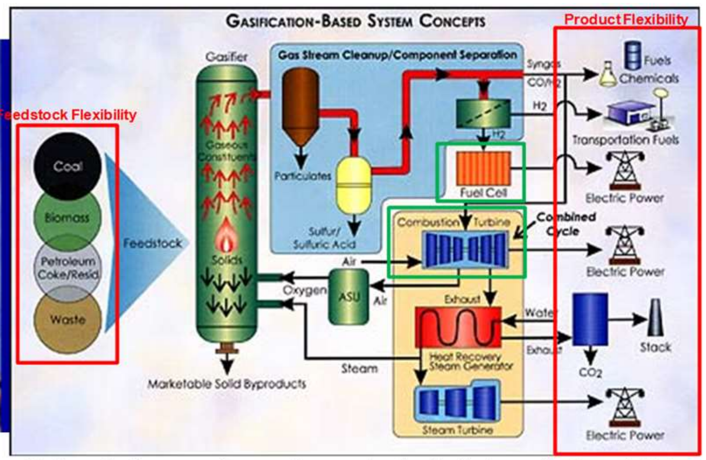
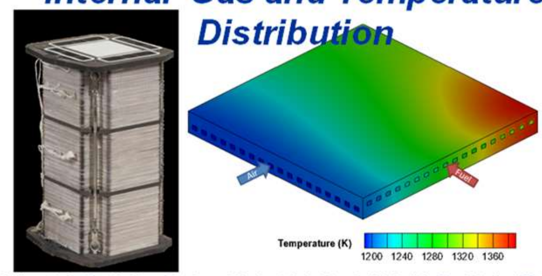
Objective/Vision: Probing High-T Chemistry in SOFC Operation

Develop an integrated sensor solution to perform direct and simultaneous measurements of physical and chemical parameters with 5-mm spatial resolution.



http://www.fossil.energy.gov/programs/powersystems/gasification/howgasificationworks.html

Example : Solid Oxide Fuel Cells Internal Gas and Temperature Distribution



Pakalapati, S. R., 'A New Reduced Order Model for Solid Oxide Fuel Cells,' Ph.D Thesis, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV

Using data gathered by sensor to optimize design, operation, and control of energy system.

Outlines: A Complicate but Interesting Story

- **Develop high-T stable silica fiber platform**
  - Ultrafast laser direct writing
  - Nano-fabrication of on-fiber nanostructures for high-T
- **Sensor Materials Development and integration**
  - Metal oxide nanostructures
  - Noble and rare-earth metal doping
  - 3D direct microstructuring
- **Sensor Deployment and Measurement**
  - What do we learn?
- **Energy system optimization**
- **Cross-cutting nature of this work**

Example : Solid Oxide Fuel Cells Internal Gas and Temperature Distribution

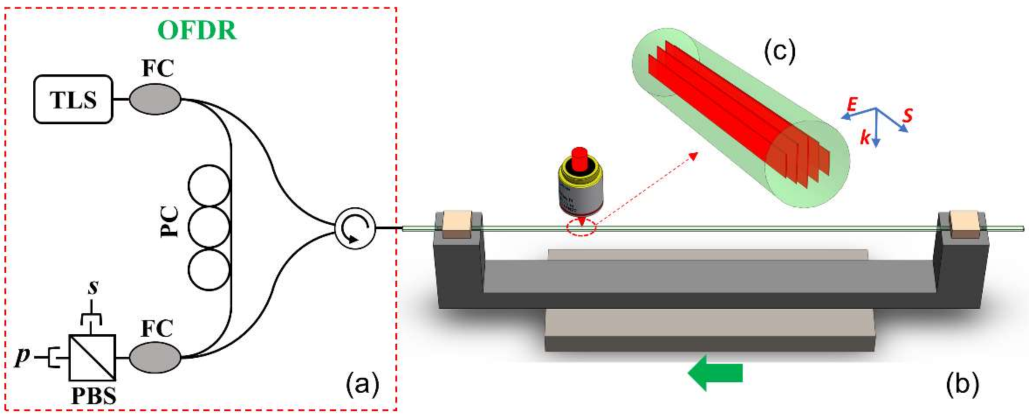
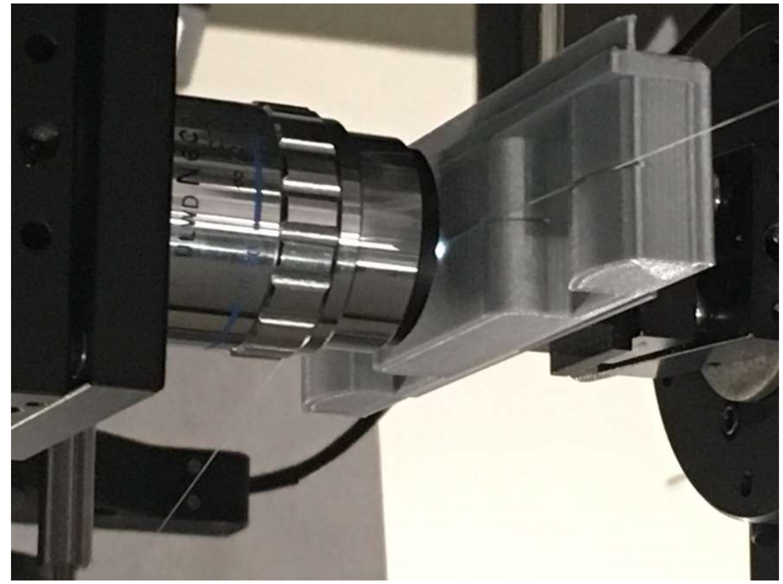
Distributed Sensors for High-T Applications

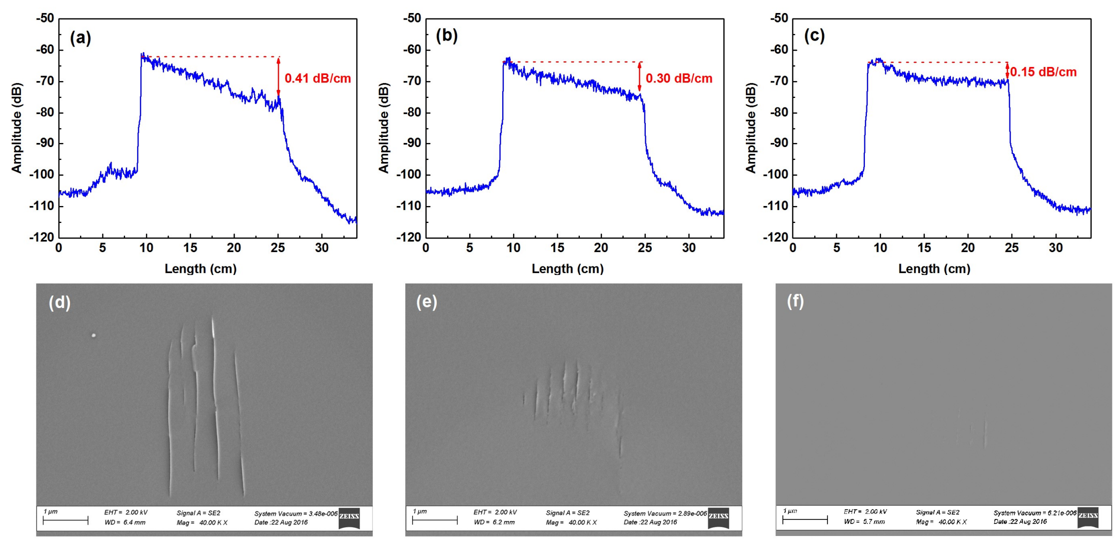
U.S. DEPARTMENT OF ENERGY
Nuclear Energy

Ultrafast laser irradiation to enhance T/radiation resilience and measurement accuracy



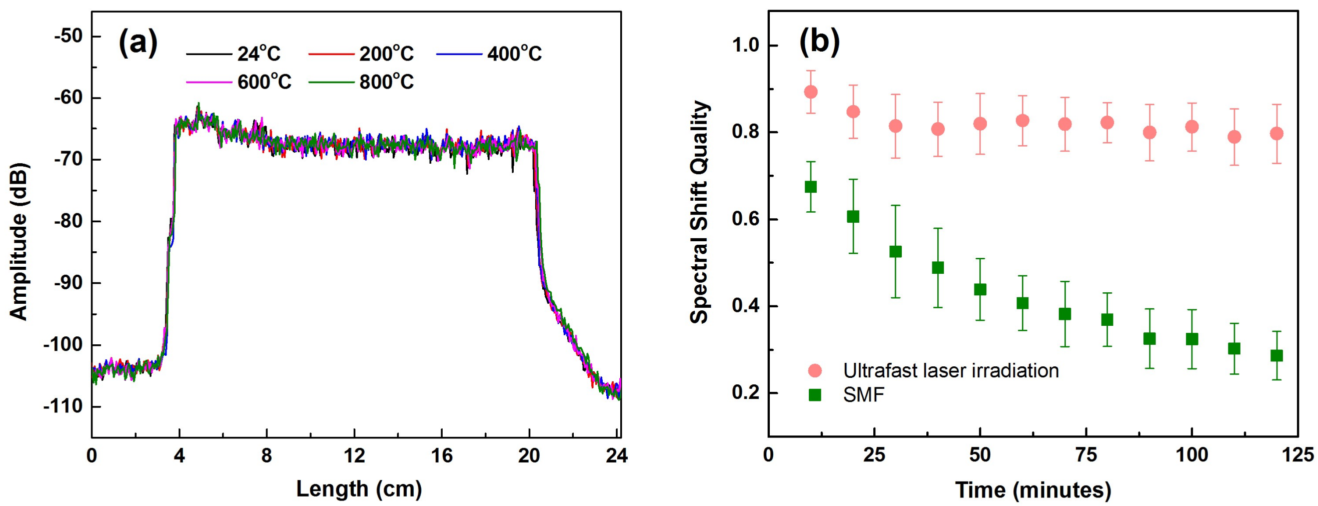


- **Temperature measurements can now be performed at 800C with H_2 atmosphere**
- **Stability verified at 800C**

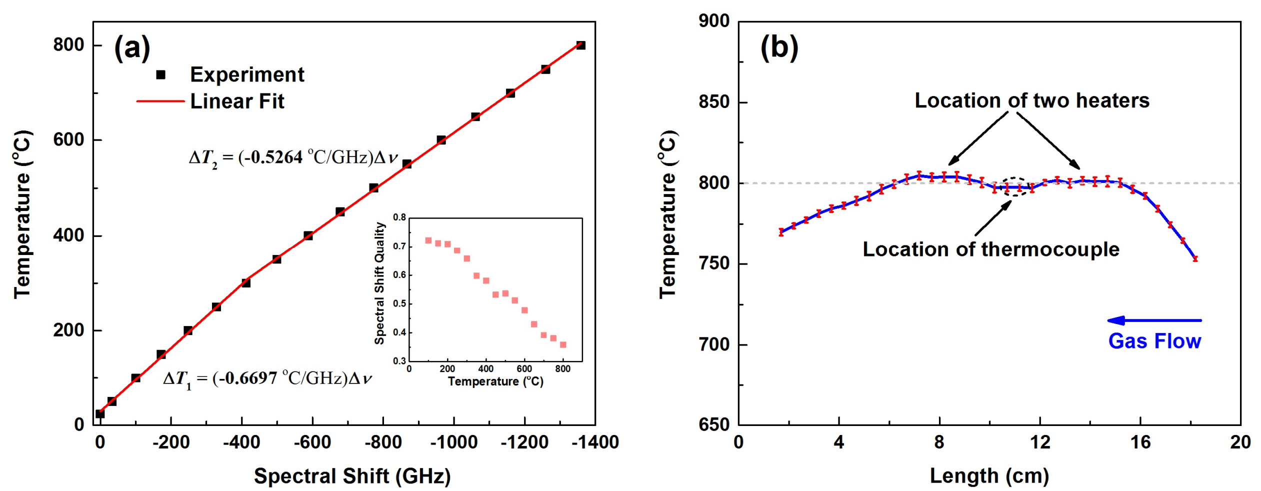


Distributed Sensors for Energy Applications

Temperature Resilience from the RT to 800C

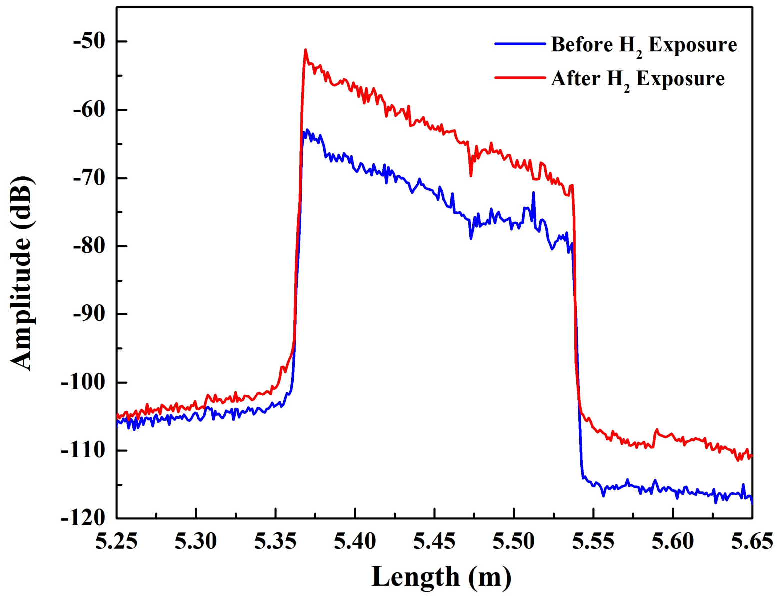


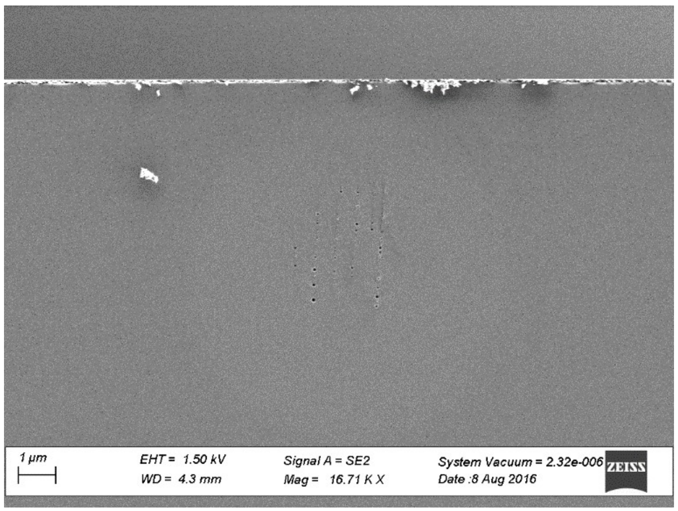
Measurement Repeatability better than 4C from the RT to 800C



Increasing Rayleigh scattering stability

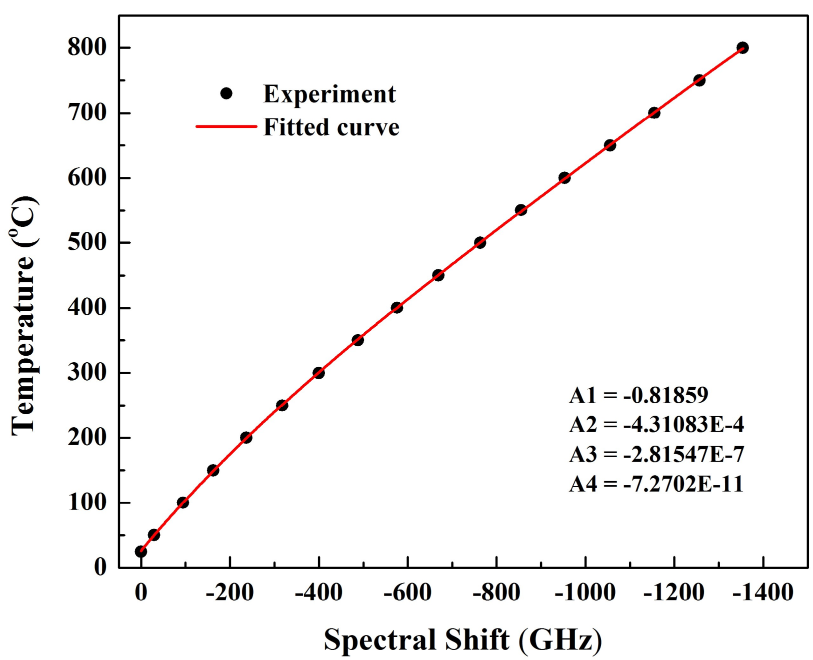
- Hydrogen exposure still increases loss and scattering
- H2 induced scattering is now less than irradiation-induced scattering
- Cross-correlation is more effective with increased scattering features that do not change with temperature

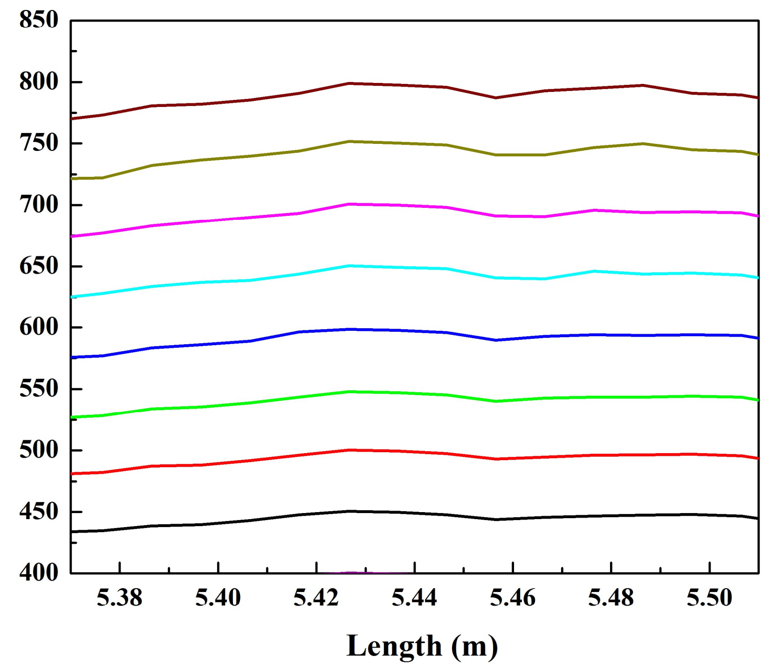




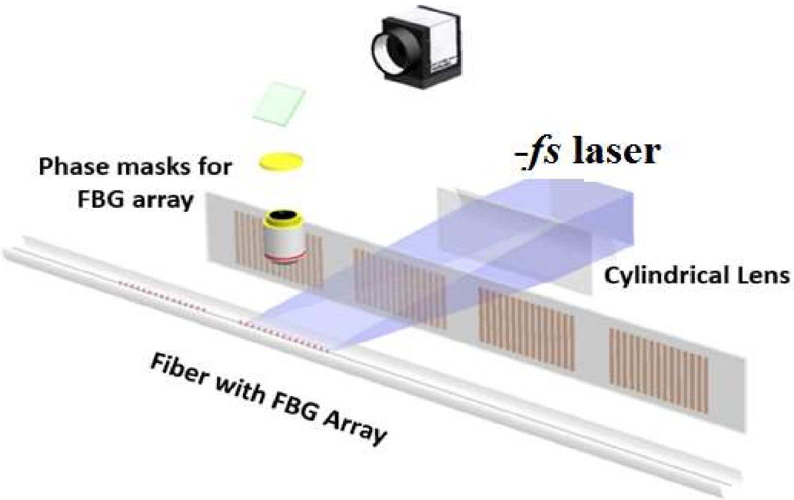
Temperature coefficients determined to 800C

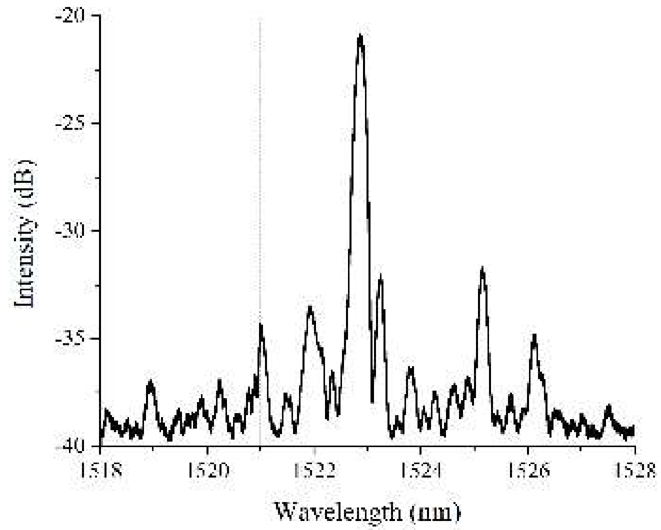
- Temperature can now be measured at 800C with H2 atmosphere
- Stability verified for ~19 hours at 800C
- 4C accuracy with heat/reheat

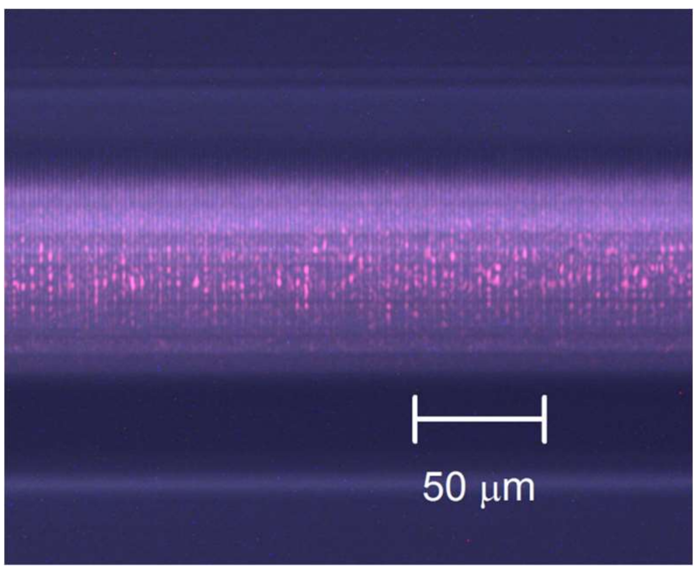


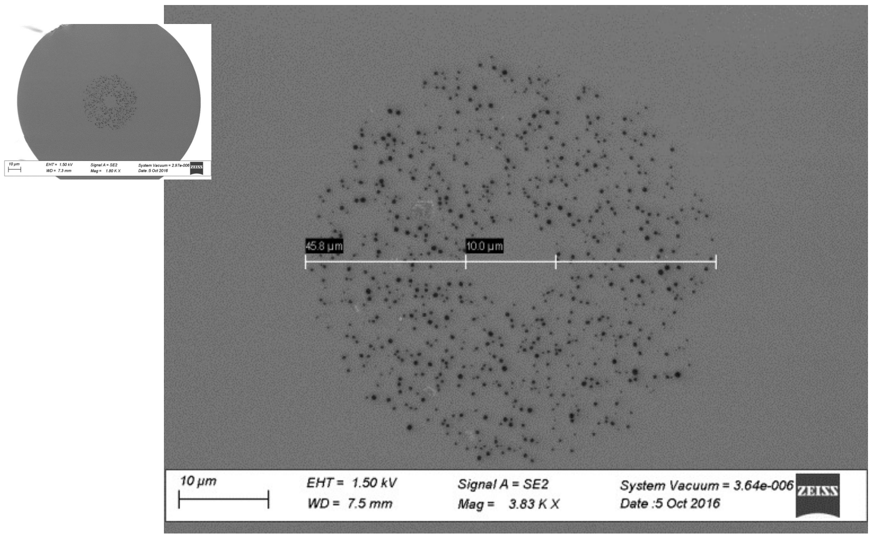


Development of Stable Fiber Bragg Grating Sensors Using Ultrafast Laser





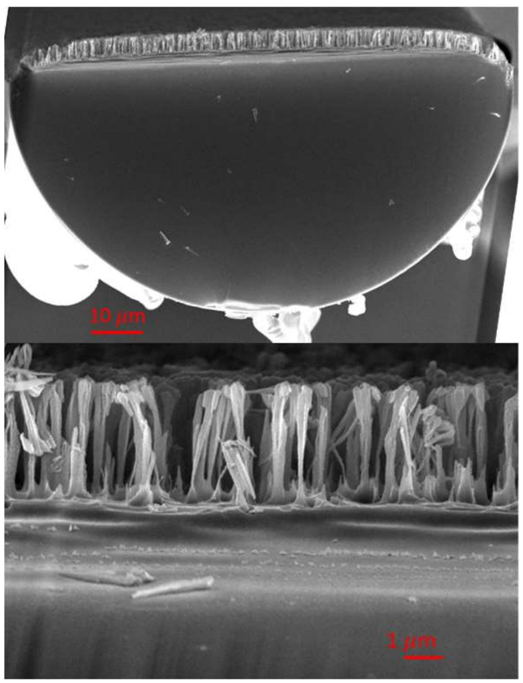




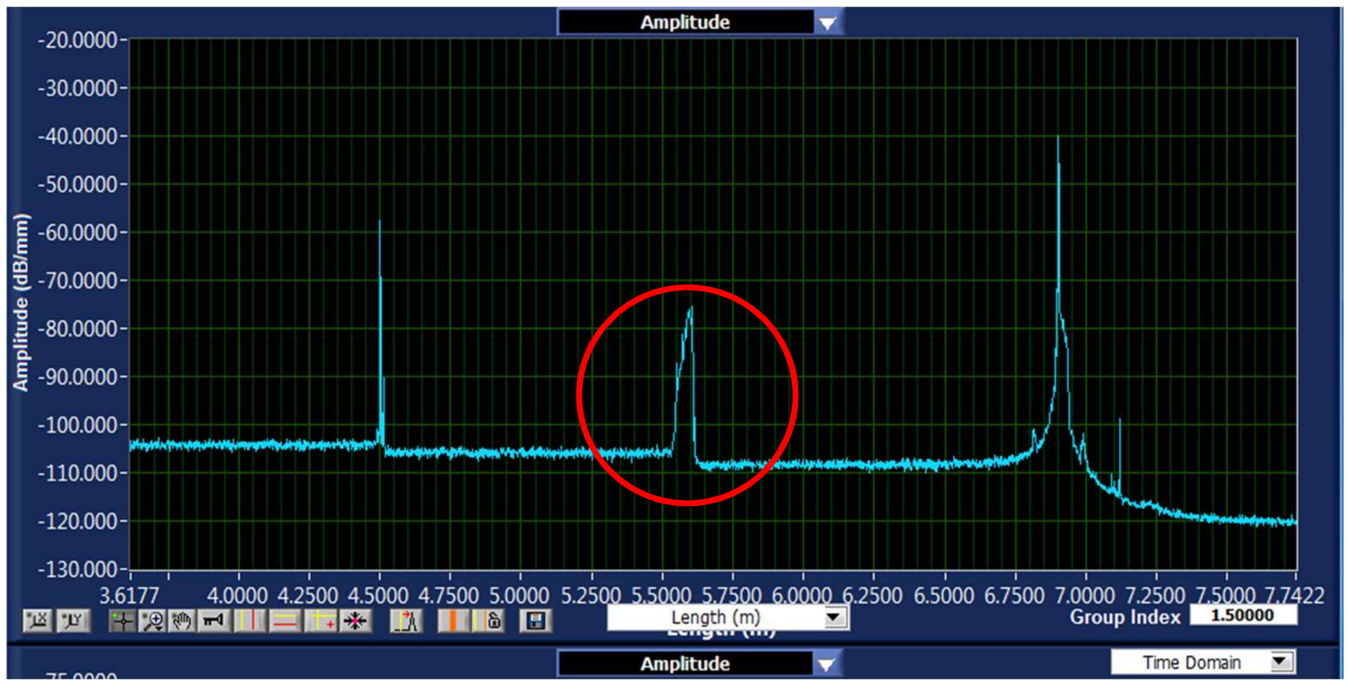
RIE on D-shaped fiber, Coating, Rayleigh

- Equipment: The Trion Phantom III LT RIE (Reactive Ion Etching)
- Gas: CHF_3 and O_2
- Power 100-300 W

Nano-grass (height: 4.7 µm)



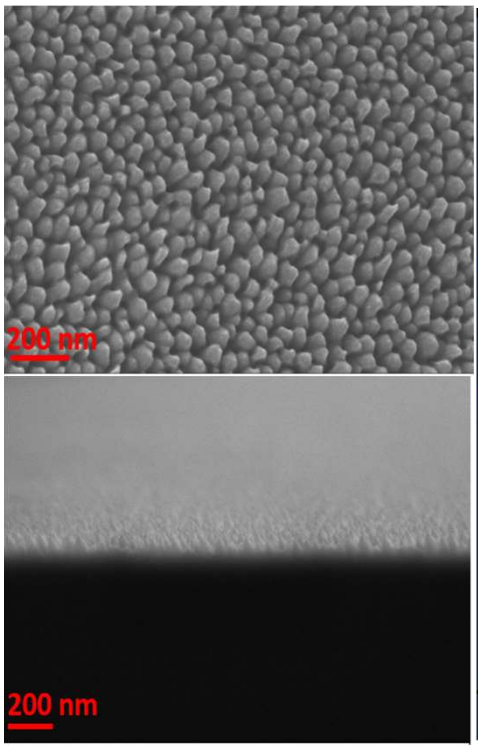
D-fiber with nano-grass Rayleigh scattering



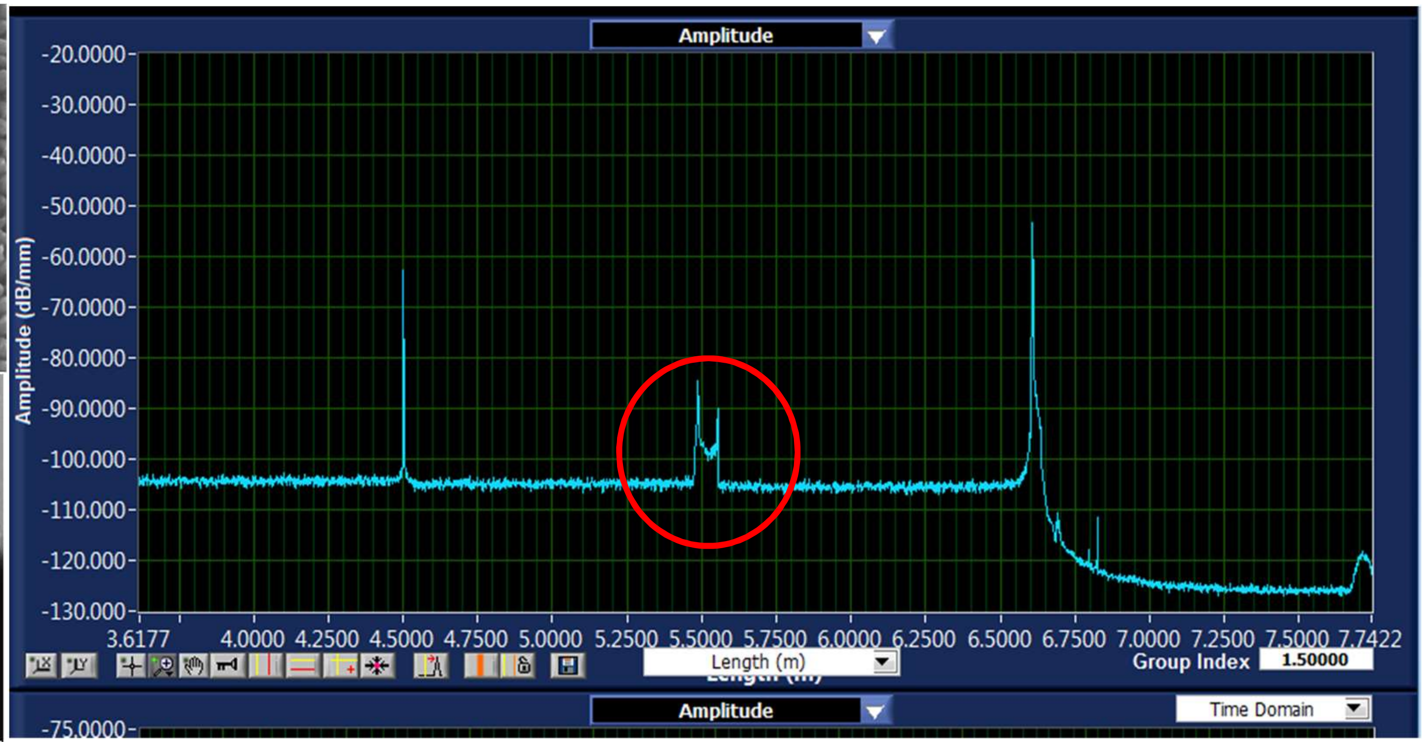
RIE on D-shaped fiber, Coating, Rayleigh

- **Equipment: The Trion Phantom III LT RIE (Reactive Ion Etching)**
- **Gas: CHF_3 and O_2**
- **Power 100-300 W**

Nano-grass (height: 0.1 µm)



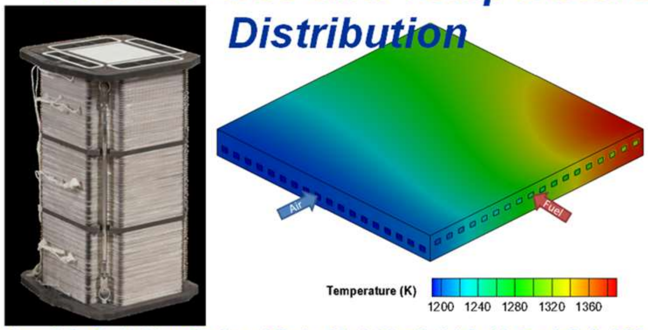
D-fiber with nano-grass Rayleigh scattering



Outlines: A Complicate but Interesting Story

- **Develop high-T stable silica fiber platform**
  - Ultrafast laser direct writing
  - Nano-fabrication of on-fiber nanostructures for high-T
- **Sensor Materials Development and integration**
  - Metal oxide nanostructures
  - Noble and rare-earth metal doping
  - 3D direct microstructuring
- **Sensor Deployment and Measurement**
  - What do we learn?
- **Energy system optimization**
- **Cross-cutting nature of this work**

Example : Solid Oxide Fuel Cells Internal Gas and Temperature Distribution



Pakalapati, S. R., 'A New Reduced Order Model for Solid Oxide Fuel Cells,' Ph.D Thesis, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV

Objective- Sensing Materials: Tailoring the Refractive Indices and Chemical Responsivity

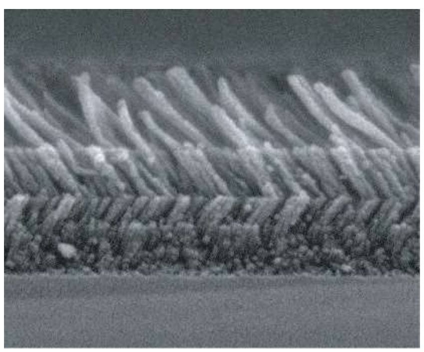
Requirement:

- 3D Geometry (Reduces unwanted anisotropy)
- $\Lambda << \lambda$ (reduce optical scattering loss)
- Processing on Arbitrary Shapes (fiber…)
- **Wide tenability of refractive indices ($\Delta n > 1.5$)**
- **Reactive to a wide array of gas species**
- **Low cost**
- **High Temperature stable**

Options

Semiconductor Processing?

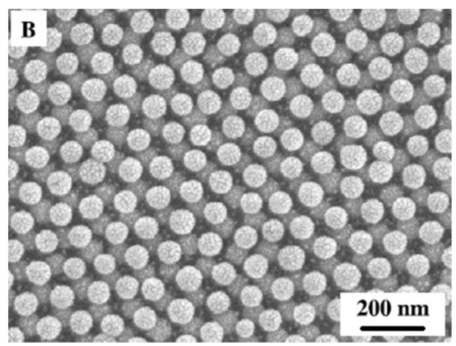
- ❖ Doping, sputtering
- ❖ Cost, not flexible



Xi (2007, Prof. Schubert's group at RPI)

Colloidal Templating?

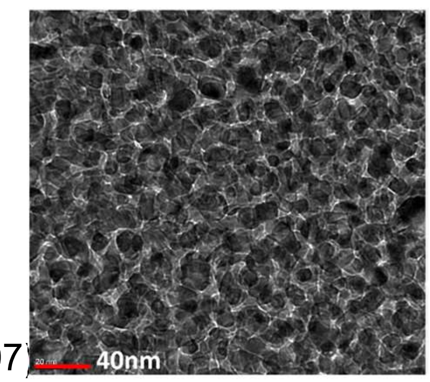
- <50-nm
- Structure limited
- Limit tuning of porosity



W. Min, Nanotechnol. 19, 475604 (2007)

Block Copolymer Templating?

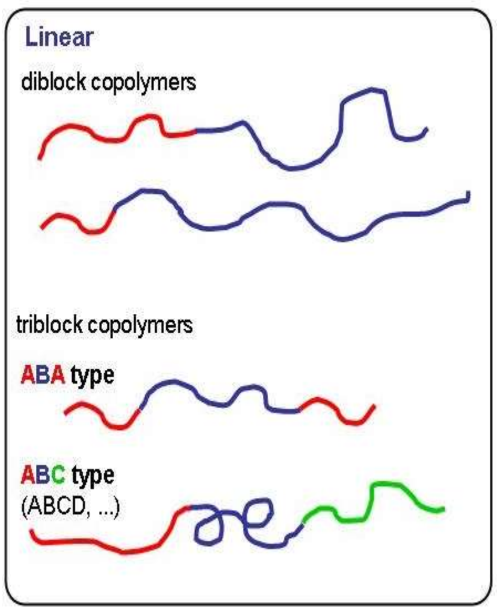
- ✓ alcohol soluble
- ✓ 5nm to 100nm
- ✓ Flexible structures
- ✓ Wide tuning of porosity



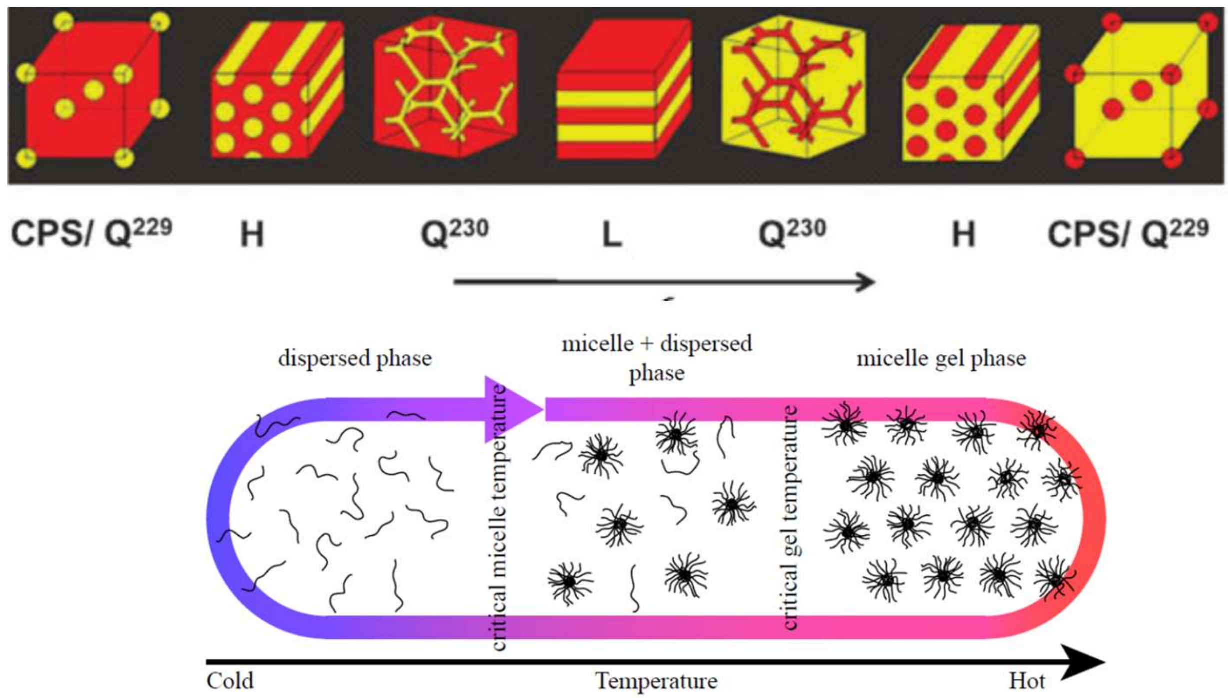
Sensing Materials: Co-Polymer Templating by F-127

F127 Pluronic

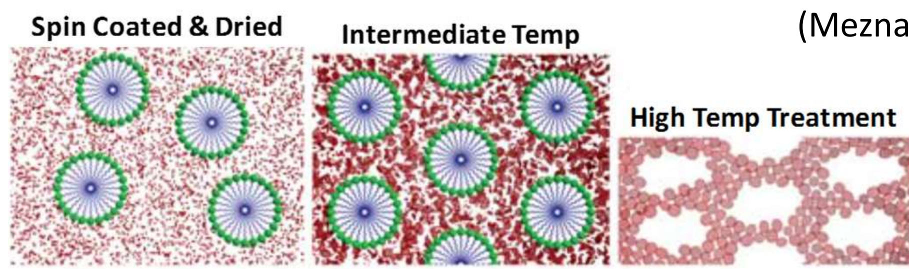
- A triblock copolymer
- Highly Compatible with the Preferred Solvents (Alcohol)
- Has better higher temperature stability



(Orilall, 2011)



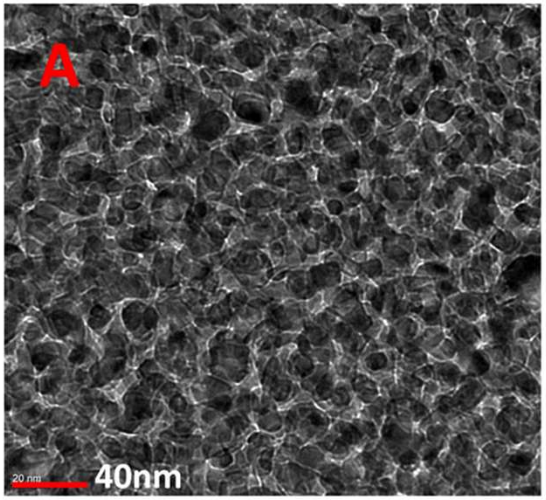
(Meznarich, 2012, p. 107)

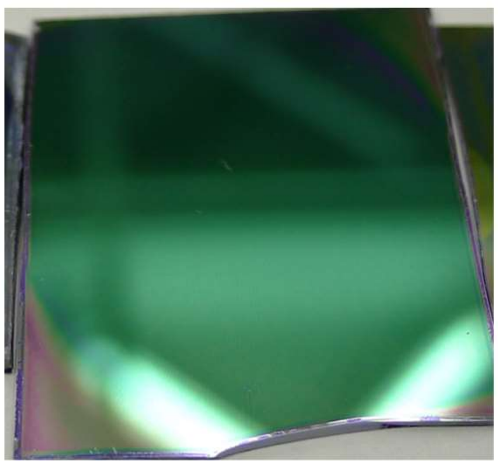


(Shao, 2010)

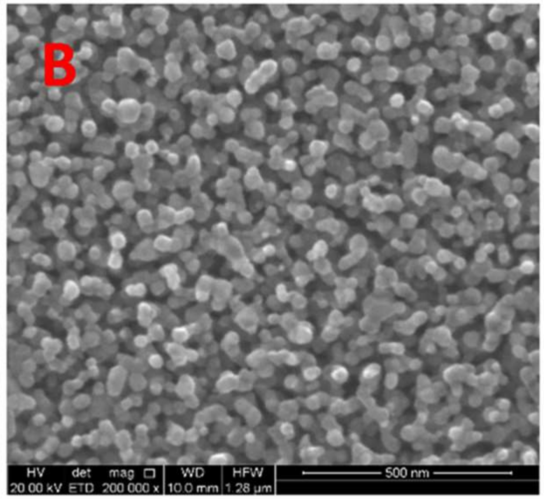
Metal Oxides and Their Dopant Variants

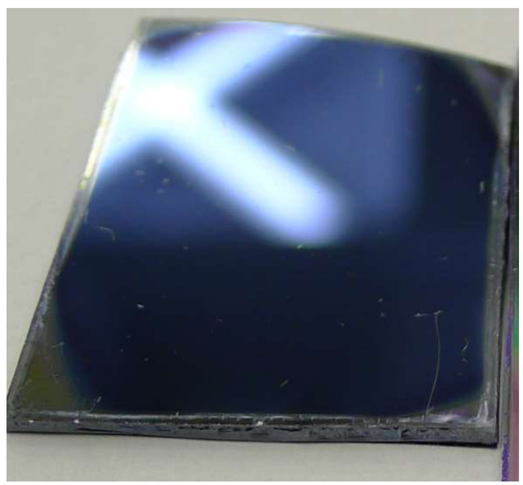
TEM of TiO_2



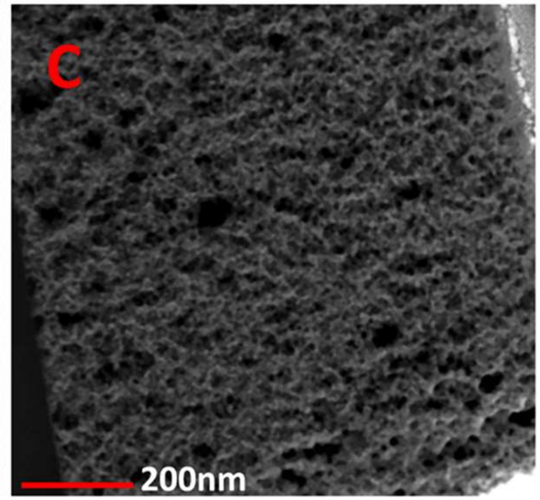


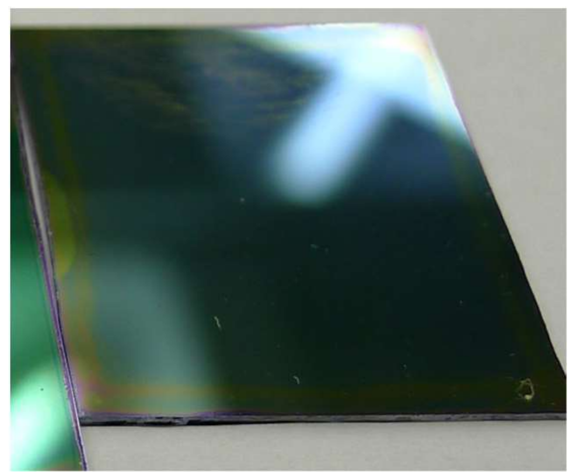
SEM of ZnO





SEM of SnO_2

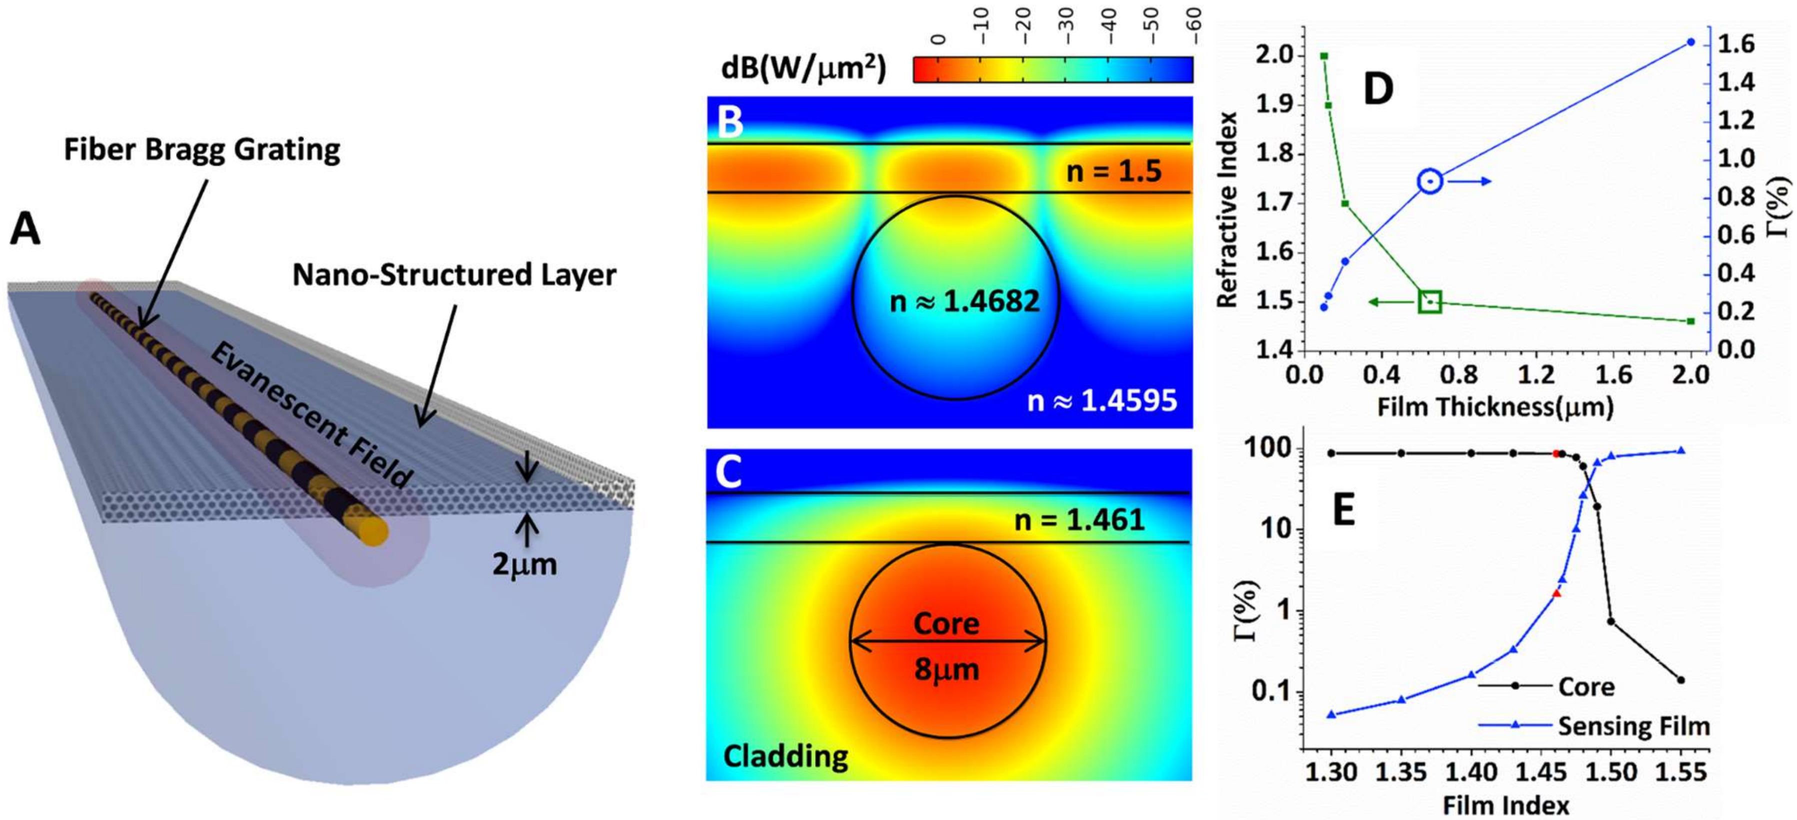




Optical Sensing: Metal Oxide on Optical Fiber Platform

In the evanescent wave configuration

Refractive Index Matching is Critical



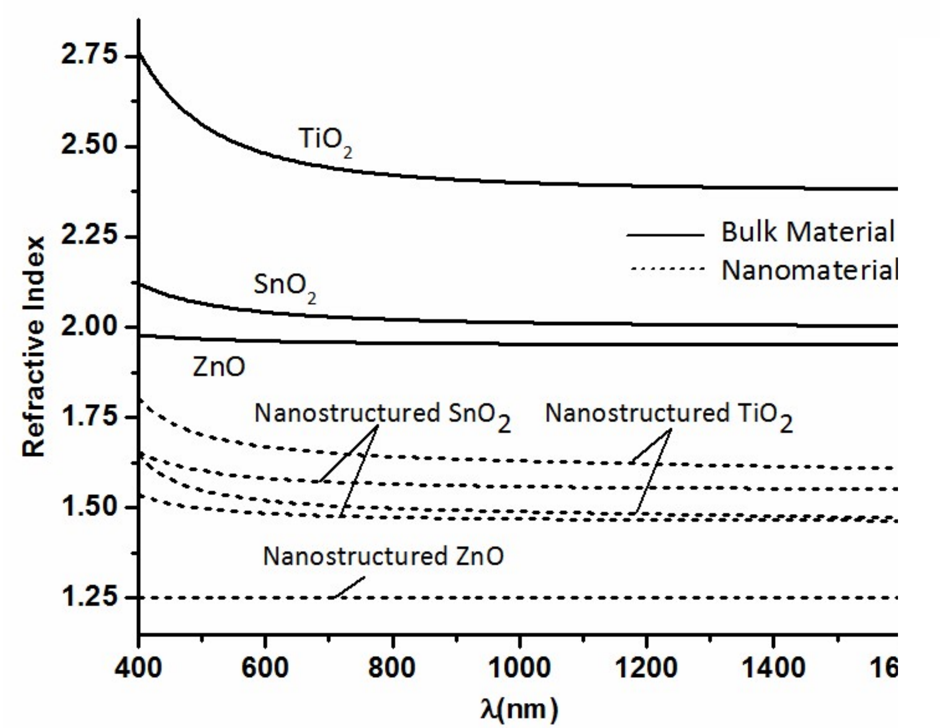
Finite Element Simulation of the Power Distribution of the Fundamental Mode

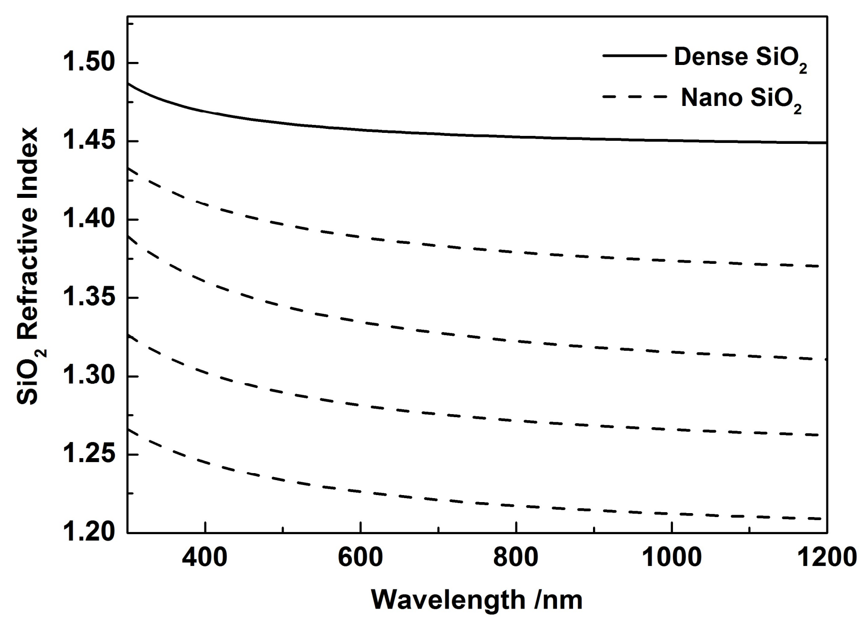
Metal Oxides and Their Dopant Variants

- Metal Source: $SnCl_4$, $TiCl_4$, and $Zn(O_2CCH_3)_2(H_2O)_2$
- Si Source: Tetraethyl Orthosilicate
- Solvent: Ethanol
- Block Copolymer: Pluronic F-127
- Stabilizer: HCl for most, NH_4OH for Zn

Controlling Refractive Indice

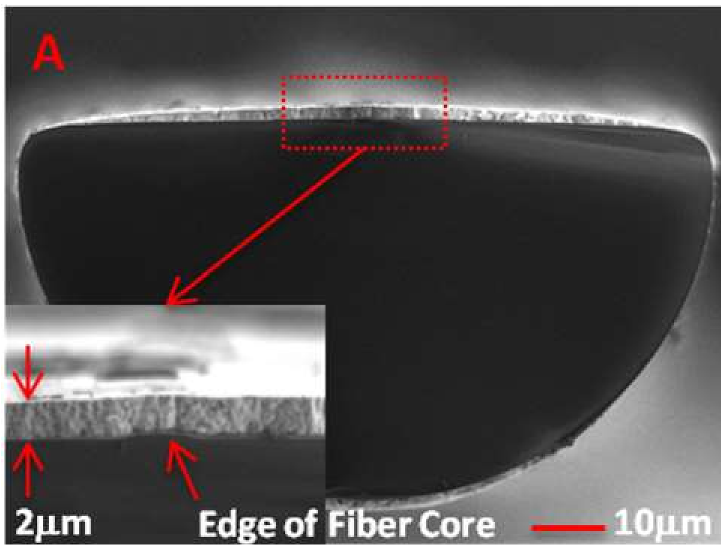
- TiO_2: $\Delta n \sim$ 1.4 to 2.5
- SnO_2: $\Delta n \sim$ 1.4 to 2.1
- ZnO: $\Delta n \sim$ 1.25 to 2.0
- SiO_2: $\Delta n \sim$ 1.2 to 1.45

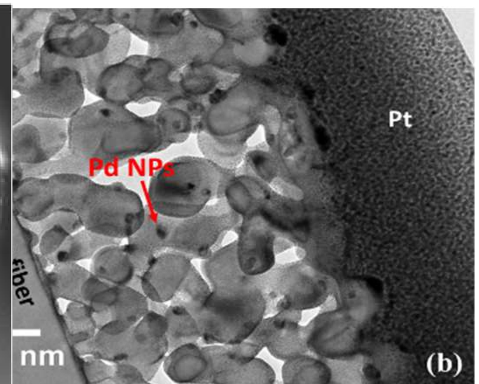


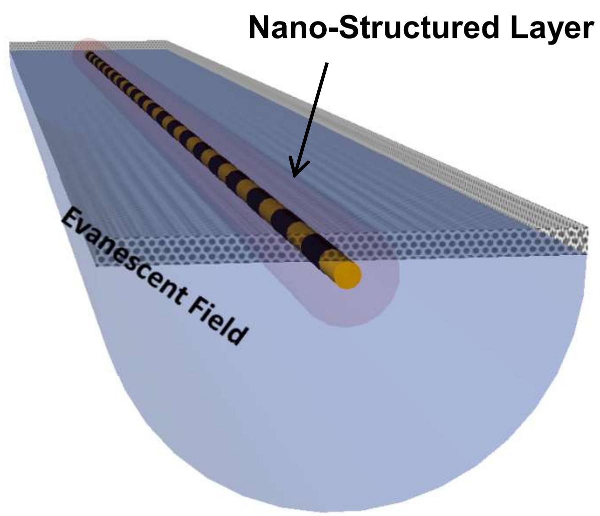


Metal Oxides Enabled Chemical Sensors

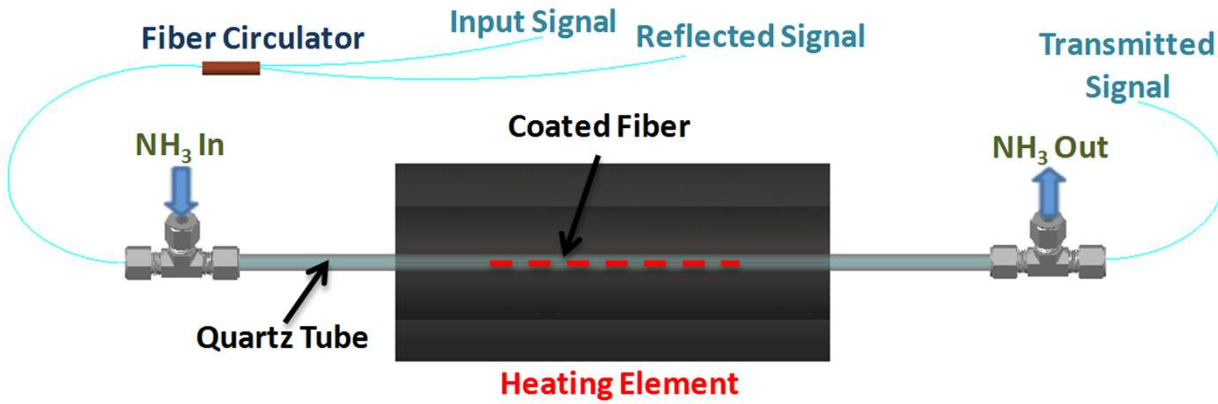
- Nano-Engineered metal oxide sensory film
  - Porosity control for refractive index matching
  - Rare-earth or noble metal dopants for specificity
  - Pd-TiO_2
- Sensor can operate >700C
- No electrical components in target environment

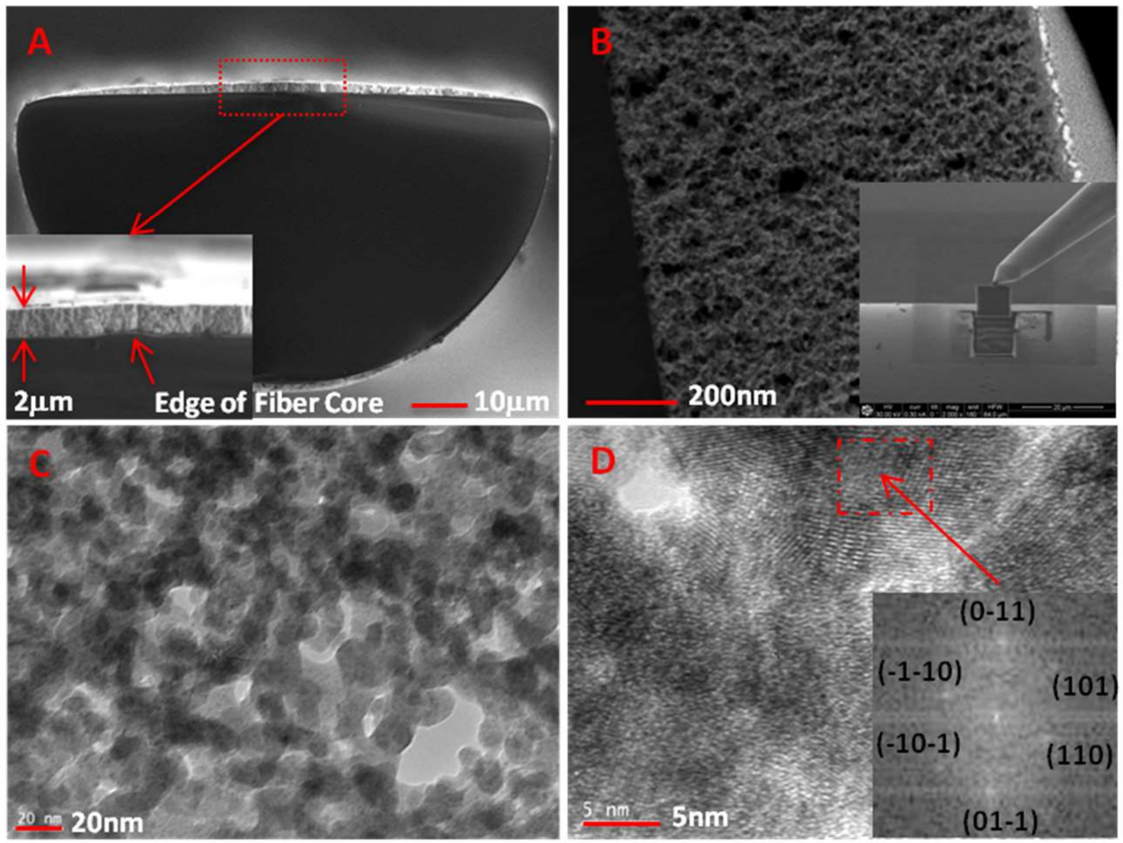






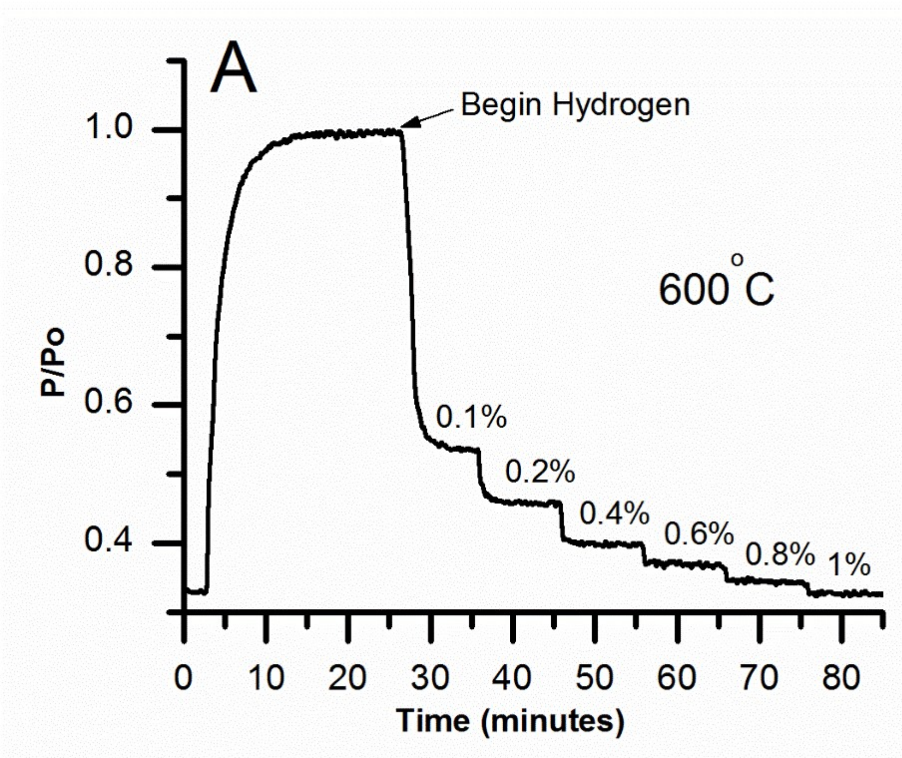
High-Temperature Chemical Sensor on D-shaped Optical Fiber

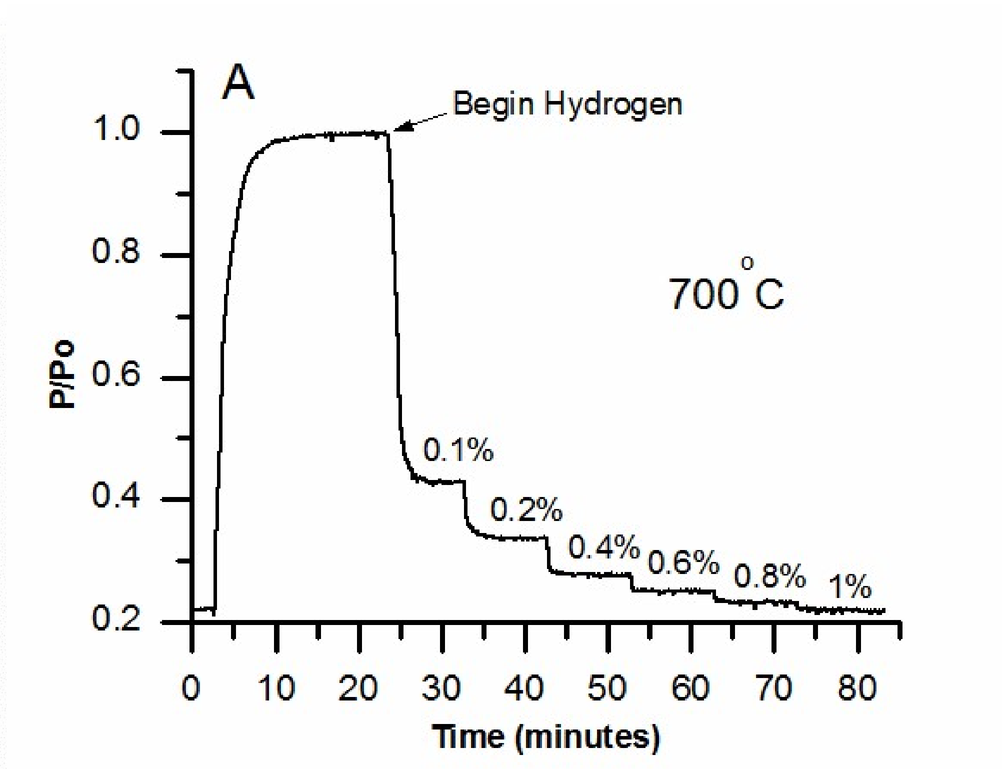




Fiber Optic Hydrogen Sensor at 700C

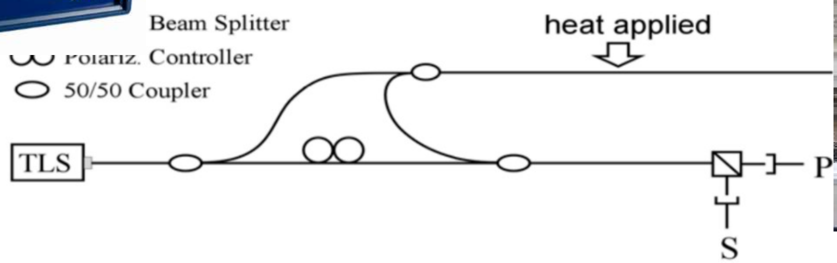
Optical Transmission vs. Hydrogen Concentrations

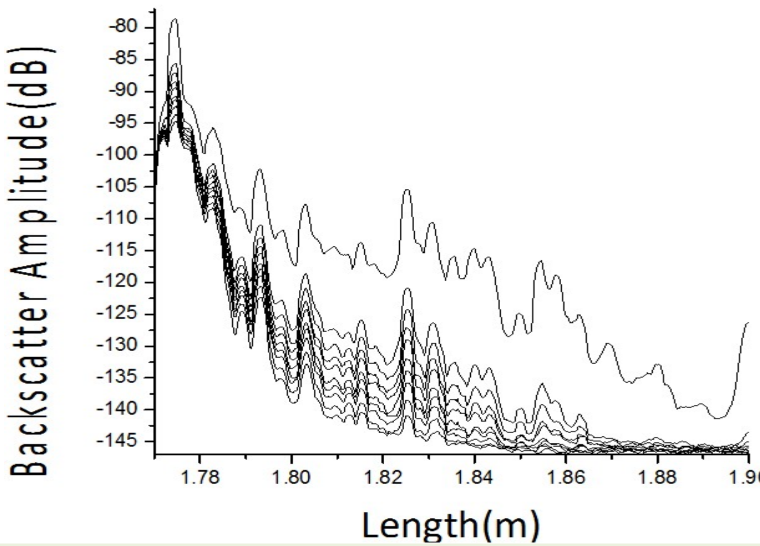




Exposed to various concentrations of hydrogen in nitrogen, recovered with nitrogen
Ideal for hydrogen driven energy conversion systems

Distributed H2 Measurements (Distributed Loss)





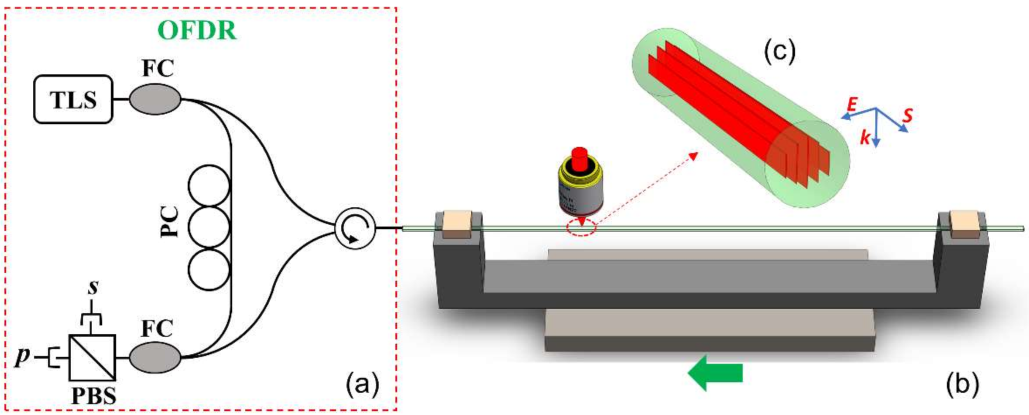
Our fiber is too "good" for sensing applications…

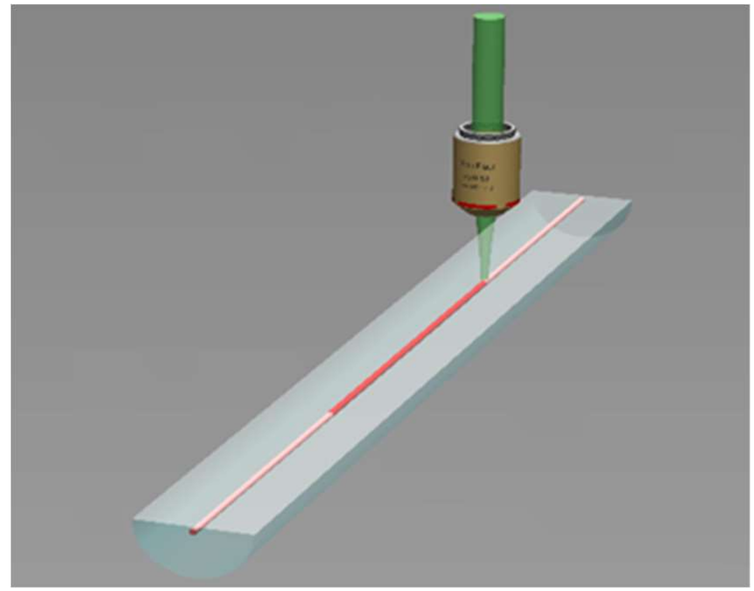
Rayleigh scattering profile is too weak (like weak type I FBG)

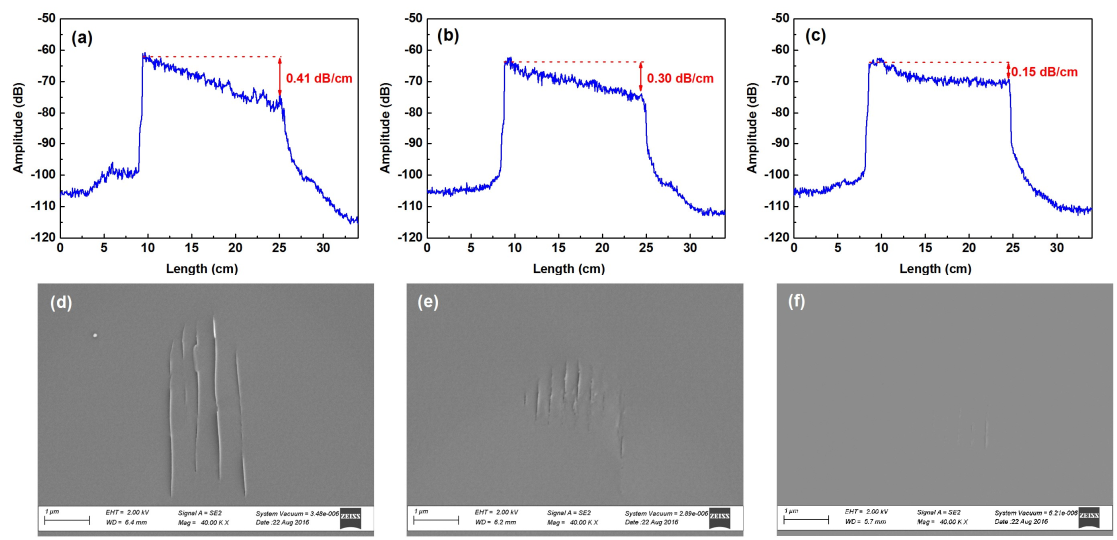
Technical Solutions… Enhanced Backgroundd Rayleigh Scattering …

Distributed Sensors for In-Core Applications

Ultrafast laser irradiation to enhance T/radiation resilience and measurement accuracy





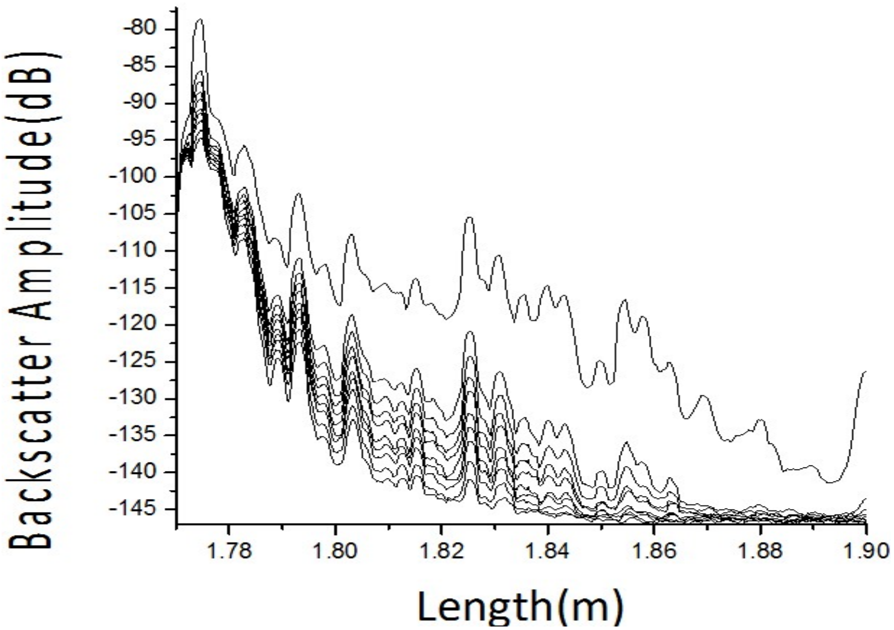


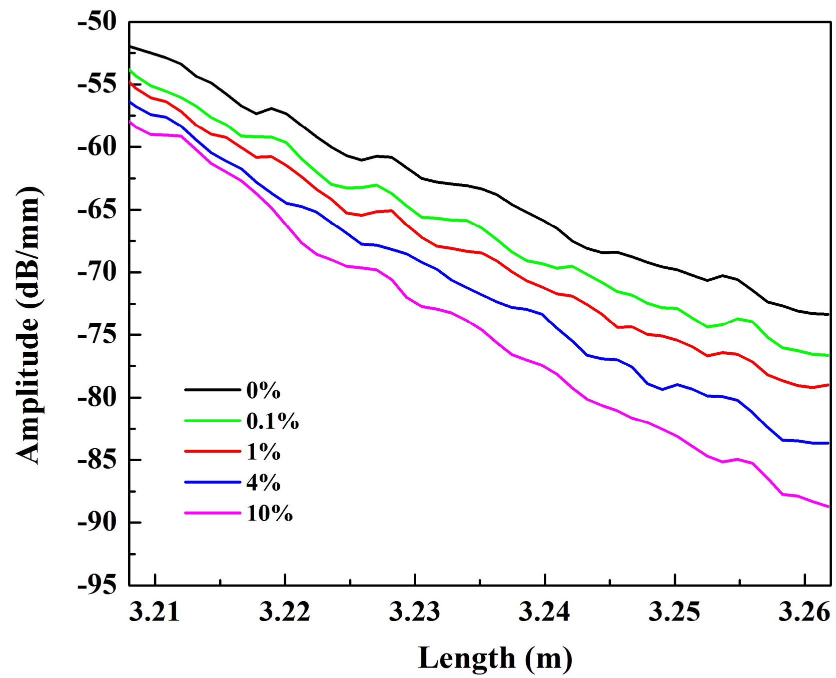
- **Temperature measurements can now be performed at 800C with H_2 atmosphere**
- **Stability verified at 800C**

Now… Distributed H2 Measurement Again…

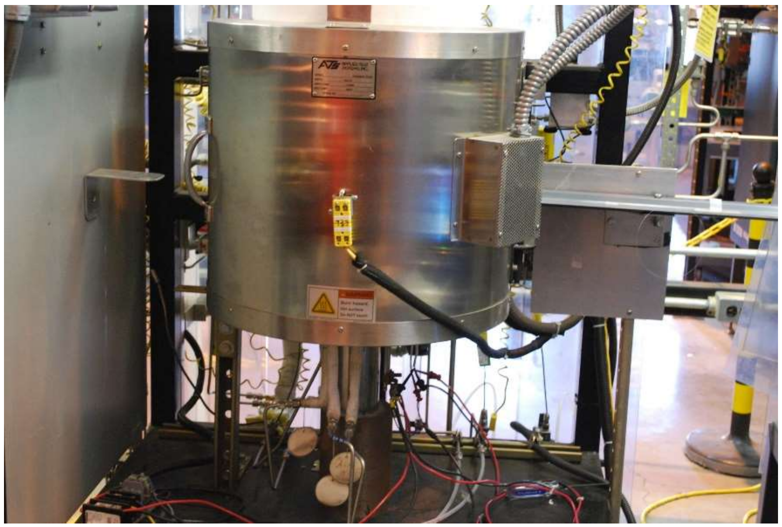
Before… (700C)

After… (750C)



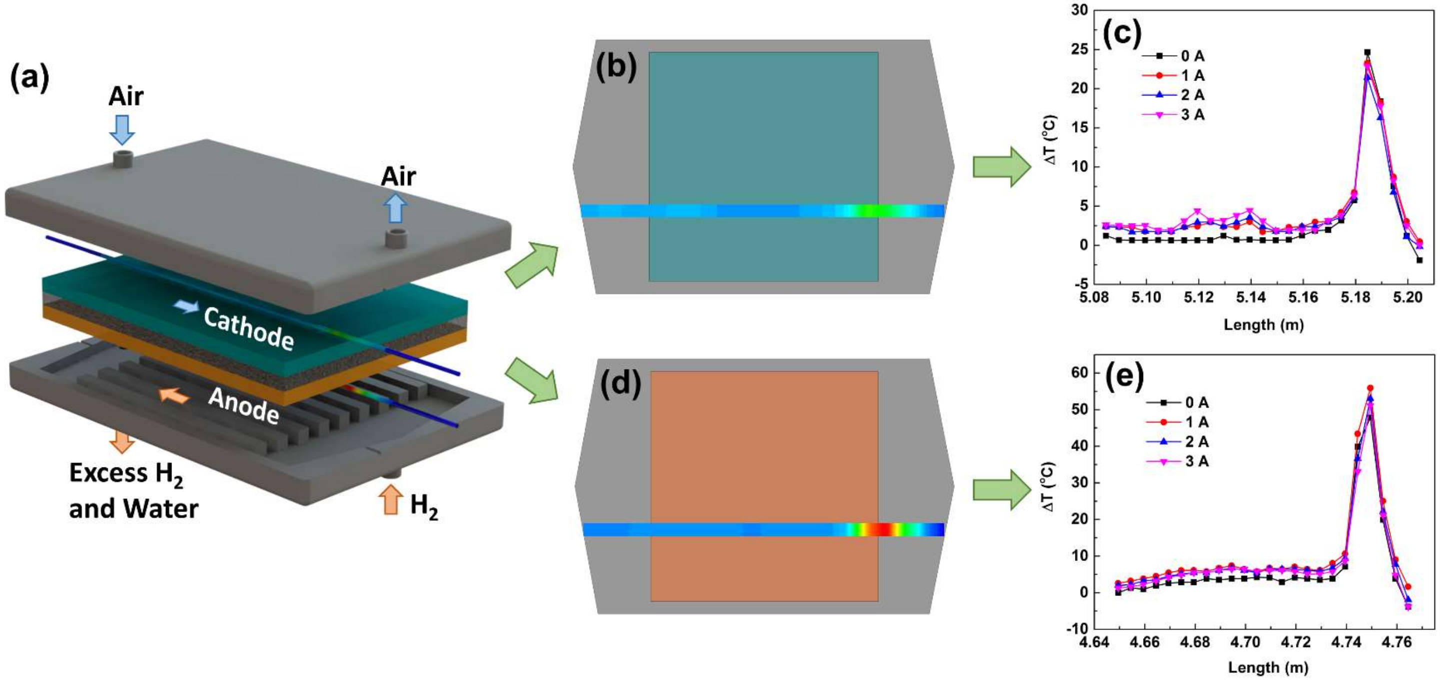


Fuel Cell Tests



- It is possible that distributed T and Chemical sensing can be achieved with 4-mm and 1-mm spatial resolution using a single fiber.
- This sensing scheme can be used to probe other fuel cell chemistry and other energy chemistry at high temperature (<700C)

Distributed T measurement in SOFC



Temperature in cathode and anode were measured respectively

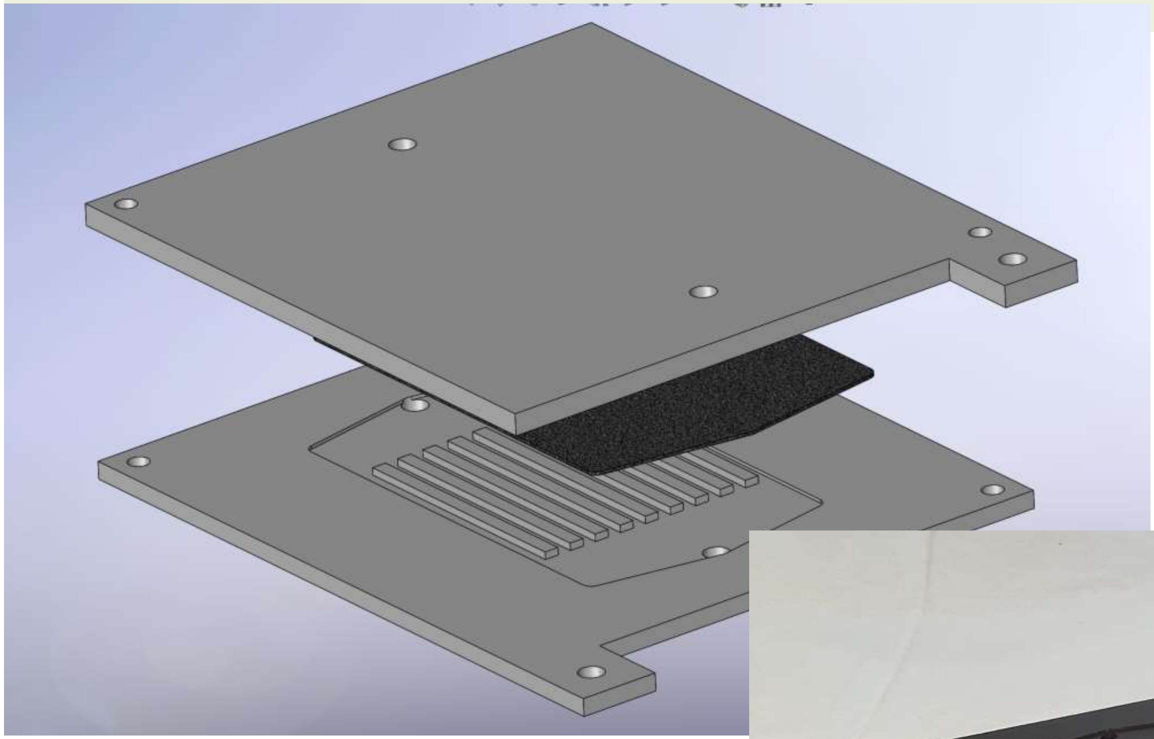
- 100% hydrogen fuel, current load 0 ~ 3 A.
- Temperature increase when fuel gas turned on

  Anode : ~55 °C, Cathode: ~ 25°C

- Temperature change with different current loads < 5°C

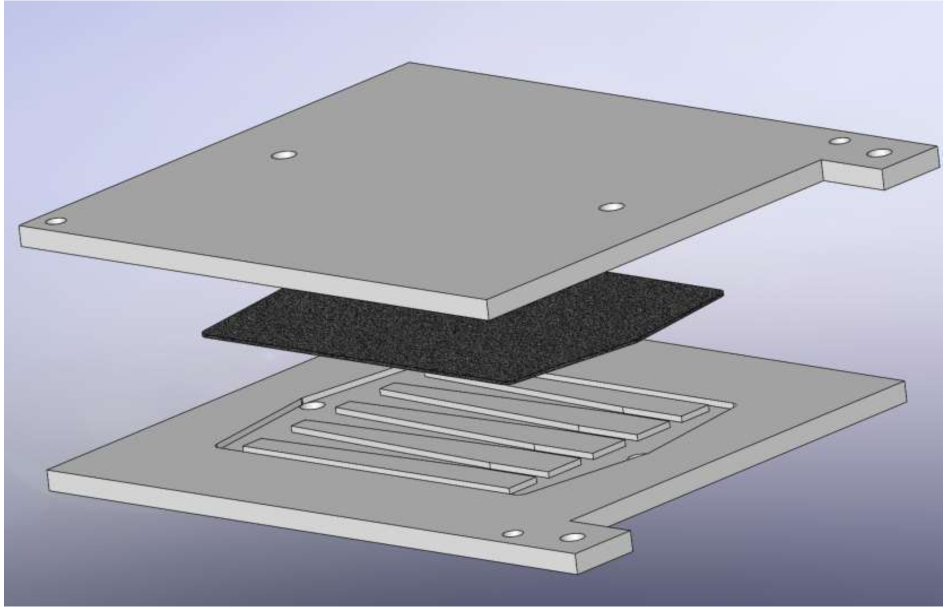
Sensor-Enabled Design Optimization

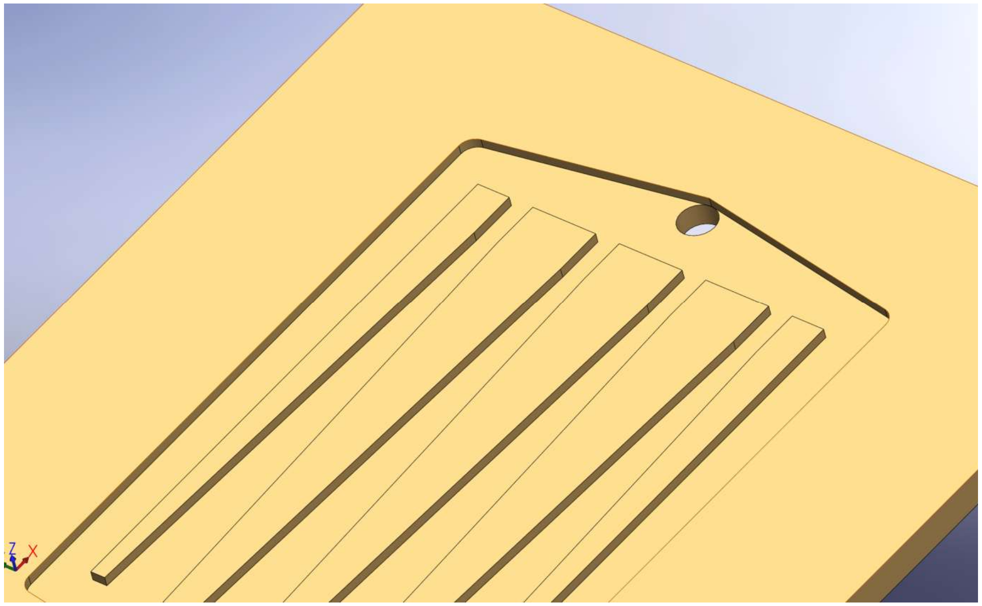
- Current Fuel Cell Plates: only consider electrical properties



Sensor-Enabled Design Optimization

- Configuration optimization to improve gas fuel (then chemical reaction) to improve the T/Chemical reactor profile in fuel cell.

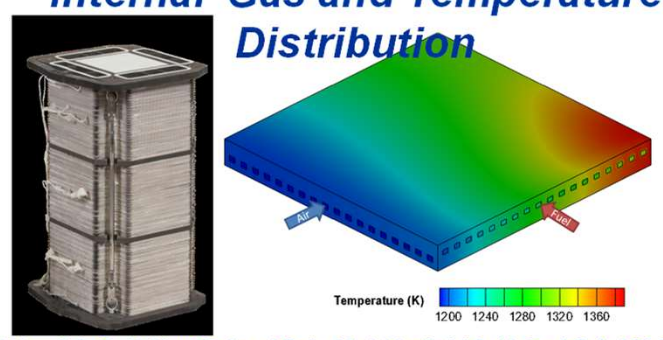




Outlines: A Complicate but Interesting Story

- **Develop high-T stable silica fiber platform**
  - Ultrafast laser direct writing
  - Nano-fabrication of on-fiber nanostructures for high-T
- **Sensor Materials Development and integration**
  - Metal oxide nanostructures
  - Noble and rare-earth metal doping
  - 3D direct microstructuring
- **Sensor Deployment and Measurement**
  - What do we learn?
- **Energy system optimization**
- **Cross-cutting nature of this work**

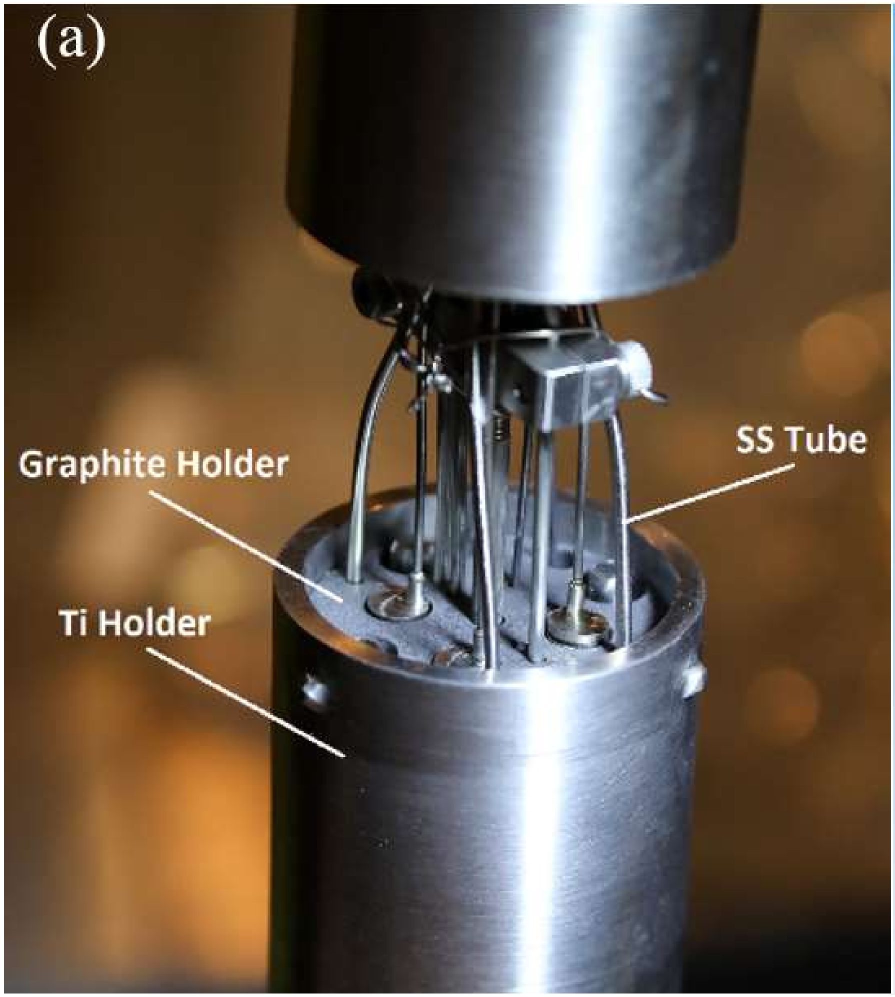
Example : Solid Oxide Fuel Cells Internal Gas and Temperature Distribution

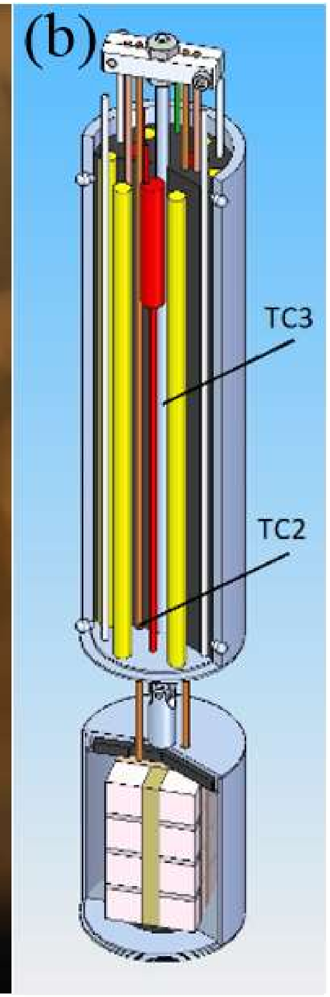


Pakalapati, S. R., 'A New Reduced Order Model for Solid Oxide Fuel Cells,' Ph.D Thesis, Department of Mechanical and Aerospace Engineering, West Virginia University, Morgantown, WV

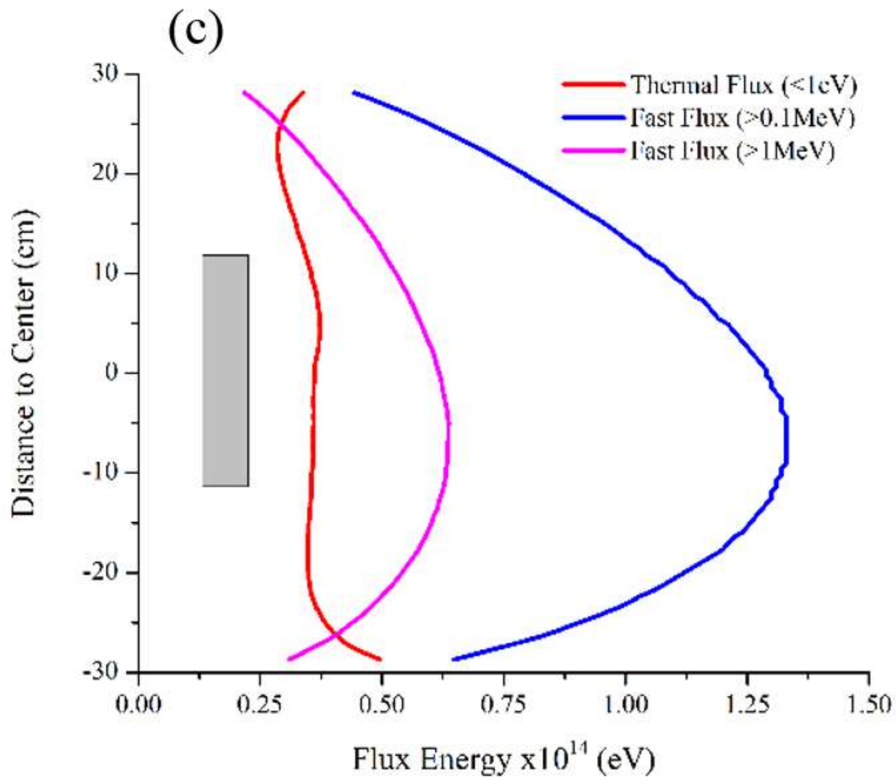
Cross-Cutting: Sensor developed for fossil fuel now used in nuclear energy

MITR In-Core Testing of Fiber Sensors





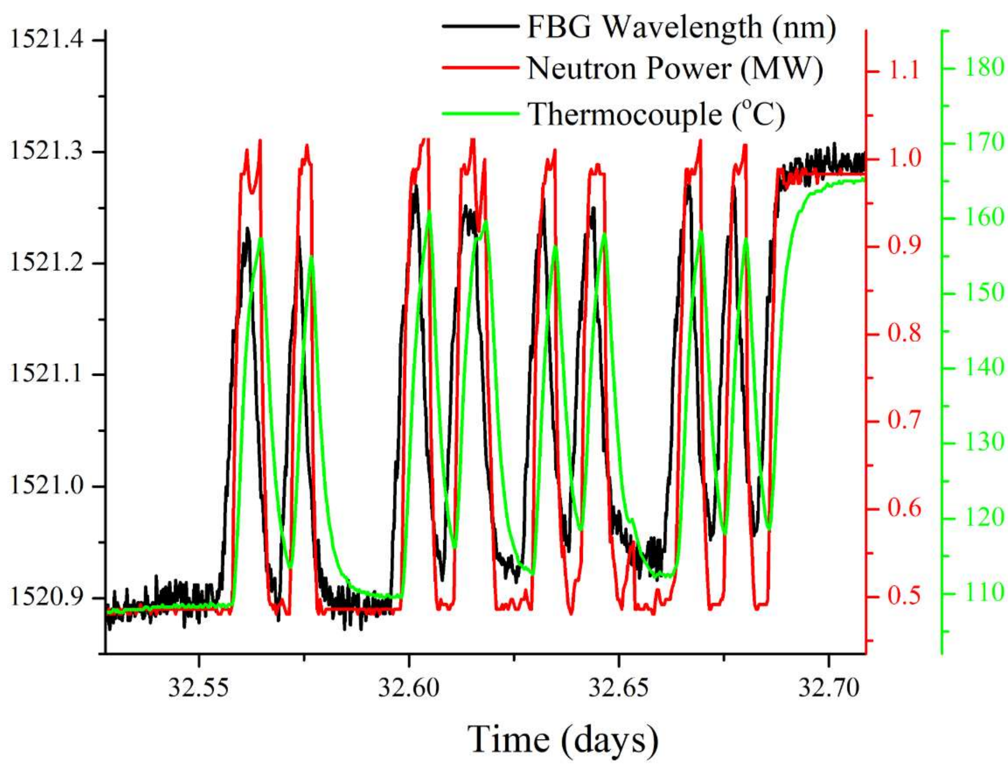
Cross-Cutting: Fiber Sensors in Reactor Cores

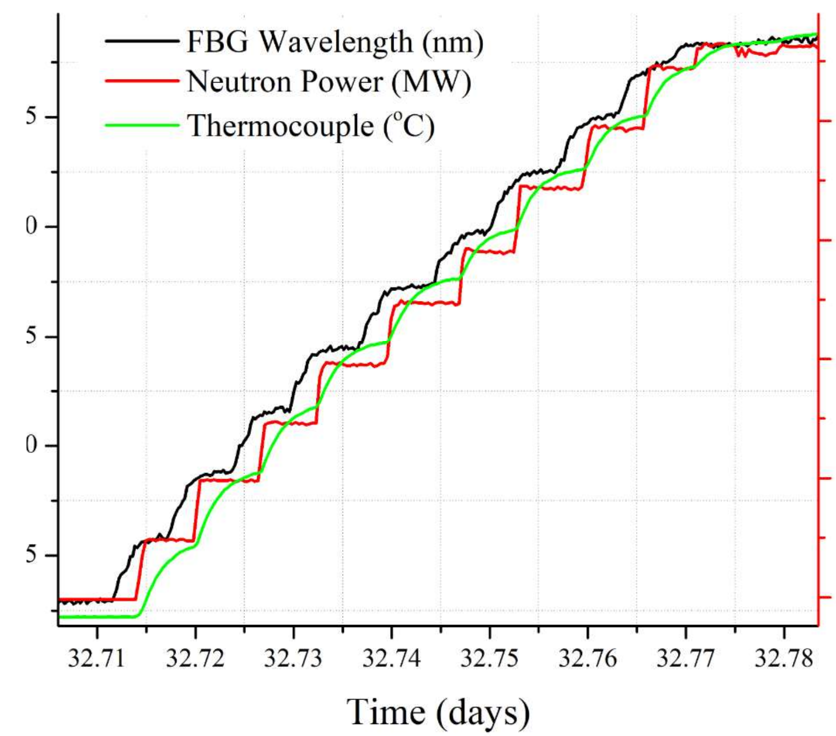


- Radiation started on May 5, 2017, scheduled for 1 year, so far >100 days
- Target temperature 650C
- Fast neutron flux >1.5×10^{14} n/s*cm^2
- Real-time monitoring (remote access) – every 20 seconds for a period of 150 days so far

Cross-Cutting: Fiber Sensors for In-Core Applications

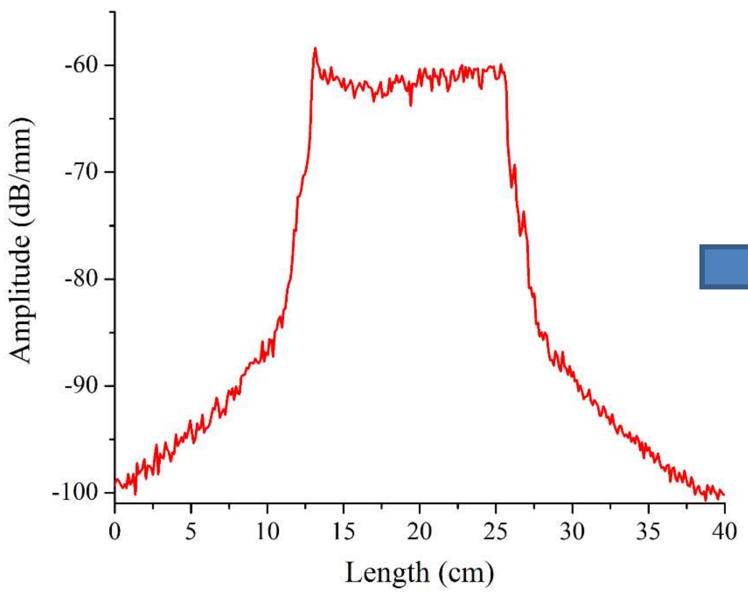
Can we monitor this reactor "anomaly"? --- YES

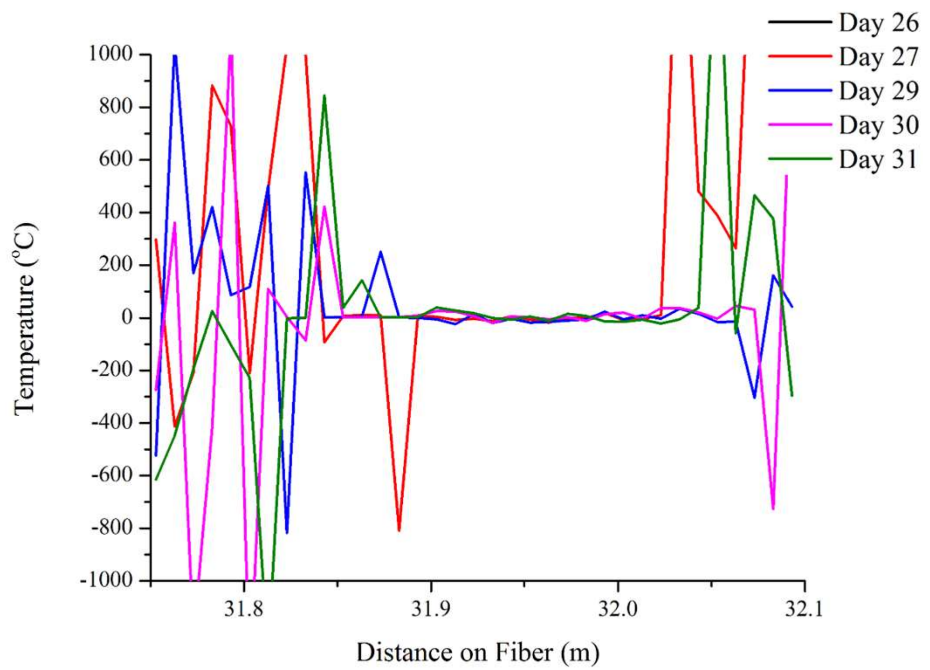




Cross-Cutting: Fiber Sensors for In-Core Applications

Distributed Fiber Sensors



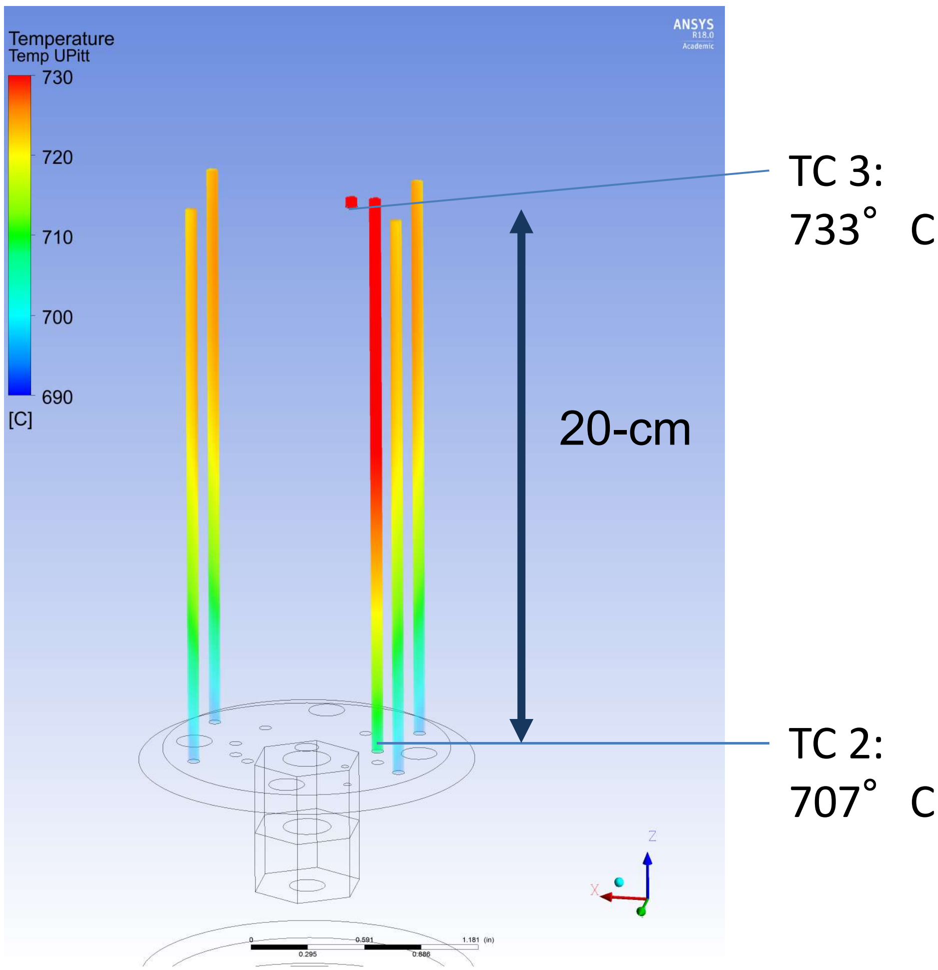


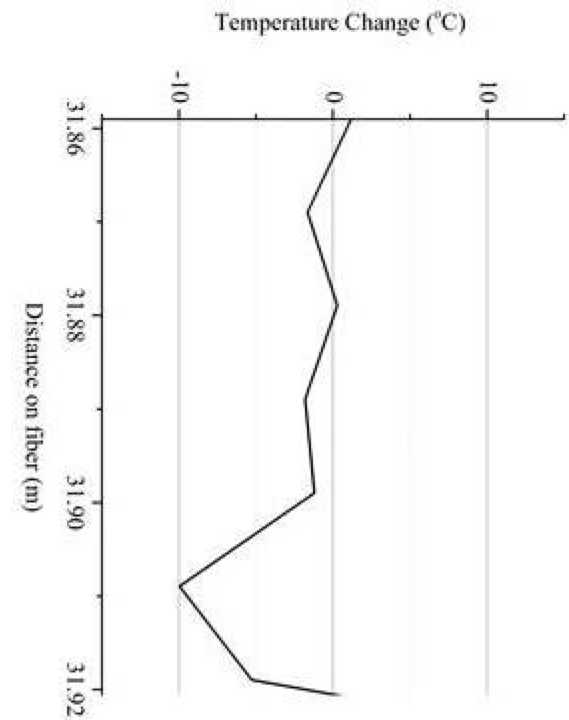
- **12-cm section of fiber enhanced by ultrafast laser**
- **Temperature stability confirmed at 800C**
- **Rayleigh enhancement up to 40-dB (critical)**

Cross-Cutting: Fiber Sensors for In-Core Applications

Temperature Profile Measurement!
(1-cm resolution)

Lower-half Sensor Capsule





Summary

- Fiber sensors will play greater roles in energy industry especially in cross-cutting areas.
- Innovation in optical fiber Sensor is a truly integrated and looping efforts from fiber, to manufacturing, to deployment, to design optimization, and back .
- **Interdisciplinary collaboration essential.**
