are not key caprocks for CO₂ storage.

Horizontal Well Treatment Stages

Synergy Opportunities

Synergy to DOE-NETL C-Storage Program

- Project has significant synergies with other ongoing work on carbon storage technologies (carbon capture & storage), shale gas developments, other CO₂ storage research.
- Provides a better understanding of geomechanical stress parameters for Midwest U.S., a key issue for CO₂ storage in the region's deep rock formations.
- Reduces uncertainty related to existing/future power plant locations by mapping key geomechanical items.

Summary/Results and Conclusions

- First year of the project focused on Paleo Stress-Strain analysis for the Midwest U.S. region.
- Analysis on natural fracture orientation indicates a complex pre-dominant northeast-southwest trend in horizontal stress.
- Analysis on fracture distribution indicates variation in fracture intensity:
 - More fractures were observed on acoustic and resistivity images collected in the western part than eastern part of the study area.
 - Factors controlling fracture orientation include direction of tectonic transport, Basin architecture, Paleo-stress.

Summary/Results and Conclusions

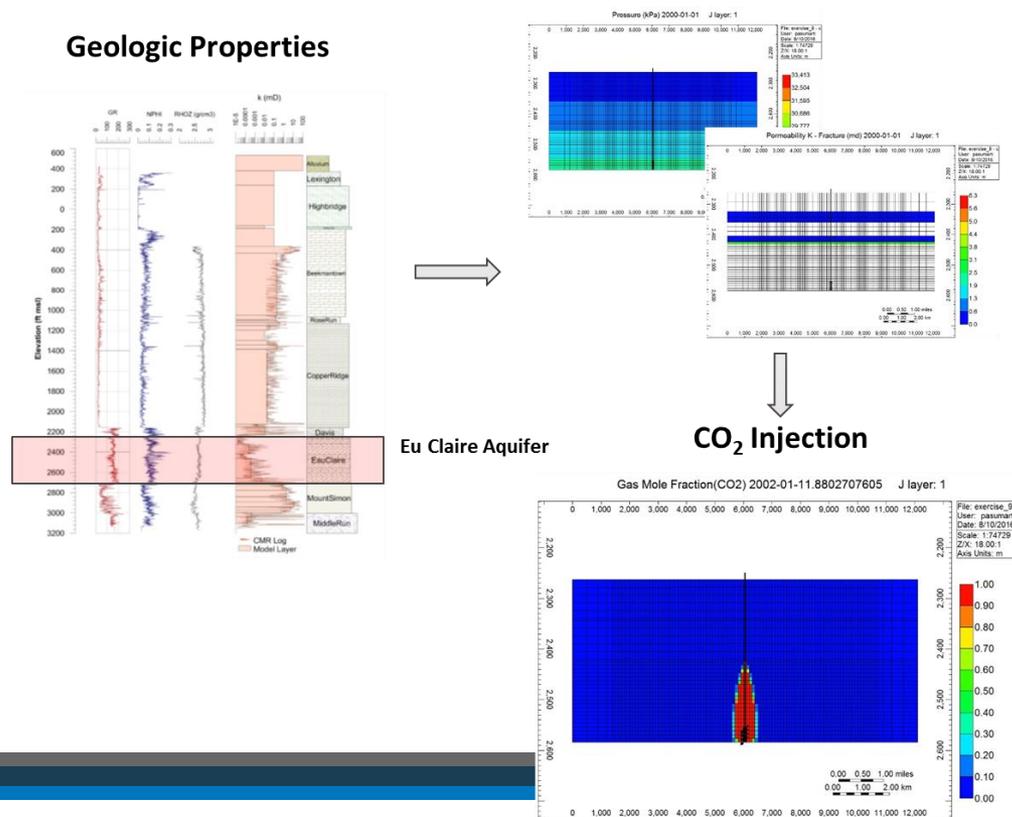

- Processing and analysis of 9,700 ft of geophysical image logs provides a better understanding of geomechanical conditions and features in the Midwest U.S.
- Site geomechanical analysis for 3 sites across the region better defines potential for subsurface deformation due to large scale CO₂ storage applications.
- Guidance developed for sites with geomechanical concerns for geophysical logging, rock core testing, injection testing, and geomechanical monitoring.

Summary- Future Work

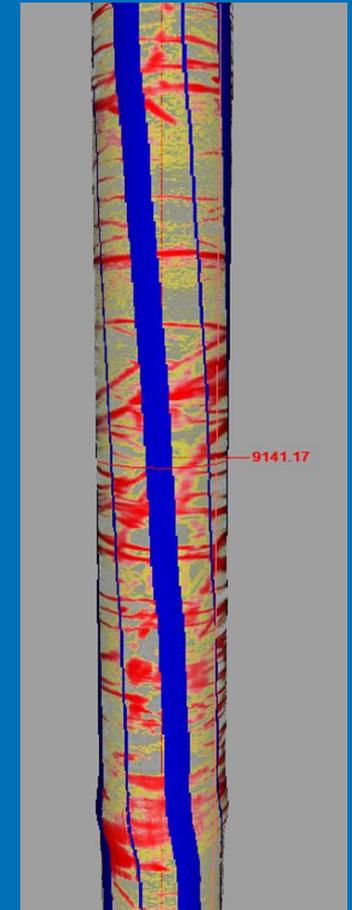

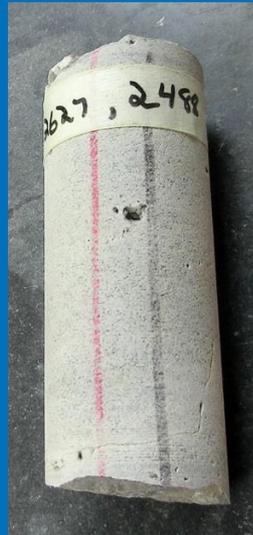

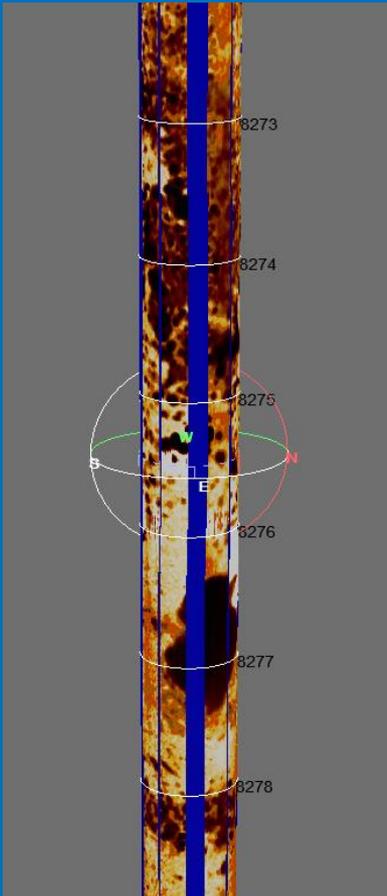

Task 6: CO₂ injection simulations for fractured reservoirs

Task 7: CO₂ injection caprock simulations

Task 8: CO₂ Storage Site/Shale Gas Risk Factor Assessment

The End. Thank You.

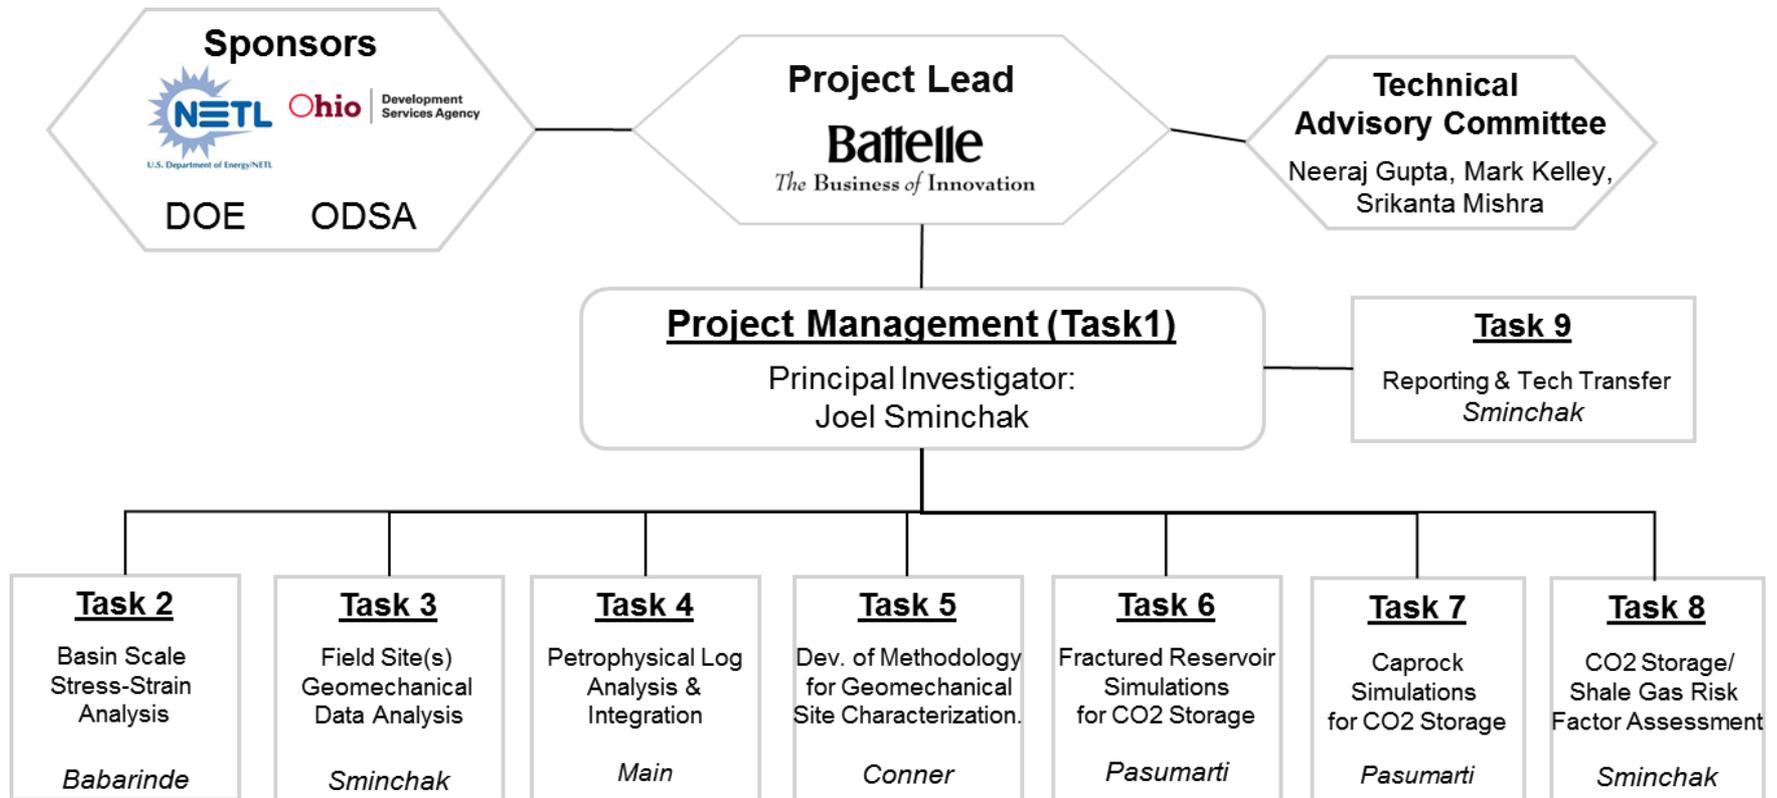

Battelle
The Business of Innovation

Additional Project Information

Project Organization Chart

- Project organized into 7 main technical tasks.

Gantt Chart

- Project is designed with a sequential series of tasks over 3 years.

Task Name	BP1				BP2				BP3			
	FY2015				FY2016				2017			
	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Task 1: Project Management & Planning	[Gantt bar from Q1 FY2015 to Q4 2017]											
1.1 Update Project Mgmt. Plan	◆											
1.2 Project Management												
1.3 Project Controls												
1.4 NEPA Reporting												
Task 2: Basin Scale Stress-Strain Analysis	[Gantt bar from Q1 FY2015 to Q3 FY2016]											
2.1 Tectonic Setting Def. for Midwest U.S.				◆								
2.2 Reg Analy. of Paleo-Stress Orien. & Mag												
2.3 Sys. Rev. of Geomech & Petrophys Prop.												
Task 3: Geomech. Data Analysis	[Gantt bar from Q2 FY2015 to Q3 FY2016]											
3.1 Data Proc from Well Logs/tests												
3.2 Geo and Geomech Des of Well Sites												
3.3 Static Geomech Rock Core Test&Analys.												
Task 4: Petrophys Log Analysis & Integra.	[Gantt bar from Q2 FY2016 to Q3 FY2016]											
4.1 Trans. Petrop Log Data to Geomech Para												
4.2 Calibr. of Logs with Static Geomech Data												
Task 5: Dev. Meth for Geomech Site Char	[Gantt bar from Q3 FY2016 to Q4 2017]											
5.1 Geophys. Logging Options for CO ₂ Sites												
5.2 Geomech Rock Core Test Options												
5.3 Inj Test Options for CO ₂ Storage Sites												
5.4 Geomech Mon Options for CO ₂ Sites												
Task 6: Fractured Res. Sims for CO₂ Stor.	[Gantt bar from Q3 FY2016 to Q4 2017]											
6.1 Numerical Model Definition/Setup												
6.2 Caprock Simulation Scenario Runs												
6.3 Simulation Results Processing/Visualiz												◆
Task 7: Caprock Sims for CO₂ Stor.	[Gantt bar from Q3 FY2016 to Q4 2017]											
7.1 Numerical Model Definition/Setup												
7.2 Caprock Simulation Scenario Runs												
7.3 Simulation Results Processing/Visualiz												◆
Task 8: CO₂ Stor/Shale Gas Risk Factors	[Gantt bar from Q3 FY2016 to Q4 2017]											
8.1 Mapping CO ₂ Stor Zones & Shale Gas												
8.2 Class. of Risk Factors Rel to CO ₂ -Sh Gas												◆
Task 9: Reporting and Tech Transfer	[Gantt bar from Q1 FY2015 to Q4 2017]											
9.1 Progress Reporting	◆	◆	◆	◆	◆	◆	◆	◆	◆	◆	◆	◆
9.2 Technical Summary Reports				◆				◆				◆
9.3 Final Reporting												◆
9.4 Project Meetings	◆				◆				◆			◆

Deliverables/Milestones

Milestones

Budget Period	Milestone Description	Planned Due Date	Completion Date	Verification Method
1	Submit Updated Project Management Plan to DOE	30 days after initial award	September 10, 2014	Project Management Plan submitted to DOE PM
1	Collect and Analyze Geotechnical Data for Basin Scale Paleo-Stress/Strain Analysis	September 2015	September 30, 2015	Task Report Submitted
2	Acquire and Process 3-4 Advanced Geophysical Logs from Key Wells in the Region	September 2016	On track for September 2016	Summary Report, Upload data to EDX
2	Complete Testing of 10 Rock Cores for Geomechanical Parameters	September 2016	January 2016	Task Report, Upload data to EDX
3	Complete Development of a Methodology for Geomechanical Site Characterization for CO ₂ Storage Sites	March 2017		Summary Technical report
3	Complete Reservoir Simulations for fractured reservoirs and caprocks	June 2017		Topical Report with Simulation Results
3	Develop maps and identify risk factors for CO ₂ Storage/Shale Gas Zones in the Region	June 2017		Summary Technical Report
3	Preparation of final technical report detailing all test data, analysis, and project results	90 days after end of the project		Final Technical Report
